ST Series II

High marks in everything

The ratings are in on our ST Series AM/FM Broadcast Consoles—and they're number one. They rate high for versatility, reliability and overall excellence.

But we know that even the finest products can be made better—that's why we've introduced the new ST Series II. These new consoles incorporate even more features to insure greater capability and performance.

The new ST consoles offer a series of modular frames that can be equipped to meet your specific needs. A wide range of input, output and signal processing modules is available to cover your present requirements and provide for future expansion.

At ADM we're never content to stand still—the new ST Series II consoles are impressive proof of that. We're so confident of their excellence that they're backed by an exclusive 5-year warranty.

Pinzone 8200 Satellite Receiver

Performance PLUS Versatility

PERFORMANCE?

- 7.0 dB TRUE DYNAMIC C/N THRESHOLD!
- 11 dB NOISE FIGURE (12 dB MAX!)
- DUAL CONVERSION — BEST IMAGE REJECTION
- HIGH PERFORMANCE SWITCHABLE AFC
- STAND ALONE OR W/SEPARABLE DOWNCONVERTER
- MEETS EIA RS-250B STANDARD FOR END-TO-END TELEVISION RELAYS
- NOISE-FREE RECEPTION AT 3 to 5 dB LOWER C/N THAN CONVENTIONAL L-D RECEIVERS
- ONE SWITCH CONTROL ADAPTS CIRCUITRY FOR DIRECT INTERFACE TO ENCRYPTION DECODERS!
- FULL 30 MHz I.F. BANDWIDTH AND 8.4 MHz VIDEO BANDWIDTH PRIOR TO FINAL SUBCARRIER FILTERING
- STUDIO QUALITY PERFORMANCE AND RELIABILITY

VERSATILITY? JUST TAKE ONE LOOK!

- 24 CHANNEL FREQUENCY AGILE
- DETENT AND MANUAL TUNING
- AUTOMATIC LNA SELECTION
- BUILT-IN 4 GHz COAXIAL SWITCH!
- FULL FUNCTION METERING — SIGNAL STRENGTH AND CENTER TUNING
- LNA POWER THROUGH THE COAX OR BNC CONNECTOR
- INVERT VIDEO SWITCH
- FULL REMOTE CONTROL — CHANNEL AND LNA SELECTION
- TWO EASILY CHANGED PLUG-IN SUBCARRIER DEMODS WITH AUTO-PRIORITY SELECT CIRCUITRY

OUTPUTS: Video (2) 1 V PP 75 Ω
 Composite 1 V PP 75 Ω
 Audio (2) +4 dBm 600 Ω
 Headphone 0-1.5 V HI-Z

POWER: 115 VAC/230 VAC opt; 20 watts

SIZE: STD 19" RACK MOUNT, 5 1/2" H x 14" D

BROADCAST ENGINEERING (USPS 338-130) is published monthly by Intertec Publishing Corporation, 9221 Quivira Road, P.O. Box 12901, Overland Park, KS 66212-9981. Postmaster, return form 3579 to the above address.

THE COVER this month is adapted from NAB brochures promoting the organization's 60th annual convention and international exposition. The convention's theme is "The Sky's the Limit"...in radio...in television...in engineering...in new technologies...and in government regulations. NAB-'82 will help broadcasters make the transition as new developments in technology and changes in regulations reshape the traditional roles of managers and engineers in broadcast stations.

The cover artwork was copied and reproduced here with the permission of NAB. Special recognition goes to artist Lynne Komai, Watermark Design, Alexandria, VA, for creating the art in cooperation with the NAB.

NAB-'82/Dallas

- Broadcasters' main convention
- Dallas Convention Center, April 4-7, 1982

NAB CONVENTION GUIDE

Most of this issue is devoted to pre-show coverage of NAB-'82/Dallas. Extensive research went into compiling data from manufacturers exhibiting at this year's convention to make our exclusive coverage as detailed and complete as possible. The results, in terms of articles and special sections, can be seen in the contents listing to the left. This special coverage will help attendees plan for the show or make it easy to obtain data on new products for those who cannot make it to Dallas. In any event, look for **BE's** extensive show wrap-up in the June issue.

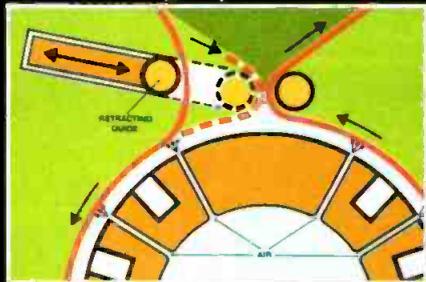

NEXT MONTH our issue will include:

- Audio technology – Radio sound quality
- SMPTE Winter Conference highlights
- INTV Conference highlights
- Special cable engineering demographics

Hitachi-5 Competition-0

That's the score in one-inch VTR technology.

We've gone the first generation of TYPE C machines *fine* better...to help you get all the potential of one-inch out of your video installation. Here's what the competition *doesn't* give you.

• Tape guide retracts for threading ease • Air drum eliminates head contact in shuttle/standby modes

1. Retracting Tape Guide

Retracts for unequalled ease of threading; repositions with one micron accuracy for up to two million threadings. Provides the reliability of a quad thread system in a one-inch format.

2. "PRO" Tape Path

The protective reverse oxide ("PRO") configuration of the tape path means *only* the video and audio heads touch the oxide surface. All other transport mechanisms guide the tape by its reverse side. Result: noticeably reduced dropouts; longer tape life.

3. Instant Head Replacement

Pre-aligned head design permits easy replacement of video heads in three minutes. No adaptors or jigs; no adjustments required.

4. Audio and Video Confidence

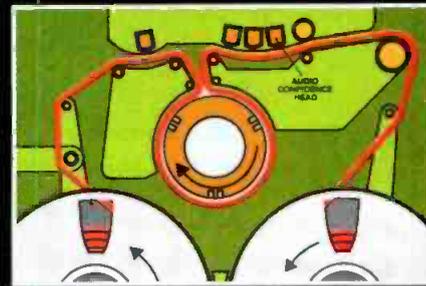

The others only let you *see* what you're taping. We let you *see and hear* everything being recorded...simultaneously.

5. Non-contact Tape Shuttle System

In shuttle and standby modes, tape rides on a cushion of air. Increases head and tape life immeasurably. Cuts frictional

resistance, yielding shuttle times of only 80 seconds end to end.

We could go on. With impressive features like microprocessor control; broadcastable slow motion; one-touch shuttle and jog; front access circuit boards; audio spot erase; and on and on. But why run up the score, when it's already no contest? See the Hitachi HR-200, it's equally impressive portable HR-100 model, and companion TC-200 Time Base Corrector.

• Full audio and video confidence
• "PRO" tape path reduces dropouts

All Wireless Microphones Are Not Created Equal

This One is a
Telex

Wireless mics aren't new, and sometimes it seems as if all systems are basically the same. However, Telex and its Turner and Hy-Gain divisions have combined their 100 years of cumulative experience in microphone, antenna and rf development to produce a DUAL DIVERSITY WIRELESS SYSTEM THAT COSTS AS LITTLE AS SINGLE ANTENNA INSTALLATIONS. The FM receiver can be operated with one or two antennas. When two antennas are used, a unique automatic phase summation network (patent applied for) provides superb dual diversity reception.

The Telex wireless sounds as good as a hard wired mic, offers plenty of options and is economically priced. If you're interested in a wireless system that is *more* than equal—write us today for full specifications.

Intertec Publishing Corp.

Leader announces the brightest idea in Vectorscopes. CRT-generated targets.

The Leader Vectorscope is unique.

Only the Leader LVS-5850 NTSC Vectorscope offers CRT-generated phase/amplitude targets that are as bright and clear as the vectors themselves. And electronically generating the targets eliminates non-linearity errors caused by CRT aging, so you can be confident that what you see is what you've got.

The LVS-5850 fits directly into your present vectorscope rack. It provides a test circle pattern—75% or 100% saturation—and lets you select the reference phase from either of two video signals or a subcarrier.

Precise NTSC sync/test pattern generators.

Leader's LCG-400 series provides accurate reference signals for any off-the-air broadcast or non-broadcast use. Available in multiburst or sweep marker configurations, they provide EIA and full-field color bars as well as staircase, raster (in eight colors), window,

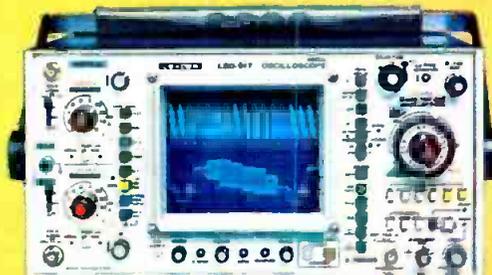

LCG-400 Sync/Test Generator.

For Demonstration Circle (6) on Reply Card

convergence and cross-hatch test signals... plus gen-lock capabilities and a host of auxiliary outputs. As a matter of fact, Leader's sync/test generators do virtually everything the \$4,000 generators do... except cost as much.

A network-proven 50 MHz oscilloscope.

The Leader LBO-517 oscilloscope gives you all the features most needed by video engineers. Waveform monitor-like displays of composite video at V or H rates with 1 mV sensitivity. Plus alternate time base for viewing entire frames and individual lines simultaneously. Two auxiliary channels for monitoring Hd, Vd, blanking, and more... a total of 4 channels. The 20 kV CRT gives you very

LBO-517 50 MHz Oscilloscope.

bright, sharp displays at all sweep rates.

Two-year warranty. Evaluation units.

High reliability permits Leader to provide a generous two-year warranty (even on the CRT) ... backed by factory service depots on both Coasts. Evaluation units are available to all qualified customers.

Call toll-free (800) 645-5104 to request:

an evaluation unit, our 1981/82 catalog, the name of your nearest "Select" distributor and additional information.

FCC update

March 1982

Questions answered by license requirement hotlines

The commission staff is continuing to receive telephone inquiries concerning the changes in requirements for licensed operators at AM, FM and TV broadcast stations, the abolishment of the Radiotelephone First Class Operator License, and the issuance of the General Radiotelephone Operator License. Questions related to radio operator examinations and licensing should be directed to Jay Jackson or Vernon Wilson at 202-632-7240, and questions related to operator requirements and duties at AM, FM and TV broadcast stations be directed to John Reiser at 202-632-9660.

Fowler receives Thomas Jefferson award

FCC Chairman Mark S. Fowler, who has proposed wide-ranging deregulation of the broadcast industry, has been named 1982 recipient of the national Thomas Jefferson Award honoring a public official concerned with the freedom of the news media.

The award was presented to Fowler at the Thomas Jefferson Award Banquet in February during Mass Communications Week at Texas Tech University.

Fowler has been a leader in the movement to deregulate the broadcast industry. He has questioned the Fairness Doctrine, which requires that broadcasters air contrasting viewpoints on controversial issues, and the "equal opportunity" rule, which forces broadcasters providing air time for one political candidate to provide equal access opportunity to all qualified opponents.

In recommendations to Congress, Fowler has proposed the elimination of the Fairness Doctrine. Proposed legislation submitted to Congress in October with FCC endorsement seeks to deregulate the broadcast industry.

Since 1973 the award has been presented annually to a public official concerned with protecting First Amendment guarantees and ensuring the freedom of the news media to gather and disseminate news.

Fowler was selected from five public officials nominated nationally by local, state or national press and broadcast associations, news media or individuals. To be eligible for the award, nominees must hold elective or appointive office on the local, state or national level.

Previous recipients of the Thomas Jefferson Award are Sen. Sam J. Ervin Jr., North Carolina; Gov. Edwin W. Edwards, Louisiana; Rep. Robert W. Kastenmeier, Wisconsin; Leon Jaworski, Texas; Gov. Ella Grasso, Connecticut; Sen. Hubert Humphrey, Minnesota; FCC Chairman Richard Wiley, Washington; Sen. Lawton Chiles, Florida; and Gov. Bruce Babbitt, Arizona.

No restriction on public FM subcarrier service proposed (BC Docket No. 82-1)

The commission has proposed to eliminate restrictions on public FM radio stations that prevent their use of subcarrier frequencies for commercial and revenue-generating purposes.

FM stations have the capacity to program one or more subcarriers on a multiplex basis to provide subsidiary communications service without disruption of their regular broadcast programming. Stereo stations use one subcarrier to carry their second channel.

Commercial FM stations are allowed, on specific authorization by the FCC, such uses as transmission of background music for department stores and utility load management data and control signals. Public stations are currently limited to program transmission of a non-commercial nature that furthers an educational purpose.

The commission said that amendments enacted last year to the Communications Act encouraging public stations to develop additional funding sources and authorizing them to engage in a variety of remunerative non-broadcast activities might make it inappropriate to retain the non-commercial limitation on subcarrier uses. The amendments were adopted to allow public stations to raise more

money for themselves, in view of the reduction in federal funding.

The rule change would directly affect the approximately 1200 public FM stations. The commission noted that the change might give many small business and government entities access to subsidiary services for the first time.

The commission also terminated a rulemaking proceeding (Docket 19079) begun earlier to consider a wider range of multiplex channel uses by public FM stations. In view of technological and other changes, the FCC said, the record developed in the earlier proceeding was inadequate.

Microwave booster use proposed

The commission has proposed to allow use of microwave boosters by TV and radio stations for transmission of program material from studios to remote transmitter sites, in intercity relays and between main TV and auxiliary broadcast stations. Microwave boosters receive on an assigned frequency and retransmit on the same frequency. Most radio relay devices receive on one frequency and "translate" to another frequency for retransmission. Microwave requires direct line-of-sight transmission.

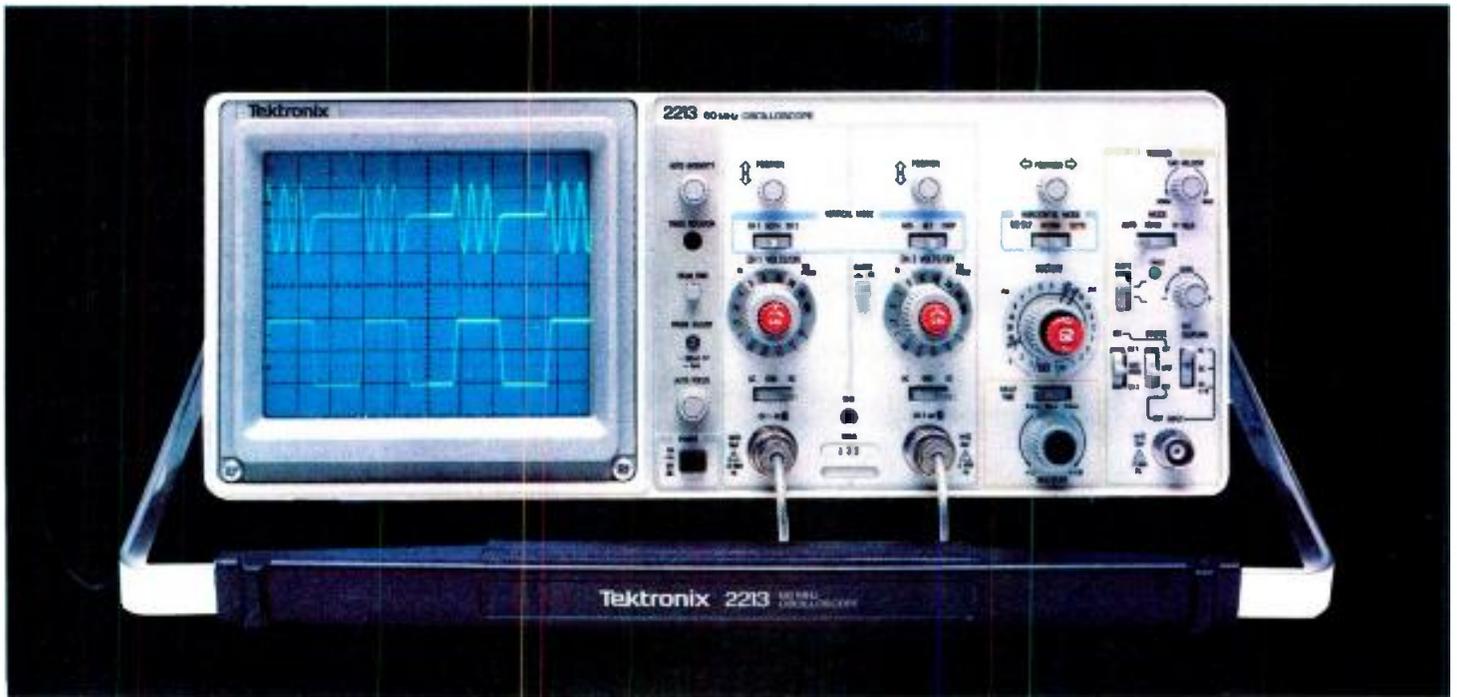

The commission's proposed rule change would permit use of boosters where obstructions prevent direct studio-to-transmitter or intercity relays. The commission acted in response to a petition by Marti Electronics which said present rules do not provide adequately for such situations.

The rules currently allow broadcasters to use "active" or "passive" repeaters or, with specific authorization, to increase the height of their microwave antennas when line-of-sight transmission is obstructed. Active repeaters translate to another frequency, requiring assignment of a second frequency. Because limited channels are available for broadcast relay use, an additional channel may not be available in a metropolitan area where the channels are congested.

The commission proposed to require type acceptance of equipment. Automatic power output and shut-off controls would be required, and a licensee would be required to take full advantage of the focusing capability of directive antennas.

Harris named broadcast bureau chief

Laurence E. Harris has been appointed chief of the FCC Broadcast Bureau. Harris comes to the commission from MCI where he was vice president for Regulatory and Carrier Relations. □

The \$1100 scope. Only Tektronix could make so much performance so affordable!

The 60 MHz Tek 2213 and 2215 introduce a scope design so radically different, it delivers full-range performance at prices well below what was ever possible before.

Not surprisingly, it is from Tektronix, the world's largest and most respected scope manufacturer and a legend for instrument reliability and value.

Design for the 2213 (\$1100) and dual time base 2215 (just \$1400) includes some 65% fewer mechanical parts. Fewer circuit boards. Fewer electrical connectors and cabling. Result: a lower purchase price for you plus far greater reliability.

Performance is pure Tektronix: there's the

bandwidth for digital and high-speed analog circuits. The sensitivity for low signal measurements. The sweep speeds for fast logic families. A complete trigger system for digital, analog or video waveforms. And with the 2215 you get fully calibrated delayed sweep for fast accurate timing measurements. New high-performance 10X Tektronix probes are included!

2213/2215 PERFORMANCE DATA

Bandwidth: Two channels dc — 60 MHz from 10 V/div to 20 mV div (50 MHz from 2 mV div to 10 mV div).

Sweep speeds: Sweeps from 0.5 s to 50 ns (to 5 ns/div with X10 mag)

Sensitivity: Scale factors from 100 V/div (10X probe)

to 2 mV/div (1X probe). Accurate to $\pm 3\%$ ac or dc coupling.

Delayed sweep measurements: 2213: standard sweep, intensified after delay, and delayed. 2215: A only, B only, or A and B alternately with A intensified by B.

Complete trigger system: Modes include TV field normal, vertical mode, and automatic, internal, external, and line sources, variable holdoff; separate B sweep trigger on 2215.

Probes: High performance, positive attachment, 10-14 pF and 60 MHz at the probe tip.

The price: Just \$1100 for the 2213 and \$1400 for the dual time base 2215*. Order direct from the

Tektronix National Marketing Center, your hotline for the 2200 Series and all Tektronix accessories.

Phones are staffed by sales engineers who can answer your technical questions.

Your direct order includes a 15-day return policy and full Tektronix warranty. Call today. You can't buy a more advanced scope for less.

Polonsky dies

The recent death of Joseph Polonsky has robbed radio and TV broadcasting of one of its most creative pioneers. His career, which spanned more than three decades, included scores of awards from his peer groups in recognition of his significant contributions to TV technology. He was elected a Fellow of both the SMPTE and the Royal Television Society; received the Montreux Symposium

Citation for his work on that world forum; and was a member of the Edward Rhein Foundation. In addition to his work in the electronics field, he was also active in bio-medicine, and was in the process of writing a book on that topic.

Polonsky began contributing to broadcasting in the late '40s with the development of high power transmitters and non-echoic antennas. He began using short (centimeter) waves

in 1952 on some of the first mobile TV links, and eventually pioneered the first monochrome ENG units using Vidicon cameras and a portable backpack transmitter. These camera units were used by CBS in 1956 to cover the major political conventions in the United States, and were the forerunners of today's widespread ENG operations.

In the radar field, Polonsky developed a novel TV conversion technique which, after its introduction in 1958, became a worldwide standard.

Polonsky's most recent position was with Thomson-CSF, where he rose to be technical director of the Broadcasting Division, and where he, after his official retirement a few years ago, continued to serve as a member of the board of directors and as a consultant on major projects.

Polonsky was also active in various standards groups, most recently in the field of high definition television, where he spoke frequently at major technical conferences advocating a universal standard for this emerging technology. He was the moderator of the Montreux Symposium Round Tables, where he assembled knowledgeable executives from all sides of the TV industry to debate controversial topics.

Singer Broadcast Model FM 20,000 E

The FM 20,000 E... a proven performer all over the globe... one model from the industry's most complete line of AM and FM Broadcast Transmitters. AM Transmitters from 250 watts to 100 kW; FM from 10 watts to 100 kW.

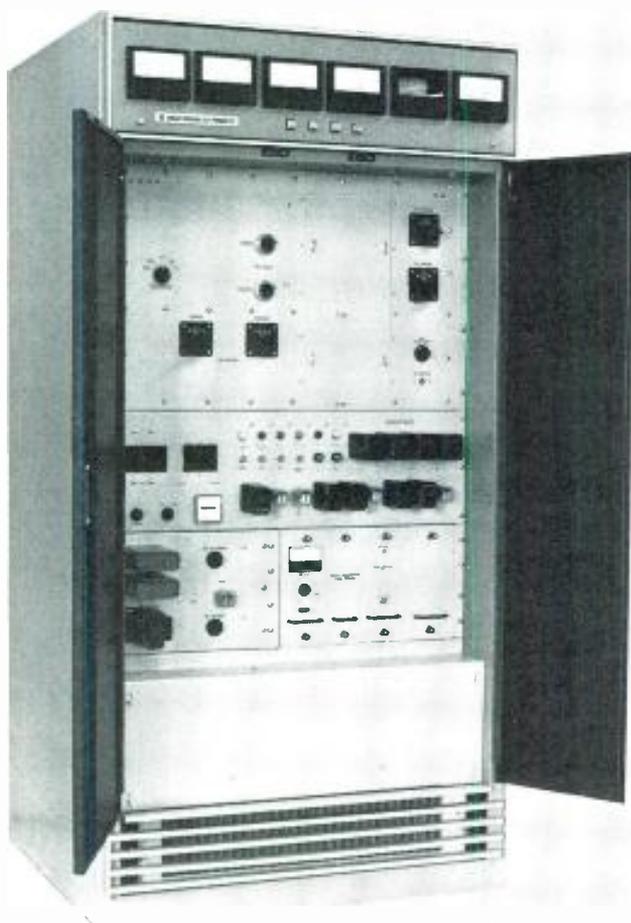

We're proud of the reputation we have earned world-

wide providing personal service, quality equipment and competitive prices. That's why we're the largest independent supplier to the world's broadcasters.

Teletext field trial enters second phase

In January, the Alternate Media Center/WETA teletext field trial in the Washington, DC area moved into its second phase. In the project's initial phase, which began in June 1981, hard news was the featured element of the service. Focus in Phase 2 has been shifted away from hard news to increased experimentation with different content, new formats and quicker access to pages. These changes reflect the project's fundamental goal: to explore the potential of broadcast teletext in providing a service of public interest.

The 40 Washington area residents selected for this pioneer teletext trial, as well as users of the 10 publicly located terminals, named hard news as one of the most frequently accessed parts of the service. Other kinds of information in Phase 1 included weather, entertainment, sports, consumer tips and area community events. Usage information collected by the Alternate Media Center reveals that news pages provided by the Washington Post, as well as entertainment and weather, were among the most widely read in the service.

In the second phase of the trial, the Alternate Media Center has redesigned the teletext service in order to

"I have never been as impressed with a new piece of gear as I am with our programmable SatCom Technologies earth station antenna."

Dave Frasier Technical Operations Manager
WWBT-Richmond, Virginia

WWBT is a technical leader that installs a lot of equipment. According to Dave Frasier, "The technical quality of our new SatCom Technologies' 9.2-meter antenna is excellent, and it has brought new flexibility and a more competitive edge to our programming."

The Model 920C 9.2-meter antenna incorporates high speed drives ($2^{\circ}/\text{sec.}$) directed by a micro-processor-based programmable controller. The controller can store and access up to 39 satellite positions. WWBT is using the controller's scheduling function to move the antenna auto-

matically from one satellite to another at specific times throughout the day to receive syndicated programming, sports events and feeds from its Washington news bureau.

SatCom Technologies' high-technology antennas are available in sizes ranging from 3-meters to 13-meters. We also offer the exclusive Torus multiple-beam antenna in 4.5-meter and 7-meter equivalent sizes. Each antenna combines the extraordinary high surface accuracy of RSi's AccuShape aluminum reflector with an extremely rigid mount. This means greatly

improved sidelobe performance and the ability to upgrade to Ku-band.

Mr. Frasier continues, "We beat our competition, we save ourselves money and headaches. We give our viewers the best service and the best programming, whether it comes from across the state or across the country."

For more information on SatCom Technologies' earth station antennas, call David Speed at (404) 448-2116.

News

explore the full potential of other kinds of information. One major element of the new teletext service is an expanded focus on analysis of news and events taking place in the Washington area. Other new sections are a bulletin board and an electronic art display.

Prestel launched in US

Prestel was officially launched as a commercial service in the United States recently from its Boston-based computer center.

"The Boston computer center allows US users and information providers to access Prestel's 210,000-page database via a local telephone call over Telenet, as well as giving US corporations the opportunity to become operators of their own videotext service on proven systems at very low cost," William Shrimpton, president of BVT, the marketing organization for British Videotex and Teletex technology, said.

Prestel, the first commercial videotext service, has been operating in the United Kingdom since the fall of 1979. It provides information retrieval through a modified TV set and telephone lines from a worldwide computerized database, permits electronic messaging and makes possible home banking and shopping. Information on Prestel currently includes hotel and airline availability, stock market reports, commodities listings, shipping movements, weather, news, sports and other information from all over the world of particular interest to business users.

Prestel currently uses the alpha-mosaic system, displaying characters of graphics in mosaic shapes, fitted together to compose a picture. Full

color photographs transmitted via Picture Prestel will be introduced to enhance the electronic shopping and advertising potential of videotext.

Boston was chosen as the site for the Prestel computer (which is called "Jefferson") because Massachusetts provides a leadership role in the field of high technology. The computer will be managed by Avco Computer Services, one of the nation's leading suppliers of large-scale computing power to business, industry and government, based in Wilmington, MA.

For the Boston launch, terminals made by Zenith and decoders made by Wolfdata and Radofin were used.

Zenith had developed a 25-inch diagonal color TV set and a 13-inch diagonal color monitor to receive and display videotext information in Prestel's 40-character by 24-row format. The specially adapted 25-inch set, which also includes TV functions, is equipped with a special Zenith wireless remote control, videotext numeric keypad and a jack for an optional alphanumeric keyboard. The 13-inch monitor has a wired alphanumeric keyboard.

Floppy disc software converting an Apple II home computer to Prestel was also on display.

The Appletel software package consists of a floppy disc (and a spare) plus an instruction manual with details of registration and how to use Prestel. The package enables users to access the entire public Prestel database; fully use the Prestel response and mailbox facilities to send and receive messages; automatically dial up and log into Prestel; automatically call up, examine, amend, store, re-call or delete sequences of Prestel information they regularly need; store pages on their discs and examine them offline at leisure; and locally edit Prestel

frames offline to annotate or comment on the information.

Hardware from these companies is now available to US users, ranging in price from \$85 for the Apple disc to \$1250 for the Zenith terminal.

More than 15,000 users worldwide are currently connected to the Prestel service; most of them business users. About 900 information providers, including American Express, Holiday Inn Hotels, Frost & Sullivan, Merrill Lynch, Newsweek and the Official Airlines Guide are using Prestel as an electronic publishing and message transmission medium. Prestel also allows users to order goods and services at the touch of a button, and is proving a profitable investment as a direct-marketing tool for information providers.

On a closed-user group basis, a number of US companies, including DuPont, ABC-TV, IBM and Digital Equipment Corporation have expressed interest in establishing their own databases. For public use, private telephone and publishing companies are expected to set up videotext services on the Prestel computer in the coming months.

Atlantic Research offers FCC compliance testing

Atlantic Research Corporation has announced the opening of its FCC Compliance Testing Laboratory. This full service testing and engineering facility features personnel experienced in FCC testing, personnel experienced in equipment design and modification for control of EMI, latest quasi-peak detection test equipment, remotely controlled open field radiation test site, 100dB shielded enclosures, 50µH LISNs, fully equipped electronic laboratories, and a model shop. □

AUDIO PREMIXERS

Highest Performance • Excellent Reliability • Low Cost

Not enough inputs on your present audio console? No budget for a new Neve console? Use the best alternative. Buy a Neve Audio Premixer in a 19" rack mountable unit only 1.75" tall. Available in 10 in/1 out and 6 in/1 out versions. The 6 in version features wide range stepped sen-

sitivity control on each input. Delivery is generally stock to 30 days.

Neve
A WORLD OF EXCELLENCE

5100 Range
TV Audio Consoles

NEW BROADCAST AUDIO TECHNOLOGY

TV AUDIO CONSOLES

Neve is proud to introduce the 5100 Range of Television Audio Consoles, specifically designed for North American requirements. From 16 in/4 out to 48 in/16 out, this new technology range leaves competition again far behind, through superior performance, ease of operation, high quality construction, and the ultimate in reliability as well as serviceability. Delivery is generally from stock to 60 days, including most options. Why wait for old technology when you can get new technology right away?

RADIO CONSOLES

The new 5322 Radio Console is designed for the discriminating radio station. If you desire a premium radio console, the Neve 5322 is the answer.

BROADCAST INTERCOM

Neve's NECOMM is a technically advanced and cost effective family of intercom systems for broadcast facilities. The microprocessor based NECOMM system features virtually unlimited capability for user modification and future expansion. Standard software programs for various broadcast applications are available now, field proven in many television facilities over the past 3 years. NECOMM is easily and economically configured in systems from 16 x 16 to 256 x 256 with a full range of terminals, from cost effective passive panels to intelligent stations. NECOMM is easy and inexpensive to install, in existing as well as new broadcast facilities, occupying much smaller physical space compared with other systems of lesser capabilities. NECOMM can fit into your facilities and budget!

Live Remotes

Marti's RPT15 Transmitter has the power to bring difficult remotes back **LIVE**.

NAB
Booth 3109

VHF-UHF
Model RPT15
Transmitter

Delivering the maximum allowable (15 watts) power for aircraft ENG, the RPT15 produces outstanding results with traffic reports, mobile units and fixed remotes — and with clean broadcast-quality audio and continuous-duty operation. Built-in encoding permits operation with Marti Mobile Repeaters and Automatic Repeaters in wide coverage systems.

RPT15 FEATURES:

- ★ Type accepted on all VHF-UHF RPU channels
- ★ 15 watts continuous output
- ★ Dual frequency capability
- ★ Sub audible encoder
- ★ Built-in metering
- ★ Built-in AC supply
- ★ FM Compressor-Limiter
- ★ Mixing mic and line inputs

Committee on ½-inch video meets

The first meeting of the SMPTE Working Group on ½-inch Video Cassette Recorders for Broadcast Applications was held at the San Francisco Airport Hilton in December. Reflecting great interest on the part of the broadcasters, it was attended by 18 experts in the fields of broadcast operations and video recorder design, and was devoted to the discussions of user requirements for the recorders. Meetings are continuing at a monthly rate. All parties wishing to participate in this working group are welcome to attend the meetings. For further information, contact Alex E. Alden, SMPTE, 862 Scarsdale Ave., Scarsdale, NY 10583; (914) 472-6606.

Barnathan to receive engineering award

Julius Barnathan, ABC president of broadcast operations and engineering, will receive the National Association of Broadcasters' 1982 Engineering Award to be presented at the NAB engineering conference luncheon on April 6. The conference will be held in conjunction with the association's 60th Annual Convention April 4-7 at the Dallas Convention Center.

Barnathan was promoted to his present position in December 1976. He had been vice president in charge of broadcast operations and engineering since April 1965. He previously had been vice president and general manager of the ABC Television Network and earlier had served as president of the ABC Owned Television Stations.

Barnathan and others at ABC were instrumental in developing the technology for closed captioning for the hearing impaired. In 1972, he was named chairman of the NAB subcommittee that developed standards for such a system, which has been in operation since March 1980.

Bergen, McNeill named to Radio Hall of Fame

Edgar Bergen, radio personality and ventriloquist, and Don McNeill, host of radio's long-running "Breakfast Club," have been elected to the NAB's Radio Hall of Fame. They will be inducted at the radio luncheon during the upcoming convention.

The Radio Hall of Fame was created in 1976 to recognize and honor those individuals who have made a significant and lasting contribution to the radio industry.

Bergen, born in Chicago in 1903, was first heard over-the-air on Rudy Vallee's "Royal Gelatin Hour" in 1936, accompanied by "Charlie McCarthy," the wooden dummy that shared his act since he was 11 years old. In 1937,

Editing starts with CMX

If you think you can't grow from absolute simplicity to total performance look at the world standard for editing.

Editing starts with the CMX 340X because it performs exactly the same simple functions competitors' limited systems do. Two machine cuts editing, for instance, requires the same number of keystrokes. But for you that's only the beginning. The expandability of the 340X will not restrict its simplicity at any point in your growth.

CMX 340X keys are grouped conveniently, color coded, dedicated and easy to reach. That's one reason it's as easy to operate as most limited capacity editors.

Editing never ends with CMX because the 340X is the most expandable and sophisticated editing system in the world. All the new techniques in post-production developed over its five-year history have been added to the earliest 340X systems. The simplicity of the 340X does not

restrict its expandability at any point in your growth.

Editing starts with CMX because every 340X system installation includes basic training in operation and maintenance. CMX has the world's largest staff of editing system specialists to keep you going. These experts are available to install and train you on new features as they become available.

Editing never ends with CMX because our staff editors provide complete 340X training that never stops. This training is supported by advanced seminars, newsletters, an editors' advisory panel, plus worldwide experience in post-production that only the editors at CMX have.

Editing starts with CMX because it did. CMX built the first simple, practical, computer-assisted editing system

over ten years ago. Along with our original customers we

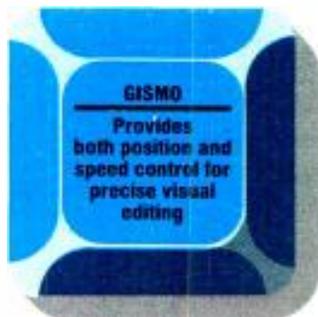

have continued to grow and to lead. While others have come and gone, CMX continues to be the world standard for editing. We have the ten-year track record to support you now

and in the future.

Editing never ends with CMX because your initial investment is protected from absolute simplicity to total performance. Before you invest in post-production, look at the difference

in total investment between competitors' limited systems and CMX.

The 340X has replaced many other systems; and every CMX user has stayed with us when he expanded his system. Editing never stops with CMX when editing starts with CMX.

STANDS ALONE, FOR LESS. THE MODEL 100 AUDIO FUNCTION GENERATOR

The Model 100 Audio Function Generator provides a precise frequency from 100.0 Hz to 100 KHz in three decade ranges.

The Model 100 has a fully synthesized frequency selection to four significant digits throughout the frequency range.

Two separate outputs are provided.

one fixed at TTL levels for triggering or sync capability and one continuously variable from 0V to 8Vp-p into a 50-ohm load, or 0V to 15Vp-p into a 600-ohm load, in all modes.

You can't find better performance for your servicing requirements. Call or write us now for more information.

Associations

Bergen and Charlie became the stars of their own show, "The Chase and Sanborn Hour," which held the top-rated position among radio programs for three years and was famous for the interchanges between Charlie and comedian W.C. Fields. Bergen left NBC in 1948, but returned to radio on CBS in 1949 and continued broadcasting until 1956. He died in 1978.

McNeill, born in December 1907 in Galena, IL, was the originator of one of the longest-running shows in network history. The "Breakfast Club" was on the air for nearly three and a half decades from June 23, 1933 to December 27, 1968. McNeill wrote scripts for the show for the first two months of the program. After that, he began using short pieces of humor sent in by the audience. The program then eased into a spontaneous, unrehearsed format that McNeill continued to use successfully for the next 34 years.

Cuban interference documentation program begins

The NAB announced recently that it will begin an extensive documentation program tracking the frequency and power used by Cuban stations to broadcast into the United States.

"We will use this data to demonstrate to Capitol Hill, the State Department and the executive branch the urgency of the Cuban interference problem for American radio broadcasters," Edward Fritts, NAB chairman of the board, said in a speech to the Louisiana State Broadcasters Association.

The Cubans are already broadcasting into the United States on a variety of frequencies and at various levels of power causing indiscriminate interference across the nation. NAB will use information supplied by the Federal Communications Commission, consultants and broadcasters to document and project the continuing increase in interference received by US broadcast stations.

The data compilation will be presented as soon as possible in meetings with the State Department, the FCC, the Congress and the executive branch.

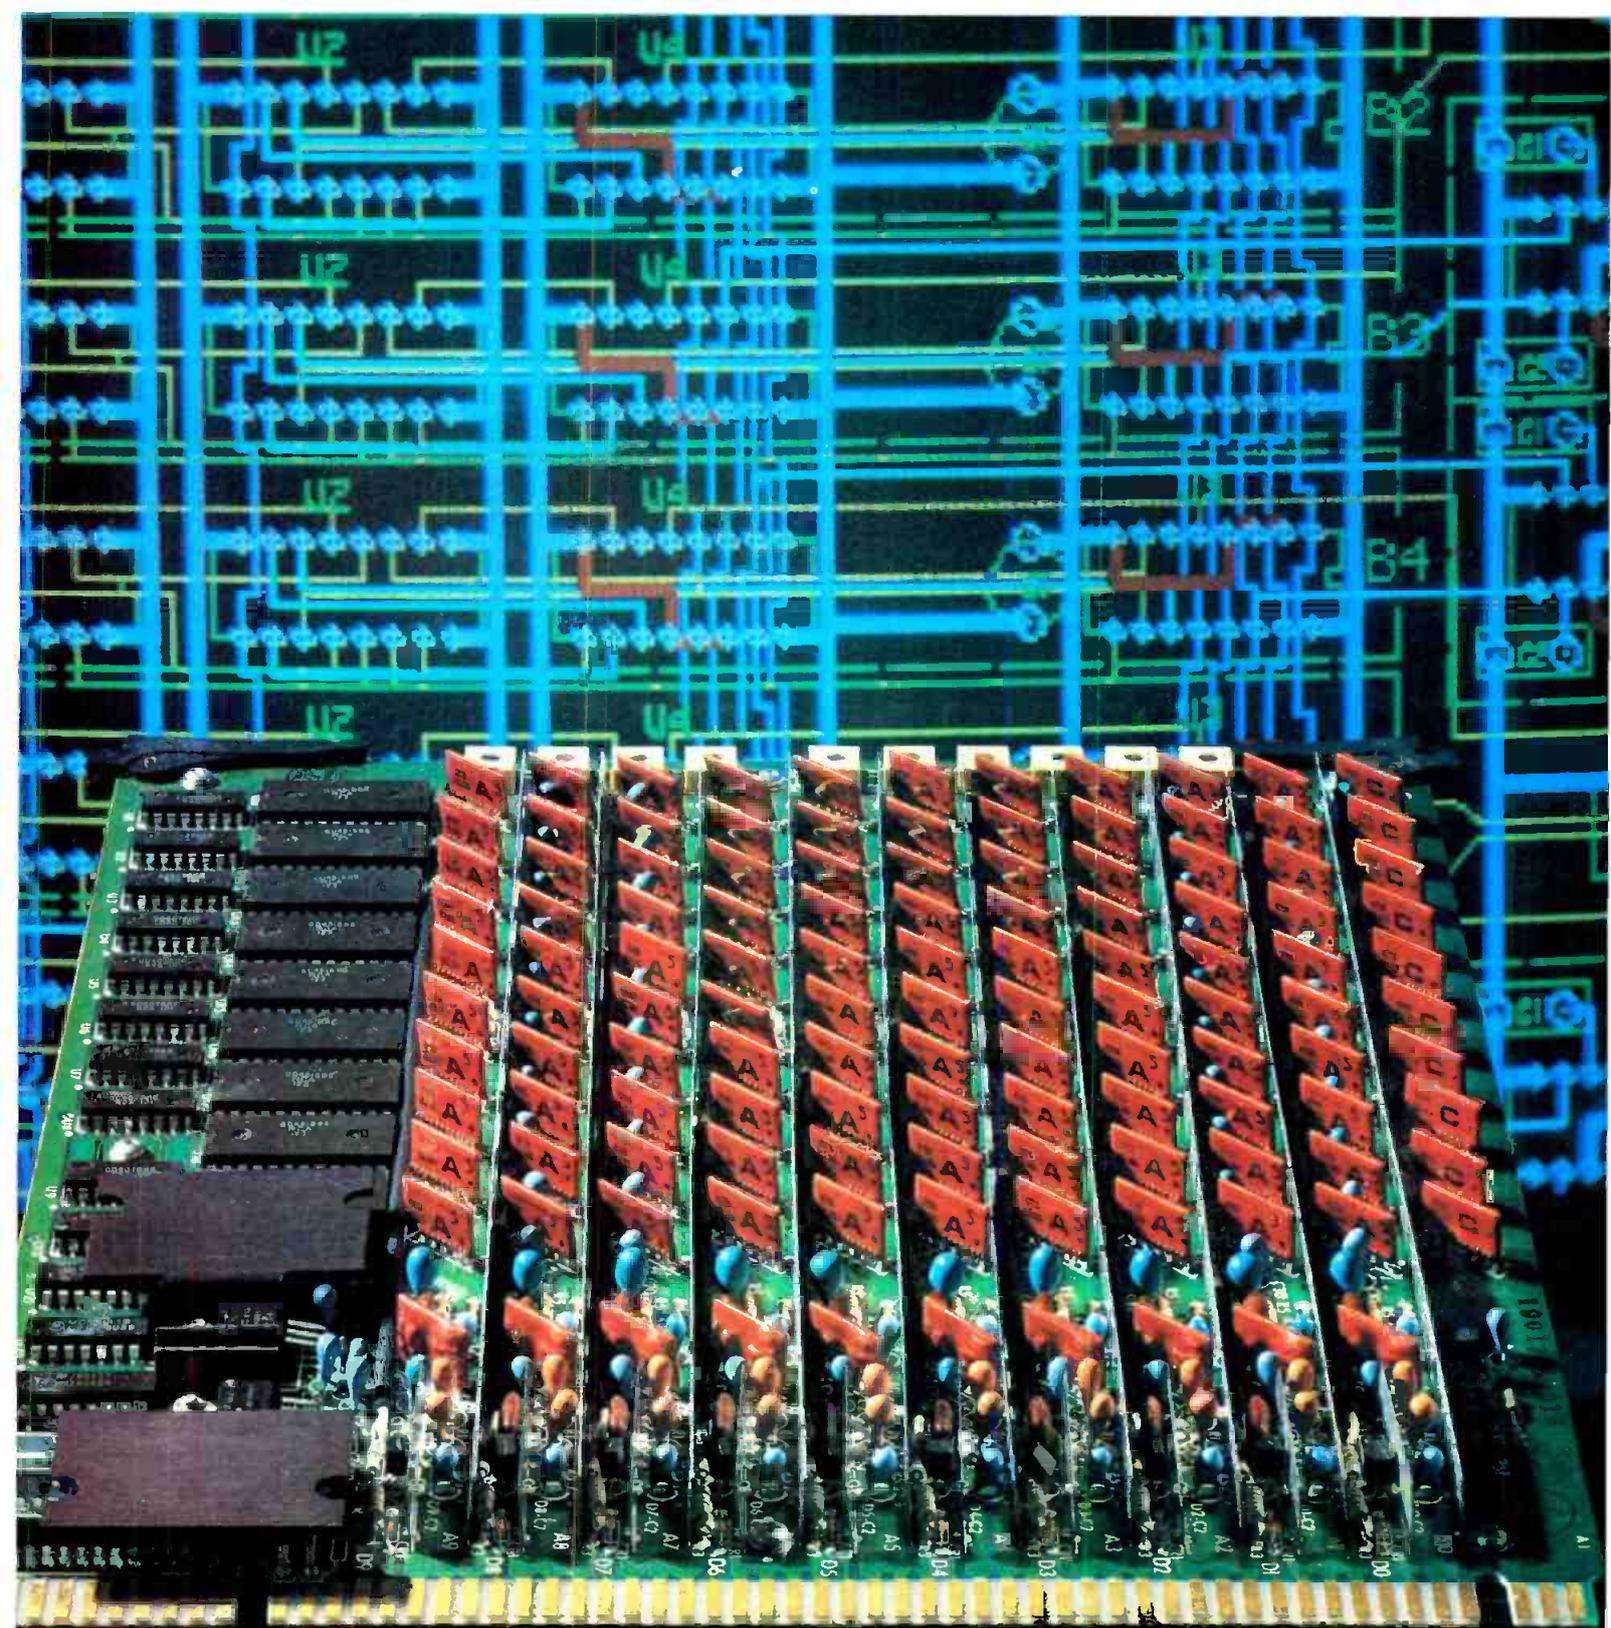

FCC urged to reject frequency proposal for auditory training devices

Considerable analysis is required before the Federal Communications Commission can consider allocating alternative frequencies for the use of auditory training devices, the NAB maintains. Therefore, NAB does not believe that allocating 530kHz and 1610kHz, as proposed by Williams Sound Corporation, can be justified at this time and recommends that the petition be rejected.

In its filing, NAB said that because the commission already has allocated spectrum for these devices, it seemed that the needs of the hearing impaired could be accommodated without allocating additional spectrum.

The association raised two major objections to the proposal: The proximity of the AM broadcast band (535-1605kHz) could cause mutual interference; and it could preclude expansion of the AM band to 1705kHz and 525kHz.

NAB said it shared the commission's misgivings that the use of easily available, low cost portable AM receivers might lead to the William's system being used for purposes contrary to commission policy. Also, NAB said that Williams had not demonstrated the need for dual auditory training device systems, operating in different frequency bands, with each system accomplishing the same purpose.

High resolution TV in your future?

Not to worry! If your routing switcher is a Dynair System 21, your television plant can already handle 1000 line video with the same ease and fidelity as it does your present signal.

We know! Our switchers have been doing this job for years in NASA installations, medical facilities and a myriad of industrial applications.

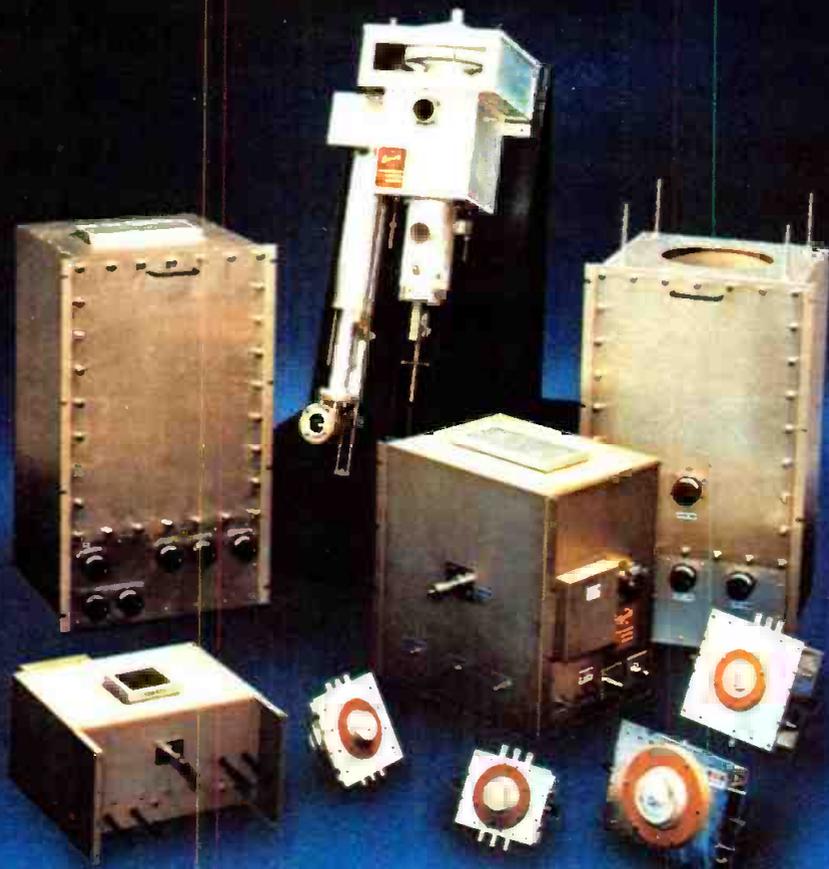

And it's not only the 30 MHz bandwidth that makes the System 21 ready now. Careful crosstalk control, use of laser trimmed precision hybrids, painstaking quality control, and over 24 years of experience assure the performance necessary.

Write or phone Dynair. We have many more facts to share.

EIMAC cavities cover 54 to 970 MHz at power levels to 30 kW —our design or yours

Varian EIMAC has complete cavity design and production capability. We make sure that tube and cavity are compatible. If it isn't an off-the-shelf-item, we have the designers and engineers for any specific job.

EIMAC has expertise in all disciplines including pulse, CW, FM, and TV. We match tube, power,

bandwidth and operating mode to achieve optimum performance.

More information on EIMAC cavities and tubes is available in our Cavity Capability brochure from Varian EIMAC. Or for prompt consideration of your special design requirements, contact Product Manager, Var-

ian EIMAC, or the nearest Varian Electron Device Group sales office. Call or write today.

CAPTION CONTEST

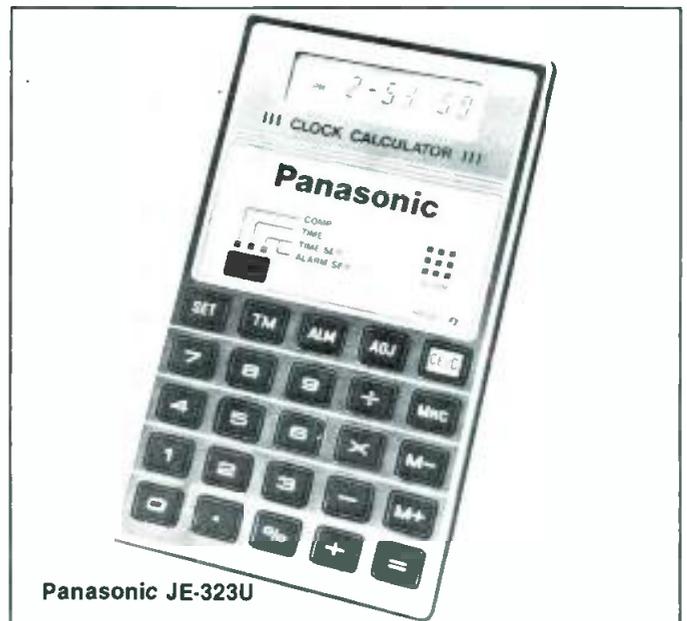

Rich Little and Vincent Wasilewski were captured in this candid shot at NAB-'81/Las Vegas. In our June 1981 issue we ran this photo with a request for reader's humorous captions.

The winner of our Caption Contest is Peter Collinson, Mt. Pleasant, MI, who submitted: "Honest, Vince. I wasn't trying to walk off with one of those new minicams...I just forgot I had it in the palm of my hand."

As promised, the winner is being sent a pocket calculator as a prize. He will receive the Panasonic credit card sized calculator model JE-323 which incorporates a clock with alarm. The clock shows a.m./p.m. and hours, minutes and seconds. With an 8-digit LCD display, the JE-323 has sure-touch rubber keys, memory, percent, sign change and automatic constant functions. It comes with a wallet case and runs for approximately one year on the lithium battery included, and is provided courtesy of Panasonic.

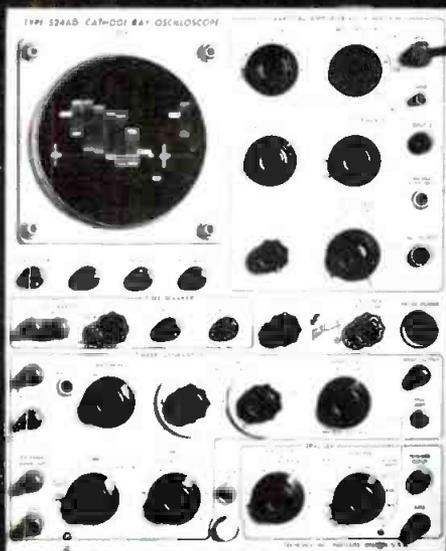

An honorable mention goes to Geoff Liston, Normal, IL, who submitted: "Sorry, Vince, I still don't do AM stereo. Maybe next year..."

690SR Comb Decoder

496 Spectrum Analyzer

2200 Multipurpose
Oscilloscopes

(Actual displays)

**Hard work pays off.
These new products
from Tektronix continue
to help you achieve
better signal quality.**

Over the years we've been first with many of the products which have not only helped improve the quality of your signal, they've simplified your job. We continue this tradition today.

380 NTSC TEST MONITOR

The industry's first combination waveform monitor, vectorscope and general purpose oscilloscope. Only Tektronix puts these three essential functions in one compact, lightweight package.

The 380 offers priced-right performance as a production or maintenance tool, in the studio or field. Vertical interval test signals, tangential noise, differential gain/differential phase and many more measurements are handled with accuracy and ease.

DC operation and optional battery pack assure completely portable operation. Probe input provides in-circuit testing of video and other electronic circuits.

496 SPECTRUM ANALYZER

Here's high performance, plus portability unmatched among lab quality spectrum analyzers. The 496 measures signals from 1 kHz to 1.8 GHz, including AM, FM, TV and STL. There's the resolution to define power line-related sidebands,

1980 Answer™ Option 3 NTSC
Application Software

dynamic range to measure signals with power ratio of 10⁸:1 and incidental FM of only 10 Hz p-p. You get proof of performance measurements, even at remote transmission sites.

Three-knob set-up and microprocessor-aided controls make the 496 easy to use. Signals are stored and compared digitally. And full programmability can be ordered now (specify the 496P) or added easily later to fully automate your spectrum analysis. The 496 is compatible with the Tektronix 1405 Television Sideband Analyzer Adapter.

**2200 MULTIPURPOSE
OSCILLOSCOPES**

The new 2213 at \$1100 and 2215 at \$1400 represent a new performance/price standard in portable scopes. You get full-range capabilities for far less than what you'd expect to pay.

Key features include two 60 MHz channels, 2 mV sensitivity and an advanced trigger system that triggers on either TV lines or fields at any sweep speeds. Model 2215 includes dual time base for making calibrated delay measurements with accuracy to ± 1½%.

These new scopes are compact, lightweight and reliable. No better value on the market today.

**TM5000 PROGRAMMABLE
GENERAL PURPOSE
TEST EQUIPMENT**

These new IEEE-488 compatible instruments offer high individual performance and make it easier than ever to configure and program a fully automatic test and measurement system.

The line includes an instrument controller, two power mainframes, 350 MHz or 135 MHz Universal Counter/

Timers, a 20 MHz Function Generator, a triple power supply, a 4½ digit DMM with built-in math capability, a 350 MHz RF scanner for signal switching, and a multifunction interface for linking instruments to a device or system under test.

**1980 ANSWER™
OPTION 3 NTSC
MONITORING SOFTWARE**

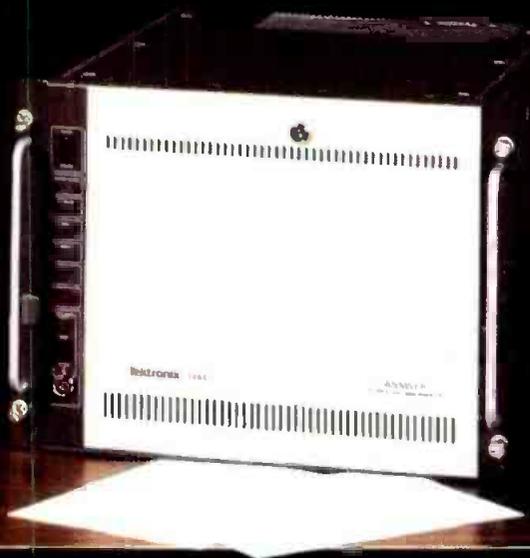

This new NTSC application program lets you operate Answer with more speed and programming ease than ever before. 1980 Answer Option 3 handles virtually every off-air signal measurement made today by the FCC using FCC or NTC-7 VITS. All automatically, with digital accuracy and repeatability. Option 3 also includes color bars and SCH Phase measurements. New PAL application software is available as Answer Option 2.

690SR WITH COMB DECODER

Our 690SR Color Picture Monitor offers added flexibility now with your choice of decoders with a notch or new comb filter. With its high resolution, precise convergence and stable color, the 690SR continues to represent the industry standard of reference for judging color picture quality.

By Bill Rhodes, editorial director

THE SKY'S

Broadcasters are getting ready to flood Dallas in April for the industry's most prestigious convention: NAB-'82/Dallas, the NAB 60th Annual Convention and International Exposition. Exhibitors from around the world are working feverishly on booth displays and special surprises to make this year's show better than ever, even though most companies had to take reduced

booth space to make room for all who wanted in. This year's NAB convention theme is: *The Sky's The Limit...in radio...in television...in engineering...and in broadcast equipment.* Beginning on page 24, the NAB staff lays out the welcome mat and provides a glimpse of some of the planned activities. This is followed up with **BE's** comprehensive exhibit coverage for NAB-'82.

THE LIMIT

Our coverage includes:

- a comprehensive product directory that lists product categories and exhibitors showing those products;
- a complete listing of exhibitors, alphabetically, with their *established* and *new* products listed by model number and name or description; and
- late exhibitor data, received just before press time.

Details of the NAB-'82/Dallas show are still being released as **BE** goes to press. Our latest map and exhibitor data will be distributed at the show to help you further. The final program will be available upon registration, but the following is a broad outline of what is being planned for you at this exciting convention. □

SUNDAY

With spotlights, flags and a flourish of trumpets, broadcasting's first citizen will be presented with the Distinguished Service Award, the most prestigious honor in the broadcasting industry. Following that, we will hear an important message on the state of our industry. Developments are occurring so rapidly in broadcasting that it is sometimes difficult to distinguish the present from the future. Vincent Wasilewski, NAB president, will report on where we are and where we are going.

And then, Glen Campbell will perform for you at the special opening celebration. Join us for a rollicking good time with "the Country Boy who sings." He will sing songs such as *Galveston*, *Wichita Lineman*, *Gentle On My Mind*, *Rhinestone Cowboy* and dozens of favorites from his 12 Gold and seven Platinum Albums.

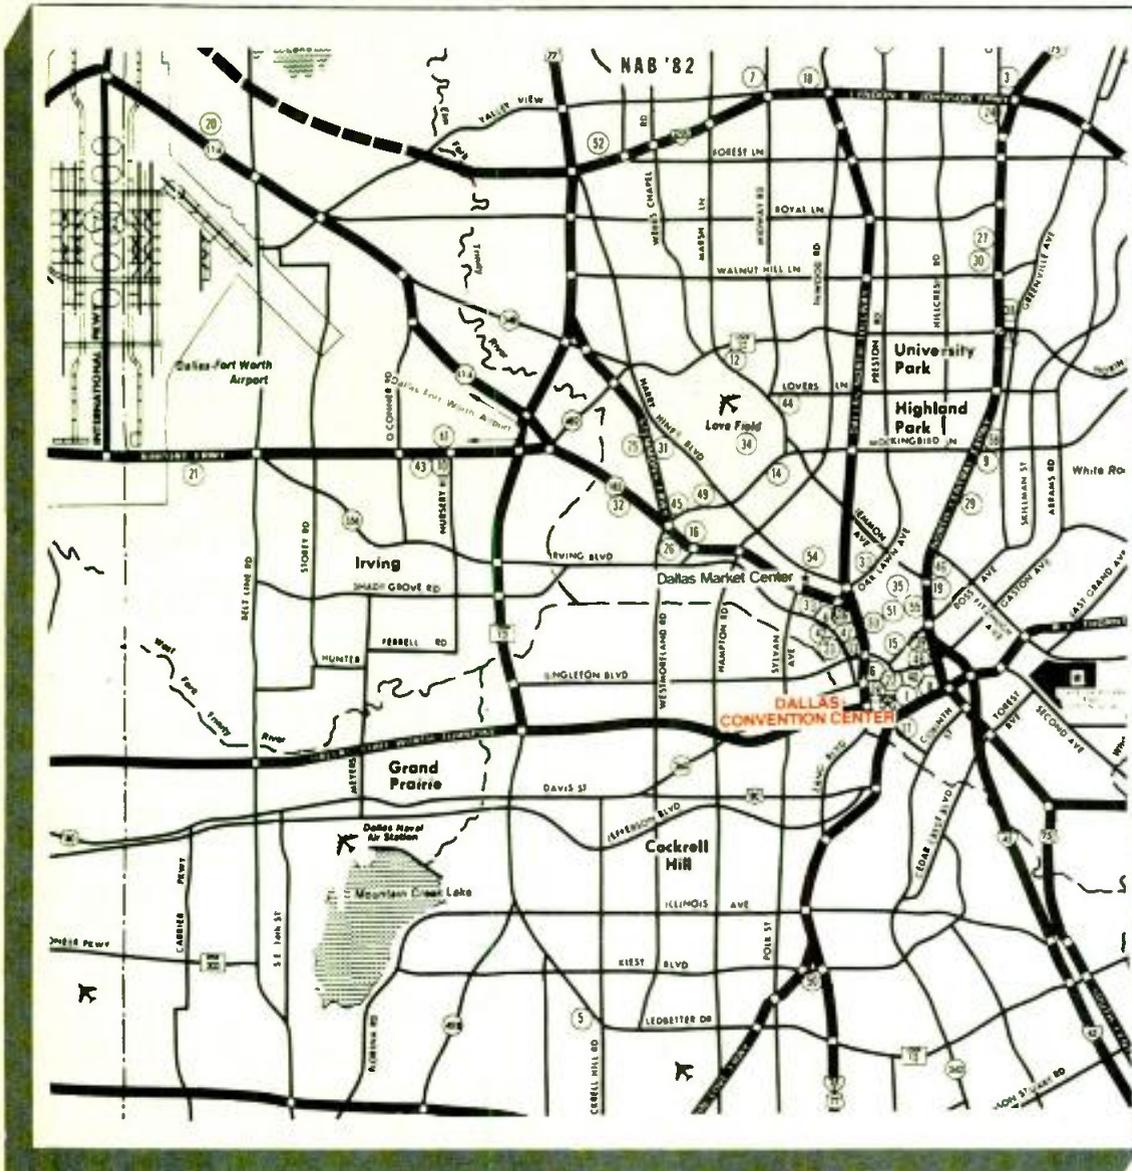

Campbell has never lost the down-home, easy-going manner he developed as the seventh son of a farmer from Delight, AR. You can bet he will feel right at home doing what he loves to do best at the festive opening show in Dallas.

He has entertained the President of the United States and the Queen of England. Don't miss his performance at NAB-'82/Dallas. It is all included in the price of your registration fee.

Canon PV40 x 13.5B IE: THE OLYMPIAN

Canon moves you a giant step forward with a 40X broadcast quality zoom lens. An incredible new lens that allows you to cover a stadium at wide angle or fill the frame with the quarterback's eyes.

Never before has a single lens provided this much flexibility and sensitivity, with remarkably little change in effective aperture throughout its entire 13.5mm-540mm* range. Built-in extenders let you go all the way to 1080mm and each lens is diascoped-equipped for modern microprocessor-

controlled cameras.

We call it The Olympian. Not only because it is ideally suited for sports coverage but also because of the dedication and team effort required of our optical and electronic engineers in making this lens a reality.

Enlarge a dollar bill forty times and it covers an area twenty feet long and eight feet wide. Now think about what you could do with the Canon PV 40 x 13.5B IE!

*1" cameras. Also available in 30mm plumbicon.

WEDNESDAY

ENGINEERING

Wednesday morning's distinguished, blue ribbon panel of experts will discuss broadcasting's best opportunity in many years to cast off the shackles of second class citizenship and secure basic First Amendment rights.

At Wednesday's luncheon, Mark Fowler, FCC chairman, will have some important words for broadcasters. An entertaining and dynamic speaker, Fowler was once a small market broadcaster who knows the challenges and concerns you face as a broadcaster in these trying times. He is sure to provide some enlightening comments on what the future holds for radio and TV broadcasters in the '80s.

And then, the wacky world of Jonathan Winters. He is a 1-man theatrical troupe complete with hundreds of improvisations and sound effects to match every one of them.

Among his credits: he's a former DJ, a film star, TV and nightclub entertainer, poet, painter and concert star whose latest achievements include the character of Mearth on *Mork & Mindy*, a starring role in *The Fish That Saved Pittsburgh*, and an NBC special, *Two Hundred Years of American Humor*.

You may also remember him as the improbable Maude Frickert and the zaniest garbageman ever in the Hefty Bag commercials.

Be there for the hilarious antics of Jonathan Winters.

Engineers come from all over the world to attend NAB's Engineering Conference. If you are concerned with technical efficiency, productivity and competitiveness at your station, your technical staff should be there too. It promises to be one of the most important engineering meetings of the year.

Traditionally offering the most significant advances in broadcast technology and operating techniques, the 1982 conference is no exception. There will be discussion of the state-of-the-art and beyond, including current theories and innovations. Well-known authorities in the field will share their expertise on topics such as digital conversion, technical certification, digital standards, conversion to AM stereo, update on satellites, stereo radio STL problems, high resolution, improved VHF transmitter efficiency, local frequency coordination and many other subjects of concern to the radio and TV engineer.

The focus is on practical, usable information, applicable to broadcast engineers in various markets. Panelists encourage questions and comments from attendees during all of these forums, an excellent opportunity for broadcast engineers to express their viewpoints and to share experiences and information with colleagues from all over the world. Individually tailored sessions reflect problems common to your station, and practical solutions are offered.

"The Missing Link to Reliable Cart Music Reproduction Has Been the Cart...Not the Cart Machine."

I've been using the Audiopak AA-3 at various stations for over two years, with gratifying results.

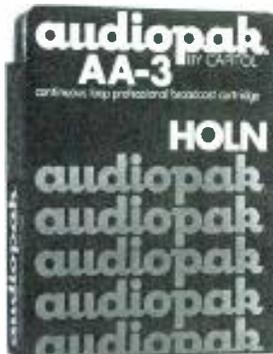

The AA-3 is capable of studio master music reproduction with excellent stereo phase stability.

It is durable and reliable in performance throughout its long life.

In my opinion, the AA-3 is the best cart we've tested."

Elliott Klein

UHF Systems? You're in capable hands with Comark.

At Comark we manufacture more of the components that make up a total UHF TV transmission system than any other name in the business. Experienced technicians with skillful hands measure, fit, connect, test, check and re-check. But that's only part of the reason you should be looking at Comark.

We are in the forefront in creative engineering and practical implementation. We pioneered the concept of maximum transmitter plant efficiency. From initial planning, to total service, our hands-on policy assures you that we live up to our word and workmanship. And because we're in charge we're able to bring our products to you more economically.

Whether you're looking for a turn-key system, or a transmitter or just components, you place yourself in capable hands the moment you contact Comark. Call us at (413) 569-5939 or write: Comark Communications Inc., PO Box 267, Southwick, Mass., 01077. Telex: 955 329.

Visit us at NAB Booth 1709.
Join our treasure hunt
where everyone is a winner.

NAB convention

Paper presentations

Here is your chance for a sneak preview of what is just around the corner in broadcast technology. These important theses reflect the most timely advances in technology, equipment manufacturing and engineering development going on in the world today.

Calling all hams

Come to the Fourth Annual Ham Radio Operators Reception. Join your fellow hams for our gala presented on Monday night. All card-carrying hams admitted.

Cronkite to receive Distinguished Service Award

Walter Cronkite, CBS News special correspondent, has been named recipient of the National Association of Broadcasters 1982 Distinguished Service Award. The award will be presented April 4 at the opening session of NAB's 60th Annual Convention at the Dallas Convention Center.

The award, established in 1953, is presented to a broadcaster who has made a significant and lasting contribution to the American system of broadcasting by virtue of a singular achievement or continuing service for or on behalf of the industry.

Cronkite has covered almost every major news event during his 31 years with CBS News, which he joined in July 1950. These assignments included exclusive interviews with the major characters in the Mideast drama, the unprecedented 14½-hour Bicentennial broadcast, and all aspects of the American political scene—primaries, conventions, elections and inaugurations. In 1978, his broadcast received an Alfred I. duPont-Columbia University Award in Broadcast Journalism, marking the first time a regularly scheduled daily network news broadcast and its anchorman received this award. He began serving as anchorman of the CBS nightly newscast in April 1962, when it was 15 minutes long, until last year when he stepped down to become a special correspondent.

A veteran journalist for 40 years, whose ability to handle pressure has earned him the affectionate nickname "Old Iron Pants," Cronkite has been on-the-scene for newsmaking events throughout the world. In 1975, 1976 and 1977, he was the only journalist to be voted among the top 10 "most influential decision makers in America" in a leadership survey conducted by *US News & World Report*. Cronkite was also selected as "the most influential person" in the field of television in the same survey.

Cronkite is regarded as an authority on the space program. He received an Emmy Award for his reporting on the flight of Apollo 11, man's first landing on the moon. He received a second Emmy for his reporting on the space flights of Apollo 13 and 14.

In 1969, Cronkite became the first broadcast journalist to receive the William Allen White Award for Journalistic Merit, and was cited for his "30-year record of excellence as a reporter, foreign correspondent and commentator."

He was named Broadcaster of the Year by the International Radio and Television Society in 1971, and that same year received the Freedom of the Press Award from the George Polk Memorial Award Committee for "resisting a White House attempt to discredit CBS News' televised disclosure of an atrocity at Bau Me, South Vietnam."

Bring along your QSL and business card for posting. It is an evening of bad jokes, good food and drink, and door prizes.

And there's more

Your registration fee also includes a special luncheon for engineers, as well as admission to the giant exhibition hall, all general sessions, and the radio and TV management workshops and forums, many of which have direct applications to engineers. Be sure to check your program for details on these topics.

For the best in technology presentations, informative nuts-and-bolts workshops, exciting general sessions and speakers, you cannot beat NAB's 1982 Engineering Conference.

TELEVISION

Feeling frustrated? It is not an uncommon ailment among TV broadcasters these days with all the confusing information about uplinks and downlinks, futuristic delivery systems, digital receivers, and all of them being touted as the greatest inventions since pockets.

The business of TV broadcasting is becoming more complex, more confusing, and more challenging. If you intend to compete as a broadcaster in this brave new world, there's no time for standing still. The future is now, it's here, and it's exciting.

NAB-'82/Dallas has the prescription to cure your frustrations and help you meet these future challenges head-on. The 1982 TV Convention is specifically designed to broaden your knowledge of today's technology as it is being used by broadcasters.

First, it zeros in on what has happened, by analyzing the trends in cable and VCR growth, cable viewing patterns, satellite delivery services, DBS proposals, pay TV revenues and video options.

Then, it will focus on mind-stretching demonstrations of videotext/teletext, high definition television, digitally produced special effects and broadcast innovations such as satellite-delivered news feeds and automated equipment.

And based on what has already been discussed, it will get more specific and down to basics with information-packed, hands-on workshops and forums. Some of the topics include:

- Using your local cable channels;
- Effective methods of competing with the new competitors;
- How to develop local programming using the new technologies;
- The future of broadcast automation;
- Network/affiliate relationships in this changing environment;
- Programming an independent;
- Dealing with cable penetration; and
- Long-range development of your personnel.

Plus the latest news on regulation and new rulemakings from Capitol Hill and the FCC; the newest trends in advertising from the experts at TvB; money-making, money-saving ideas to improve your bottom line; and exciting speakers and general sessions.

This is an opportunity to enhance your knowledge of the future.

Many of our capabilities aren't even options on other graphic generators.

Which is the do-all, top-of-the-line graphics generator?

It may not be the one you think it is. Unless you specify the D-8800 Graphics Generator System from 3M.

It's the graphics system that gives you almost every creative capability you could want.

Such as the features you see above, photographed from a monitor using graphics generated from the D-8800 keyboard with no external hardware. Including dual channel mix. Ten roll and crawl speeds. Eight mask positions. Both horizontal and vertical autocentering. Character reduction and

italics that give you hundreds of fonts to create and store.

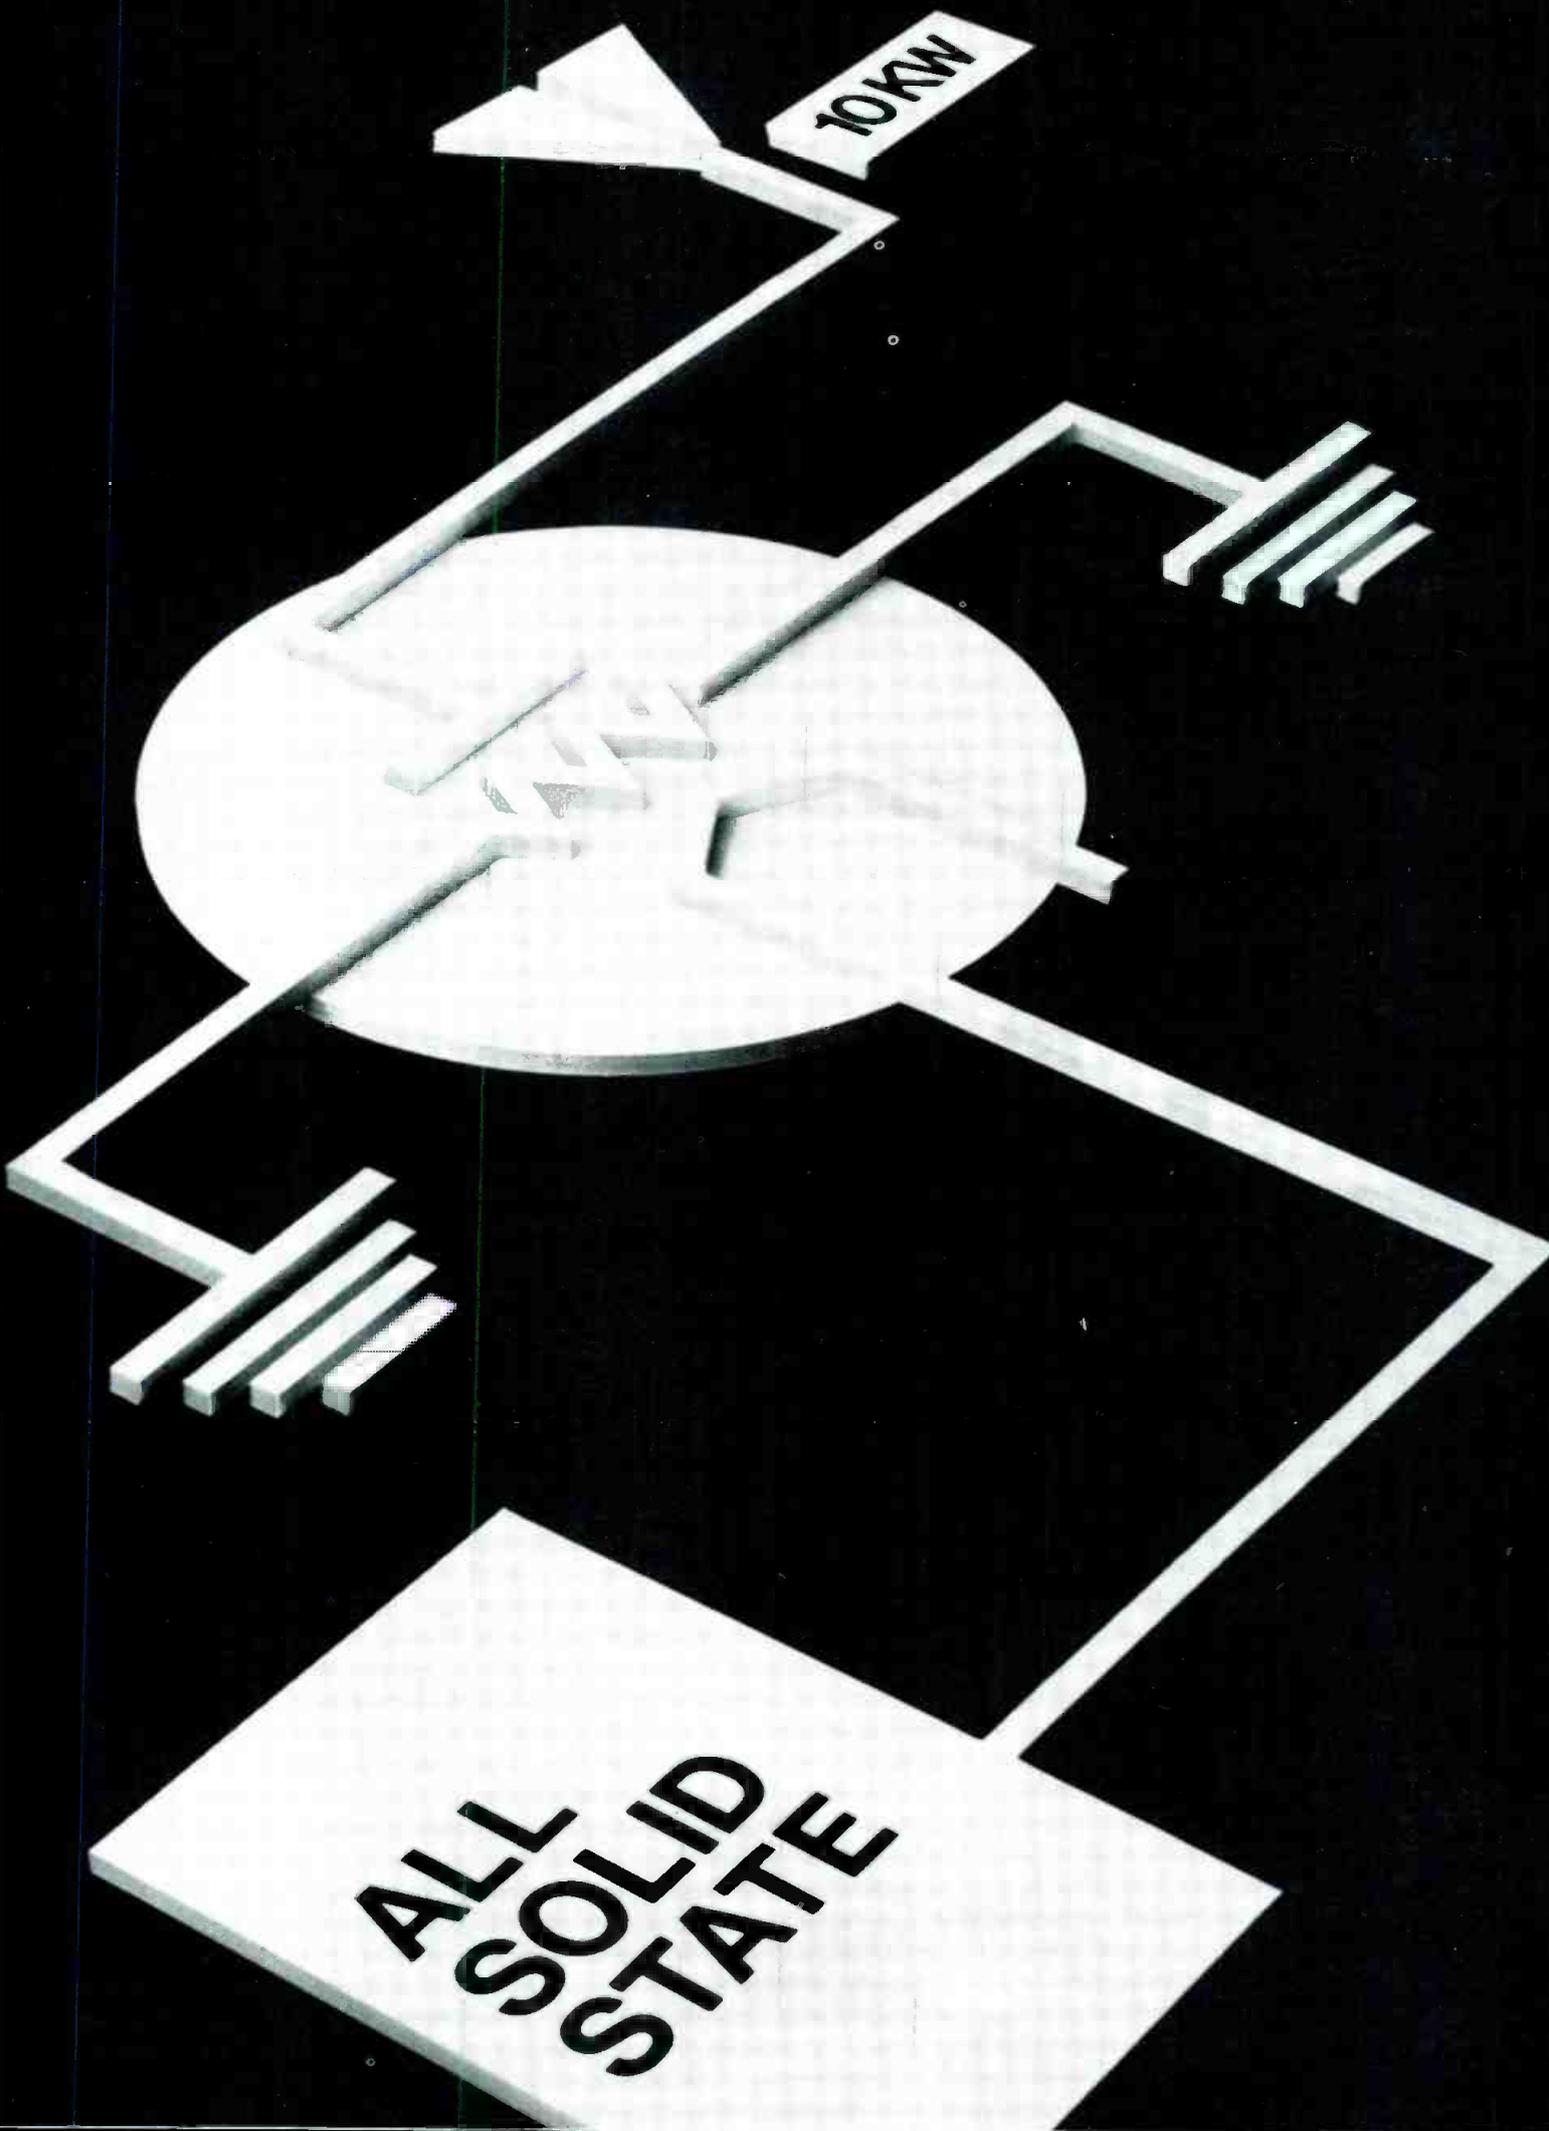

And much more.

Plus the D-8800 talks to you in plain English, at the keyboard. Not in codes that so often take weeks, even months to learn to decipher.

Call 3M today at 612-733-8132 and ask for a demonstration. You'll quickly discover the D-8800 is your only real option. Or write on your letterhead to: Professional Audio Video Equipment/ 3M, Bldg. 223-5E/3M Center, St. Paul, MN 55144. In Canada contact 3M Canada, Inc., P.O. Box 5757, London, Ontario, N6A-4T1.

3M hears you . . .

10KW

ALL SOLID STATE ASS'S

ELCOM/BAUER FM RADIO TRANSMISSION

The Simplicity and Stability of Grounded Grid and One Tube Design: The Best of Both Worlds in a New, 10,000 Watt FM Transmitter.

In a power range from 3kW to 10kW, the broadcast engineer can now have the reliability, efficiency and low maintenance that are inherent in a one tube transmitter design. Combine with this the operational benefits of a grounded grid configuration power amplifier stage that requires no neutralization and you have the best of both engineering worlds.

Add to This a New Exciter, Solid-State IPA and Exclusive Broadband, Low-Loss Ferrite Combining

The new 690A Exciter is the heart of all Elcom/Bauer transmitters. Its advanced solid-state engineering delivers great frequency stability while assuring you an exceptionally clean signal for further amplification.

Our solid-state IPA consists of four power amplifier modules (2 amplifiers per module) when combined produce 1,000 watts of drive power, with plenty of power in reserve. All of these modules are identical and loss of one of the four driver amplifier modules will not result in an off-air condition. All modules are broadbanded and require no individual tuning over the entire 88-108 MHz FM band. The modular design gives you back-up capability for more reliability in addition to an overall reduction of transmitter tuning requirements.

The exclusive Elcom/Bauer ferrite combiner is also broadband to take full advantage of the new solid-state IPA.

Easy Access and Spacious Cabinets for Engineering Maintenance

Every component in an Elcom/Bauer transmitter is readily accessible; full-length, non-interlocked front doors and side panels, which may be removed if necessary, are provided along with interlocked rear doors. High voltage grounding switches and grounded shorting sticks are provided. In addition to roominess and ease for the engineer, every safety precaution has been re-examined and no compromises made in assurance of operator safety.

Extensive Features That Guarantee Performance/Reliability

All important operating parameters are metered including operating elapsed time and AC line voltage. Solid-state rectification is used exclusively in all power supplies that are conservatively rated and easily accessible. Rugged variable inductors of solid brass (silver plated) are used to provide simple, stable tuning adjustments.

Automatic recycling restarts the transmitter should a momentary fault occur. A tally light memory keeps the appropriate fault indicator lamp lit until it is reset locally.

Interfacing to remote control or ATS systems is simple with all of the standard functions accessible

via terminal strips. Interface for telemetry control equipment is standard, too.

Every transmitter also includes VSWR protection, automatic power output control, AFC status indication, solid-state timing diode logic and relays, tuning controls with counter indicators, multimeter readout on secondary operating parameters and front panel circuit breakers and fusing.

The Quality You Can Depend On—Anywhere in the World.

Your broadcasting requirements need the simplicity and stability of grounded grid and one tube design—the best of both engineering worlds in a new FM transmitter. And, you should investigate the advantages of flexibility and cost-savings that come with the exclusive Elcom/Bauer ferrite combining. A comprehensive two-year warranty and in-depth engineering, available on a 24 hour basis, are your further guarantee that Elcom/Bauer can and will respond to the most stringent requirements for your facility.

A customer list is available upon request. We invite your technical evaluation of new FM transmitters that broadcast professionals are calling: "The Heritage Of The Future."

NAB convention

RADIO

It will be a cost-cutting, money-keeping, cash-conscious convention designed to help radio stations in every size market make and keep money in these cash crunching times. For example, there will be creative seminars on:

Managing Cash Flow—Is your money working for you or is it on vacation? Smart dollars work hard. Here is how to make cash flow work for you, not against you.

The New Tax Law—Projections, payments, estates, depreciation...if you learn the new law, you will learn how to keep more of your hard-earned dollars.

Budgets—Expense and Sales Projections—Learn how to build a budget, stick to it and live with accurate expense and sales projections.

The Art of Negotiating—How much money do you give away every year by paying retail for office supplies, equipment, money? The total dollar figures may surprise you. Learn how to negotiate like the big money people do.

Home Computers Work Great At Small Stations—Hundreds of small market stations are saving thousands of dollars with do-it-yourself computers and customized software. This is a hands-on session you will not want to miss.

Small Market Special—We have slated a complete mini-convention chock full of sessions that are custom-made for and by small market radio broadcasters.

The 1982 Edition of *Sales, Sales, Sales*—Tuesday, April 6, is all-day sales-day at the convention. Presented with RAB, it will cover everything for every size market from co-op to closing, from collecting to credit.

The New Satellite Programming Services—You asked for it, here it is! How much? How often? Whose drive time? Whose dish? How many spots? Everything you need to know about the new satellite-distributed programming services.

Jim Newman Wants To Talk With You—Famous management specialist Jim Newman is your private management trainer/motivator in this exclusive, intensive NAB radio-only session.

The Great American Arbitron Shoot-out—Do we have a single service industry? Should we? It's showdown time in the world of radio audience servicing.

Leasing a Cable Channel—Doing nighttime sports with a daytimer? A new format for your market? Creating a new profit center? Here is how it's being done by radio stations on cable.

What The FCC Did Not Deregulate—Don't throw out your set of FCC Rules and Regulations. You still have heavy dues to pay to the FCC.

Spanish Language Forum—Here is a special forum session devoted to the unique challenges of Spanish language radio.

"Hello, Is This The FCC? Well, I've Got This Problem..."—Listen in on a phone conversation like you've never heard before. It's about radio, advertisers, lawyers, contests, the FCC and you.

This Was A Paid Political Announcement—1982 is an election year. Your knowledge of the rules affects your pocketbook and your license.

There will be all this and much more news for radio attendees. □

PREAMPS FOR PROFESSIONALS

... Who Demand Better Performance

than their present console can offer or need state-of-the-art peripheral capability.

The QLZ quad microphone preamp delivers!

Equivalent input noise with 150 ohm input impedance @ 60dB gain = -128.5dBv (20Hz to 20kHz). Distortion (THD or IM) : @ 60dB gain, +20dBm (600 ohm) out = .005% @ 20dB gain, +20dBm (600 ohm) out = .0007%. Frequency Response: $\pm .25\text{dB}$ 20Hz to 20kHz (-3dB @ 10Hz, 180kHz).

Each quad preamp offers accessibility to inputs via front panel connectors (XLR on QLZ, tip/ring/sleeve on the QHZ) or at the rear panel of our '800' Series rack. Adjustable gain with clip level indicator is provided for

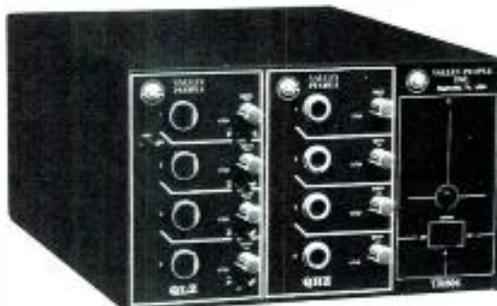

... Who Desire Ease In Interfacing

high impedance sources to line level gear with the added benefit of transformerless brilliancy.

The QHZ quad preamp delivers!

Equivalent input noise with 50K ohm input impedance @ 20dB gain = -104dBv (20Hz to 20kHz). Distortion (THD or IM) : @ 20dB gain, +20dBm (600 ohm) out = $\leq .05\%$ (.007% typical). Frequency Response: $\pm .25\text{dB}$ 20Hz to 20kHz (-3dB @ 10Hz, 100kHz).

each input. Excellent RF suppression is incorporated in all inputs and outputs. As an added benefit, 48 volt 'phantom' powering is standard on the QLZ, as is the phase reverse switch for each input.

Each is available at a cost which will surprise you!

NAB-'82/DALLAS PRODUCT DIRECTORY

This special section provides a directory to the NAB-'82/Dallas exhibitor products. Each exhibitor was asked to complete a comprehensive checklist of products to be shown. The following section is a compilation of the data provided. It shows major equipment headings followed by the exhibitor name and booth number (when provided by deadline).

This special section will be an aid in finding the equipment of special interest at the show. But a word of cau-

tion: As **Broadcast Engineering** goes to press, there are still changes being made daily in the exhibitor sign-ups, equipment being displayed and booth assignments. So, although every attempt has been made for accuracy in this section, double check the final program at NAB-'82 to organize show coverage.

For those not attending the NAB-'82/Dallas, the June issue of **BE** will provide a convention replay and will cover both sessions and new products.

200 Series Features:

The 200 Series is an advanced, state-of-the-art production switching system, offering one, two or three PolyKey® Effects (PKE) Systems. Each PKE has a 5 level processor with the following features:

- 4 input busses
- Manual or auto transitions
- Video key plus title key over/under
- Black/white/color border edging
- Chroma key standard
- Rotary and spin wipes

Every 200 Series switcher also has a Downstream Transition Unit which includes:

- "Flip-flop" mixer with cut bar
- Fade-to-black with pulse processing
- DSK with border edging and color
- Pointer Generator

Why Buy Dial-Up Radar?

SuperRadar is included in our system!

Dial-up radar systems cost 30,000 to 40,000 dollars . . . and show precipitation over a small section of a state — often confusing the viewer!

Now — ColorGraphics Weather Systems, in cooperation with Weather Services International (WSI) announces **SuperRadar**—digitized color remote radar from government weather radars throughout the nation, updated from the massive data base of WSI.

This service offers striking advantages:

- No ground clutter!
- Displays the first national radar picture!
- State or regional SuperRadar displays on command!
- Animated plotting action; selectable colors!
- Time sequence up to 100 pictures to show movement!
- Overlay directly over satellite picture for striking effect!

• Now — Highest resolution in the industry — 760 X 480!

Best of All — The Same ColorGraphics System Also Has:

Digital color satellite display from Environmental Satellite Data!

WSI weather data terminal!

High resolution, animated Color Weather Graphics!

All This For Less Than The Cost of Many Dial-Up Radars Alone!

ColorGraphics Weather Systems, Inc.

Better listening through better design—Series 99B

...Crisp, Clean, Brilliant Sound

Superior features!

"ELSA" (Patent 4,142,221) the only Cartridge Preparation System that automatically erases the cartridge, eliminates azimuth error and locates the splice. "ELSA" combines with:

- Crystal-referenced DC Brushless Servo Motor
- Standard High-Speed Cue
- Micro-adjust, center pivot head module
- Exclusive ITC open-face head design (Patent 4,193,103)
- Exceptional Frequency Response
- Improved headroom, transient response and square wave performance
- Distortion-free cartridge positioning system
- Multi-turn Calibration Controls
- Multi-function Test-Tone Generator
- Dramatically reduced heat allows for sealed case
- Microprocessor controlled

Series 99B—a combination of performance features that meets even the highest standards.

Reading this ad may solve your next audio problem

Solving audio problems is a daily requirement for the professional. Often, the solution requires the use of accurate test instruments, with a high degree of reliability.

The Spectra Sonics Model 510 Bandpass Filter and the Model 802 Signal Generator are the answer to your service requirements, permanent or portable. The battery powered units are accurate, reliable, compact, affordable, and easy to use.

THE MODEL 802 SIGNAL GENERATOR

The Model 802 is a signal generator capable of developing five selectable frequencies. An adjustable gain control allows the user any number of gain settings with impedances of 600 ohms or greater.

The Model 802 may be used for tape machine calibration, signal to noise measurement, as well as low and high level amplifier trouble shooting.

THE MODEL 510 BANDPASS FILTER

The Model 510 is a 20Hz to 20kHz, (-3dB), bandpass filter with a gain of 60dB. The 510 may be utilized with a standard voltmeter to make unweighted noise measurements on individual pieces of electronics, or complete systems. The 510 may also be used with existing noise analyzers for unweighted noise measurement. Battery operation eliminates ground current flow between instruments, resulting in consistent and accurate measurements not previously available.

The Model 510 Bandpass Filter and the Model 802 Signal Generator are audio problem solvers. See them today at your nearest distributor or contact Spectra Sonics.

Special microphones for special sound requirements

As an audio specialist, you know making do with "utility" microphones isn't good enough. You need a complete assortment of microphones, each suited for specific applications. Microphones that not only sound superb but are built to withstand the abuse of session to session punishment.

Shure SM line professional microphones offer built-in ruggedness and reliability and are designed to give you the optimum performance you need in every circumstance, whether it be for • a bass drum (SM7); • an acoustic stringed instrument (SM17); • percussion instruments (SM56 and SM57); • snare drum or acoustic guitar (SM81); • amplified instruments (SM53 and SM54); • studio quality vocals inside the studio (SM59); • studio quality vocals outside the studio (SM85); • stand-up interviews (SM61 and SM63); • desk-top applications (SM33) ... or *whatever* your needs.

...under one cover

For all the facts on Shure's full line of professional microphones, fill out and return the coupon below for your **FREE** copy of our new 72 page catalog describing over 150 microphones. No matter what your sonic requirements, there's a Shure microphone that fills the bill.

The Sound of the Professionals®

Shure Brothers Inc., Dept. 63, 222 Hartrey Ave., Evanston, IL 60204

NEW! AVAILABLE FROM AFA! AFA SLATE CAMERA SYSTEM SC-300

Compact, self-contained title card camera for mobile and studio operations!

- Available as a table-top console or rack-mount unit
 - Adjustable timer
 - Cool light source
 - Noise free operation
- Simple to operate and maintain
- Dimensions: 19" slide mount 8³/₄" high x 20" deep
 - Immediate delivery

Call us today for more information: (201) 767-1000

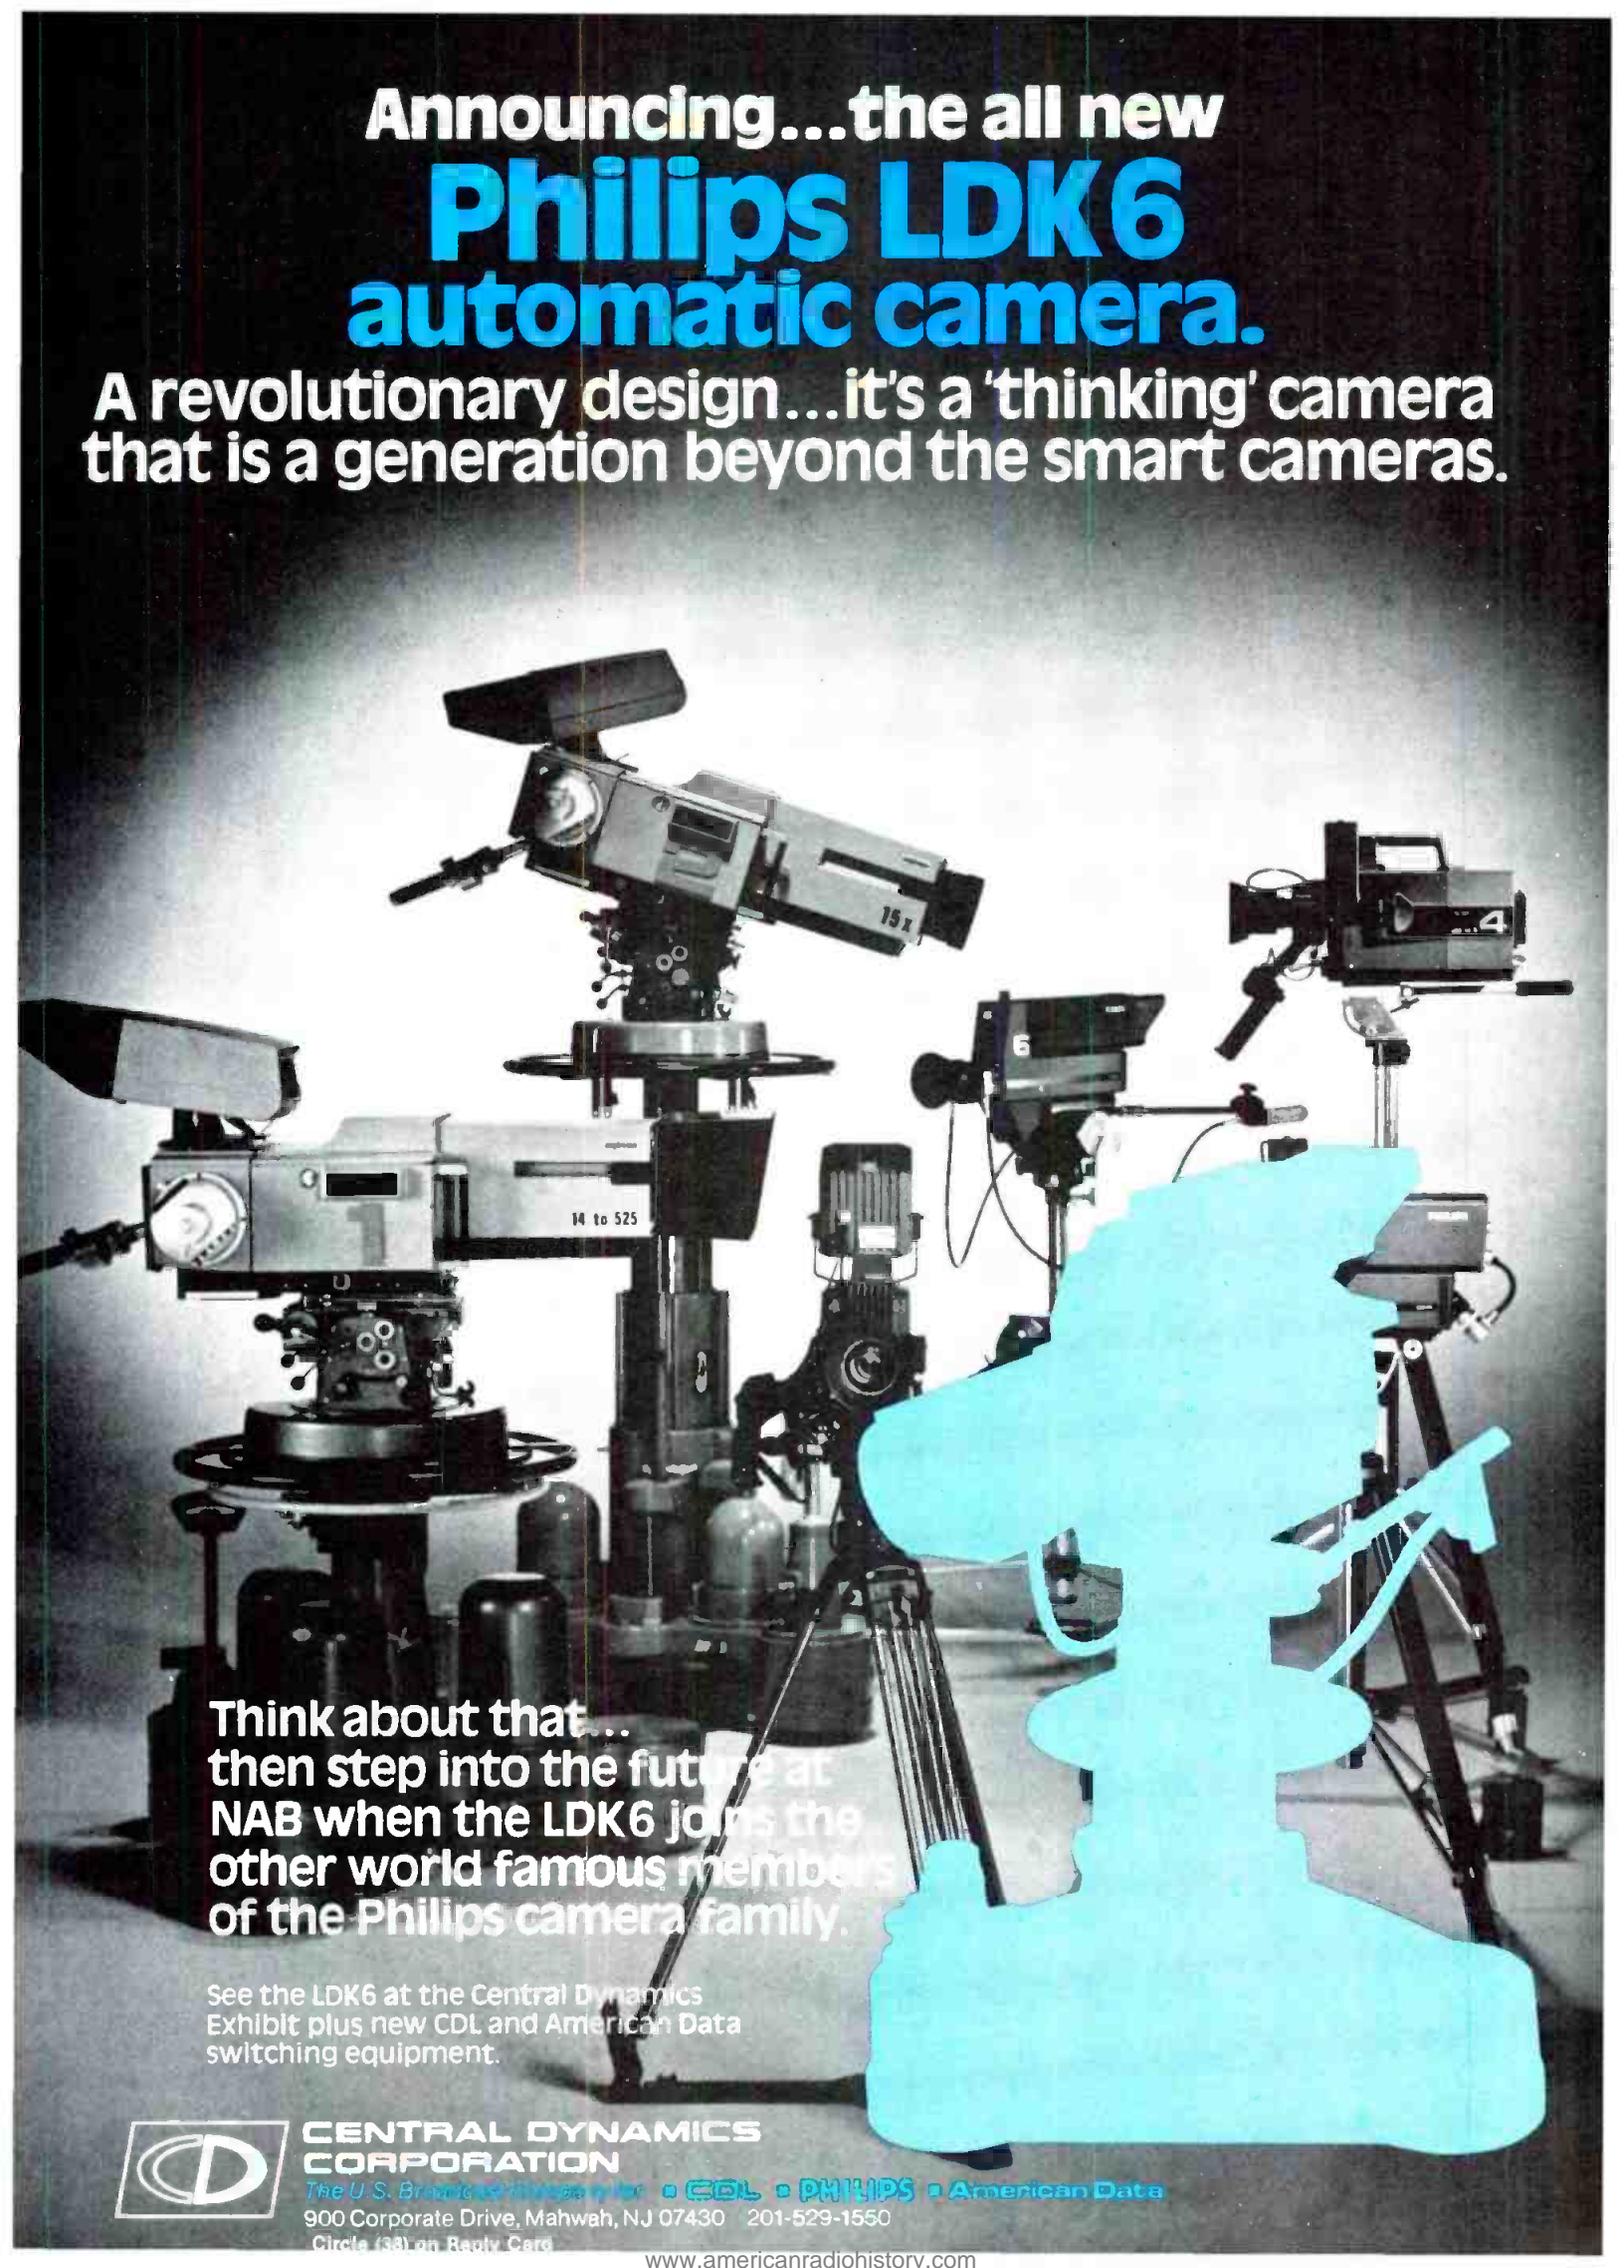

AFA

AF ASSOCIATES INC.

100 STONEHURST COURT, NORTHVALE NJ 07647

Announcing...the all new
Philips LDK6
automatic camera.

A revolutionary design...it's a 'thinking' camera
that is a generation beyond the smart cameras.

Think about that...
then step into the future at
NAB when the LDK6 joins the
other world famous members
of the Philips camera family.

See the LDK6 at the Central Dynamics
Exhibit plus new CDL and American Data
switching equipment.

Versatile, Affordable Titlers

TM-1024B

Combines titler & message generator in one small package at one low price.

- Choice of 8 color backgrounds in stand-alone mode
 - Switchable for downstream keying applications
 - 16 page resident memory
 - Character insert & delete
 - Manual & auto sequencing with variable dwell
 - 10x14 character matrix
 - Auto line centering
- Titler and message generator combined for \$2795

T-1000A

Advanced character enhancements.

- Black and white characters in 2 heights
 - Drop shadow and border in both black and white
 - "See-thru" characters
- Plus: Roll, Crawl, Off-line editing, and 16 page resident memory
- All these features for \$3995.
- For more information, call or write today.

A VERY MOVING STILL STORY.

Editors, Engineers, Animators, Producers, Special Effects Specialists, Station Managers, Training and News Directors, Read This Ad.

In the beginning, all was stillness. A dark and cumbersome, costly and inefficient sort of stillness accentuated by the *kachunka-kachunka* of the slide chain machinery. Then came a company called Echo Science Corporation — us, actually — with a concept called Electronic Frame-Stor™. And suddenly, all was stillness — and light.

But what excited the engineers at Echo Science wasn't stillness at all, but movement and, yes, re-movement. These were the challenging chapters to be written in the Still Story. How to make all of those electronically stored stills move around in all manner of ways — and do so in a container that was easy to move. For the Still Story, a hero was needed.

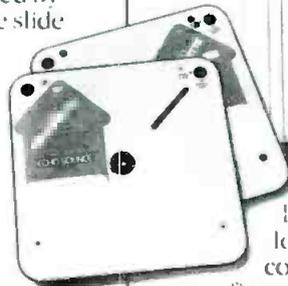

Thus was born The Image Maker.*

The Image Maker. A Brief Definition.

Here's what The Image Maker is: A high-band color disc recording system that uses state-of-the-art electronics and an exclusive Discassette® recording medium to perform a versatile number of professional television production tasks from still frame storage to special animated effects. It is a highly reliable, very compact and most cost efficient method of acquiring an impressive package of capabilities.

Loops, Sequences, Special Effects.

The joy of The Image Maker — and the key to its success as a productivity tool — isn't just in its storage of still frames, but also in the manipulation of those stills to serve a variety of needs. In this regard, The Image Maker is a marvel of special effects wizardry, all made possible by a combination of features. Variable speed operation all the way from freeze frame to real time. Random access of as many as 512 frames on

line. The ability to preset 64 locations. These features are conveniently laid out on a fingertip touch panel to make it just that much easier for the operator to do animation sequences, generate backgrounds, superimpose effects or pre-program motion loops.

From Cold Fronts To Hot Switches: The Plot Thickens.

More advanced features deliver even more broadcast and production benefits. For instance, because The Image Maker boasts variable speed in both directions, weather motion — or motion analysis of any kind is, well, a breeze. And because it also features two independent heads, the operator can preview upcoming video images, then "hot switch" to the next one without going to black.

Between the cold fronts and the hot switches are a full range of other capabilities. Instant replays. Logo and ID flashes. These are capabilities enhanced by the fact that The Image Maker will conveniently interface with today's modern character generators and titlers.

The Discassette. The Removing Part Of The Story.

Not all of The Image Maker's innovations are located exclusively within the confines of the machine itself. In fact, one of the key innovations — and one unique to Echo Science products — is our

Discassette, the removable recording medium that provides both operational and storage convenience. In this day and age, when space is at such a premium and ease of storage and retrievability are very real assets, a library of Discassettes sure beats drawers full of slides or closets stacked with disc packs.

Going Mobile With The Image Maker.

Movable images. Removable media. Both are important parts of The Image Maker story. A third, though, is The Image Maker itself on the move. Because we deal with some mighty tough customers, we build The Image Maker to be a mighty tough television production tool. The combination of the recording technology (one that eliminates the possibility of head crash), Echo Science craftsmanship, and a compact, road-rugged design makes The Image Maker as versatile on remote shoots as it is in the studio.

A Moving Conclusion. Buy One.

Perhaps the most moving part of The Image Maker story is the one you read on the bottom line. Because, ultimately, it's the cost efficiency of The Image Maker that will move you to take a closer look. Clearly, it doesn't make a lot of sense to tie up a 1-inch VTR to do routine or special effects work when the feature-rich but modestly priced Image Maker can do that — and more.

There's a happy ending to our Very Moving Still Story. Call us today and we'll write it together.

See Us At NAB

TURN ON

Compuvid introduces the greatest turn on since the invention of television. With the Nite Scan information system, late night viewers will be "turning on" your station for news shorts, weather, sports, advertising, etc. □

The Nite Scan character generator utilizes "field proven" bubble memory technology with expandable non-volatile memory capacity. When regular programming is through for the night, don't let America turn you off...TURN ON NITE SCAN. □

NITE SCAN

“VIVE LA PEIRCE-PHELPS!”

TELEFRANCE USA, the French cultural and entertainment cable programming system, asked us to design and build their new video production facility in New York City.

We designed a system to fit in their available space.

We chose the precise equipment to meet their budget requirements.

And we had it completed when they needed it.

TELEFRANCE said, “C’est incroyable! Merci!”

Now we’d like to do something special for you.

THE 6112 IS BOTH A PRODUCTION AND A POST-PRODUCTION SWITCHER

- TREMENDOUS PRODUCTION CAPABILITY
- EASE OF OPERATION
- TWO FULLY INDEPENDENT MIX-EFFECTS SYSTEMS
- AUTOMATIC MIX AND WIPE
- DUAL BACK PORCH CLAMPS
- ROCK STABLE CIRCUITRY
- DOWNSTREAM KEYER
- TWO ADDITIONAL KEYERS
- NO DELAY LINES

Model 6112 **NTSC \$7950**
 PAL \$8950

Chroma Keyers Encoded or RGB \$1050
(Encoded chroma keyer not available in PAL)

With the model **6403**, the **6112** is directly plug compatible with many editors. No modification to switcher or editor is required.

Under **6403** control the **6112** accepts commands such as duration times, pattern type, bus selection etc., directly from the editor keyboard. The **6403** also provides additional capability of accurate start and finish, size and position of pattern transitions.

CROSSPOINT LATCH has the largest selection of compact switchers - and switcher products to choose from. Write for our free Post-Production Booklet.

CROSSPOINT LATCH CORP.

95 Progress Street, Union, N.J. 07083 (201) 688-1510 Telex 181160

The "Studio Optimod"

The Orban 424A Gated Compressor/ Limiter/De-Esser

There are lots of production limiters out there. Old favorites. Pretenders to the throne. The competition is fierce. So, when Orban set out to design a new production limiter, we knew it had better be superior.

The result of our research is the "Studio Optimod"—a Gated Compressor/Limiter/De-Esser with versatile controls, simple set-up, and a natural, transparent sound that must be heard to be appreciated.

Try one and A/B it against your current favorite. You'll notice the **sound**—remarkably smooth and natural over a wide range of control settings—even at high compression ratios where apparent loudness and punch are significantly enhanced. It's no accident: The unit is a direct descendent of our super-popular, second-generation OPTIMOD-FM broadcast limiter. So it exploits our years of experience in making an AGC device sound natural on diverse program material without critical re-adjustments. Yet full versatility exists for special effects in production.

A bonus is a smooth, natural de-esser. It's independent of the compressor/limiter section so you can simultaneously compress and de-ess vocal material without compromise. You can even de-ess sibilant vocals which have been mixed with other program.

The icing on the cake is unique gating and "idle gain" functions which prevent unnatural noise-producing gain variations during pauses and abrupt gain changes when the unit is switched in.

Our new Model 424A (dual channel) and 422A (single channel) are destined to become the new industry standards in dynamic range control. Prove it to yourself. Contact your Orban dealer today.

Alexander announces life after death.

Think your battery belt is dead? Then talk to the replacement battery experts — Alexander. We never say die! Instead, we'll bring that battery belt back to life, at reasonable cost.

Just call 515-423-8955 and describe the cell configuration of your particular belt. We'll

make up your replacement modules — charging you only a fixed price per cell used — and ship them to you freight paid. And we use rechargeable nickel-cadmium batteries that are unconditionally guaranteed for six months.

Try us!

Give or take a few pennies, and using some conservative assumptions (18hr/day, 5 year full depreciation), that's all it costs to replace your current audio processor with an Orban OPTIMOD-AM, -FM, or -TV. And get an *immediate* improvement in on-air audio quality. An improvement that pays off every minute of every hour of every operating day.

OPTIMODs are fully adjustable to program requirements. Their patented technology has literally revolutionized audio processing in the last six years, and yields a cleaner, brighter, louder sound unmatched at any price.

And their superior sound is complemented by Orban quality and service—a well-established, industry-respected commitment that protects your investment.

Money may be tight. But particularly in trying economic times, the winners are

those who compete the hardest and deliver the best-sounding product to their audience. OPTIMODs are lethal competitive weapons. And, at 13¢/hr, very sound investments.

Can you afford not to go with an OPTIMOD?

For further information, see your local Orban Broadcast Products dealer, or call us Toll Free (800) 227-4498. In California (415) 957-1067.

Hear the OPTIMODs *live* at our NAB Booth 1812.

EQUIPTO ENCLOSURES

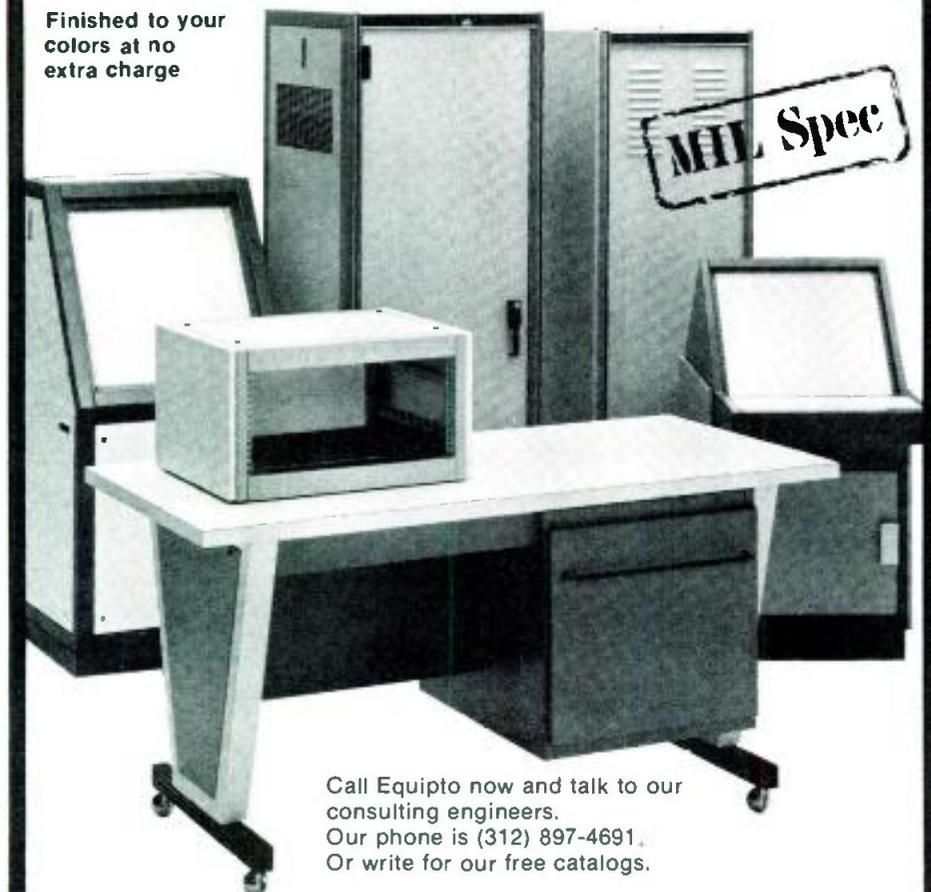

We can make your cabinet engineering easier!

You know electronics. We know electronics cabinetry. So talk "engineer talk" by phone with your counterpart at Equipto . . . not an intermediary, but an engineer who knows your needs and how to fill them. He may suggest one of our more than 400 stock models. Or he may design an enclosure just for you.

Modular or custom, you'll have a 3-view engineering drawing within days. If needed, more specific drawings will follow . . .

And when you're ready, Equipto will send a finished cabinet for your evaluation program; equipment and instrumentation mounting, or destructive testing.

Finished to your colors at no extra charge

Call Equipto now and talk to our consulting engineers.
Our phone is (312) 897-4691.
Or write for our free catalogs.

Introducing the New CHYRON® IV.

The New CHYRON Adds True Graphic Capabilities To The World's Leading Character Generator.

The latest Chyron is the system that the broadcast industry has been waiting for. You have known the Chyron IV as a powerful character generator that's easy to use.

Now, utilizing advanced computer graphics, it has become a flexible graphics tool, as well. The result: a truly versatile graphics generator that provides virtually all of the electronic functions you need. And, it's still easy to use!

More Artistic Freedom

CHYRON IV's digitizing tablet provides full flexibility for the artist to draw, change select colors and fill. He has,

in effect, a true electronic paint system. *Background graphics* can be created and displayed or stored for later use. In addition to the digitizing tablet, graphic information can be entered with a black and white camera in the font compose mode.

This new background graphics capability gets the artist away from plain text into the generation of "pictures": graphic images, representa-

tions, vignettes with as many as 16 colors or gray scale values, etc.

Multicolor characters are available, too. Full color or halftone artwork is digitized and displayed with up to seven different color values per character. The display can be changed from *gray scale values* to *psuedo-color* for ease of trim and area identification. This means that multicolor logos or other artwork can be displayed and treated as a single character to take advantage of all the CHYRON IV animation and character manipulation features.

New Board is the Key

A state-of-the-art multimode graphics module is the heart of the new capabilities. It replaces the existing font compose module and operates in several differing modes.

In its basic operation, the new module provides an advanced means of camera font compose. A built in A/D converter samples incoming camera video at 10 times sub-carrier and digitizes each sample with four-bit accuracy (thus, the 16-level gray scale). Software then analyzes the data to produce extremely smooth curves and slopes for virtually perfect capture and the elimination of trimming in most cases.

Many Other Features

Other CHYRON IV features provide even more flexibility. Up to four "vignettes" may be created and independently positioned or animated. Text can be moved out of the safe title area, the color palette has been expanded to 512 choices, character edging can be any color and diagonal typing has been provided. The roll and crawl modes have been improved to allow smooth motion through horizontal and vertical blanking. And there's more. Call or write for all the details.

The CHYRON® COURIER

An Occasional Newsletter
Dedicated to the Latest
Chyron Developments.

Vol. I, No. 1

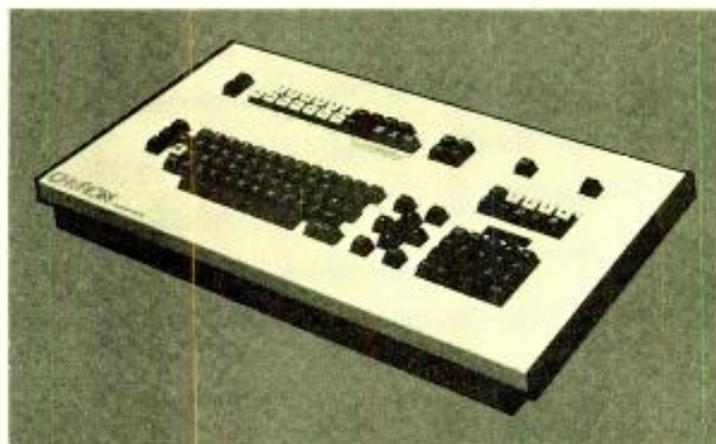

Earlier CHYRON IV's Can Be Retrofitted for New Features

The new CHYRON still carries the model number IV. It will not obsolete the many earlier CHYRON IV's still serving nobly out in the field.

Your current CHYRON IV can be retrofitted to provide all of the newly-developed features. Return your IV to the factory, and we will replace the unit's present font compose module with the new multimode graphics module and add the necessary systems modifications to accept the new features. It will convert your old CHYRON IV into a true graphics generator, with all of the many advantages of the new model.

Updated training sessions will be available, too. Classes for operators may be scheduled at Chyron headquarters in Melville, N.Y. or at your place of business.

For details on the retrofitting of your earlier CHYRON IV and on the latest operator training, call or write today.

Highlights of the New System

In brief review, these are the main features of the new CHYRON IV.

- Background graphics plane
- Advanced font compose with 16 levels of gray scale
- Multicolor characters (7 colors each)
- Digitizing Tablet
- Winchester disc
- 512 color choices
- Four-level animation plane
- Blanking-to-blanking display capability
- Colored edge
- Fader provides 256 levels, with gamma correction (pre-programmable)
- Diagonal typing
- Software-based for future enhancements.

THE \$250,000 CART MACHINE.

by Ray M. Kohfeld, President, Ramko Research

PhaseMaster, The industry's most advanced broadcast reproduction system.

From the beginning of the PhaseMaster cart machine project more than two years ago, we were convinced there was an electronic solution to the problem of stereo phase stability. Consistent stereo reproduction and machine-to-machine compatibility could be solved. We believed that for many crucial system parameters, performance could be achieved in a cart system that would meet or exceed the best reel-to-reel machines.

What we didn't realize however, is that the development of the "ultimate" cart machine would cost over a quarter of a million dollars and take thousands of man-hours to accomplish. We finally achieved what we were after—no, what you were after—but not without some very trying times.

Early on, the goals were clear.

By employing leading-edge technology throughout each area of the tape system, we felt that the PhaseMaster could out-perform everything in the audio chain. Right on through the transmitter. The signal-to-noise, distortion and wow and flutter performance criteria had to rival reel-to-reel specs while retaining all the conveniences and benefits of the standard plastic tape cart. The major problems of tape skew and guidance had to be overcome in order to deliver a system which would, once and for all, take care of phase problems. This problem was judged by us to be absolutely critical for proper and consistent stereo reproduction. FM now, and AM just around the corner.

The final goal we set for ourselves was to design a cart system that offered automatic machine-to-machine compatibility—an important benefit that to our knowledge no other reel-to-reel, cartridge machine or add-on processing

system offers. We believe that it is a significant factor for the broadcaster to be able to pickup anyone's cart at random, record it on any PhaseMaster and then play it back on any PhaseMaster: the program material being precisely locked in-phase. Whatever the phasing of the original source, the signals will be automatically and faithfully reproduced. Ultimately, tape skew, chatter or even head misalignments would no longer be a problem.

Side-to-side stereo shift; holes in the mono mix or worse yet, reception: audio modulation due to tape chatter from the cart: major problems that we've lived with for years. You waste valuable time trying to get around it, cart manufacturers would like you to believe that it's solved in their carts, programming and management don't want to hear about it, and your audiences reach for the dial when your station doesn't sound good because of it.

To have introduced another cart ma-

chine that didn't solve all these persistent problems would have been negligent. To say the least, another mouse-trap. As we've stated, the goals were clear from the onset, but not the solution(s).

Our attempts at phase correction: shortcuts aren't our way of doing things.

When we first looked at the problem, there existed only one other means of phase correction. This is an electro-mechanical approach which adjusts head alignment for each cart prior to the initial recording. Although this is certainly an improvement over what had existed (nothing), we felt it had many shortcomings. It can't correct phasing in real-time, the compatibility factor is not high enough, it's overly complex—subject to breakdowns, and it adds valuable, additional time to a producer's already busy schedule of production.

What about stereo matrix?

Another approach which initially offered some technical promise at the outset was stereo matrixing. We went down this road early and discovered that a matrix system not only added unwanted electronic noise (something we were taking great pains to get rid-of) but it did very little to accomplish our goal of machine-to-machine compatibility. These fundamental drawbacks are inherent in this design approach and we eventually discarded it after many attempts to make it do things it just couldn't do.

Cross-correlation and signal injection: not the answers either.

After discarding the stereo matrix approach, we researched the viability of mixing timing signals onto the Left and Right audio tracks. This was closer to what we had in mind but detracted from the end result in that the audio had to be reprocessed which naturally degraded the high quality audio we were aiming for.

The third technique investigated was a cross correlation scheme that is essentially a form of probability theory with user adjustments. This also was eventually dismissed because of its inability to second-guess many complex waveforms and the necessity to readjust for various types of program material.

Although all of these approaches have some merit and have since shown up in the marketplace, the individual shortcomings were too much of a compromise of the promises to ourselves that we could do it better. Much better.

The answer! Perfect phase correction via the Q-track.

The elegantly simple and totally unique answer to the phase-stability problem came because of persistence and, at times, downright obstinance to not accept anything less than what we set out to achieve: picture perfect phase accuracy and stability—an ultimate, real-time correcting solution to the biggest problem the cart system serves up to every broadcaster.

The phasing (or more accurately, time base) correction system in the new PhaseMaster cart machines takes a sample of the upper (Left) audio channel, encodes it and then records it on the cue track without interference to any other information. Upon playback, the encoded signal is reconstructed and compared to its mate on the upper track so that we now have two identical signals to compare with each other. This has been the key. We are now able to compare apples to apples. Dissimilar information normally found in Left and Right audio is no longer a limiting factor. After these two identical signals are compared by a clever signature-determining circuit, a control signal is developed. Any time-base differences between these signals are applied via control signals to timing circuitry in both the Left and Right audio for correction. The result? Phase correction in real-time... measured in microseconds. The heads, the tape or both can be severely out-of-whack and the PhaseMaster's phase compensating electronics don't care. The audio can be complex, sinusoidal or recorded only on one track.

You can record your program material on any PhaseMaster Record/Play machine and rest assured that it will reproduce exactly like the original source no matter it be across the hall or across the world.

Control instrumentation technology helped us find the solution and we're now preparing for patent application.

Compatibility with your present system.

The new PhaseMaster also offers you compatibility with all your present, previously recorded carts. An easy transition can be made at your own pace without having to rerecord your station's entire library. To state it simply, PhaseMaster now gives you a professional R/P system without the drawbacks you've grown accustomed to.

Last, but not least, the best mechanical design you've ever seen.

The deck is a $\frac{3}{8}$ " casting for stability, with a stainless steel cover plate for

wear-resistance and EMI shielding. A crystal-controlled D.C. servo motor insures timing accuracy to within $\pm 0.05\%$ and, practically no heat generation. The speeds are field selectable: $3\frac{3}{4}$, $7\frac{1}{2}$, and 15 ips.

Your carts are securely held in position by the edges to prevent distortion, using spring-loaded rollers. Insertion and withdrawal is smooth and positive-feeling. The machined head stack is rock stable, and we've included internal illumination for periodic inspections and maintenance. There are no microswitches to break or jam—and never any start-up wow because the motor is started by an optical sensor as you begin to insert the cart. To keep damaging heat away from the tape, the capstan is ceramic. And bearings have a longer life because the motor doesn't need to run continuously due to the cart sensing design and the ability of the motor to reach full speed by the time the cart is fully inserted. The pinch roller is engaged by an adjustable air-damped solenoid with a teflon coated plunger for friction-free, quiet operation.

On the PhaseMaster R/P machine you get front panel switch selectable inputs; integral diagnostics for faster, easier maintenance; three cue tones are standard. An automatic $4\frac{1}{2}$ digit timer is standard. Left/Right audio plus phase analysis solid-state meters, motor "out-of-speed" and "already played" indicators are standard, too.

With the kind of performance we didn't compromise.

We've set new standards for wow and flutter: .04-.07%. The amplifier's signal-to-noise is -65dB utilizing dynamic noise reduction without companding or expansion. Frequency Response is ± 1.0 dB. And, of course, there's balanced I/O's and a +25dBm output capability.

It's been worth the wait.

We call it the \$250,000.00 cart machine. That's what we invested on our bottom line to engineer a system that you can have for less than \$1,400.00.*

Call us collect at (916) 635-3600 or contact your Ramko sales rep for more information and a schedule of when you can have a free, two week trial of PhaseMaster—the industry's most advanced broadcast reproduction system.

*PhaseMaster playback machine. Prices subject to change without notice.

Engineered For Your Bottom Line.

Rely on Dielectric

The networks do

... for assured continuous operation and proofing.

The U.S. Navy does

... for their communications, radar and fire control systems.

NASA does

... for the Space Shuttle Program and Columbia flights.

You, too, can be confident with Dielectric's RF instrumentation and components. For more than 40 years, our products have been respected by the communications industry for their exceptional reliability and accuracy.

Today, Dielectric is in the vanguard of advanced RF technology, supplying a wide variety of devices from meters and loads to waveguide for electron beam accelerators, the space shuttle program, military communications, fusion power generation, radio astronomy, and deep space satellite tracking radar. This same quality is common to all our products. That's why we offer an unprecedented 2-year warranty on our RF meters, loads and couplers.

Call us, toll-free, for the name of your local distributor. We have people 'round the globe you can rely on.

Integrity and craftsmanship . . . a New England Tradition

Your image is on the line.

Barco's broadcast color monitors put your image on the line—clearly.

With the CM-33B 13" and CM-51B 19" monitors you can choose from a medium, standard, or high resolution delta dot tube. Your choice. But all three assure the broadcaster a color critical picture that lets you know exactly what is going out on line.

The medium resolution CM-33B offers a phosphor

triad pitch of .43 millimeters and the CM-51B .47 millimeters. Other features include • Switchable underscan/overscan, • RG off switch for easy set-up, • Color temperature switch.

All models are fully modular and are designed for general purpose applications. The CM-33B is ideal for ENG/EFM applications and the CM-51B is perfect for studio use.

We know your image is on the line. Barco's worldwide reputation for quality is sure to enhance your image.

FOR PROFESSIONAL USE ONLY.

THE TASCAM 122 STUDIO CASSETTE RECORDER.

Tascam. Now we've designed a cassette recorder for the studio. One that has everything you need to reproduce your studio sound faithfully.

Performance plus a combination of features makes the 122 a tool of the trade, not a plaything.

Dolby Headroom Extension. Gives you up to 10dB more headroom over 10 kHz. Cassette dubs end up hotter, fuller, cleaner when played back on any standard Dolby* B deck.

Three-head System.

Separate record and reproduce heads are mounted in a single housing, eliminating azimuth error.

Front Panel Trimmers.

The kind of fine-tuning you're used to having on studio machines. Notice the parallel line inputs in place of hi fi microphone inputs.

Plus Options. Like full transport remote control and dbx.* Check out the 122's qualifications at your Tascam dealer. When you want the best you can get, it pays to use a professional.

Two-speed Transport.

You get 1 $\frac{7}{8}$ ips plus 3 $\frac{3}{4}$ ips, a two-position pinch roller for cueing in the pause mode and a capstan motor that doesn't idle needlessly in the stop mode, for long-term reliability.

SEE THE FUTURE

6800 \$3500

6124 PAL \$14,700

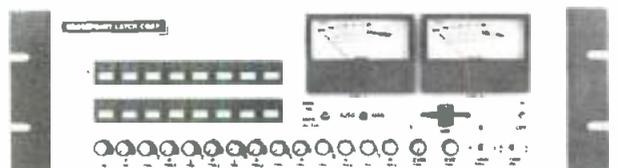

(RGB Chroma Keyer Only)

AUTO DRIVE™ Model 7200 is a computer which is directly plug compatible with the 6124 switcher. AUTO DRIVE™ is capable of storing the complete panel configuration of the switcher and then, under full computer control, manipulating the 6124 smoothly from one panel configuration to the next rapidly with frame accurate precision. This converts the 6124 to a very sophisticated special effects generator capable of running several stored sequences of operations, in a way that cannot possibly be achieved manually. AUTO DRIVE™ is uniquely designed for both production and post production use. For productions, events and sequences can be stored on the preview bus and then RUN on the program bus at the touch of a button. For post-production use, interfaces are available for many editors, allowing the 6124 to be driven directly from the editor keyboard, accepting all commands such as pattern type duration times etc.

The 6803 is an audio follow switcher for the 6124. The 6803 is slaved to ME1, following the action of the fader arm on the switcher thus producing audio dissolves. The 6803 can be controlled from the editor keyboard. The 6803 handles seven stereo audio inputs at levels between -20 and +10 dbm. The 6800 has all transformer coupled inputs and outputs. The 6800 is similar to the 6803, with the addition of a tone oscillator and manual front panel override for the inputs.

The cold,
hard facts.

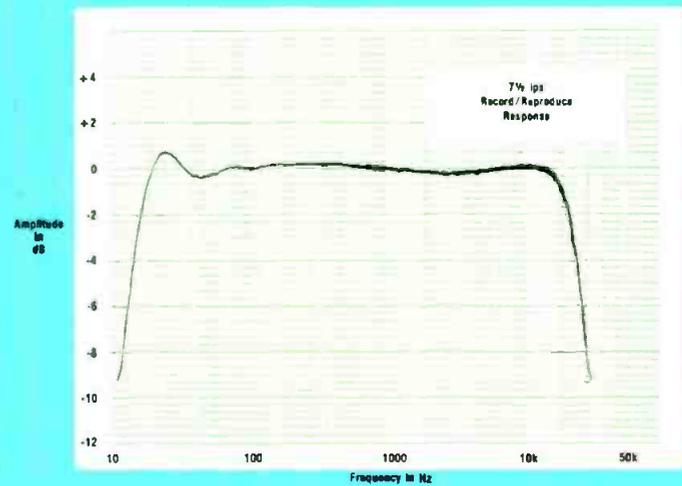

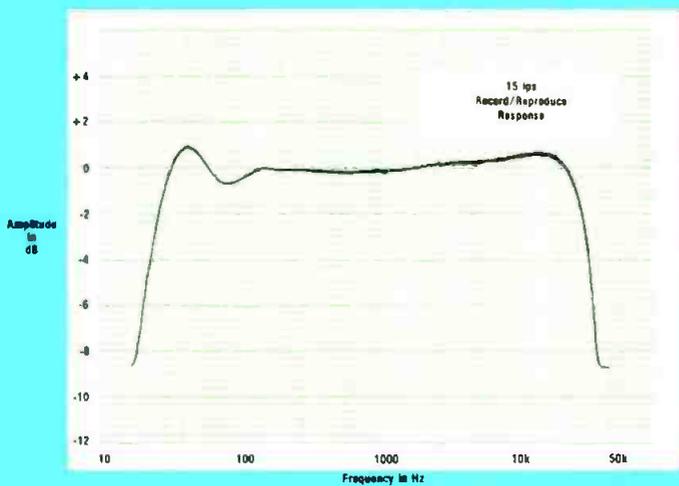

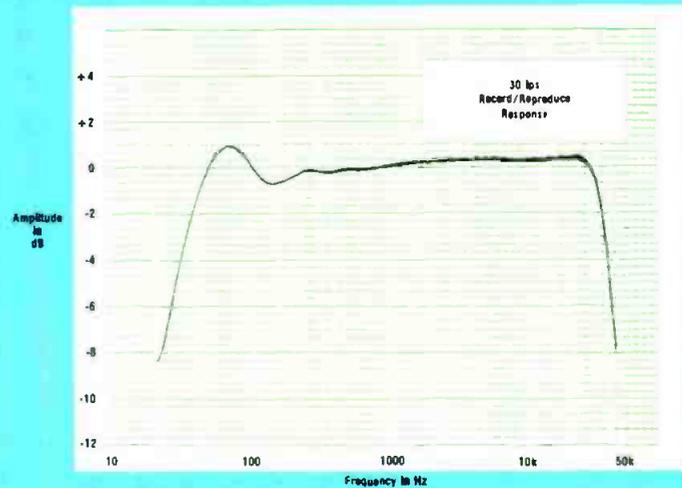

Specifications speak for themselves

MCI invites you to compare specifications for the JH-110B against those of any other tape recorder on the market today. No pretty pictures, no bright copy, just facts. The JH-110B...unsurpassed in a field of professionals. And that is a cold, hard fact.

Unless otherwise specified, the following conditions apply to all graphs:

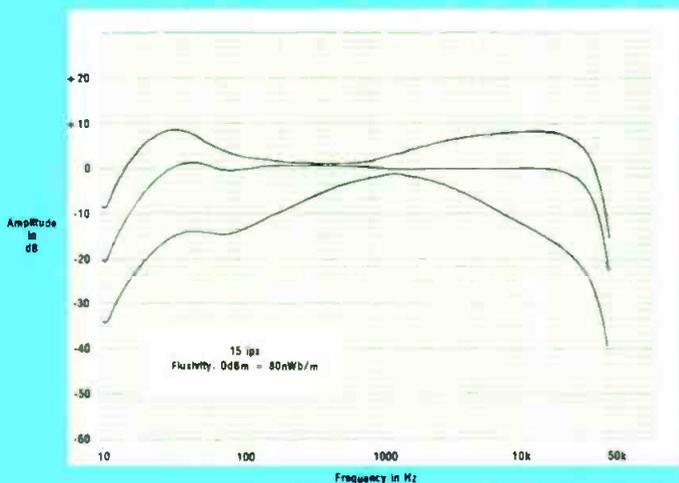

- Speed: 30 ips
 - Overbias: 1.0dB @ 10kHz
 - Fluxivity: 0dBm = 250nWb/m
- Speed: 15 ips
 - Overbias: 3.0dB @ 10kHz
 - Fluxivity: 0dBm = 250nWb/m
- Speed: 7½ ips
 - Overbias: 3.0dB @ 10kHz
 - Fluxivity: -10dBm = 80nWb/m

All tests were performed utilizing Scotch Type 226 Tape.

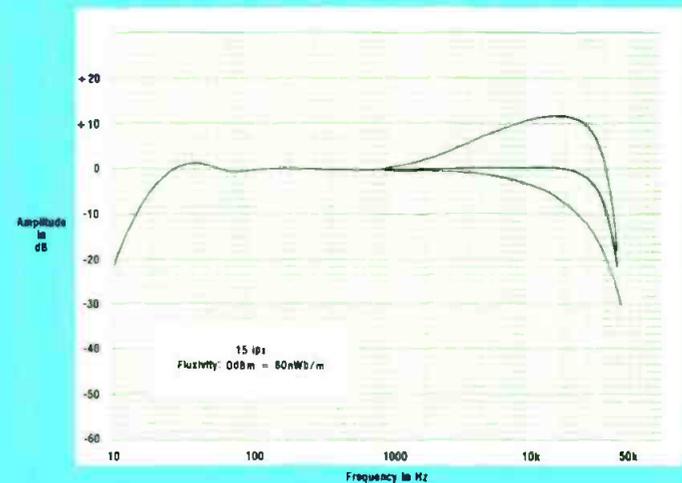

RECORD/REPRODUCE RESPONSE

These graphs represent the frequency response of the recorder on and off tape, assuming a constant input level. They demonstrate the flat and extended response of the JH-110B Recorder.

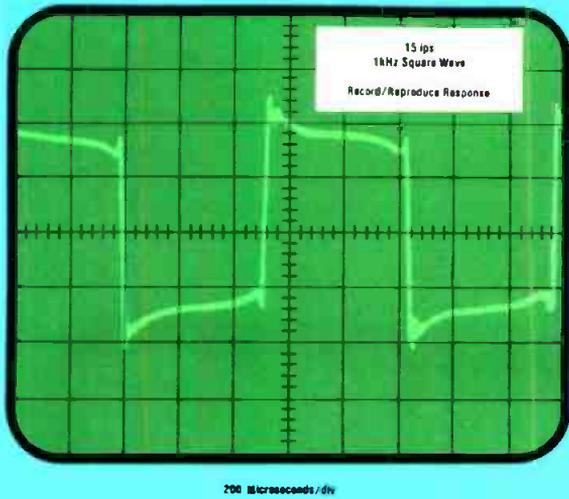

REPRODUCE EQ RANGE

A wide range of reproduce equalization adjustment ensures that the JH-110B will conform to NAB, IEC and AES standard response curves. There is sufficient range to compensate for head wear and to align to reference tones on aged or degraded tape copies.

RECORD EQUALIZER RANGE

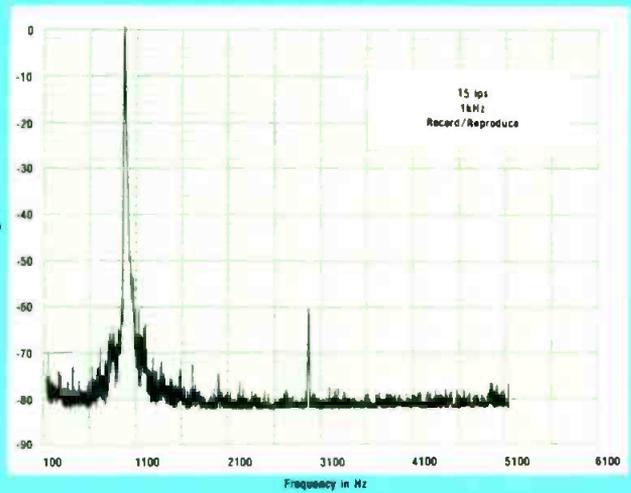

The record circuitry of a recorder is aligned to complement the reproduce response previously aligned to match standard curves. The JH-110B features a wide range of adjustment to allow alignment with any of the range of tapes available today.

200 Microseconds/div

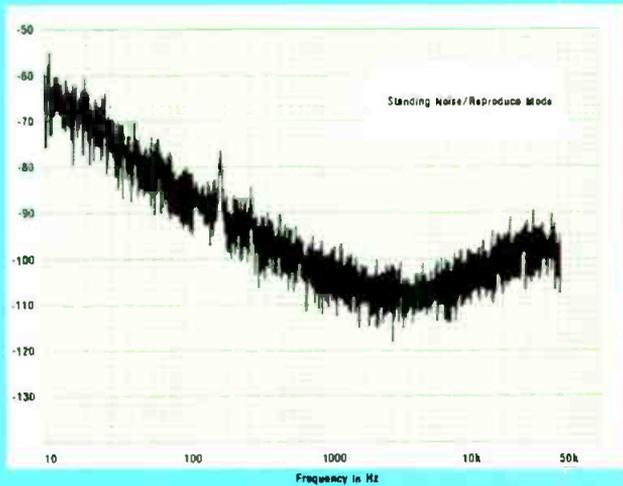

SQUARE WAVE RESPONSE

are Wave Response demonstrates both transient response and se linearity throughout the recording process. Response such as the JH-110B produces excellent reproduction of live, dynamic erial and reduces copy to copy degradation.

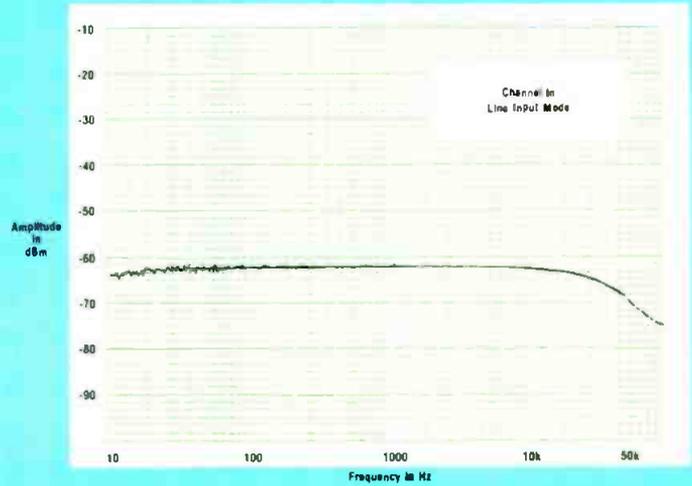

DISTORTION/PURITY OF SIGNAL

Both flutter, or variations in tape speed caused by transport eccentricities, and distortion degrade the purity of recorded signals. Using latest technology op amp design, the JH-110B minimizes second order distortion, while maintaining a wide dynamic range and very low noise floor. This, in combination with the closed loop servo capstan drive system and standard scrape flutter filter provides purity of signal unsurpassed by any other professional recorder. Odd order harmonic distortion and modulation noise are functions of the tape used.

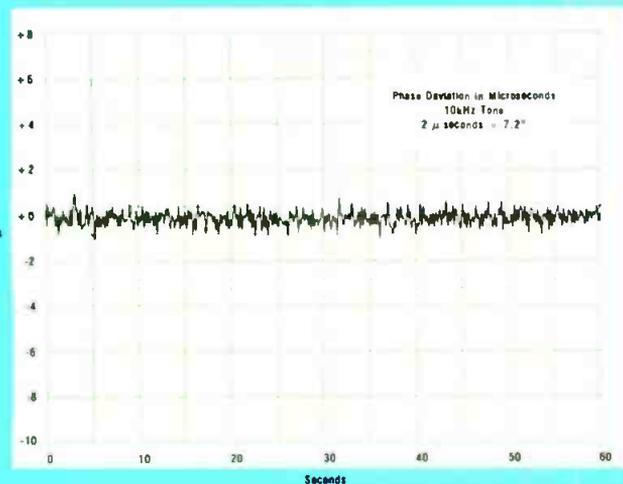

STANDING NOISE/REPRO MODE

is an amplitude versus frequency plot of the various noise components generated internally by the electronic circuitry. Use of st technology and high specification components ensures low e figures on the JH-110B.

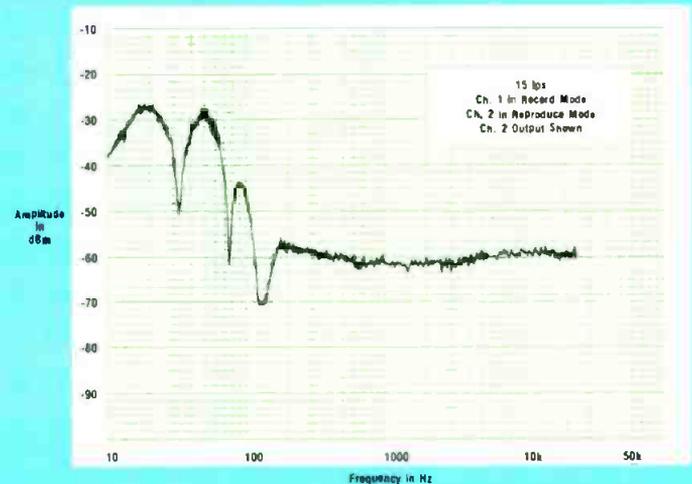

COMMON MODE REJECTION RATIO

Common Mode Rejection is the ability of the electronics circuitry to reject any signal applied equally to both sides of its balanced input, signals such as RF, hum, etc. The JH-110B design ensures a high Common Mode Rejection Ratio, making it ideal for use in any operational atmosphere.

TAPE WALK

using between tracks is very important and is a function of the chine's tape path stability. The JH-110B transport and head emby design yield a most stable tape path for maximum phase igrity.

REPRODUCE CROSSTALK

Crosstalk is the leakage from one track or channel to another, and is primarily a function of the heads. The JH-110B exhibits excellent crosstalk figures across the frequency spectrum, including minimizing of the low frequency nodes encountered in typical head design.

JH-110B Specifications

Frequency Response

Record/Reproduce
 30 ips, AES 40 Hz - 28 kHz +.75/ - 2 dB
 15 ips, NAB 30 Hz - 24 kHz +.75/ - 2 dB

 7.5 ips, NAB <.10%
 3% 3rd harmonic: 30 ips, AES 1040 nWb/m
 fluxivity 15 ips, NAB 1020 nWb/m
 level 7.5 ips, NAB 1000 nWb/m

Distortion is primarily a function of tape formulation and bias setting used. All specifications are typical and may vary.

Bias and Erase Frequency

120 kHz

Depth of Erasure

(Ref. 250 nWb/m)
 At 1 kHz better than 80 dB

Amplifier Electronics

Input impedance 10k ohms balanced
 Output impedance 120 ohms balanced
 Output clipping + 24 dBm

Transport Speeds

Fixed 7.5, 15 and 30 ips
 Variable ± 20% around fixed speeds

Configurations

¼ inch Full track
 ¼ inch 2 track
 ½ inch 2 track
 ½ inch 4 track

Reel sizes

Available with NAB A (3,5 or 7 inch), NAB B (10½ or 14 inch), DIN 1000m (11½ inch)

Tension

5½ oz. ± ¼ at all play speeds, beginning to end of reel

Long term speed stability

Better than .02%

Wow Flutter

30 ips <.022% DIN 45507 weighted
 15 ips <.035% DIN 45507 weighted
 7.5 ips <.055% DIN 45507 weighted

Rewind time

2400 ft. 110 seconds
 4800 ft. 170 seconds

Start time

to 0.1% DIN 45507 flutter, 10½" reels

30 ips 900 msec
 15 ips 500 msec
 7.5 ips 500 msec

System Weight

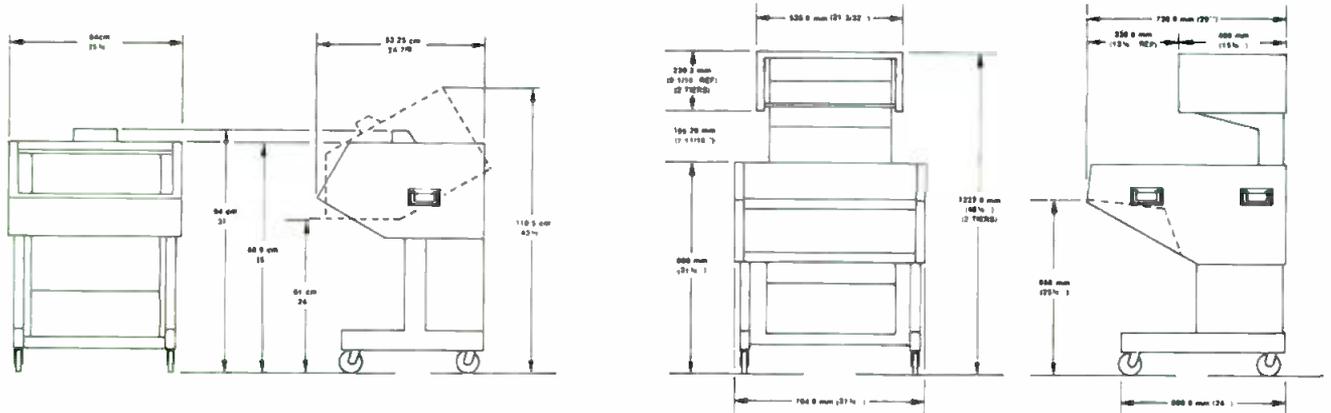

Transport unmounted 34 lbs.
 Electronic drawer, dual channel 19 lbs.
 Variable profile cabinet (VP) 73 lbs.
 High profile cabinet (HP) 115 lbs.
 Power supply 23 lbs.

FLEXIBILITY TO MEET YOUR NEEDS.

The JH-110B is available stock in mono, stereo, 4-track and 8-track formats for use with ¼", ½" and 1" tape on reels from 5" up to 10½" in diameter (14" diameter optional). Ready for mounting in the MCI variable profile (VP) cabinet with electronics under the transport or in the MCI high profile (HP) cabinet with electronics over the transport, it can also be mounted in your 19" rack or custom console.

MCI-815B-5

The first 8-days-a-week logger.

The Dictaphone Veritrac SL.

Whether charting the hits or checking the spots, Dictaphone's new Veritrac SL voice communications recording system is practically indispensable. Here, in a package you can lease for as little as \$99 a month, is recorded testimony to what you've aired. Uninterrupted by tape changes. 24 hours a day.

What's more, the Veritrac SL is modular. It can be configured to meet your station's specific needs. Providing recording time of up to 8 days. And it has something else going for it. Dictaphone reliability and service.

Dictaphone

**Investigate
Comtech Data's
Total Capability
in
Satellite
TVRO Systems.**

The more you know about Comtech Data's Satellite Video Receiving Systems, the more you will like what you see.

In fact, Comtech is fast becoming a leading single-source supplier of satellite TVRO systems to institutions, commercial operators and cable TV operators nationwide. We can provide complete satellite video receiver systems or individual components including antennas, receivers, LNA's etc.. Our equipment has earned the reputation of providing years of high quality, trouble-free service — all at an affordable price.

NEC unveils E-FLEX Digital Video Effects System.

"C" format VTR, Dual Video Transmission System, other technology also revealed.

Visitors to NEC Booth #2528 at the NAB show will see newest addition to the DVE® family... plus other major technology innovations from NEC America, Inc.

★★★★

NEC/NAB NEWS

Final
Edition

E-FLEX system puts Emphasis on Flexibility.

NEC adds to its string of successes in digital special effects with the introduction of the E-FLEX system.

This new generation DVE® brings many NEC optional digital effects into one package with "user friendly" control parameters and some special surprises.

Pocketable digital effects become a reality through the application of Bubble Memory technology. Special demonstrations of the E-FLEX system have been scheduled during the four days of NAB with deliveries of the first units to commence June 1.

The real show in Dallas is at BOOTH #2528 lower level. Well worth looking for. NEC AT NAB.

TT-8000/NTC-10B improve tape handling characteristics.

This new Type "C" 1-inch VTR and TBC combination is designed to handle a wide range of production, studio and post-production applications.

Improved performance, simplified operator controls, and new tape handling characteristics combine with optional hetrodyne capabilities in the NTC-10B to make the TT-8000 the ideal investment in 1-inch recording.

3-chip CCD, Digital VTR prototypes demonstrated.

NEC will demonstrate its world leadership in communications technology design and manufacture through exhibition of the industry's first professional 3-chip CCD color

DV-10 Multiplexed signal horizontally compresses two images into a single picture.

camera and completely digital 1-inch VTR prototypes.

Both systems are at the forefront of the broadcast technology revolution.

DV-10 doubles video capacity.

Unlike systems that restrict you to one signal per channel, the new DV-10 Dual Channel Video Transmission system accommodates two full video signals on each video path.

Broadcasters, users of CATV, security systems or satellite transponders can now double signal capacity without increasing present video channel space.

ENG field crews can feed two live cameras, camera and VTR, or any other combination of two signals into a single channel microwave link or other interconnect with the DV-10. Built-in U-Matic TBC is an additional feature of the system.

The multiplexer is modularized in a compact package for full field flexibility. The demultiplexer and power supply rack-mount in just 12 inches of space.

NEC RF Group shows TVRO system/VHF Transmitter.

Visitors to the outside exhibit area at the Convention Center will have the first opportunity to see a new 4GHz_z TVRO earth station with NEC electronics and an ALCOA aluminum antenna. This system is a complete 4.5 meter satellite antenna and receiver for broadcast downlink applications. An NEC 20 kW VHF TV transmitter will provide a centerpiece for RF Group functions within the Convention Center in booth 2528.

END STV PIRACY

Whether you're going into STV for the first time or you have an existing system which has a high subscription theft rate, check out the new, secure Dynacom system.

We have provided "ticket module" decoders to small international markets and fully addressable systems to larger U.S. markets.

Some key features to our system are:

- Effective, secure, scrambling technique
- Fully addressable or ticket module billing
- Available with up to six push button controls covering all UHF and VHF channels.
- Available in all television formats, NTSC, PAL, SECAM

Call Robert Payne today at (404) 428-3100, and start STV paying off for you.

Ampex Announces the Practical End of Video Jitters.

Video Jitters can drive you up a wall.

It happens when you've repeated an edit over and over. You want it perfect. Now, everything's cued up just right. You hit the edit button, and what do you get? A glitch. A shaky picture. A sour stomach. Video Jitters.

The culprit is stiction—friction build-up so bad that the tape actually jerks across the heads and scanner. Humid conditions can make it worse.

But not if you use Ampex 196 One-Inch Broadcast Video Tape.

Every batch of Ampex 196 has to pass the toughest test in the industry—stiction-free operation at the extreme environments of 90% RH and 90°F, to guarantee that you have consistent stiction-free operation under all conditions.

Ampex 196. Less friction, because who needs it?

Ampex 196 One-Inch Video Tape.

AMPEX

Electro-Voice's Greg Silsby talks about the Sentry 100 studio monitor

When I first described to Electro-Voice engineers what I knew the Sentry 100 had to be, I felt like a "kid in a candy store." I told them that size was critical. Because broadcast environment working space is often limited, the Sentry 100 had to fit in a standard 19" rack, and it had to fit *from the front, not the back*. But the mounting hardware had to be optional so that broadcasters who didn't want it wouldn't have to pay for it.

The Sentry 100 also had to be both efficient and accurate. It had to be able to be driven to sound pressure levels a rock 'n roll D.J. could be happy with by the low output available from a console's internal monitor amplifier.

The Sentry 100 also had to have a tweeter that wouldn't go up in smoke the first time someone accidentally shifted

into fast forward with the tape heads engaged and the monitor amp on. This meant high-frequency power handling capability on the order of five times that of conventional high-frequency drivers.

Plus it had to have a 3-dB-down point of 45 Hz, and response that extended to 18,000 Hz with no more than a 3-dB variation.

Since it's just not practical for the engineer to always be directly on-axis of the tweeter, the Sentry 100 must have a uniform polar response. The engineer has to be able to hear exactly the same sound 30° off-axis as he does directly in front of the system.

I wanted the Sentry 100 equipped with a high-frequency control that offered boost as well as cut, and it had to be mounted on the front of the loudspeaker where it not only could be seen but was accessible with the grille on or off.

I also didn't feel broadcasters should have to pay for form at the expense of function. The Sentry 100 had to be attractive, but another furniture-styled cabinet with a fancy polyester or die-cut foam grille wasn't the answer to the broadcast industry's real needs.

And for a close I told E-V's engineers that a studio had to be able to purchase the Sentry 100 for essentially the same money as the current best-selling monitor system.

I'm happy to report that we've achieved all our objectives.

Market Development Manager,

If you're ready to move up to a specialized mixer, you're ready for Ramsa.

The Sound Reinforcement Specialist: Ramsa WR-8716

When your sound says you're professional but your mixer doesn't. When you're wasting your subtlety and style on "make-do" boards. When you're creating compromises instead of clear-cut distinctions. Then you're ready for Ramsa—the new mixers that are specialized so you won't have to compromise.

The WR-8716 is a fully modular sound reinforcement console with 16 input

modules, 4 group modules, and 2 masters. It features 16 input pre-fader solo buttons, 4 group modules with pre-fader insertion patch points, and lockable post-fader solo buttons. There are 6 illuminated VU meters with peak LED's for easy outdoor

reading and a separate stereo variable frequency EQ for monitor sends. Pan pot controls allow panning to the left or right masters while level controls permit 16 x 6 board operation. The left and right direct channel assign function lets you bypass the group modules for individual sources. Portable operation is a snap with easy access connectors.

And the WR-8716 features plastic conductive faders for greater reliability and smooth, low-noise operation; external power supply for light weight, and switchable 48V DC phantom power for condenser mics.

RAMSA

The Recording Specialist: Ramsa WR-8816

The WR-8816 recording console includes the same modular construction, input modules, power supplies, and faders as the WR-8716 plus many important recording advantages. Like direct outputs for 4, 8, or 16 track recording and peak-reading LED meters that let you monitor any 4 out of 24 signals with clear, quick response.

You'll command a variable frequency EQ section with 3 frequency settings for the high and low frequencies plus continuously variable

midrange. Stereo echo send replaces the separate mono controls you'll find on competitive boards. And you get two independent stereo monitor controls—one for musician's headphones, one for control room monitors—a special feature for any mixer in this class. And there are other important features

like low noise electronically balanced mic inputs with new high-speed IC's, 16 switchable post-fader solo controls and XLR-type mic connectors.

Ramsa offers a full line of specialty mixers including the more compact WR-8210 recording mixer and WR-130 sound reinforcement mixer. So don't hold down your professional sound, call (201) 348-7470, because you're ready for Ramsa.

When you cover the action from the source...

the source for mobile studios should be Gerstenslager.

In a van or trailer, your most modern, best equipped studio could be your Gerstenslager. It all starts when you tell us what you need. The job to be done. Then we'll work with your engineers and principal equipment suppliers. Develop the plans. Detail placement of every piece of equipment, generators, wiring, climate control, consoles. Exactly as you want it. Then, build the unit from the frame up. A studio on wheels that is actually a dependable broadcasting station comparable to conventional studio systems.

How we do it with examples of work we have done for others is included in this brochure. It's yours for the asking. Write or call: (216) 262-2015.

GERSTENSLAGER

The Gerstenslager Company, Wooster, Ohio 44691

"JUST PLUG IT IN AND IT MAKES MONEY"

It's not just how it works. But how long it works.

See us at NAB Booth #3331

That's one General Manager's comment about his station's new EMCEE® translator. He's not far off the mark, either.

EMCEE 1, 100 and 1,000 watt UHF and VHF translators do install easily and require virtually no maintenance. EMCEE can even provide complete translator turnkey packages. Including system design, documentation and construction.

The result is fringe areas turn solid. Brand new markets open. Numbers and billing increase. And your dependence on local cable systems ends for good.

EMCEE translators could create one additional expense for your station, though. Overtime in accounts receivable.

(EMCEE TU-100)
100 watt UHF translator

NOW...from ECHOlub A sophisticated, computer-controlled PRODUCTION SWITCHER

The SE/3 is a new-generation, programmable Switcher/Special Effects Generator that offers extremely sophisticated control, editing and effects capabilities at an astonishingly low price. The secret of both price and performance lies in a powerful micro-computer that replaces most of the digital logic found in other switchers, and in an innovative, transition-centered approach to the system architecture. Providing full computer control of all switching and effects, the SE/3 has 12 inputs, full BC crosstalk and distortion specifications and an RS-449 port for editing. Two-and-a-half separate pattern generators and

three mix/effects amplifiers can simultaneously air five different sources and three wipe patterns without lock-outs. It provides for the programming, storage (of up to 200 shots) and instant re-creation of any desired sequence of patterns, pictures and transitions.

A contact-closure editing interface is available for initiating any pre-programmed event. The slim-profile control panel (only 1 3/4" deep) can be installed remotely from the main chassis for maximum flexibility. Yet the SE/3 costs only \$14,000.

Send for complete details.

WHY ARE LEDDICONS® WORLD LEADERS?

Higher resolution is an important reason, but did you know that EEV 30mm Advanced P8400 series Leddicons feature all these advantages?

- * Integral, variable light bias for minimal picture smearing under low light conditions
- * Unique anti-microphony mesh
- * Direct plug in replacements - no camera modifications

LEDDICONS are BETTER LONGER
Proven everyday throughout the world.
Specify Leddicons for replacements and your new camera. Available NOW.

Please send me my free World Broadcast Systems Map, Brochure and full technical details of Leddicons for my application.

NAB-'82 / DALLAS EXHIBITS ROUNDUP

This special section alphabetically lists the NAB-'82 exhibitors and previews products to be displayed in Dallas. Following each exhibitor listing is a number by which the reader service card may be used to provide exhibitor data. Also, if the exhibitor is advertising in this issue, the location of the ad is indicated for additional details about the company's NAB-'82 exhibit products.

Although this section will be a valuable aid in planning NAB-'82 activities, caution should be exercised. The listing here is comprehensive as of press time, but changes are still occurring in exhibitor sign-up, products being shown and booth assignments. Check the final program at NAB-'82 to make final plans. Look for the **BE** wrap-up of this convention in the June issue.

8000 FROM CETEC

Cetec's new 8000 Series console was designed and built especially for broadcasters. You get all the features you need without paying for things you don't use. This means you get a luxury console — including precision Penney and Giles faders — at a moderate price. Features include five

lighted meters, two peak indicators, five advisory enuciators, and a built-in LCD timer. In addition to the 25-watt RMS monitor amp, there is a separate headphone amp with enough gain to keep

everyone happy. Just pull the monitor control knob and you get instant mono sum for quick A/B comparison. You can even feed all

three stereo busses and the mono

buss at the same time without interaction. Great specs include low distortion and noise, with plenty of head-room. Strong RF fields do not affect the 8000. Broadcasters helped us design the 8000, and the results are just outstanding.

Isn't it time you talked to Cetec?

Component Series—finally, a professional quality console system that changes as your requirements change. 248 gives you custom console performance and features in an expandable system that you design.

Select from a choice of fader, input, assign and output modules—mix and match to suit your application. 248 adapts—whether you're into radio, TV, pre/post production, sound reinforcement, recording, film or anything in between. And only the 248 Component Series offers big console features in this size and price range. Look at the features and flexibility.

The future in compact console design is here, now. Call Quad-Eight for the name of your dealer. And see us at NAB Booth 2705A. Dealer inquiries invited.

- Up to 24 inputs and 2, 4 or 8 mixing busses.
- Resettable detented 3-band parametric EQ w/peaking and "Q" controls.
- Variable Hi-Pass and Lo-Pass filters.
- Studio console performance specifications.
- Full stereo/mono capability.
- Exclusive building block housing system.
- Field expandable, from 8 x 2 to 24 x 8.

A picture worth a thousand hours.

Everything about our new video animation system is designed to save you many hours of costly production time. This means you can now use animation for perhaps the very reason you never used it before . . . time.

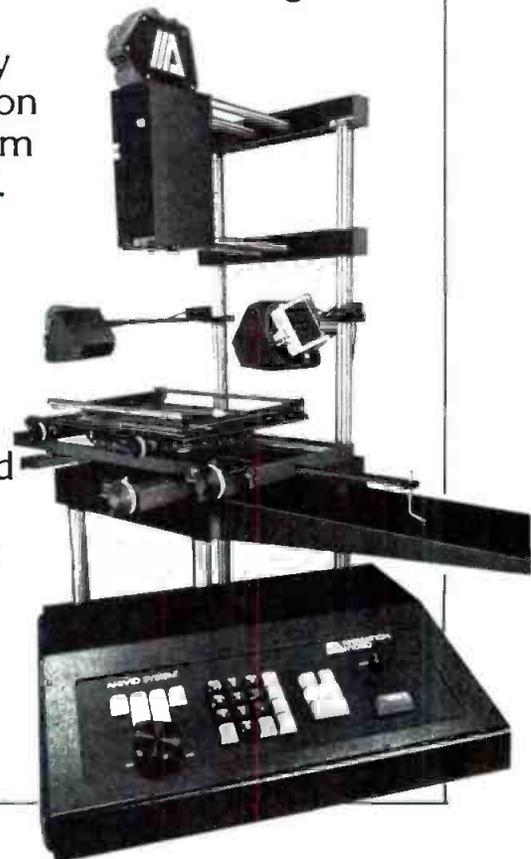

Now, topical animation can be produced quickly to accompany news, sports, weather or similar short deadline projects. Then, when you have more time, use the AniVid System for more entertaining station or advertising production.

Besides having time on your side, you'll also enjoy full color, broadcast quality first generation animation on video tape. Suddenly you have all the advantages of film animation with the time and cost savings of video tape.

Altogether, it's everything you would want in an animation system. The AniVid System consists of a microprocessor based VTR Controller, a three tube color camera, and a full featured animation stand.

The system accepts any kind of artwork from pencil tests, cel artwork, three dimensional subjects, animatics, pixillation, timelapse, titling, still storage and filmograph to computer generated graphics.

CP* provides the best TV signal. Harris provides the best CP system.

Harris' Cyclotran is the first complete TV broadcast system designed specifically for circular polarization. It's the most economical way to enjoy the benefits of CP without major expense for a new tower and transmitter building.

The system includes Harris TV transmitters with power ratings up to 100 kilowatts; Harris CP antennas designed

with low windloading specifications or multiplexed to permit multi-channel operations on the same tower; and Harris' 9100 Facilities Control, offering un-manned operation. Cyclotran improves picture quality, increases fringe area coverage and maintains maximum output without violating FCC standards.

Upgrade your TV broadcast

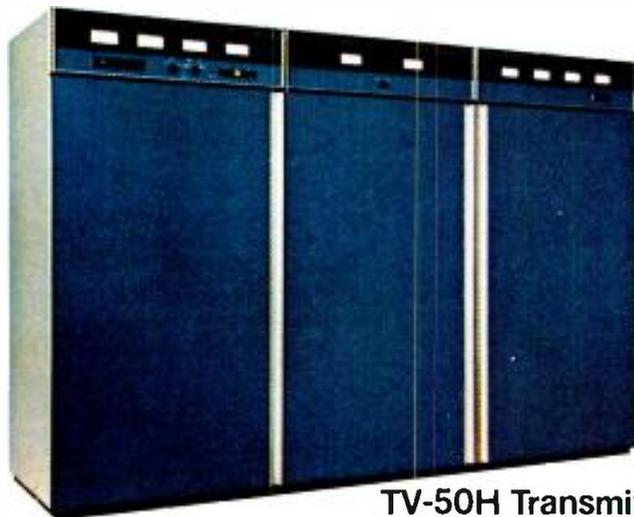

performance. Turn first to Harris—the company that delivers state-of-the-art equipment and high quality service at a competitive price. Contact Harris Corporation, Broadcast Products Division, P.O. Box 4290, Quincy, Illinois 62301.

BATTERY/AC PORTABLE MIXER

MODEL 200B

Latest in the 200 Series, the Model 200B is a professional quality eight input stereo mixer built in a portable case and designed to operate either from the included 12 volt Gel-Cell battery or from an optional 110 volt AC power supply and is suitable for remote recording or any application where highest performance is required in a rugged portable mixer. Battery is external but can optionally be had in a special lid assembly if desired for greater portability; standard battery will operate mixer 8 to 10 hours on a full charge (larger batteries and/or spare batteries available), and charger is included. Other options include the Intercom Module, limiters, and output transformers. Mixer is fully modular, and any module can plug into any slot. Mixer comes with lid and measures 13 x 17.5 x 7" with lid, and weighs about 30 pounds.

INPUT MODULES include input pads, input transformer, phase reverse, mike power (12 v "T" or 48 v phantom), gain adjust pot, three equalizers with selectable frequency on the mid equalizer, low cutoff, two cue sends with pre/post slider switches, panpot with in/out, solo, +15 VU danger indicator, on/off switch, and optional Penny & Giles or standard Duncan conductive plastic sliders.

MASTER MODULE provides a stereo slider master and two Cue Masters, two standard VU meters which can also be switched to read cues or monitor or battery level, stereo monitor phones level and phones jack, and output, power, and echo return connectors. The monitor phones switch automatically to an input when a solo button on a module is depressed.

INTERCOM MODULE (optional) provides for monitoring in a headset (such as the DT109), intercom to second operator (who can also monitor), test tones, slating takes, listening to playback, and a one watt 8 ohm stereo power output. The 9th slot can house either the Intercom Module or a 9th input module.

PERFORMANCE is near state of the art, and equals or exceeds comparable professional equipment. Interface equipment carries a one year limited warranty.

INTERFACE ELECTRONICS has been making high performance low cost professional mixers for all purposes since 1971. For more information or a quote, contact Louis or Rich at (713) 660-0100.

Dealer inquiries invited.

Unlock HAWKEYE's Performance with this Plumbicon* tube, the new 1/2-inch 80XQ.

It gave RCA what they needed to create the HAWKEYE.

RCA's HAWKEYE, introduced at NAB in 1981, is a new breed of lightweight, modular recording camera systems that go just about anywhere...producing broadcast-quality video tapes.

Key to HAWKEYE's performance is the revolutionary 1/2-inch Plumbicon 80XQ (with its specially designed deflection coil) the world's first broadcast quality electrostatic focus 8mm pickup tube.

A radical approach to pickup tube technology, the 80XQ offers performance equivalent to that of the larger Plumbicon tubes that have led the broadcast industry since 1964.

But be careful—HAWKEYE is also offered in an optional Saticon version. HAWKEYE cameras cannot be modified to accept Plumbicon tubes after Saticon tubes have been installed. Compare these RCA published comparisons of the HAWKEYE with Plumbicon and Saticon tubes:

But that's not all. The electrostatic focus of the 80XQ insures excellent resolution in the corners—virtually the same as in the picture center. And the published registration performance is met without the need for computer matching into triplets of coils and tubes. So if you ever have to replace a tube you can be confident of holding registration. With a Saticon version you may be faced with changing tube and coil assemblies, and fitting them to the optical block.

If you are considering buying HAWKEYE, then you have weight, power, sensitivity and resolution on your mind. It makes sense to specify the 80XQ Plumbicon—the tube designed with these things in mind.

To learn more, contact:
Amperex Electronic Corporation,

March 1982 *Broadcast Engineering* 91

IF IT WERE YOUR JOB TO GET THIS ON TAPE, WHAT TAPE WOULD YOU GET IT ON?

In an era of new technology and changing social values, the Royal Wedding is a throwback to another century. And for a few unhurried hours, the entire world will take the time to enjoy this real life fairy tale.

Satellites will carry the signals around the globe. But for many, including those in America, the Royal Wedding will be seen on tape. The scheduling is tight. The ceremony will go on the air while the procession is still being recorded. There is no time for second chances.

That's why Scotch® Video Tape was there when the Royal Wedding was first recorded. And again when the Moon Walk was first recorded. And again when the Space Shuttle Landing was first recorded.

U.S.-Russia Hockey Game. The Return of the Hostages. The Eruption of Mount St. Helens. Whenever there was one chance to get it, chances are they got it on Scotch Video Tape.

So whether your production is important to the world or just important to you, why take chances? Get it on the one tape you know will get it right.

Magnetic A/V Products Division/3M.

"Scotch" is a registered trademark of 3M.

HISTORY IS RECORDED ON SCOTCH VIDEO TAPE.

3M hears you ...

The advertisement displays a collection of audio equipment from RUSSCO. On the left, a turntable is labeled 'turntables'. Above it, a preamp is labeled 'preamps'. In the center, a tone arm is labeled 'tone arms'. To the right, a mixer is labeled 'mixers'. Below the mixer, an equalizer and coupler is labeled 'equalizer - couplers'. In the foreground, a stereo monitor amp is labeled 'amps'. The equipment is arranged on a dark surface against a light background.

Money in the bank!

When you increase efficiency, cut down time and improve the quality of your broadcast, you put money in the bank. RUSSCO does it and shines with the quick-starting MARK V Vari-Speed turntables, our audio mixers, phono preamps and power and distribution amplifiers. What's NEW is the RUSSCO all metal Tone Arm...Solid, Smooth & Reliable! The NEW 4 channel TEL-A-MOTE Remote Mixer is the sportscaster's small dream machine that ties up perfectly with the NEW T112 Studio Equalizer / Coupler that greatly improves the sound of remotes & talk shows. The NEW MA220 Stereo Monitor Amp gives you separate level & tone controls for each channel. Call Barbara Gaudin for catalog sheets with great specs and Low prices.

SONY

© 1982 Sony Corp. of America, 9 W. 57th St., New York, NY 10019. Sony is a registered trademark of Sony Corp.

THE SYSTEM EVERY SOUND ENGINEER WOULD BUY IF HE CONTROLLED THE PURSE STRINGS.

If your engineers could be heard, there's no doubt which wireless microphone system they'd choose for sound, quality and design. A Sony. How do we know? We've asked them.

But we've also heard that because they cost more than ordinary systems, some people have been reluctant to buy them. Well, take a moment to see why it's penny-wise and pound-foolish to settle for anything less.

First, the modular combination of Sony receivers and diversity units makes it the most flexible system you can buy. The portable rack can be used with either three receivers as shown above or two receivers and a diversity unit. So it satisfies virtually any production requirement. Second, it's the *only* modular system. Not a hodgepodge like competitive systems. Which means it can be set up and rearranged in a mere fraction of the time it takes to set up other systems. And finally, because it's a Sony, you're assured of something else: superior sound quality and worry-free operation.

So if you're in the market for a wireless microphone system, remember, if it costs less than a Sony, you're getting exactly what you bargained for. For the facts about the state of the art in wireless microphone systems, including 19" rack mounting for studio installation, consult our dealer listing.

HERE IS YOUR **NEW** UHF 5 KW STANDBY

The **ACRODYNE TT-3480U**
is **THE ONLY** single tube, 5 kW UHF TV transmitter that is:

- **FCC type accepted**
- **in continuous production for over two years**
- **field proven in standby service throughout the U.S.**

This transmitter combines the latest in solid-state and tetrode technology. Low level diplexing, pioneered by Acrodyne, and IF modulation insures many outstanding features for UHF broadcasters. These features include: 10 second instant-on from a cold start; all solid-state, broadband, hybrid-combined drivers and integrated forced air cooling.

The TT-3480U is also ideal as a primary transmitter

in full service broadcast applications licensed to operate at minimum power. A pair of TT-3480U's will provide 10 kW in a redundant configuration that eliminates your need for a standby transmitter. Acrodyne manufactures a complete line of TV transmitters, utilizing tetrodes, up to 10 kW UHF and 25 kW VHF. Acrodyne means innovation in TV transmitter technology.

HIGH I/Q

ASACA/ Shibasoku's CMM Series monitors decode color on the I/Q axis.

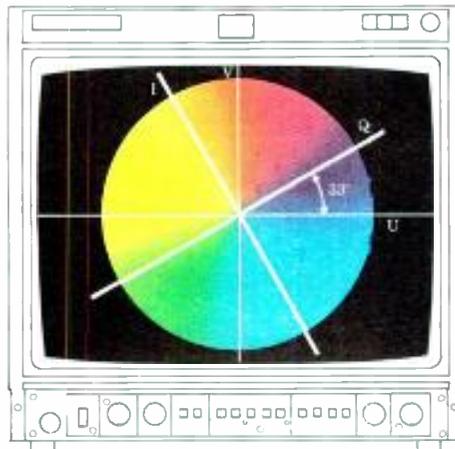

Asaca/Shibasoku's new high resolution monitors have the I-Q to deliver color performance other monitors simply cannot produce. Using R-Y, B-Y decoding no longer meets the demands of today's professional standards.

I-Q axes in color triangle.

The Asaca/Shibasoku monitor like the human eye resolves certain colors best; reds, oranges, yellows, and flesh tones. The I-Q decoding system enables the monitor to display these colors at a higher resolution using wide band demodulation of 1.3 MHz rather than 0.5 MHz as in R-Y, B-Y systems.

We cared enough to give you a monitor with the I-Q to reproduce the best possible pictures. We know you're smart enough to buy it.

FEATURES

- 20" and 14" models available—high resolution delta CRTs.
- I-Q wide band demodulation system.
- Complete board interchangeability between models.
- Switchable high performance comb filter and aperture correction.
- Multi-standard capabilities (NTSC, PAL, SECAM) on all models. Switchable from the front panel (20" model). No adjustments necessary because of digital sync circuitry.
- Dynamic focus insures perfect focus on all areas of CRT. Adjustable from the front panel.
- Special feedback circuits guard against color changes due to variations in temperature.
- Active convergence—40 controls allow precise adjustment on all areas of CRT.
- Pulse cross with expanded vertical blanking interval.
- OPTIONS... Built-in color bar or cross hatch patterns. Built-in safe title marker generator. Multi-standards. RGB inputs.
- TWO YEAR WARRANTY ON ALL PARTS AND LABOR INCLUDING THE CRT.

DEEJAYS LOVE IT!

DeeJays love Auditronics' 200 Series on-air console because it has a slot to plug in their own custom-tailored voice EQ module. They love the 200's variable-threshold compressor/voice-actuated noise gate that allows hands-off processing of live announce or remote signals. DeeJays love the 200's self-contained logic system that starts carts, reel recorders and turntables and permits simple one-button two-way communication between control room and Studios A and B. To learn what else DeeJays love about Auditronics' 200 Series on-air consoles, circle reader service number or call

“I want the world.
Consistent .05% corner registration
and full auto-setup of up to 96
cameras on computer command.”

HITACHI HEARD YOU.

**AUTO
SETUP**

Don't want much, do you?

Dynamic registration not just at dead center but at all four corners.
Plus 2-minute auto-setup of all those cameras.

You're asking for some smart camera system, networks
of the world and top-drawer video production companies.

Well, Hitachi heard you, and has created an outright *genius*—
the Hitachi SK-110 Camera System.

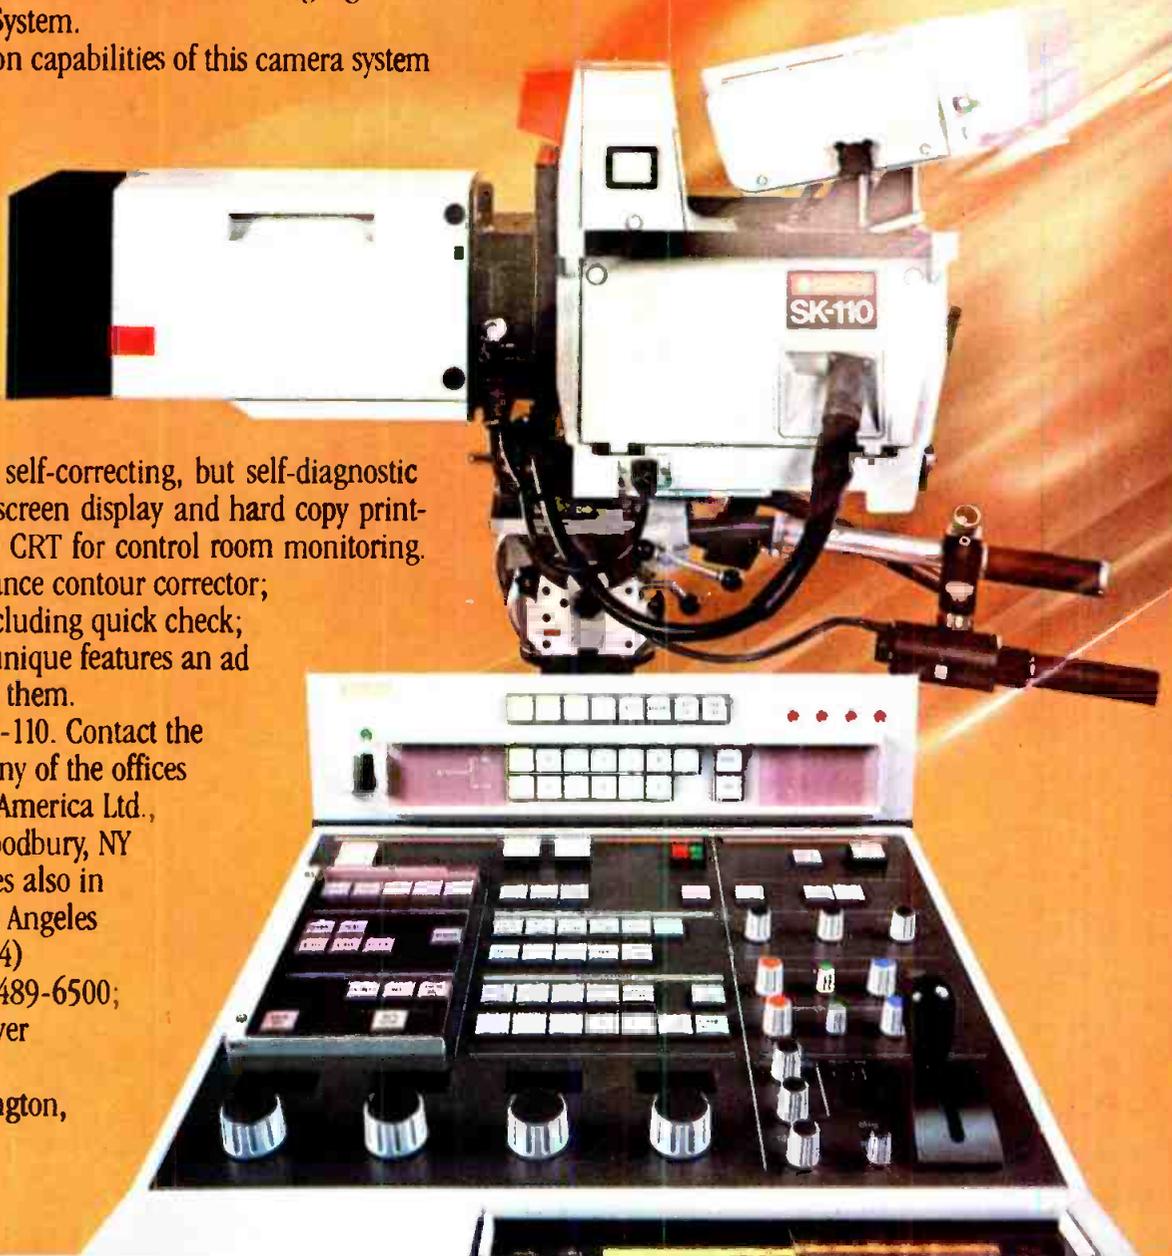

The computer registration capabilities of this camera system
produce pictures of a
clarity and resolution
previously unheard of.

And you get auto-setup
at the push of just one but-
ton, and zero reference,
too, where the computer
sets the green channel and
compares blue and red to
it with absolute precision.

The SK-110 is not only self-correcting, but self-diagnostic
as well. It gives both video screen display and hard copy print-
out; can be hooked into the CRT for control room monitoring.

There's a high-performance contour corrector;
5 automatic setup modes including quick check;
5 data files; so many other unique features an ad
can't begin to tell you about them.

The ultimate Hitachi SK-110. Contact the
broadcast video division at any of the offices
listed below. Hitachi Denshi America Ltd.,

INNER VIEW: A closer look at Conrac Monitors

Active Convergence: Registration made simple.

Conrac's Active Convergence System gives you complete control over color registration adjustments and greatly streamlines convergence checks.

It uses 36 independent controls to individually adjust nine separate areas on the CRT screen—including corners!

You spend less time on convergence checks—and the adjustments you make will be much more accurate.

Conrac's system uses 24 operational amplifiers to independently control red, green, and blue in each screen area. Vertical and horizontal waveforms are referenced for shaping the signals that excite the convergence yoke assembly. Dynamic blue lateral convergence is achieved with operational amplifiers.

Beam Current Feedback: The Ultimate in Black Level Stability.

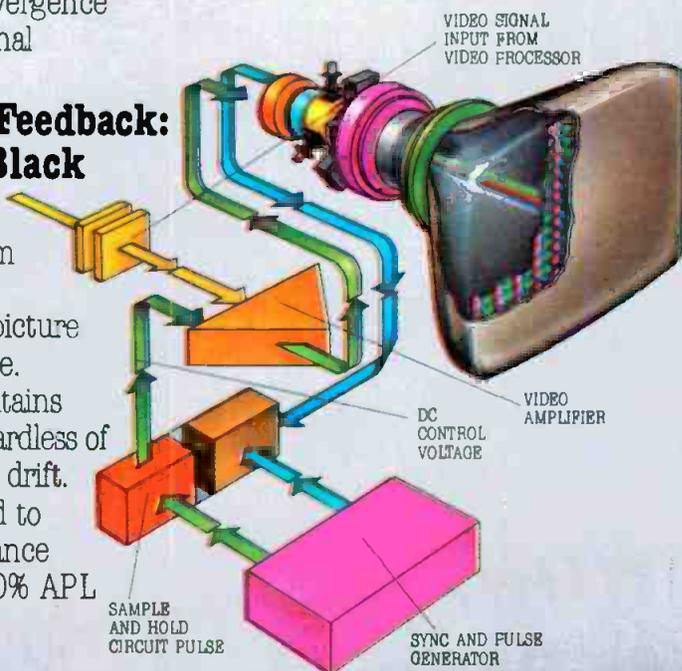

Conrac's unique Beam Current Feedback system maintains a more stable picture for a longer period of time.

It automatically maintains black level stability—regardless of CRT aging or component drift. In fact, black level is held to within 1% of peak luminance level between 10% and 90% APL (Average Picture Level).

Conrac's Active Convergence system lets you adjust color registration on nine separate areas of the CRT.

Conrac's exclusive Beam Current Feedback system automatically maintains black level stability.

Conrac's unique system uses a keyed back porch video amplifier and beam current sensing that occurs during the vertical interval.

The video signal is ac coupled to the video amplifier, thus eliminating the dc component and retaining the level between black and white. It is then amplified and applied to G1 of the CRT. The feedback loop is completed when a sample cathode current (gated by the brightness pulse) is applied to a sample and hold circuit.

If the cathode current changes for any reason, the video amplifier's dc level is automatically adjusted. Result: reference black level will remain constant.

Conrac Technology: 30 years of leadership.

Conrac's track record of technical innovation stretches back nearly three decades.

And what we've learned since then goes into every monitor we make today. That's important to you. Because the more technology we pack into each monitor, the more performance you'll receive from it.

Active Convergence and Beam Current Feedback are just two ways Conrac technology can save you time and money.

For the complete inner view of Conrac technology, call or write us today: Conrac Division, Conrac Corporation, 600 North Rimsdale Ave., Covina, CA 91722, Telephone: (213) 966-3511, Telex: 67-0437

Quality you can take for granted.

PERFORMANCE

Why the Ampex VPR-2B is the world's most popular video tape recorder.

With over 4000 machines in use, the Ampex VPR-2 Series is without question the most widely acclaimed line of VTRs in broadcasting history. Outstanding performance and simple operating features, backed by a global network of parts, service and training, are just a few of the reasons why.

Ampex leadership began with technical innovation. You'll find the highest standards of design, production and quality control in every VPR-2B.

And today, after more than 25 years of dedicated service to the television industry, Ampex continues to lead the way in providing high quality, reliable tools to the video marketplace.

As Ampex leadership started with outstanding products, it continues with the strongest worldwide service

support. With Field Engineers on call and an extensive computerized parts network, you get immediate answers to all your video questions. And each year, more than 2000 students throughout the world go through comprehensive product training at Ampex centers. There are more people skilled on Ampex VTRs than on any other video recorder in the world.

But the VPR-2B is more than just the dominant force in the video

business. It's a part of the Ampex tradition. A tradition born of technical innovation, product reliability and proven product performance. And it's a name you can count on. Call your Ampex representative, or write Ampex Corporation, Audio-Video Systems Division, 401 Broadway, Redwood City, CA 94063 (415) 367-2011. Sales, spares and service worldwide.

AST® Automatic Scan Tracking
Delivers disturbance-free transitions between play, slow motion and still frame modes.

Frame-Accurate Editing
Results from the VPR-2B's precise tape timer and search systems, AST® and simple edit controls.

DELTA does it accurately

TCA-10/20-EXR Dual Scale Remote Output
On/Off and Hi/Lo Switching.

RF Ammeter Systems

- MEETS FCC REQUIREMENTS OF 2% ACCURACY •
- MINIMUM MODULATION EFFECT •
- ALL COMPONENTS CAN BE GROUNDED FOR SAFETY •
- ON/OFF SWITCH FOR GREATER LIGHTNING PROTECTION •
- PATENTED TEMPERATURE COMPENSATED RECTIFIER CIRCUIT •
- WIDE TEMPERATURE RANGE -40°F to $+150^{\circ}\text{F}$ •

The Delta series of TCA RF Ammeter systems utilize a toroidal current transformer (TCT) to obtain a sample voltage proportional to the RF current flowing in a conductor. This sample is then connected to a special temperature compensated rectifier circuit via a 50 ohm coaxial cable. The rectifier converts the RF sample voltage to a DC current to drive an indicating instrument.

Every TCA system is calibrated at our laboratory at an RF frequency in the broadcast band—corelated to the National Bureau of Standards. Correction curves are supplied when more than 2% accuracy is required.

We have a wide range of models, scales and optional items which are illustrated and explained in our RF Ammeter Products catalog. Just call or write us for more information.

Midwest and **JVC** put you where the action is!

JVC Provides Rugged Quality and Dependability. Midwest Gives Them To You Fast... And For A Great Price!

JVC cameras, recorders and editors are famous for their reliability and their ability to take the bumps and jolts of mobile unit installations. That's why they're the choice of so many cable companies.

If you need a mobile unit that can take the punishment that on location productions dish out, you need to talk to Midwest about their complete line of JVC equipped units. Midwest maintains an in-depth stock of the full JVC line.

Let Midwest put you where the action is, with rugged JVC production equipment in an M 1 or an M 20 mobile unit.

For information on the complete line at Midwest, call toll-free today.

RCA FM power tubes. 15 to 55kW outputs at high efficiency.

RCA is now in the FM power tube business with a series of four tubes and cavities designed specifically for high-gain, high-efficiency broadcast service:

Tube Type	Output	Gain	Efficiency	Cavity Model
8986	15kW	20db	80%	Y1393D-V1
8985	25kW	20db	80%	Y1393D-V2
9011	30kW	21db	80%	Y1393D-V3
8984	55kW	16db	78%	Y1369

There's a very persuasive reason for using a tube with high efficiency: lower operating costs. Over the lifetime of a transmitter this can mean considerable savings.

And RCA tubes are designed for long life.

Our cavities complement our tubes. They provide high-gain, grid-driven circuits which take full advantage of the tubes' high Gm electron optics, high efficiency, ease of neutralization and ease of cooling.

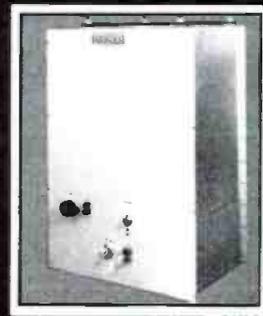

Along with our power tubes, and the cavities that bring out their best performance, we also supply service and application engineering.

Find out more today. Contact RCA Power Tube Marketing, New Holland Avenue, Lancaster, PA 17604.

Call (717) 397-7661. Or get in touch with RCA, Brussels, Belgium.

Sao Paulo, Brazil. Sunbury-on-Thames, Middlesex, England. Paris, France. Munich, West Germany.

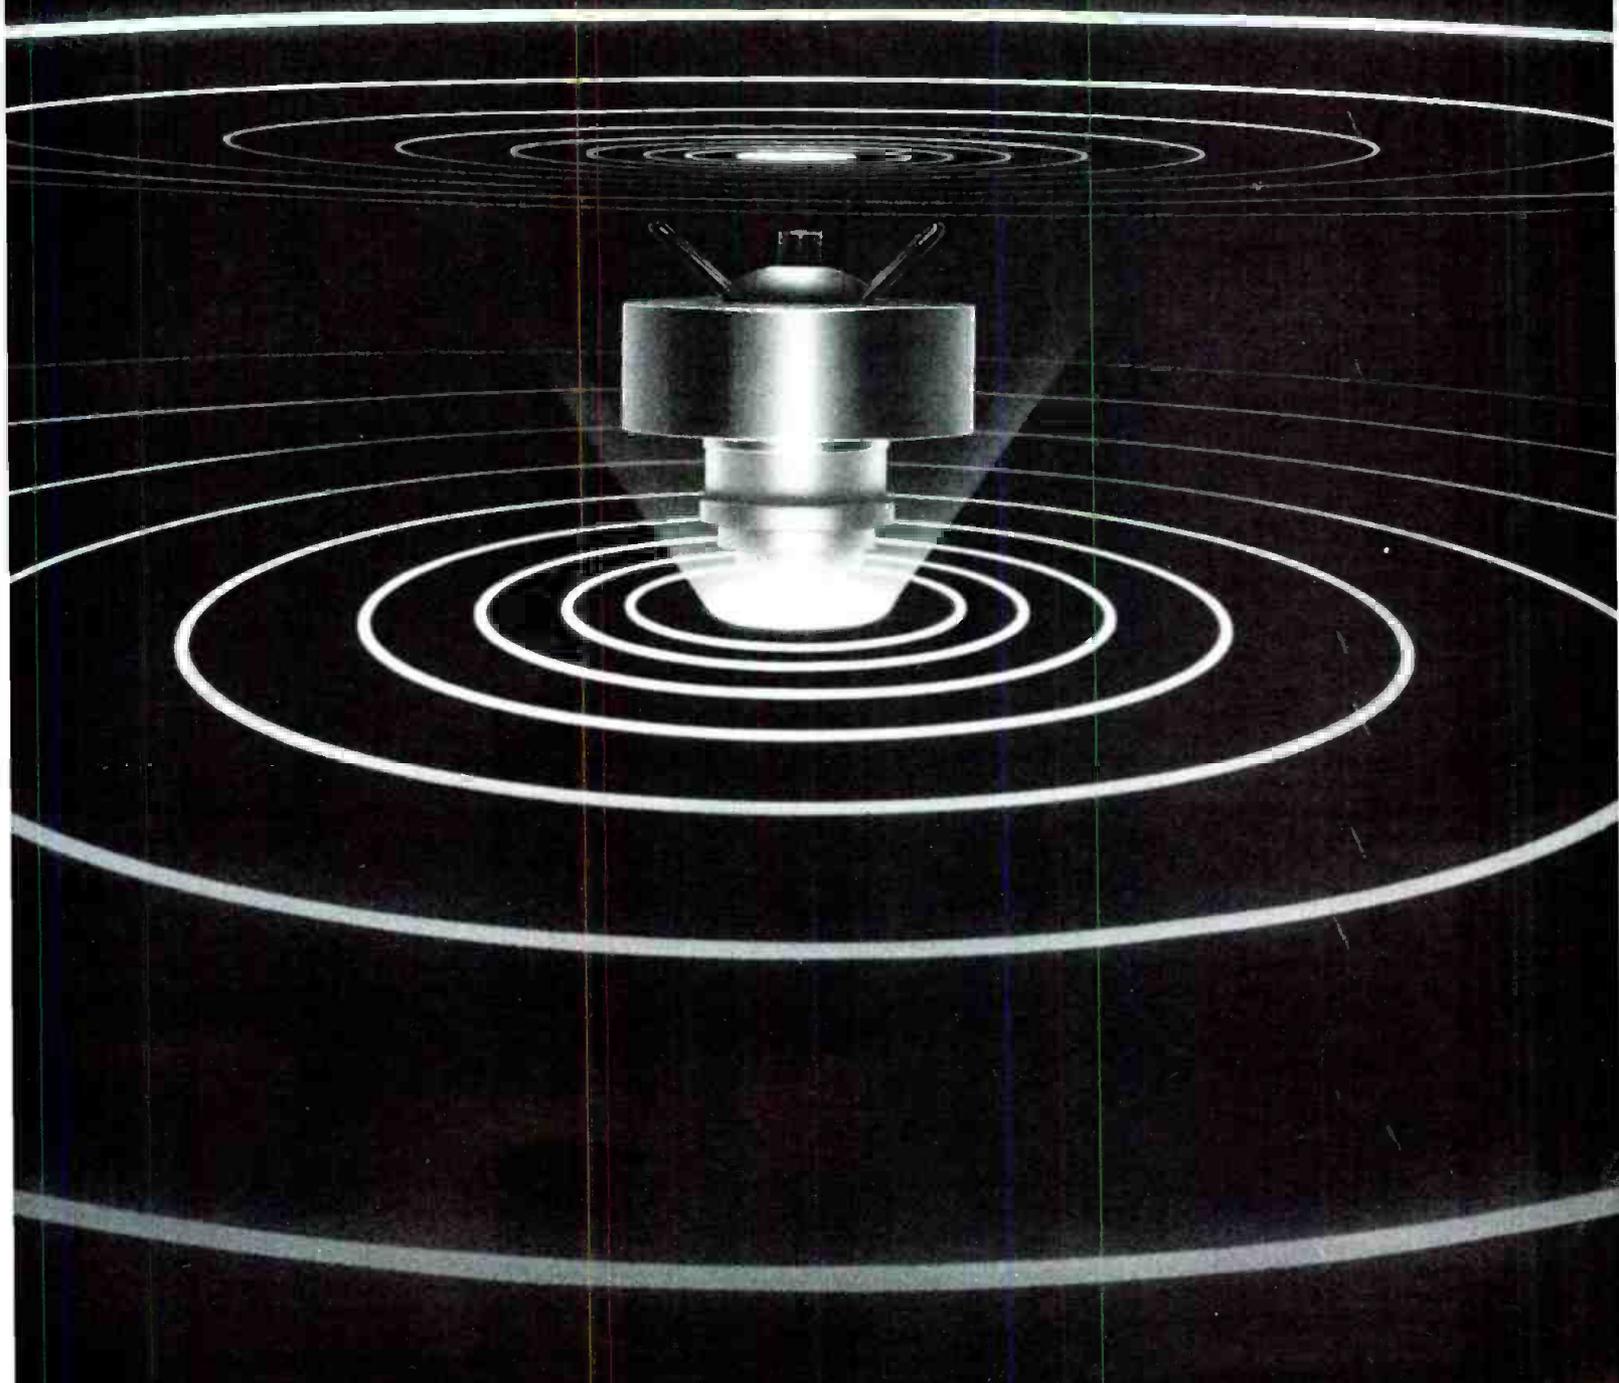

Mexico 16 D.F., Mexico. Hong Kong.

We supply both the power tube and the cavity. In our pictured Y1393 cavity, the 9011 tube delivers a measured gain of 20 db with an efficiency of 80%.

UTAH SCIENTIFIC ACQUIRED BY Dynatech

To Our Broadcast & Teleproduction Friends:

You've probably already heard the news of Utah Scientific being acquired by Dynatech Corporation, and are perhaps wondering why we sold and what this means to the future of the company.

First, our reasons for selling had to do with tax considerations and our desire to be owned by a highly successful, high-technology company having publicly-traded stock. We found such a company in Dynatech, whose record of growth in sales and earnings is complementary to our own.

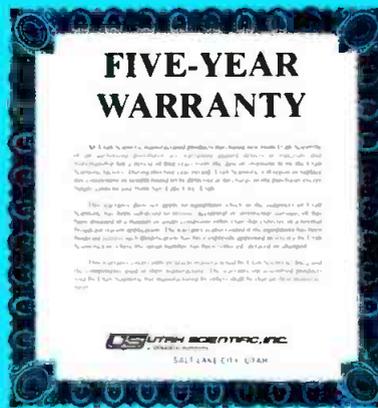

As to changes, there are none planned. We will continue to operate in Salt Lake City with no changes in personnel or operations and our name will remain Utah Scientific. While we do expect to expand into other broadcast products either through internal development or acquisitions, we will continue to devote substantially all of our time and efforts to our highly-successful routing switcher business.

Sincerely,

Lyle O. Keys, President

New From Utah Scientific FIVE-YEAR WARRANTY ON PARTS & LABOR

on all Utah Scientific-
manufactured
products

From the day we opened our doors, the products of Utah Scientific have been backed by a two-year warranty covering both parts and labor.

Nearly five years have passed and we have yet to charge a customer for service.

In light of the excellent reliability record our products have established, we are now extending our warranty to five full years, parts and labor*.

This new warranty policy covers not only new systems, but all systems previously shipped or on order.

We are most appreciative of those faithful customers who have helped push us to the top of our field, and are providing this warranty extension as a measure of our gratitude to them and our faith in the ongoing reliability of our products.

*Subject to limitations as to misuse, willful damage, etc.

TRY THAT ON YOUR GRASCOMDYNAMFERNSATEK SWITCHER.

Here's another fine message about SHOK-STOP™

Thermodyne cases team-up with any equipment you have.

You name it, AMPEX, JVC, HITACHI, SONY, PANASONIC, SHARP, IKEGAMI, TOSHIBA, VIDEOTEK, MICROTIME or TEKTRONICS. If you have state-of-the-art equipment, we have the only cases of comparable quality.

In addition to our standard line including 98 "blank foam" cases, Thermodyne has hundreds of custom foam cutting patterns for video recorders/players, cameras, monitors, time base correctors, remote control units and more.

We're ready to team-up your equipment with the ultimate case at prices you can afford, and with a delivery date that's easy to live with.

For our latest product and price information send us the quick response coupon or call Thermodyne International Ltd. at (213) 603-1976.

INTRODUCING

THE HAWKEYE'S EYE.

RCA's revolutionary new handheld HAWKEYE ENG camera was built around a revolutionary new RCA tube—the ½ inch SATICON*. Its superior performance is the direct result of enlightened design techniques and the inherent characteristics of the Selenium-Arsenic-Tellurium photoconductor.

The SATICON tube offers outstanding resolution, and handles high-contrast scenes without unpleasant distortion or discoloration. Color pictures come through spot-free, without flare. For these and many other reasons, SATICON tubes are now used in over 50% of the new color cameras sold in North America and Japan.

On the basis of performance, reliability and general user acceptance, they

will soon predominate in color television cameras worldwide.

SATICON tubes are now available as new or replacement equipment for most ENG, studio and remote cameras. For more information, please write RCA Camera Tube Marketing, New Holland Avenue, Lancaster, PA 17604. Telephone: (717) 397-7661. Or RCA Brussels, Belgium. Sao Paulo, Brazil. Sunbury - on - Thames, Middlesex, England. Paris, France. Munich, W. Germany. Hong Kong. Mexico 16 D.F., Mexico.

Does the Revox PR99 remind you of something?

It should.

It's inexpensive to buy, easy to maintain, practical, reliable, made in West Germany, and built to keep on going through years of demanding use.

No gadgets, no frills. Merely a solid machine equipped with everything a professional needs to get the job done efficiently—and with high quality results.

What's more, the PR99 now comes in three versions: all-steel console, transport case

with snap-off cover, and rack mount. All three may be ordered with the new monitor panel: speaker, amp, volume control, and track selector.

Other features include:

- Die-cast chassis
- Precision machined headblock
- Balanced line in and out switchable for calibrated or uncalibrated mode
- Servo-controlled capstan motor
- Edit mode switch
- Tape dump
- Self-sync
- Choice of 3.75/7.5 or 7.5/15 ips
- Remote control and vari-speed available.

In short, the PR99 is so versatile, so dependable, and so downright sensible that you could almost call it a "volksorder."

Except, well...the shape isn't quite right.

Harris' New SX Series of All-Solid-State AM Transmitters

Now a high technology blend of broadcast and computer science has created the SX-1 (1000 watts), SX-2.5 (2500 watts), and SX-5 (5000 watts)—Harris' new family of all-solid-state high performance, high reliability AM transmitters!

Harris' solid-state experience brings you energy-saving efficiency. A typical SX-5 equipped station can expect an annual power bill reduction of 15 to 36%.

Exciting new technology is employed throughout the line, including Polyphase Pulse Duration Modulation* for exceptional audio performance. Plus microprocessor control and status monitoring, sophisticated diagnostic techniques, and a unique cooling system that protects components from dirt build-up. All SX transmitters are designed for AM Stereo operation.

Find out what this new generation of Harris transmitters can do for you. Contact **Harris Corporation, Broadcast Division, P.O. Box 4290, Quincy, Illinois 62305-4290. 217-222-8200.**

*Polyphase PDM — Patented.

***The Performance
a Broadcaster Expects,
The Features and
Reliability He Demands.***

THE NEW OTARI MTR-10 SERIES PRODUCTION RECORDERS

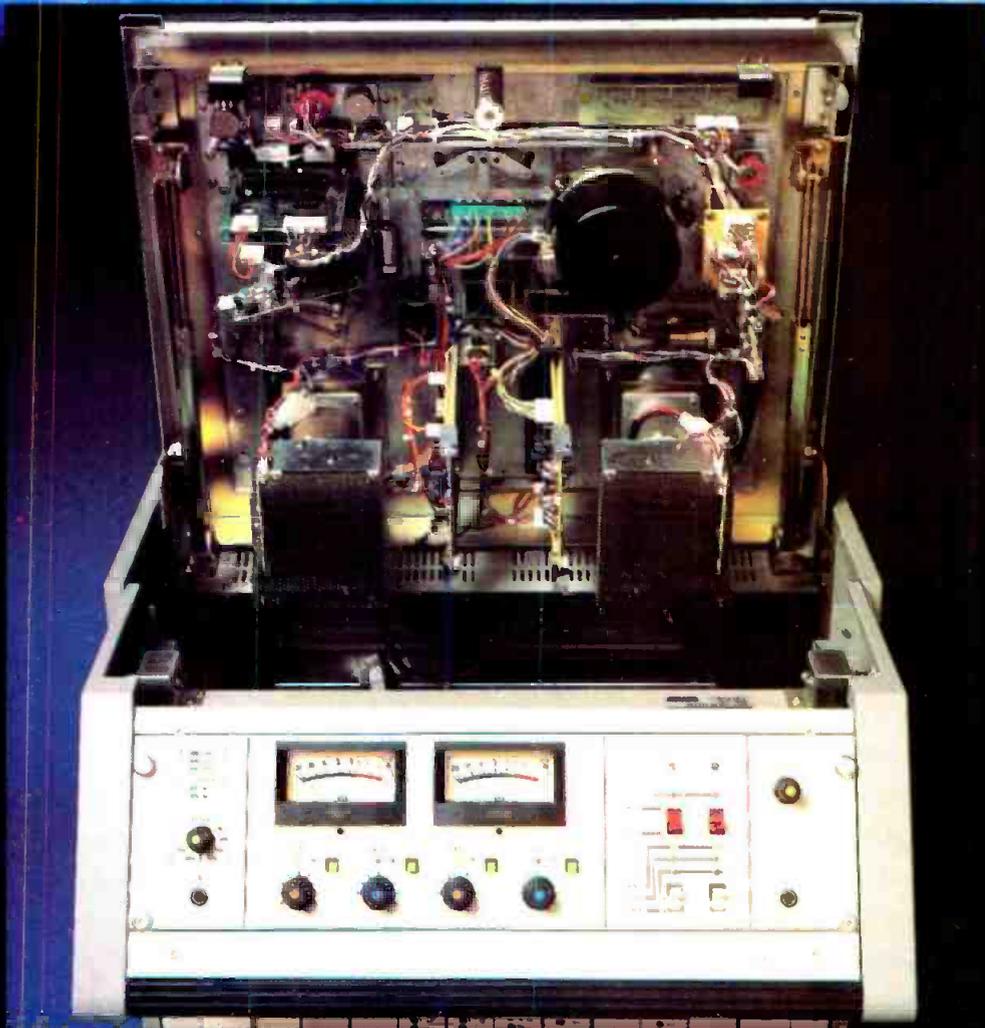

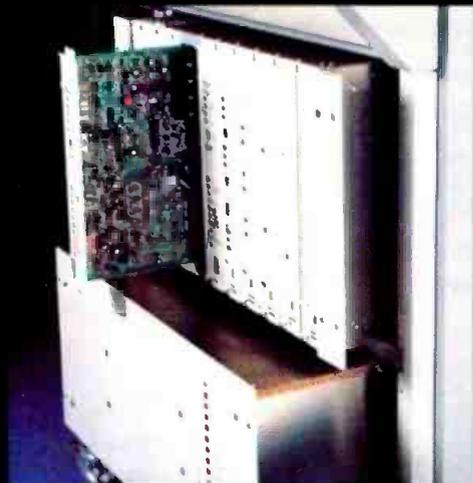

We engineered them to be the ultimate in broadcast production. They embody the innovative technology and the highest reliability that has made us The New Workhorse in audio production.

THE ULTIMATE IN PRODUCTION EFFICIENCY

- Three speeds: $3\frac{3}{4}$, $7\frac{1}{2}$, 15 or $7\frac{1}{2}$, 15, 30 ips.
- Full, two and four track formats.
- Flexibility in cabinet choice: desk type, overbridge or rack mount for custom installation.
- Full servo, D.C. PLL transport governed by an on-board microprocessor—an industry first.
- $\pm 20\%$ vari-speed with ips or percentage display.
- Built-in, no overshoot return-to-zero with optional 10 memory/one stroke and keyboard access autolocator.
- Internal multi-frequency square/sine wave generator.
- Preset master bias switching.
- Electronically balanced I/O with direct-coupled, high current outputs.
- Automatic reel size sensing with single hand, bi-directional tape rocking.
- Cue control with lifter defeat and controlled wind.
- Dump edit and shuttle edit control.
- Integral, precision splicing block.
- Cue speaker and headphone monitoring.
- Direct access playback head.
- Modular, single card electronics with high slew-rate integrated circuits.

THE ULTIMATE IN ANALOG AUDIO

- Dynamic Range: $> 75\text{dB}$ measured from noise floor to 3% THD (30 ips, #226 tape).
- Frequency Response: 0 VU (+4) 35Hz-29kHz, +1.0, -3.0dB @ 30 ips.

- Wow & Flutter: Less than 0.04%, DIN 45507
- Distortion: Less than 0.1% @ 1kHz, 250nWb/m.
- Maximum Output: +28 dBm.
- Adjustable record phase compensation.

These features and more will allow you to do your job faster while delivering every last dB of performance. It's the productive and efficient solution to the demanding new realities of the contemporary broadcast facility.

ENGINEERED TO BE EASILY SERVICED

Access to all components makes maintenance straightforward. The audio, transport, master CPU and power supply electronics are all of modular, card frame design; the entire transport assembly is top-hinged to allow wide-open access while the deck is in operation.

ENGINEERED TO THE HIGHEST STANDARD OF RELIABILITY

Reliability is paramount in Otari's approach to doing business. We've earned an enviable reputation for quality and value that has made us the

world leader in broadcast automation (Model ARS-1000) and compact production recorders (the 5050 Series). With the new MTR-10, we have successfully bridged the gap between the new technology and reliability.

Evaluate the MTR-10 recorder for yourself by contacting your authorized MTR-10 Series professional audio dealer. It will become evident that Otari is several steps ahead of the competition—again. Audition the performance, features and engineered reliability that will meet the needs of all broadcasters for years to come.

If you're really thinking of buying broadcast precision, there's only one logical decision.

On the other hand, our routing switchers handle channel growth very nicely.

A patch panel will work just fine in your system. If you plan to limit yourself to only ten channels.

But in the fast moving world of cable-vision, more than likely you'll be programming a lot more than ten.

That's where 3M Routing Switchers come in.

Because our switchers allow you to start small, and expand gradually. As your needs grow.

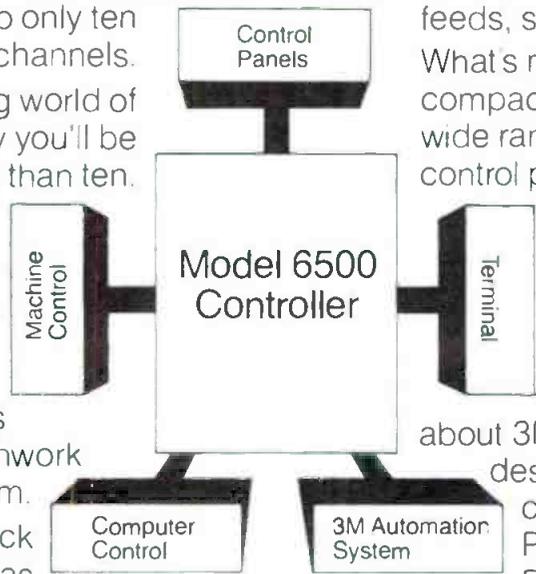

Without the bulky wire mess and inconvenience of a patchwork routing system.

They allow for more VTR's, quick and easy switching, as well as multi-channel programming.

And they're perfect for switching in network feeds, satellite relays, and live remotes.

What's more, 3M Routing Switchers are compact and fully electronic. They offer a wide range of capabilities. From simple control panels like thumbwheel, touchpad, universal pushbutton, and LED pushbutton, to completely automated, computer-controlled systems. From 15 x 12 to 40 x 40 and larger.

For more information about 3M Routing Switchers, or a custom design consultation for your studio, call collect 612-736-1032. Or write: Professional Audio Video Equipment/3M, Building 223-5E/ 3M Center, St. Paul, MN 55144.

**The routing switchers that grow
as your needs grow.**

3M hears you . . .

Protect yourself against the high cost of static

Electrostatic discharge, in addition to causing problems like the one above, can damage delicate electronic control and logic circuits. It takes so little voltage that you might not even feel the spark.

As little as 500 volts can send erroneous data, alter "memory", write incorrect data on a disk, or cause printers to run wild, throwing paper into the room. All of which means expensive service calls and even more expensive system down time.

Only 500 volts, yet you can easily generate over 12,000 volts of static charge just walking across a carpet. Even on a vinyl floor, 4000 volts is not uncommon.

The solution is simple

3M Brand Static Control Floor Mats can create an inexpensive "island of protection" around your delicate electronic equipment, harmlessly draining the static charge from operators and other personnel.

For as little as the cost of a single static-related service call, you can say goodbye to all these problems.

3M Brand Static Control Floor Mats come in hard mats for easy movement of casters chairs, and soft mats for comfortable standing.

For information about how you can purchase 3M Static Control Floor Mats, call toll free

1-800-328-1300

CLEAR THE AIR WITH THE **NEW** TRANSDYNAMIC PROCESSOR THE SUPER CLEAN SOUND THAT WINS MORE LISTENERS.

VERSATILITY, RELIABILITY AND LOW DISTORTION. THAT'S WHAT THE TRANSDYNAMIC™ PROCESSOR IS ALL ABOUT. IT TEAMS WITH AUDIO & DESIGN'S EXPRESS OR COMPLEX LEVEL CONTROL AMPLIFIERS TO CREATE A SUPERIOR TRI-BAND SYSTEM. IT FEATURES:

- TWO INDEPENDENT PROGRAM CHANNELS. FOR STEREO OR DUAL MONO PROCESSING.
- FIELD TUNABLE BAND-SPLITTING FILTERS (6 OR 12 dB PER OCTAVE PHASE COMPENSATED CURVES).
- SEPARATE CONTROL OF THE COMPRESSOR ATTACK, RELEASE AND RATIO FOR EACH BAND.
- WIDE BAND VCA LIMITER AT THE SYSTEM OUTPUT FOR ABSOLUTE OVERMODULATION PROTECTION.
- SELECTABLE 0, 25, 50 OR 75 μ S PRE-EMPHASIS IN THE CONTROL CIRCUITS (NOT THE SIGNAL PATH) OF THE OUTPUT LIMITER.

- ADJUSTABLE PEAK MODULATION ASYMMETRY FOR AM OPERATIONS.
- SWITCHABLE HIGH AND LOW PASS FILTERS THAT ATTENUATE EXTRANEIOUS INPUT SIGNALS AND CONTOUR THE SYSTEM BANDWIDTH.
- SENSIBLE SET-UP ADJUSTMENTS WITH LED BAR GRAPH PPM METERS.
- TAMPER-PROOF SOLID STATE AUDIO SWITCHING CIRCUITRY.
- NO MYSTERIOUS EPOXY "BRICKS" OR "SECRET PARTS".

NO MATTER WHAT YOUR FORMAT, THE TRANSDYNAMIC SYSTEM IS THE CLEAR CHOICE FOR YOUR SOUND.

AN AUDITION IS THE ONLY WAY TO FULLY APPRECIATE THE TRANSDYNAMIC. CALL TODAY, TOLL-FREE 800-426-6170 FOR FURTHER INFORMATION.

SYSTEM INSTALLATION BY FACTORY PROFESSIONALS IS ALSO AVAILABLE.

Quality Reliability Performance

Exceeds all my expectations. Great performance and range. Unexpected power and performance. That's three experienced broadcasters talking about the new Andrew TRASAR™ UHF-TV transmitting antennas recently installed at their stations.

Here are some important features that convinced them to buy TRASAR™: • Unique traveling wave slotted array design • Excellent null fill • Up to 2.5° beam tilt without loss of gain • High power rating with reserve capability • Very low VSWR • Fiberglass radome for protection from the elements • And there's more! Obtain complete information in Bulletin 1083 or contact your Andrew Sales Engineer.

With flexible,
field-proven,
electrically
transparent
Phillystran®
high-
performance
tower guys . . .

the next time you re-guy
will be the last time
you re-guy!

Phillystran HPTG for

- new towers re-guying
 insulating sections

"The leading edge on cloud banks generated static discharge on the metallic guys of our AM/FM tower. This caused on-and-off cycling of our transmitter.

"Phillystran eliminated that cycling problem. It also changed our D-shaped pattern into a preferred omnidirectional by eliminating the directional aspects common to steel guys."

Don Russell, Chief Engineer
WDAN-AM & WDNL-FM
Danville, Illinois

Phillystran HPTG, made
with DuPont's Kevlar . . .

1. simplifies installation or re-guying of AM, FM, AM directional and TV towers. Lightweight, flexible, yet as strong as EHS galvanized steel. Negligible creep and elongation for tension-once and walk-away installations.
2. eliminates EMI and RFI associated with steel guys . . . improves FM signals, while also eliminating UV degradation, chipping, water-intrusion and the breaking problems associated with fiberglass insulating sections.
3. maintenance-free. Nonconducting, noncorroding, nonmetallic. No painting or greasing required. Eliminates problems caused by severe chemical/industrial pollution. No insulators required. No problems with fire or vandalism because each socketed assembly includes a steel lead line.

"With Phillystran insulating sections, we had a 25% gain in our FM signal. Electrically-transparent Phillystran was our best investment in 1980."

**TO FIND OUT
WHAT EVERYONE
ELSE WILL BE
STRIVING FOR
NEXT YEAR,
COME SEE SONY
THIS YEAR.**

**SONY UNVEILS TECHNOLOGY SO
ADVANCED IT MAY NEVER FIND ITS WAY INTO
OUR COMPETITORS' PRODUCTS.**

If by chance you visit all the other exhibits at NAB before coming to Sony, you'll get two things: sore feet, and a clear understanding of just how far ahead of the rest of the industry Sony really is.

After all, where else will you find the future of 1" recording—the BVH 2000? It contains virtually every technological innovation in 1" Type C video recording known to man. And we've arranged no fewer than 14 of them for you to come and play with.

And what other exhibit features the most sophisticated and cost-effective editors and peripherals in the business? All plug-compatible, all based on Sony's total system approach, and all technologically superior.

And where else will you find the incredible Betacam™ system? The most compact, the most lightweight, and the highest performance combination of recorder and cameras (one-tube and three-tube) of its kind anywhere.

And most important of all, it's the greatest value for your money in the industry.

The answer: only at Sony.

So after wading through an endless array of ordinary exhibits, come watch Sony turn up the lights on the most significant broadcast innovations of 1982.

Marconi deserves an Oscar

Smooth, silent, reliable.

The New Marconi Line Array Telecine B3410

For a remarkable contribution to film in TV, Marconi's new Line Array Telecine B3410 fully deserves its great reputation.

The unique combination of full digital processing with micro-processor control and CCD sensors means exceptional picture quality, shorter set-up times, rapid change of TV standards, long life and minimum maintenance. No tubes, no replacements!

Also offering fast change of film gauge and full resolution cinemascope, this most outstanding newcomer is available for swift delivery at a highly competitive price.

For full details contact: Marconi Electronics Inc. (John White or Simon Frazer)

The Gordon Headroom Meter:

a better idea in program monitoring.

We've combined the best aspects of the traditional VU meter and the precision of the European Programme meter. The result is a meter that meets the UK/EBU standard for

response to program peaks while maintaining a more conventional and artistically desirable "syllabic" response to music and speech.

Get the complete package for \$122.00, or our VU-conversion option for \$69.00. Quantity discounts are available. For further information, contact:

**“At half CMX’s price,
how good can the Commander be?”**

“Better!”

**says Andy Maisner, owner of the American Film Factory,
Venice, California**

“I was prepared to pay whatever it took to bring American Film Factory’s facilities up to state-of-the-art standards. But I wasn’t willing to just sign a blank check—so we thoroughly evaluated all the leading computer-assisted videotape editing systems on the market. I was really surprised to discover the United Media’s new Commander II was capable of everything CMX could do and more—and at half the price. Half the price!

“Let me get specific—the biggest Commander advantage is complete computer control of multiple mix-effect banks for double re-entries. Sure, CMX can do that with a Grass Valley Switcher, but equipping it with E-MEM costs almost as much as the entire Commander II system.

“The other big advantage is Commander’s tremendously flexible list management. Everybody has it, but

Commander’s degree of sophistication far exceeds the others.

“Commander offers a lot of useful features—like sync step, independent audio and video dissolve, and split audio/video edits in and out in one pass. Again, most other systems can cope with these editing needs somehow, but Commander handles them with true automation.

“Reliability is excellent—in a year of operation, we’ve never had a hardware failure. In fact, we’ve already bought our second Commander II system. Commander II is fully CMX-compatible, which reassures my clients—and it’s easier to use and much more versatile, which excites my editors.

“With the Commander’s built-in total capability and realistic price, it’s certainly the *best* system you can buy.”

**We
 put it all
 together.**

From Emmy award-winning coverage of the 1980 Winter Olympics to historic coverage of the Space Shuttle, and in hundreds of Network and Independent feature productions, Convergence video editing systems are the number one choice because of their speed, reliability and ease of operation.

Since 1975, Convergence has led the way with numerous product innovations. We produced the first ENG editor and were the first to incorporate Joystick Control. Most recently we pioneered the modular editing system design concept.

Today we're working on further innovations to assure that you'll always find more functions and features for your editing investment.

The Machines of the 80's.

THE GARNER 1100

One-inch has already gained nationwide acceptance as the video tape of the 80's. And a lot of people who depend on one-inch have invested in the Garner 1100 degausser so they can get the maximum use out of their tape.

With Garner's one-pass, endless-belt operation, you get complete erasures at the rate of 13 reels per minute. Once you try it, you'll agree that the Garner 1100 is the machine of the 80's.

THE MODEL 270

If your operation uses 3/4" cassettes, then take a look at the Garner Model 270. It completely erases all prior video and audio in one five-second pass. Put it to work in your studio and watch it pay for itself in a short amount of time.

TEST GARNER YOURSELF! Put either one of our machines to the test for 30 days. If they don't live up to your standards, just return them to us. We're confident that after testing Garner, you'll want to put our machines to work for you.
...And a complete line of audio erasers.

Dependability...Guaranteed

DYNAPHASE 55/600 Ohms

A New 600 Ohm Headphone From Stanton—The Choice of the Professionals

Now the great performance enjoyed by recording professionals worldwide in the Stanton 881S cartridge is also available in a brand new, lightweight headphone... the Stanton Dynaphase 55/600 ohms. Professional quality sound is the result of superior Stanton driver design that includes 1½" dynamic high velocity elements with a specially formulated synthetic film diaphragm assembly (Pat. Pend.) and samarium cobalt magnets... allowing for low distortion and

exceptionally wide frequency bandwidth.

The tuning of the air cavities behind and in front of the diaphragm is a unique design of Dynaphase 55/600 ohms. It results in the flattest response and finest acoustical behavior of the driving element. Includes adapter plug.

For further information, contact Stanton Magnetics, 200 Terminal Drive, Plainview, N.Y. 11803

Visit us at NAB Conference Booth #3125

STANTON

THE CHOICE OF THE PROFESSIONALS™

Circle (127) on Reply Card
www.americanradiohistory.com

If we had set out to give you only
the features our competition gives you,
this is where we'd be today.

Most VTR units give you only a fraction of the features you might want from a video tape recorder. So we didn't stop where our competition did. We kept on adding features. Until we developed the most versatile 1" machine on the market.

Compare the 3M TT-7000 VTR and NTC-10 Time Base Corrector to the competition. Nobody puts together more of the features you want than 3M. And once you see our unit, we think you'll agree that buying anything else is like getting half a machine.

The 3M TT-7000 Video Tape Recorder gives you:

- Autotrack following (ATF), with multipoint sampling, ¼ reverse through 2X forward, plus preset slo-mo speeds and direction (optional).
- Video and sync confidence heads.
- Three channel audio confidence heads.
- Video sync channel.
- All DC motor and servo tape transport.
- Play start after scanner lock.
- Spot peels in any combination.
- 19" rack mountable with full dust cover.
- Front panel plug-in modules.
- Frame accurate insert and assemble editing.
- Dual tape timer with zero memory.
- Tape speed override on front panel.
- Stop tone and cue-up (0, 3, 5, 7 sec. preroll).
- Contact closure and TTL external interface.
- Variable speed forward/reverse shuttle.
- Still frame jog.
- Autochroma and color framing.
- Audio 3 record in play mode (built-in speaker).
- Instant stop action from play or slo-mo (with ATF option).
- Instant audio bias level adjust.
- Video level calibrate marker.
- Preset/Manual tracking select on front panel.
- Fixed precision rabbited drum tape guide.

- And low RF, high temperature and low voltage alarms.

Our Time Base Corrector comes complete with its own list of standard features:

- Sixteen line correction window.
- Ten bit quantizing.
- Four times subcarrier sampling.
- 65 dB signal-to-noise ratio.
- Velocity compensation.
- Digital one line drop out compensator.
- Compact size (8¾" high by 17½" deep by 18½" wide).
- 45 pounds total weight.
- Portable cabinet or rack mountable.

- And front panel plug-in modules.

Add it all up, and you've got the most complete VTR/TBC package on the market. For a free demonstration, call (612) 733-7914 or write 3M Professional Audio/Video Equipment, Bldg. 223-5S, 3M Center, St. Paul, MN 55144. Get the picture.

**3M means business.
And the time
to act is now.**

3M hears you...

#1 SELLER

PCL-505/C and PCL-505A/C

Sound technology and time-proven performance have made the PCL-505/C Aural Studio-Transmitter Link the work horse of the Moseley STL line. The PCL-505 C has been the world's Number 1 selling composite aural STL since its introduction in late 1974. Taking the technology used in the PCL-505/C a step further, the PCL-505A/C was specifically designed for the dense metropolitan RF environments. Excellent adjacent-channel rejection is achieved in the PCL-505A/C, through the use of a Surface Acoustic Wave (SAW) first I.F. filter, in conjunction with a phase-linearized second I.F. filter.

The PCL-505/C and PCL-505A/C feature on-frequency RF amplifiers and micro-strip line techniques. Excellent frequency stability is achieved by referencing the low-noise, frequency-modulated oscillator output to a crystal-controlled reference oscillator. Composite stereo waveforms allow the stereo generator to be located in the studio, far from strong RF fields, and the wideband input carries both the stereo waveform plus two subcarriers as well.

Both versions are ruggedly constructed for continuous duty, with extensive multimetering and excellent serviceability. A built-in remote connector allows remote control, or optional automatic transfer panels for switching operation to standby units.

So, whether your STL requirement is for a ruggedized, economical work horse; or, if your market has grown to the point of crowded STL spectrum, Moseley's PCL-505 series of STL will accommodate your needs.

- TRUE COMPOSITE STEREO FM
- CARRIES STEREO WAVEFORM PLUS TWO SUBCARRIERS
- ON-FREQUENCY RF AMPLIFIER

- EXTENSIVE MULTIMETERING
- PCL-505A/C RECEIVER FOR HIGH DENSITY RF AREAS

#1 PERFORMER

PCL-606 and PCL-606/C

- ULTRA LOW NOISE AND DISTORTION
- EXCELLENT SELECTIVITY
- OUTSTANDING FREQUENCY STABILITY

Topping the Moseley line of aural studio-transmitter links, the PCL-606 and PCL-606/C are tailor-made for the broadcaster who demands the very finest in performance and engineering. Extremely congested, high-density RF environments are no problem for broadcasters using these all-new, state-of-the-art systems. Either the monaural (PCL-606) or stereo composite (PCL-606/C) provide today's broadcaster with the highest quality program interconnect available in an aural STL. Both are designed for maximum performance and reliability, with easy service features to minimize maintenance down time.

The dynamic range of both systems can be optimized as a function of

- SELECTABLE IF BANDWIDTH
- BUILT-IN DIAGNOSTIC METERING

signal strength, by a pin diode attenuator circuit in the receiver. Superior frequency stability is achieved in the PCL-606 and PCL-606/C Transmitters by locking phase and frequency to a synthesized AFC. Ultra-phase linear I.F. filters, and a broadband, extended digital demodulator provide surprisingly low noise and distortion, while the balance between distortion and selectivity can be tailored to user needs by adjusting I.F. bandwidth. A compensated, linear, baseband response maximizes both monaural and stereo transmission. Both the PCL-606 and PCL-606/C have switch-selectable signal metering functions to measure the incoming RF signal over its entire range. Internal system performance metering functions are built into both transmitter and receiver. All normal service adjustments are easily accessible through the top cover, and brass-enclosed module construction makes PC board servicing easier than ever. Should there be a failure or abnormality shutdown; the receiver is equipped to switch internally and automatically to a standby unit for continuous performance.

Continuing the legacy of the PCL-505, the PCL-606 and PCL-606/C are revolutionizing the state of the art in the aural STL marketplace.

PRODELIN

THE SHOW BUSINESS DAILY

FIVE METER ANTENNA A HIT

Prodelin 5M Earth Station Antenna Sets New Standards

The smash hit of the new season isn't a stage musical, it's a new antenna by Prodelin—a star producer for more than 35 years.

Prodelin's new 5-meter antenna comes in several models offering a choice of feeds and polarizations—*high efficiency Cassegrain* with a diagonal horn and specially shaped subreflector in plane or dual polarized receive-only or transmit-receive configurations or *prime focus* with the LNA at the focal point in plane or dual polarized receive-only.

Some of the outstanding features are:

- Antenna can be easily erected without the use of cranes or special hoisting equipment.
- Segmented reflector significantly reduces size of shipping containers. Provides savings on handling and transportation costs.
- Segments have integral indexing tabs for positive self-alignment.
- Textured front surface diffuses sunlight and reduces solar heating at focal point.
- Individual reflector segments are interchangeable and field replaceable.

Prodelin's 5-meter antennas utilize a twelve-segment compression-molded fiberglass reflector. A patent has been applied for on this feature.

The parabolic reflector is easily assembled from twelve identical self-aligning segments. These segments are made from compression-molded fiberglass (FRP) material providing exceptionally high strength to weight ratio. For complete data and specifications, circle the number or contact Prodelin directly at P.O. Box 131, Hightstown, NJ (609) 448-2800.

**Nobody's perfect . . . but
 we'll help you get close.**

Phase errors in stereo cart machines, stereo
 reel-to-reel machines, stereo-to-mono
 dubs, and more can now be corrected inex-
 pensively and effectively.

The revolutionary Howe Series 2000 Phase
 Chaser™ is one neat little package that can
 be placed in the audio chain in any of sev-
 eral locations to correct phase error be-
 tween left and right channels.

The Howe Series 2000 Phase Chaser™ is
 not expensive, just essential.

Get your facility in phase
 for as low as \$800.

Phase Chaser™ is a trademark
 of Howe Audio

Introducing the only $\frac{3}{4}$ " time code editing system that performs 20 automatic edits from multiple sources. The Panasonic 700 B-2 Series Time Code Editing System.

**700
B-2
SERIES**

Now Panasonic adds a new dimension to the speed and accuracy of time code editing with our new 700 B-2 Series Time Code Editing System. The AU-700 editing recorder, the AU-A70 programmable editing controller, and the AU-J10 multiple source adapter. Together they let you do what other time code editing systems don't: Perform up to 20 automatic, multiple-source insert and assembly edits. And the 700 B-2 Series is packed

with outstanding performance features.

The precision of direct drive.

Check out the excellent stability and precision of the AU-700's direct-drive video head cylinder and capstan servo motor. The superb performance and durability of our crystal-oriented HPF™ heads. All combine to produce an outstanding picture with horizontal resolution of 260 lines color, 330 lines

monochrome and S/N ratio of 46 dB color, 50 dB monochrome. You'll also get an edit with less video noise because video head switching has been moved to the vertical interval so it never shows up in the picture. At the same time, we incorporated DUB IN and DUB OUT connectors with separate Y/C signals and a flying erase head. And to keep that good-looking picture looking good, all circuitry is mounted in a durable annealed aluminum die-cast chassis.

The speed of microprocessors.

Another touch of ingenuity is the AU-700's microprocessor controls. Designed to work perfectly with the AU-A70 editing controller, they give you the speed, accuracy and versatility of full-logic, mode-to-mode switching. The AU-700 will accept SMPTE time code on a separate track or on audio track one as well as standard CTL pulses. And its electronic

AUDI-CORD: A GOOD SOUND INVESTMENT!!

"A" SERIES

An intermediate priced cartridge tape machine series with most of the quality and features found in units costing much more.

3 TRANSPORT REPRODUCER:

TWO TRANSPORT RECORD-REPRODUCER

THREE SELECTABLE RECORDING MODES

— STANDARD DUAL REPLAY MODES:

- Dual Recordings
- Dubs — Copies
- Mixed Composites

AT AUDI-CORD WE DON'T TRY TO FOOL YOU ABOUT TAPE CARTRIDGE MACHINES. — WE KNOW THEIR APPLICATIONS AND THE LIMITATIONS. WE OFFER NO MIRACLE CURES — AND NO EXPENSIVE TO OWN COMPLEXITIES.

WE DO OFFER STURDY QUALITY, GOOD USEFUL FEATURES, FINE CUSTOMER SERVICE AND — TOP DOLLAR VALUE.

HERE ARE A FEW OF OUR MAJOR PRODUCT FEATURES:

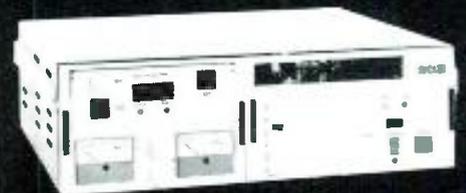

- 28 Model variations
- Modular constructed for easy service.
- Interchangeable transports and other assemblies.
- 1 or 3 tone — mono or stereo.
- Replay reminder system.
- Full remote control — automation compatible.
- Meets the needs of the 1976 NAB standards.
- Latching connectors — slip/lift cover.

RACK CABINETS OPTIONAL FOR ALL MACHINES.

GRAPHICS.**

LENCO

Circle (136) on Reply Card

Now give yourself a clear advantage — with a picture that's clearly better. Not just visually, but cost-wise, too.

Lenco's new PCE-462 takes RGB sync, blanking, sub carrier and optional luminance and gives you NTSC out — with such high resolution superiority that we'll be glad to compare it against anybody else's.

Now you can upgrade picture quality at a fraction of the cost of other equipment. And enjoy enhanced results from compatible graphics computers with RGB out.

Frequency response. Compare this Lenco at ± 0.3 db to 6.5 MHz, to -3 db at 7.5 MHz. Truly outstanding performance.

Enhancement. Compare Lenco sharpness with signal boost of +8.3 db at 3.5 MHz.

Non-composite RGB or composite green. This Lenco video input processor accepts either without modification.

Luminance channel input optional with plug-in circuit board. Now you can up-date your older 4-tube cameras instantly. All the hardware is here — BNC coax connectors, internal wiring, etc. Just plug in for your clearest color ever.

LENCO'S FREE OFFER

It will improve your picture right now.

Write or call us today. We'll send you a spec sheet on the PCE-462 and give you a side-by-side comparison spec check with all other units now available: the answers you want — direct from our engineers.

Why Your Radio Station Should Own An Eventide H949 Harmonizer.[®]

● IT'S A COMPLETE AUDIO TIME COMPRESSION SYSTEM AT A FRACTION OF THE PRICE

The \$3500* H949 gives you the same audio time compression and expansion capabilities of competitive single-purpose units costing well over twice as much. You get the power to control time itself...with no editing, no program material deleted and no abnormal pitch effects.

● IT'S A COMPLETE SPECIAL EFFECTS DEPARTMENT

The Eventide H949 Harmonizer[®] special effects unit gives you an almost endless variety of effects. There's variable delay, echo and reverb. Feedback level and equalization controls let you "custom-tune" the audio. Pitch change capability can create new voices. Mix input with pitch-changed output for chorus and harmony effects. Want the distinctive sound of flanging? The H949 offers the best flanging ever. There's time reversal and repeat too. For even more versatility, many more effects can be created from combinations of the basic effects.

WHAT CAN THIS MEAN FOR YOUR STATION?

● IT CAN HELP YOU MAKE MORE MONEY

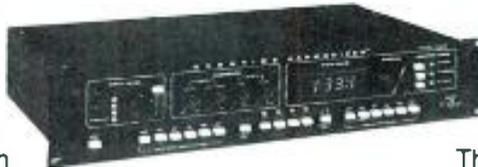

Go after those co-op dollars! The H949 can easily compress an existing national spot to accommodate a local retailer tag. Local advertisers who deliver their own ad copy will love what the H949 can do. Endless retakes to correct

the non-professional's timing errors are eliminated. Use pitch-change to make that local retailer sound more like an announcer (He'll love that!) Time compression with the H949 can bring order out of chaos when running back-to-back religious or political programs which are often mistimed. And, you'll find yourself doing more and better station-produced local spots—with those special audio effects that make for a more professional custom production. Your advertisers will notice and appreciate the difference.

● IT CAN GIVE YOUR STATION A MORE DISTINCTIVE, TIGHTER SOUND

The H949 Harmonizer can really make a difference. Use its special effects capabilities to produce really distinctive promos, intros and custom jingles. For a brighter, fast-paced sound, some stations choose to speed up their music by a few percent, utilizing the Harmonizer to maintain normal pitch. Using pitch-change, you can even create new voices to populate your air.

Eventide's Timesqueeze Jr.™ T.V. Time Compression System— At Just \$5000, Isn't It Time Your Station Owned One?

• EVENTIDE'S NEWEST VIDEO TIMESQUEEZE SYSTEM COSTS JUST \$5000* COMPLETE

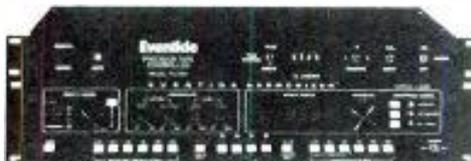

That's thousands less than any other T.V. time compression system. Eventide's Timesqueeze Jr.™ interfaces with virtually every variable-speed-capable VTR or film chain (and audio recorders too.) Compress or expand the running time of program material with no editing, no program material deleted and no abnormal pitch effects.

• WE CUT THE PRICE BY SIMPLIFYING THE CONTROLS

We've kept operating controls to a minimum. Just set the desired percentage change on four thumb-wheel switches. The resulting time change can easily be calculated to the fraction of a second.

• WE DIDN'T CUT BACK ON PERFORMANCE

Pitch normalization is the key to successful time compression. That's why the heart of every Eventide Timesqueeze System—regardless of price—is Eventide's fabulous H949 Harmonizer.* Both Timesqueeze and Timesqueeze Jr. deliver the superior specs of the H949 Harmonizer—15kHz frequency response; 96dB dynamic range. You'll find your Eventide Timesqueeze System is an invaluable production tool. Endless retakes to correct timing errors are eliminated. Movies and syndicated programs can be time compressed without edits or cuts to accommodate fixed time slots and varying commercial loads. And Timesqueeze time compression gives your commercial productions extra punch. Spot retention studies prove it!

• DOUBLE DUTY FOR GREATER VALUE

When not being used for time compression, Eventide Timesqueeze Systems can provide all the audio production effects that made the H949 Harmonizer an industry standard. There's pitch-change, chorus and harmony effects, variable delay, echo and reverb effects, flanging, time reversal, repeat and more.

• EVENTIDE'S SUPER COMPUTERIZED TIMESQUEEZE

Now that you've read about the capabilities of our \$5000* economy Timesqueeze Jr., just imagine what our top-of-the-line system can do. Incorporating a Hewlett Packard HP-85 (included in the \$7985* price.) this system offers totally automated control of all calculations and operations. There's a C.R.T. readout to keep you fully informed as to tape machine status, running speed, pitch ratio and other operational data. It's so smart it can even print out how-to-use info and interconnect diagrams.

SEE BOTH EVENTIDE TIMESQUEEZE SYSTEMS NOW. CALL EVENTIDE OR YOUR DEALER TO ARRANGE A DEMONSTRATION. VISIT US AT N.A.B. BOOTH 2934.

To the audio professional, when a compressor or limiter is needed to tame the potentially disastrous consequences of uncontrolled level or to create special effects, one name stands out as the best: UREI.

Studio Standards for more than a decade, the compressors and limiters from UREI have earned their way into thousands of recording, mastering, and broadcast installations around the world.

Because we built our reputation for unparalleled professional performance and quality with our compressors and limiters, we have continuously advanced their engineering and technology to offer more reliability, features and performance. When you need the fastest, quietest and most flexible gain control instruments available, you can be totally assured that these products will prove to you why they've earned the title — Studio standard:

The Model LA-4

A single channel, half-rack unit with patented electro-optical attenuator. Featuring smooth, natural sounding RMS action, it offers selectable compression ratios, a large VU meter, adjustable output and threshold levels and stereo coupling.

The Model 1176LN

A peak limiter which features adjustable input and output levels; individual attack and release time controls; selectable compression ratios; switchable metering; and

stereo coupling. The 1176LN is the most widely used limiter in the world.

The Model 1178

A two channel version of the 1176LN in a compact (3-1/2) rack mounting design. Featuring perfect tracking in the selectable stereo mode, it additionally offers selectable VU or Peak reading meter ballistics.

From One Pro To Another — trust all your toughest signal processing needs to UREI.

The UREI Compressor/Limiter

“The person you describe is the person we'll deliver”

It's not a slogan.

It's our track record.

We've successfully recruited for virtually every kind of executive post in broadcasting, cable television, and publishing. At every level.

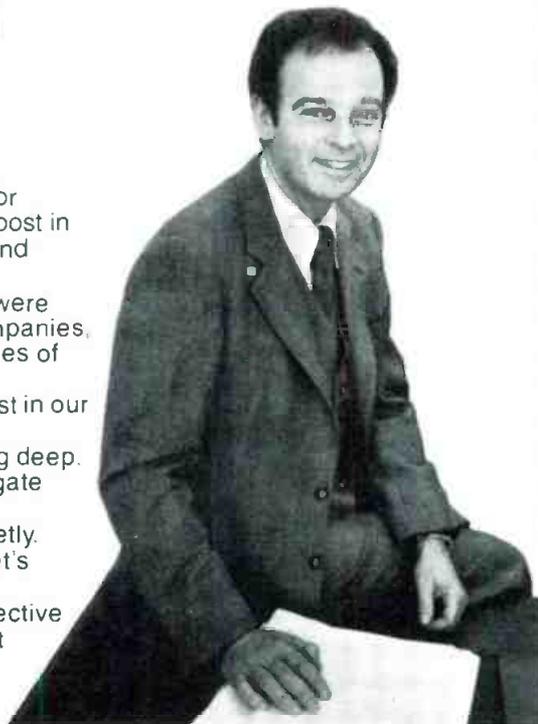

The executives we delivered were right for our clients, for their companies, and for the specific responsibilities of each position.

Our clients tell us we're the best in our field.

We know where to look. We dig deep. We sift meticulously. We investigate thoroughly.

And we do it all very, very quietly.

If you seek a key executive, let's discuss why our search and recruitment will be your most effective way to get the person who's right for you.

Tektronix: A peek at new products

As this issue was being prepared, a group from Tektronix came to Kansas City to show us two new products you will be seeing for the first time at NAB-'82/Dallas.

The first was an option to the model 1980 ANSWER system (previously described by Les Dunn in the July 1981 issue of **BE**). This new Option 03 NTSC Transmitter Monitoring Software relieves users from routine measurement runs by providing continuous, automatic monitoring of user specified video signal characteristics; automatic alerts with print-out, telephone call, or alarm device whenever the monitored signal violates user-set limits; and automatic logging of specified measurement parameters at user specified times.

The second is the three-in-one portable 380 NTSC Test Monitor, which is claimed to be the only product of its kind in the world. It is manufactured in Japan by Sony/Tektronix Corporation, a joint venture company, and will now be marketed in the United States. TV facilities in all NTSC system countries will now be able to purchase the 380 from Tektronix. A PAL version of the product will be introduced later this year.

The 380 incorporates the functions of a waveform monitor, vectorscope and an oscilloscope, and it enables the user to examine the entire video signal. It is expected to be available eight to 12 weeks after its introduction at NAB-'82/Dallas.

For information on other Tektronix products at the convention, see the listings in the directory section of this issue.

GRAB ONTO THE BALANCED AND FLOATING 1710A.

Accurate Distortion Measurements In A Strong RF Field?

At the studio, and especially at the transmitter, an engineer needs the flexibility and performance of the Sound Technology 1710A. It's the totally RFI immune distortion measurement system* that's designed to give the broadcast engineer the accurate information he needs—without the headaches that go along with other test instruments that just plain fail, or worse yet, give erroneous data.

Because the 1710A has a bridging input and a transformerless balanced and floating output, you can throw anything into it and hang virtually anything on it. Single-ended or balanced lines—it doesn't matter. Ground either side of the output and the 1710A doesn't care. You now have the flexibility to perform rigid test checks without all the hassles.

The 1710A is several precision instruments in one. It combines a flexible, ultra-low distortion sine wave signal generator, a high resolution automatic measuring THD analyzer, an IMD analyzer and an accurate A.C. level meter in one instrument.

The Capabilities And Spec's.

- Fully automatic nulling circuitry that measures distortion as low as 0.002%. In less than five seconds.
- A simultaneously tuned, balanced and floating oscillator that's capable of 10Hz to 110kHz. With three digit pushbutton frequency selection that's both repeatable and fast. And, adjustable from -90 to +26 dBm with three precision attenuators to 0.1 dB resolution.
- You can measure signal-to-noise ratios with a 100 dB dynamic range; sources from 30 μ V to 300V; power either in dBm or watts; push a button and reject hum and high frequency noise with built-in 18dB/octave

filters (30kHz, 80kHz and 400Hz).

Each Sound Technology precision test instrument is painstakingly manufactured and rigorously quality assured which results in the reliability that has made us a standard in audio instrumentation. And to prove this point further, we fully guarantee the 1710A for two full years. Parts and labor.

If you're spending too much time getting the facts and find yourself bobbing around in a sea of RFI problems, grab onto the balanced and floating Sound Technology 1710A.

It'll make your job and your station's performance a whole lot more secure. Contact us for full information and the name of your nearest factory representative.

*10 V/m rejection

Varian GEN II KPA. Pushing earth terminal technology through the 80's.

Designed specifically for today's modern world of earth terminal communications, the new Varian GEN II KPA simplifies complex communications problems with its advanced computer interface options. Easily adaptable, GEN II can be programmed to IEEE 488, RS-232 and RS-422 data busses.

Smaller, more modern design. Modular construction includes a proprietary,* digitally-controlled, all solid-state, low noise regulated power supply.

Integrated in the RF section is a digitally-controlled PIN diode attenuator to provide precise setting of the RF output.

Controls/Monitors/Logic section circuits use C-MOS high

noise immunity digital techniques to energize, protect, control and monitor KPA performance. The modern front panel features all-LED indicators and digital meter displays.

Enhanced Varian klystron for high efficiency.

GEN II utilizes the original, field-proven Varian VA-936 series klystron, with enhanced specification including 24-channels for top performance.

GEN II provides high efficiency with only 12 kVA for a full 3.35 kW tube, less than 1 kVA in standby and automatic 10% reduction of heater voltage for extended klystron life.

*Patent applied

More information on the new GEN II KPA for the 80's is available from Varian Microwave Components and Subsystems Division. Or the nearest Electron Device Group sales office. Call or write today.

VICTOR DUNCAN VIDEO

Designed to meet your equipment needs

At Victor Duncan Video our facilities and business systems have been designed to meet your needs. Developed through more than twenty years of professional production experience, our Rental departments offer the very latest video equipment. And not just cameras and recorders, but the myriad of support and accessories needed to keep your production on schedule. Our rental technicians have extensive field experience, not just "shelf" experience, and can help provide recommendations and alternatives for your equipment needs.

Our knowledgeable sales staff can provide product demonstration and comparison of the most current production equipment available. In cooperation with the video engineering department, our sales consultants can also provide complete system design and installation services as required for your specific needs.

We wrote the book on Time Code.

And now it's yours free.

Time Code Pioneers. Before we wrote The Time Code Book, we helped establish SMPTE Time Code standards and engineered the first SMPTE Time Code Generators and Readers. The first to make SMPTE Code really work, our leadership has been recognized and awarded.

Innovation, A Way Of Life. Now, we've introduced the first microprocessor-based equipment enabling you to utilize Vertical Interval Time Code (VITC). Because it's one thing to earn a reputation, it's another to maintain it.

And again, we're contributing to a standard. Further participation with SMPTE helped establish a proposed recommended practice for VITC, and our equipment is designed to make the most of its capabilities. With VITC every field/frame is identified and the code is in the video picture, permitting you to read the code in still frame while freeing the audio track normally used for time code.

At Technology's Leading Edge. Like all EECO Video Products, our VITC Generators and

Readers are innovated for performance, providing quality, reliability and precision at competitive prices. And our Readers allow you to extract VITC at wind speeds.

15 Years Of Industry Involvement. Supported and serviced by our factory, EECO Video Products are distributed worldwide by Ampex Corporation and in the Southwest by Hoffman Video Systems.

Ask For Our Free Time Code Booklet. For the whole time code picture—Serial and VITC—ask for The Time Code Book, from the people who wrote the book. Write or call, EECO Incorporated, 1601 East Chestnut Ave., P.O. Box 659, Santa Ana, CA 92702-0659 Phone: 714/835-6000.

Watch for the unexpected at NAB-'82

Each year at this convention, unexpected events occur that set new records of achievement in instrumentation and in convention attractions. Two years ago, the magic act at the Thomson-CSF booth drew the crowds. Last year, the VRC (video recording camera or recorder-in-camera combination) and the Ampex new products made big hits in new equipment.

Also, last year at the Bird and McMartin booths there was a cooperative effort that set new records at the convention. Operating into an 80kW dummy load loaned by Bird, the McMartin transmitter operated at new power levels for such a demonstration. The tests were planned for 10-minute operations each hour, but actual tests ran longer. There were rumored efforts behind the scenes to shut down these demonstrations; if so, they were unsuccessful. It is our understanding that this demonstration was impressive enough to sell the transmitter on the floor and that it was shipped to a South American customer from the convention.

There is no way to tell what will stand out at NAB-'82/Dallas. But, keep watching for the unexpected.

 Fully expanded Commander II Editing System and other stand-alone products.

The new advanced-design MQ-Series mixers.

RIGHT ON THE MONEY.

Introducing the MQ-Series. A new line of highly affordable mixers that refuse to compromise with audio performance. Or with your needs.

You get the tonal flexibility of a 4-band EQ on each channel and the added flexibility of per-channel echo and foldback

sends. Plus a pair of master-program 9-band graphic equalizers. And direct interface flexibility with per-channel dual input switching.

There's also the dependability and service convenience of a modular layout with each channel's components mounted on a separate internal printed

circuit board. The MQ-Series. Right on the money, right down the line.

Visit your Yamaha dealer or write us for more information. Yamaha, Box 6600, Buena Park, CA 90622. In Canada, Yamaha Canada Music Ltd., 135 Milner Ave., Scarb., Ont. M1S 3R1.

HOW TO BEAT THE RISING COST OF PIRACY WITH OAK'S ORION™ ADDRESSABLE SATELLITE SECURITY SYSTEM

Oak's ORION was introduced in late 1979 as the world's first commercially available satellite encryption system. Since then, ORION has been used in applications ranging from teleconferencing and pay-per-view events to network program distribution.

Signals transmitted by ORION are encoded to ensure that only authorized viewers are able to receive an intelligible signal. But while ordinary encoding protects signals from reception by terminals *outside* the network, it does not by itself provide for selective distribution *within* the network. ORION uses a combination of addressability and program level tiering to accomplish this objective.

Unauthorized viewers receive no audio and see only a jumble of broken color bands.

Only authorized viewers equipped with an ORION decoder can recover the original television signal.

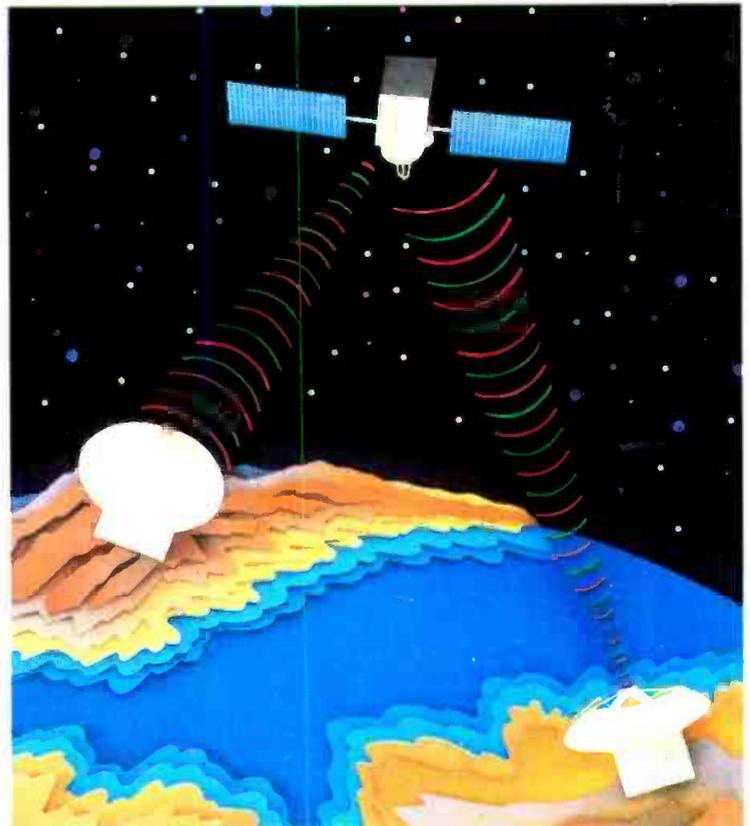

Selective program distribution means that the program supplier has complete computer control of decoder authorization levels at all times. Fully proven computer software minimizes operator input requirements, and a business computer interface is also available.

Individual decoders can be turned on and off immediately in accordance with program changes and subscriber status. Each decoder may be authorized to receive any or all of 49 different program tiers.

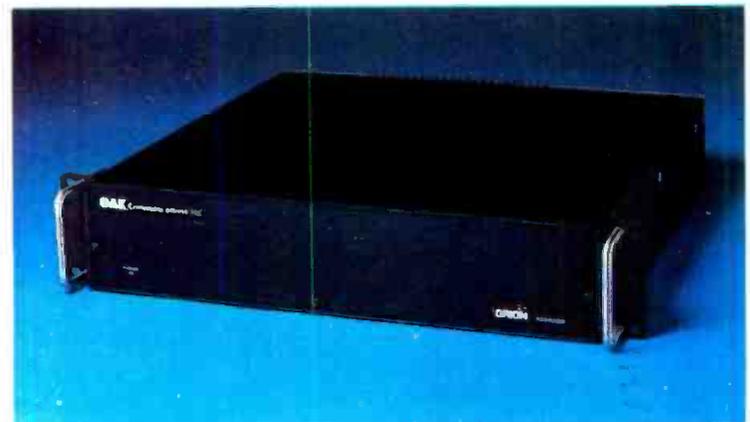

In entertainment program distribution, program level tiers might correspond to regional news, movies, sports or any other desired category of programming. Pay-per-view events in particular may offer significant opportunities, not only in increased direct revenues, but also in competing for subscribers.

In teleconferencing applications, designated decoder groups can be authorized to receive different levels of private information, in effect creating networks within a network. Program levels might correspond to several divisions within a company, or even to different companies. As a result, network operating costs could be reduced significantly.

ORION's flexible program tiering concept has evolved from many years of addressable technology experience at Oak—the world leader in CATV and STV signal encryption. For a detailed technical description, call or write:

Who on earth is listening in? With Oak's ORION Satellite Security System, it's up to you.

The ORION Satellite Security System consists of a pre-encoder, post-encoder and one or more decoders. Each unit occupies two mounting spaces in a standard 19-inch rack. The extremely rugged construction of the ORION components is designed to ensure maximum reliability, particularly in applications where equipment is subjected to rough handling encountered in shipment. ORION versions are currently available to meet NTSC as well as CCIR video standards.

Weather and News without the **BLUES**

No blue tint or edging—all hair detail intact!*

These same results are possible in **your** newscasts and other live broadcast situations. Operating on a new principle, detail from the foreground camera comes through perfectly in the composite—including each strand of hair, smoke, liquid, shadows, transparent objects—the works! No blue tint, blue edging or edge crawl—no “cut-out” look; no soft edges on hard objects—no hard edges on soft objects.

NEWSMATTE needs no encoder and is simple to operate with its one knob control. It will integrate into your switcher or can stand alone. **NEWSMATTE** marks a breakthrough for live broadcast just as the Emmy award winning **ULTIMATTE-4** was a breakthrough for commercials and TV production. Call or write **now** for more information or a demonstration.

See **ULTIMATTE'S NEWSMATTE!**

Great announcer mics should be heard and not seen.

You won't see the MCE 5, but you will hear the rich full frequency sound that tells you it's a Beyer. Now the top quality and reliability for which Beyer is famous has been packaged into the world's smallest broadcast microphone – the MCE 5 – the announcer's mic.

The MCE 5 is an omni-directional electret condenser microphone with 20Hz-20kHz \pm 3dB frequency response, 62dB signal-to-noise ratio and a maximum rated SPL at 1kHz of

116dB. Its matte black finish will not reflect light, so it goes unnoticed on camera. And Beyer's unique floating element eliminates pick-up of clothes rustle and body movement. Wind and air noises are reduced by up to 20dB, with the (removable) windscreen. You get only the announcer's voice.

Unlike conventional mini mics that are subject to breakdown from temperature and humidity, the MCE 5 is specially designed to withstand the elements.

The Beyer MCE 5 is available in a variety of configurations and connectors including: balanced, unbalanced, XLR, 1/4-inch and open end; as well as phantom and self-powered with its own battery.

You may not find the Beyer MCE 5 on our announcer, but you'll find it at your local Beyer dealer, today.

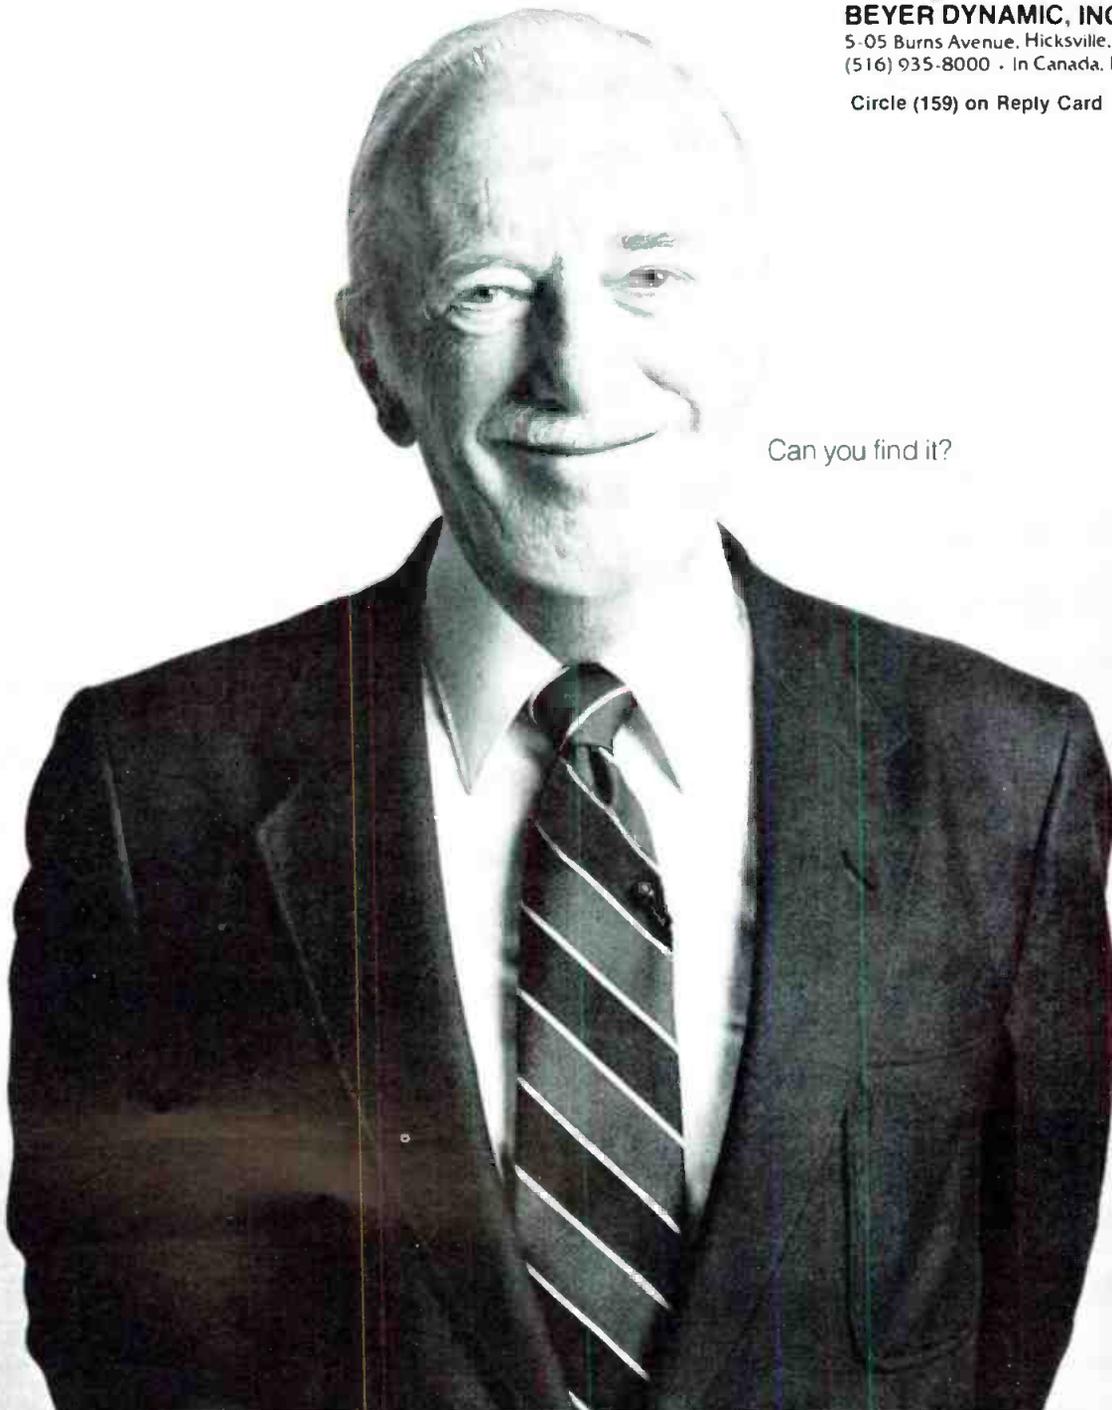

ACTUAL SIZE.

Central Dynamics at NAB '82

New Philips LDK6... the 'thinking' camera.
New CDL and American Data switching equipment.
2 stages... 2 live presentations.

CD-480 Model 4
(1 SFX, 4 buses)

CD-480 Model 10 (2 SFX, 10 buses)

CD-480... the most powerful and modular production switcher available today.

The 480's proven superior performance, reliability and flexibility has evolved from these powerful video production modules.

That's why you can customize a 480 to your specific production requirements... within your budget. And because of the 480's modular design we can deliver the largest model within 90-120 days.

Design your own switcher starting with any one of 9 basic models, and selectively equip it with a wide range of powerful 480 modules and accessories.

No other manufacturer can offer you that flexibility... and every 480 is equipped with the unbeatable video power of the CD-480 SFX Processor System that includes the SFX Amplifier, Key and Wipe Modules.

The 480 family includes switchers with 4 buses to 10 buses... even a model you can upgrade from 1 SFX and 5 buses to a Model 8 or 9 with 2 SFX Amplifiers and 8 or 9 buses. And the 480 continues to evolve which means you can always add the latest 480 production accessories.

That's why over 300 users call the 480 the most powerful and flexible new generation switcher available today.

Start designing your new CD-480 now so you can have the competitive advantage. Call or write for literature or our complete CD-480 Design Kit.

the trendsetters

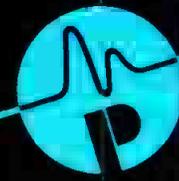

Unquestionably the industry's standard of excellence in broadcast equipment

Most manufacturers meet industry standards; we exceed them. Our TOMCAT cartridge recorders/reproducers and BMX series of broadcast consoles deliver trendsetting on-line performance in broadcasting systems worldwide, from Boston to L.A., Australia to Great Britain.

TOMCAT: simply the world's finest. Innovative design assures superb sound quality, reliability, and low noise operation. Our Maxtrax™ wide-track fixed azimuth heads yield more signal, lowest phase error.

BMX, Series II: the ultimate in high performance mixing consoles. These compact units feature proven RF immunity and CMOS remote control flexibility, plus a choice of 10, 14, 22, and 26 input mainframe configurations. A new mix module is now available to offer two mix-minus busses for telephone talk shows. All this in a no-nonsense panel layout!

See why TOMCAT and BMX series have made us the industry trademark. Call or write today for free information on our complete line of equipment.

Shooting the rapids EFP-style with Steadicam...

Planning ahead with Steadicam, Cinema Products' Oscar-winning video/film camera stabilizing system, pays off in spades. Economically as well as artistically. A good example of such planning is a new sports series for cable TV, "Outside The Arena," produced by Westwood Communications, Inc. (Eugene, Oregon).

The premise for the series is to take well-known sports figures out of their commonly-known element, and to feature them as they are engaged in various interesting activities. The pilot program involved videotaping a famous pro football player kyaking down the McKenzie River in Oregon.

To get the best footage from the camera raft (equipped with a Hitachi SK-91 camera and an HR-100 1-inch portable recorder), Steadicam was mounted on a specially built pole which was welded onto the framework of the raft.

"Even though the raft was forever being tossed every which way but the right direction, Steadicam came through with flying colors," says Steadicam operator Stephen W. Allen of Allen Production Services, Ltd. (Portland, Oregon). "In situations where I had to pay more attention to the water in front of the raft than to the monitor, Steadicam practically kept in frame by itself."

"Steadicam was an integral part of the planning for the production of this segment," says producer Bruce O'Neil.

"Future segments will no doubt place even greater demands on the Steadicam, due to the many and varied locations we plan to use for this series."

The results of the two-day Steadicam shoot on the McKenzie River were spectacular. Says director J. Clayton Lawson: "Steadicam enabled us to capture some of the most exciting moments ever shot on a white water river."

Steadicam, of course, is not restricted to "shooting rapids." On the contrary. It is a most versatile production tool which can be used effectively—even in "normal" shooting circumstances—in a thousand and one dramatic ways.

Steadicam operator Stephen Allen shooting with video camera and Steadicam on the McKenzie River in Oregon.

More Tests More Accuracy Less Time ...

The QEI Model 691 Tuneable Stereo & SCA Modulation Monitor *

That's right, QEI's 691 performs more than 40 proof-of-performance, sound quality and troubleshooting tests (up to 4 tests simultaneously) with greater accuracy and in less time than possible before.

Most functions and test connections are on the front panel in easy to read, easy to use groupings. QEI's auto-ranging meters guarantee correct readings every time and SCA capability is a simple matter of an optional plug-in module.

* FCC Type Approval No. 3-244

STOP GROUND-LOOP HUM!

VIDEO HUM STOP COIL...HSC 1

Will ELIMINATE HUM and other INTERFERENCE in Video Lines caused by differences in Ground Potential.

- For Color and Black and White.
- FLAT-DC to 6.5 MHz.
- No Low-Freq or Hi-Freq. Roll-off.
- No Differential Phase Distortion.
- No Differential Gain Distortion.
- No Envelope Delay.
- Passive Device - Failure Free-Low Price.
- Small Compact Package 4" x 4" x 2-1/4".

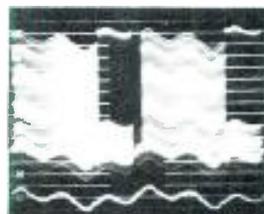

ELIMINATES HUM AND INTERFERENCE:

IN STUDIO

- Between Buildings
- On long runs in Buildings
- Between Studio and Transmitter
- On Incoming Telco circuits
- On Outgoing Telco circuits

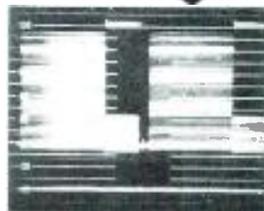

IN FIELD

- Betw. Remote Truck and Telco
- Betw. Remote Truck and Microwave
- For Intertruck Hookup
- For VTR Units
- For Monitoring Lines

THE PERFECT 29 SECOND SPOT

The Lexicon 1200 has a wideband twin!

With the Lexicon Model 1200, you can speed up taped material, or slow it down, and still maintain true broadcast-quality sound.

And now the 1200 has a wideband twin: the Model 1200B.

The 1200B does everything the 1200 does, with the added feature of wideband (15 KHz) operation to meet network TV and AM radio broadcasting standards.

Like the 1200, the 1200B automatically reduces or expands the playtime of recorded material. Commercials can be tailored to fit with the push of a button. Tag lines

are easy to add. Taped newscasts can quickly and easily be time-adjusted. All without loss of audio quality.

Lexicon Audio Time Compressors work with virtually any variable-speed tape recorder or variable-speed projector and/or videotape recorder.

Write for detailed information and application notes today.

Master Control Automation™ takes the “excitement” out of Broadcasting. But it adds reliability.

From the people who brought you BIAS™ now comes Master Control Automation. It insures an accurate flow of event activity while simultaneously listing reports, reconciling aired spots, and preparing the log for subsequent billing.

And it's all possible through the most sophisticated software system on the market for on-air switching. Master Control Automation will control any on-air switcher regardless of manufacturer. It receives the program log and manages switching activity without

operator intervention. You monitor the entire process at one or more control terminals with a minimum of effort. And you know it's working right.

Master Control Automation™ is a part of the total system umbrella . . . Network Control System™ Complete broadcast automation with BIAS™, BUY LINE™ (Avail Submission and Electronic Mail), Feature Film™ (Inventory and Amortization), and Financial Accounting Packages. Available together or separately. Call us today for a demonstration at (901) 345-3544.

The simplest, most efficient way to run a television station.

Flexible Flier

Commerce Airborne's Turnkey ENG system.

"Fully flexible" describes the electronic system that makes this ENG system the most sophisticated airborne video platform ever offered. Using specially designed communications, audio and video control devices, crewmembers easily configure the system to a multitude of mission requirements.

A few of the many system capabilities include:

- Individual access and control of company and inter-agency FM communications
- Selective audio access to microwave by Talent or crew
- Microwave relay from ground crew with passive or active airborne participation
- Complete, selective audio/video cueing
- Audio Follow Video or "split" operation of camera, VTR, microwave receiver, etc.
- Full-loop air-ground-air microwave system check (with active auto-tracking receive site)
- Simple, remote control of all systems from ENG console

Standard equipment on Hughes 300C/ENG helicopters. Also available for other airborne ENG applications.

Leave the driving to us.

Replace your troublesome tube driver with our trouble-free solid state driver.

Since 1967, MPD has been the world leader in solid state RF/Microwave high power amplifiers for a broad spectrum of the most demanding military, aerospace and telecommunications applications. Now, all that expertise in high quality performance and maximum reliability is utilized in these solid state drivers, designed to meet the needs of modern TV broadcasters.

COMPLIES WITH NTSC & CCIR STANDARDS

For worldwide black & white and color TV broadcast applications.

UP TO 1500 WATTS WITH SOLID STATE RELIABILITY

The final solution to tube burn-out problems and maintenance headaches.

NO AGING

Power margin allowance, normally required for tube aging, is eliminated.

NO CAVITIES, NO MISALIGNMENT, NO TUNING

Drift-free output puts an end to the annoying, time-consuming task of frequent re-alignment of tube-type amplifiers and cavities.

MULTI-CHANNEL BANDWIDTH

VHF low band 54-88 MHz; VHF high band 174-230 MHz; UHF 470-960 MHz.

MODELS FOR ALL TV APPLICATIONS

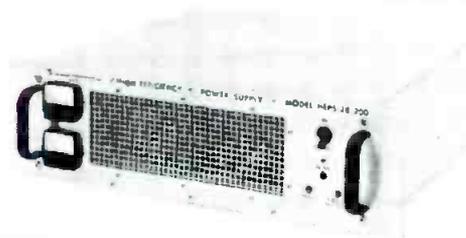

VHF low band (Ch. 2-6) and high band (Ch. 7-13), ratings up to 1500 watts peak sync. Visual Class AB; Sound Class C. UHF models, Class A, up to 100 watts peak sync.

FULLY PROTECTED

Load VSWR protection via self-contained circuitry. Integral cooling and thermal protection are standard.

HIGH EFFICIENCY DC POWER SUPPLIES

Specially designed for use with these drivers, MPD switching power supplies feature better than 85% efficiency, 24-30VDC, up to 280 amps, 8400 watts. Self-protection, BITE and remote operation are standard.

Audio switching systems:

Past, present and future

By Mike Palmer, Arrakis Systems, Fort Collins, CO

The switching and routing of audio signals has been a technical problem since Alexander Graham Bell spoke the first sentence over the telephone on March 10, 1876. In fact, the greatest difficulty the telephone system faced was audio switching. The modern telephone system that connects more than 40 million homes in the United States is a monument to the genius and ingenuity of the early pioneers.

The development of audio switching from the knife switch to the modern electronic routing switcher has been spearheaded by the telephone industry. The 1870s and 1880s saw the use of the first crude rotary and toggle switches. The first simple patching system was used in Richmond, VA, in 1882. By 1901, the

modern ¼-inch 3-wire telephone jack and patch panel, which is still in widespread use, was fully evolved. The telephone lever key switch was first used in 1888 and developed by 1912 into what we would recognize today. That switch is still commonly used for switching on audio consoles.

The relay was invented by Morse for the telegraph in the early 1830s. It began as a part that weighed three to five pounds, and evolved into our modern telephone relay by 1910. The relay, the patch panel and the lever key switch were the guts of early telephone switching systems. In the 1920s, a standard 10,000-line telephone switching office used more than 50,000 mechanical relays.

Early radio developed at this stage. The first station, KDKA of Pittsburgh,

began broadcasting in late 1920. As in telephony, these broadcasters were confined to the mechanical relay, patch panel and mechanical switches for audio switching. Ironically, the majority of stations to this day rely on these same tools.

The modern age of electronics began in the early 1950s with the introduction of the transistor. The world of electronics owes a debt to Bell Telephone for the development of the transistor and the revolution it brought to our field.

Bell Telephone introduced the industry's first electronic switcher in the late '60s. Called the ESS 1, which stands for Number One Electronic Switching System, it is computerized and capable of switching 100,000 lines peak. The primary switching element

Audio switching

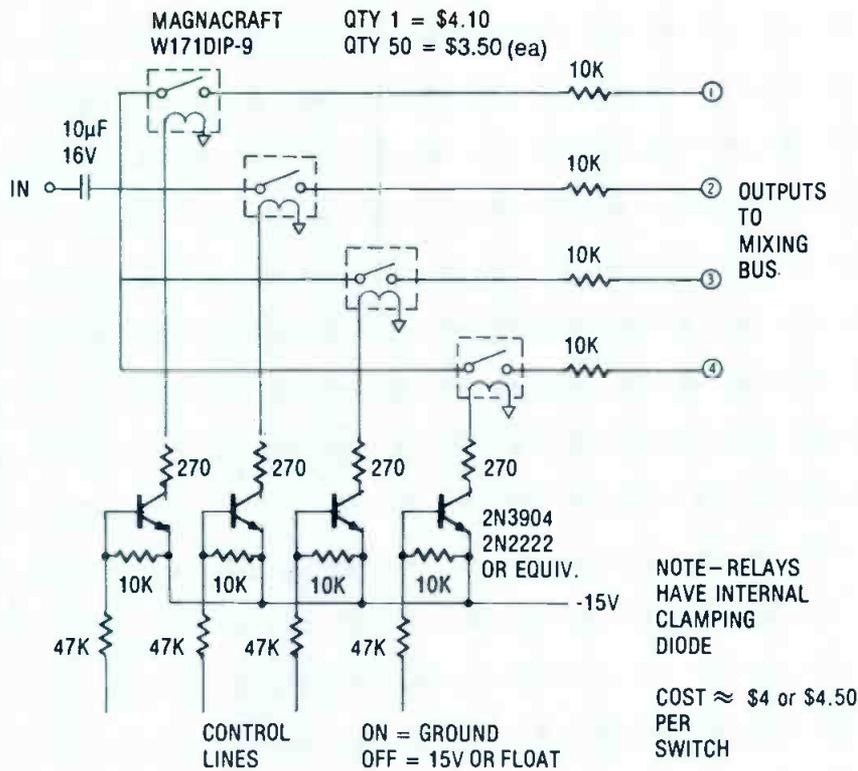

Figure 1. Reed relay switch building block.

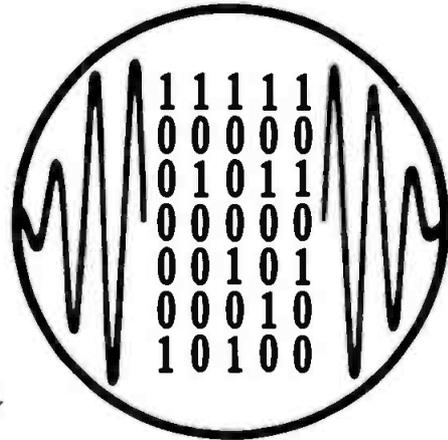

is the reed relay. The IBM 2750, introduced in the same period for voice and data switching, used thyristors for its switching elements.

True solid-state audio routing switchers came on the scene for the radio and TV market at this time. Prices, however, were and are very high, which prevented their use by most of the radio market.

In order to survey present market trends and to elicit comments, Arrakis Systems polled 1500 Midwestern radio stations through its normal brochure mailings. The response was almost unanimous. More than 95% of the stations polled use patch panels for patching around defective components and elementary switching. Nearly 20% of the stations use some form of custom switcher based on relays or mechanical switches for routing net lines, interstudio and transmitter lines. All those polled saw the need for a reliable, easy to operate, inexpensive audio routing switcher. Complaints were that rotary and push-button switches were unreliable and that electronic switchers were much too expensive.

You'll save time, trouble, testing -and money- with ADC Custom Jackfields.

Standard Longframe Jackfields

If you consider the cost of your time, building your own jackfields is expensive. ADC can deliver pre-wired, pre-tested custom jackfields in just 2 to 4 weeks. And they're priced from 20% to 50% below your do-it-yourself costs.

We offer various configurations including your choice of options such as: choice of panel size, longframe (1/4"), or bantam jacks, wire wrap or solder assembly, variable cable lengths, choice of normalling configuration and types of terminations.

When complete, we thoroughly inspect and computer-test every circuit, every connection to make sure the unit operates to specification. That's why we can back every unit we produce with a five year warranty. And our 40-plus years' experience in building jackfields for the telephone industry helps us make these reliable units:

Standard Longframe Jackfield—One of our most popular jackfields shown here with jacks mounted in a 1 3/4" panel. This unit shows normals, tip, ring and sleeve wired out to a terminal block. We also offer 240 other low-cost configurations.

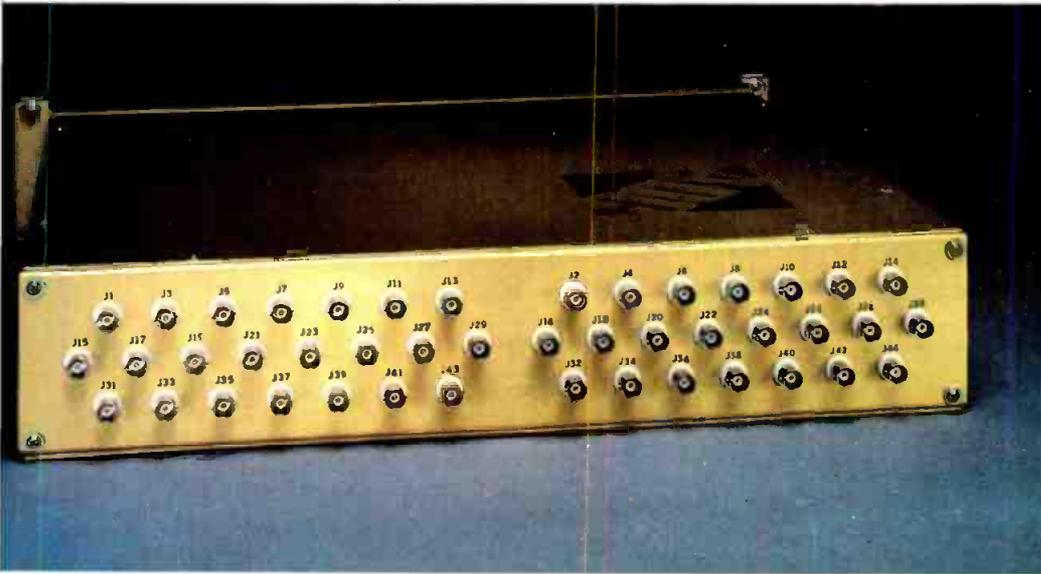

ADC Pro-Patch Video Jackfield is the newest offering in our broadcast jackfield line. Shown here in rear view, this unit features self-normalling loops that are internal to the jackfield. Loops are color phase compensated for cross-patching. No phase shift occurs between self normal and patch cord.

ADC Pro-Patch Audio Jackfield is another new member of the family. This configuration incorporates pin and socket termination that allows instant making or breaking of normals, and eliminates soldering at the patch bay, thus reducing installation labor costs.

For more information about ADC Custom Jackfields call our toll-free hotline today. 1-800-328-6188. In Minnesota, call (612) 835-6800.

Audio switching

It is easy to understand the widespread use of patch panels and rotary switches when you contrast the \$200 price of a 24-by-24 stereo patch panel or \$150 price of an 8-by-8 stereo switcher using rotary switches with the \$3000 plus price for an 8-by-12 stereo audio electronic routing switcher.

The 1980s and 1990s, however, are going to see staggering technological and procedural changes. Satellite downlinks will particularly effect the

radio market. Microwave links from satellites are capable of bringing hundreds of high fidelity simultaneous audio channels to any radio station. With satellite links costing less than \$20,000 installed, unprecedented flexibility in programming is possible at a realistic price.

The question is now raised of what we can do with even 10 simultaneous audio channels. Patching is possible and is certainly the cheapest way. Unfortunately, programming will be 24

hours a day and a patch panel, rotary or push-button switcher cannot be automated or set with a timer. The audio routing switcher will undoubtedly prove useful in these applications.

The National Public Radio Satellite Net is a perfect example of the situation that most stations will face eventually. The satellite can potentially microwave down simultaneous channels. Any one can be mono or any two can be combined to form stereo. Not all of this programming can go straight on the air. Most are recorded for future airing. Two local stations exemplify the wide range of possible approaches. KSMU, Springfield, MO, used toggle switches to pair demods and the patch panel for switching. KSOZ, Branson, MO, has combined a Ramko routing switcher with a Chronotimer and the station's own controller to perform the same function. It costs KSMU less than \$100 and KSOZ almost \$6000.

A list of companies that produce audio routing switchers, plus specifications and prices, appears in Table I. The switchers start out at approximately 8-in by 12-out stereo, costing approximately \$3000. This is the Ramko Research switcher, which stands out as the least expensive. It achieves this by a design aimed directly at the radio market. The majority of available switchers are designed for audio follow video for television. For many of these, audio only is available separately. The average price for these switchers is \$40 per crosspoint. That comes to the \$7000 and \$8000 range for 8-in by 12-out stereo. Devices used to form the crosspoint vary from unit to unit, and so do the basic specifications of distortion, noise and bleed-through. Most of these switchers are modular and may be combined in series and parallel to form larger stereo switchers.

Audio routing switchers are made up of simple building blocks. Generally, there is a differential input buffer amp. This input is sent to a switch card with a 1-by-10, 1-by-20, or larger solid-state switch matrix. The switch card plugs into a motherboard with the output bus. The output bus connects to the active balanced outputs.

The switch matrix is almost universally controlled with a BCD digital control bus. Control of the routing switcher can then be as simple as a thumbwheel switch or as flexible as a microprocessor.

Although audio routing switchers are useful now and have become attractive for use with satellite links, their prices are still far from attrac-

Audio switching

tive. To form an idea of future price trends, I spoke to several engineers and marketing managers at a number of manufacturers. The opinion was unanimous. Although prices have decreased about 30% in the last five years, everyone expects prices to begin heading up rather than down. Certainly there is no expectation of any of today's technologies producing a radical price decrease.

All of the basic switching technologies have been around for 10 years or more and are well-established. The forces that produce price decreases in established technologies are increasing volumes or denser integration in ICs. The telephone industry uses tremendous numbers of reed relays, which is the main reason for their comparatively low price. The CD 4016 and CD 4051 are examples of what we face with IC technology. The CD 4016 is a quad-bilateral CMOS switch that has been on the market and well-established since the early '70s. Price per switch is 16½ cents. The CD 4051 is a CMOS single-pole 8-throw switch with BCD decoding that has been on the marketplace nearly as long, and is 13½ cents per switch. Further integration along the lines of the CD 4051 is possible. A 40-pin chip with one input switched to 32 outputs by five binary control lines could be built. It would combine the circuitry of four CD 4051 ICs on the same chip. Because of chip

size, this is about the limit of integration and would require large volumes to bring the price much below the \$4.50 price of four CD 4051 ICs on the market today.

In light of the present high prices and the unique switching requirements of each individual station, it is likely that we will see a lot of custom switchers in the next years.

Current audio switching is based upon a number of solid-state and mechanical devices. These include in approximate order of increasing cost:

- CMOS ICs;
- junction FETs;
- thyristors;
- LDRs (photoresistors);
- reed relays;
- telephone type mechanical relays; and
- mechanical switches (rotary, push and toggle).

Current designs in routing switchers revolve basically around CMOS ICs, JFETs, LDRs and reed relays. Each of these devices has its own special strengths and weaknesses. A set of schematics with performance data and pricing is presented for each of the four basic switches throughout this article. These schematics are designed to facilitate cookbook design of custom switchers.

The important parameters of these four devices are cost, size, performance and reliability. Performance is

broken down into distortion, noise, level, power, bleedthrough and switching transients.

The CD 4016 is the least expensive of all audio switchers at 66 cents per hundred. It has four CMOS switches with input, output and control accessible at the pins. Each switch costs 16 cents. This compares favorably with the reed relay at about \$4 for a SPST switch. The CD 4016 is the building block of Ramko audio routing switchers and is one of the major reasons for the switchers' competitive prices. The chip comes in a 14-pin DIP package and has excellent reliability. Buffering the inputs and outputs of the switches is highly recommended to eliminate static discharge problems and improve switch performance.

Performance of the CMOS switch can be adequate if the input and output circuits are designed to limit signal level to the switch. Distortion is a function of signal level, supply voltage and control voltage. With a 15V supply, a 10,000Ω load, and a 5V peak-to-peak input signal, distortion is 0.2%. As the signal increases further, distortion increases rapidly. To handle levels as high as 18dBm, an attenuator must be placed before the switch and then again be placed after it. Signal-to-noise suffers slightly, but this is a worthwhile tradeoff. The Ramko switcher uses this technique to reduce distortion. Lab tests show it to have less than 0.1% distortion at 8dBm output with a signal-to-noise of 75dB.

Unfortunately, there are switching transients because the CMOS switches are in integrated circuit form. The CD 4016 uses two complementary CMOS transistors to form the basic switch. One gate is directly accessible but the other is buffered by a CMOS inverter. It is therefore impossible to control the rise time of the control signal to the switch. A switching transient of as much as 0.4V is coupled through the gate to source capacitance. With a discrete device, an RC time constant can limit the rise time of the control signal and reduce the transient to inaudibility.

Bleedthrough (crosstalk) is 75dB at 1kHz and -60dB at 20kHz. Overall, the performance of the CD 4016 is moderately good. It is inexpensive and reliable. The only drawback is the switching transient, which in many applications is not a problem.

Junction Field Effect Transistors (JFETs) are often confused with CMOS FETs. However, they are actually bipolar transistors that use the depletion layer of a reverse-biased PN

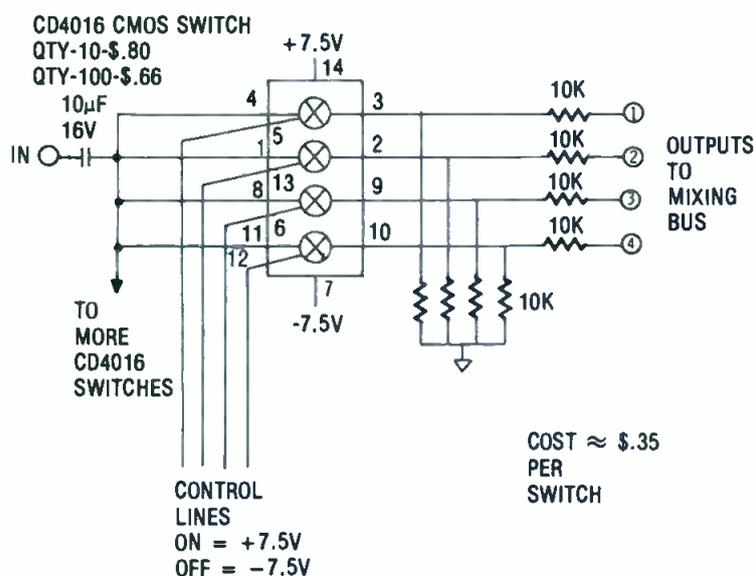

Figure 2. CMOS IC switch module.

If you've pledged allegiance to the American red, white and blue...

Barco can give them to you, brilliantly. Thanks to our new **American Standard Phosphors**, we can also give you increased compatability with broadcast network colorimetry and precise color reproduction to tolerances of ± 0.005 . But Barco also gives you freedom of choice because we can still offer you E.B.U. chromaticity coordinates, if you prefer.

Whatever Barco unit you choose, rest assured you'll get all the versatile Barco features you've heard about. Features like modular construction, delta and inline tubes, as well as different screen sizes and resolutions to choose from. And those are just some of the reasons why Barco has become the standard of the industry, there are plenty more.

Check out our numbers.

Audio switching

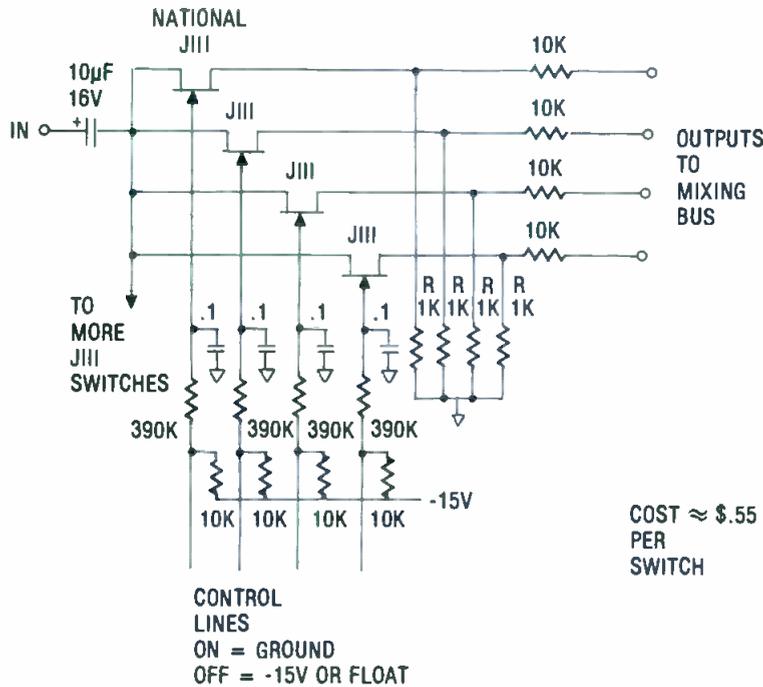

Figure 3. JFET switch building block.

junction to modulate the resistance of a narrow channel. They are not subject to static discharge problems any more than any other bipolar transistor is. They are low-noise, easy to use, and relatively inexpensive. National's J111, a JFET that I have had a great deal of experience with, costs about 30 cents per hundred. The JFET is the basic building block of many routing switchers.

The JFET as a switch is similar in certain respects to the CMOS switch. A gate voltage turns it on or off. Distortion increases as signal level approaches the cutoff voltage. Transients are coupled through the gate to source capacitance. The level of the transient depends on the rise time of the gate control voltage and can be reduced to inaudibility with a 1- to 10-second rise time. The J111 costs almost twice the amount per switch as the CD 4016. It is equally reliable. Four J111s will fit in the same space as a 14-pin DIP. The CD 4016 uses two CMOS devices in a complementary parallel arrangement to overcome inherent deficiencies, but the JFET can be used to stand alone.

JFETs may be used in two basic ways for audio switching. They may

There's something to be said for bringing recording technology into broadcast audio...

"...it's reliable...clean...quiet...and affordable!"

New Gould portable video monitor/ oscilloscope lets you select by number any line of composite video.

Meet our new OS3350/5. It's the first-ever NTSC 525-line waveform monitor, complete picture monitor, and 40 MHz oscilloscope combined in a single, portable package.

Through an onboard time-base generator, it lets you examine each of the composite video signal's 525 lines—one at a time. PAL plug-in available.

Or you can display complete pictures, highlighting any line selected for inspection to show the relationship between waveform and picture.

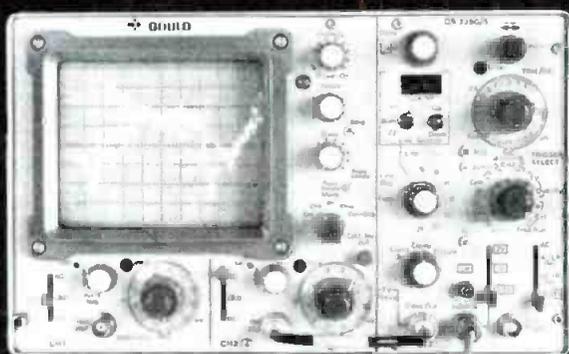

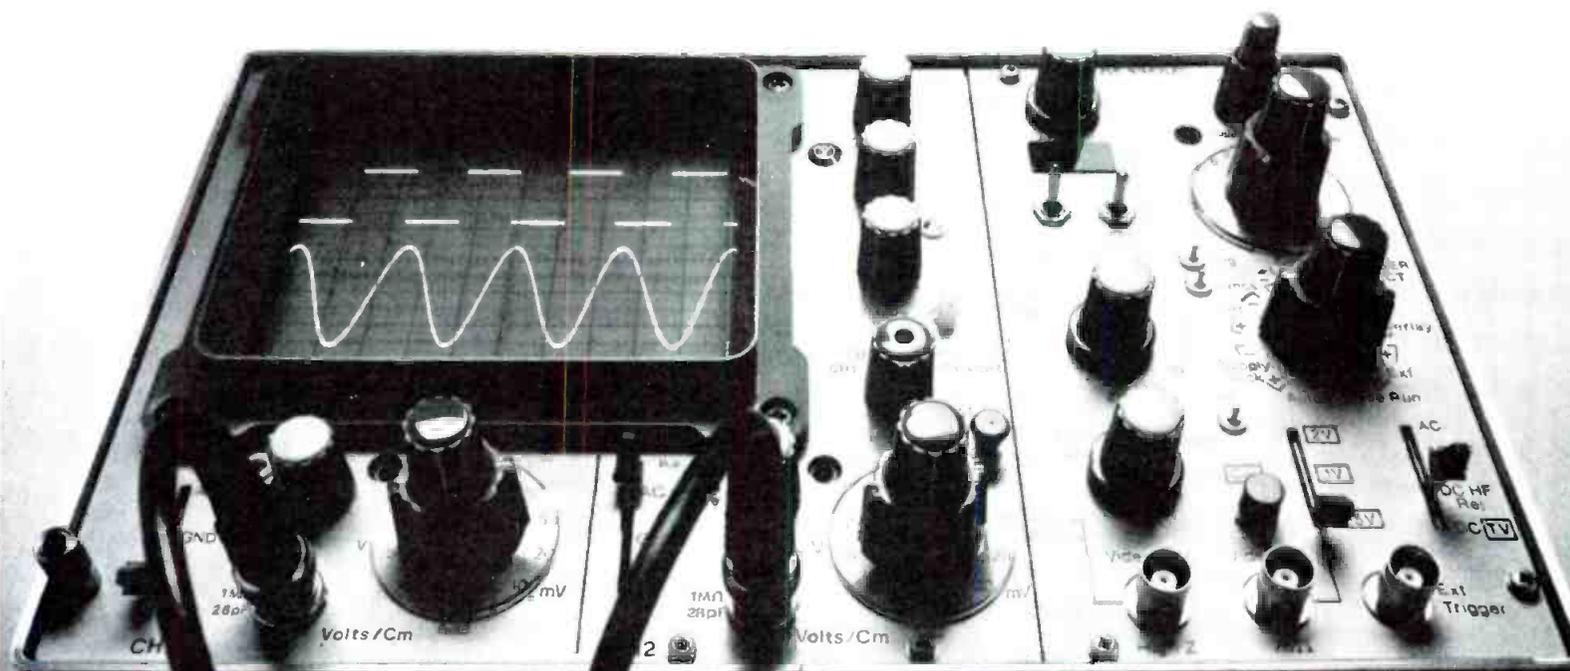

And finally, our OS3350/5 functions as a general-purpose 40 MHz, 5mV/cm dual-trace scope.

Our compact monitor/oscilloscope is suited for testing and troubleshooting TV, CATV, CCTV, video recorder/playback and other equipment in mobile TV, microwave repeater, broadcast station, institutional, military, plant and production-line applications.

For more information, contact Gould Inc., Instruments Division, 3631 Perkins Ave., Cleveland, OH 44114. For brochure, call 800/331-1000. In Oklahoma, call collect 918/664-8300.

Audio switching

be used in series or in a series-shunt arrangement. The series switch is self-explanatory. The series shunt switch uses a series JFET and then a JFET to ground. The first JFET is on while the second is off and vice versa. The primary purpose of this arrangement is to reduce bleedthrough through the switch when it is off. Contrary to popular belief, the simple series JFET is capable of better than 75dB of attenuation at 16,000Hz, as demonstrated by the circuit (Figure 3). The trick is proper choice of device, circuit impedances, gate drive and proper PC board layout. As with the CMOS CD 4016, the JFET will normally be operated in a buffered arrangement with an op amp input and op amp output.

In summary, the JFET is much like the MOSFET. It is slightly more expensive, but has slightly higher performance and is immune to static discharge. JFET switch ICs such as National's LF 11508 are also available.

Photoresistors have sometimes been used for audio switching. They basically represent a light source that is coupled to a photoresistor material. These devices received a bad name from the early photomodules that used incandescent light sources. These early photomodules had poor reliability and tended to shift resistance with age. Modern photomodules, typified by Clairex CLM 6500, use LED light sources and have excellent reliability and stability.

The Clairex CLM 6500 comes in a small package about the size of an 8-pin miniDIP. Their price, \$2.40 per hundred, is roughly 10 times that of a CMOS or JFET switch.

The photomodule must be buffered by an op amp to match impedances. The photomodule is not level sensitive. The CLM 6500 varies from 300Ω to about 10MΩ depending on LED current. It is, however, completely resistive and therefore has no distortion. It also has no turn on transient because it uses light to turn on and not a voltage that can couple through internal capacitance. These features make this device desirable as an audio switch.

Unfortunately, the off resistance is not sufficiently high to give reasonable attenuation of more than 60dB at 16kHz. This doubles the cost of a photomodule switch to nearly \$5. The series shunt arrangement also requires two drivers. The LED must be driven by about 20mA to be fully on. This is in contrast to the CMOS and JFET switches that require drive current in the microamps.

In summary, the photomodule has

some good and some bad qualities that make it useful for certain applications in which absence of distortion and switching noise are more important than cost.

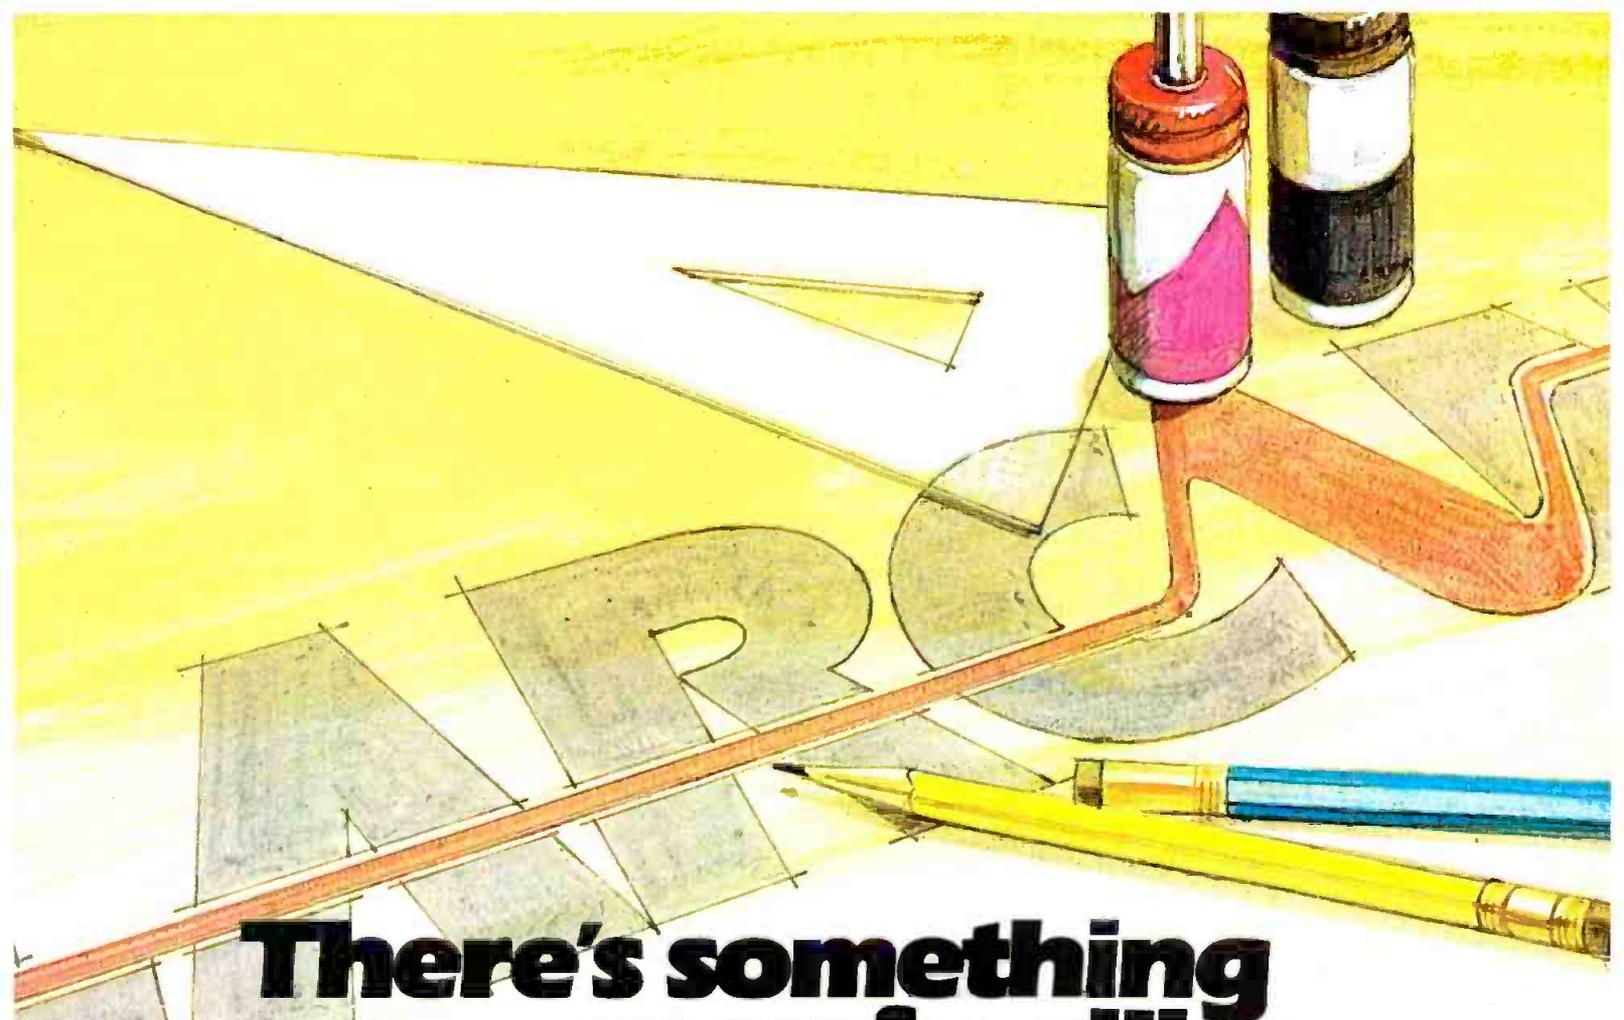

Reed relays are the ultimate mechanical switch in many ways. They are small and may be purchased packaged in DIP form. Many are designed to be switched by IC compatible currents as low as 10mA. They feature high reliability. Life can exceed 100 million operations. The reed relay introduces no noise, has no distortion, accepts 24dBm signal levels, has low bleedthrough at audio frequencies, and does not have a switching transient if placed in the circuit properly. All this comes at a price of about \$3.50 for an SPST switch. Quantity has very little effect on price. A DPST switch costs almost exactly twice the price of a SPST switch.

To summarize, the reed relay costs more than 20 times the cost of a CMOS switch and 10 times the cost of a JFET switch. It is used in several of our current audio routing switchers. The only advantage of the CMOS and JFET switches is in switching power. A SPDT reed relay draws about 150mW in contrast to the FET switches that can draw microwatts. Other than this one point, the reed relay is a nearly perfect audio switching device. There is no signal degradation at all.

It must be pointed out that the CMOS and JFET switches do not act alone. They both require the use of input and output op amps for buffers. These buffers enable the switches to mix channels and create multiple feeds. However, if strictly crosspoint switching is required, these op amps with associated circuitry can make the price of a small crosspoint routing switcher using CMOS or JFET devices comparable to the price of one using reed relays. For larger switchers, the number of crosspoints per input buffer would increase to make the reed relay switcher again much more expensive.

Routing switchers, whether custom or off-the-shelf, are going to be expensive. We have also seen that they will likely remain expensive for some time to come. Fortunately, there are some emerging technologies that should begin to effect the field in the late 1980s.

Current audio routing switchers use what is called space division switching. This means that there is a bus line assigned to each output, which means that a 50-by-50 switcher must have 50 bus lines. Each input must then have 50 switches to be able to switch to any

There's something very familiar about us.

For more than 30 years, broadcasters have relied on our equipment, and we've grown in step with the industry. We've supplied more than half the broadcasting equipment now in use in Canada.

We're the only Canadian company that designs and builds a complete range of transmitters and antennas for radio and television broadcasting. Only one company fits that description — and now we have a new name, LARCAN Communications Equipment Inc.

Canadian General Electric has sold its Broadcast Equipment business to its managers and employees, in partnership with LeBlanc and Royle Communications Inc. The initials of that totally employee-owned Canadian company, active in communications tower design and installation, inspired the new name, Larcán.

The people, the plant and the equipment are the same. We still design and manufacture state-of-the-art equipment like the Model F VHF and UHF Television Transmitters, FM Broadcast Transmitters and Ultrapower Antennas in Rexdale, Ontario.

The new company has assumed all existing warranties on CGE broadcasting equipment, and the high level of service you've come to expect is assured.

Larcán, with expanded product lines and marketing efforts, invites you to meet some familiar faces at Booth 2736 during the NAB Convention in Dallas, from April 4 to 7. **We'll talk about new times.**

Audio switching

output. This is 2500 total switches.

There is one other basic type of switching available today: time division switching. Time division switching has been used by the telephone company for more than 10 years in the ESS 101. This system converts the audio to an 8-bit digital code that is sampled at 8000 c/s. This means that each channel has 64,000 bits per second. The bits from each channel are then sped up and fed to a single bus line in sequence. In other words, channel one sends eight bits, then channel two sends eight bits, and then channel three and so on until it is time for number one again. Each output channel then needs only be assigned a time slot in the data stream. The input channel need only change time slots to change outputs.

The telephone company has been doing this for many years to save on wires. Of course, the telephone company does not have to reproduce high fidelity sound. Although each input does not require a switch for each output, each input does require an A/D converter. An A/D converter that will reproduce high fidelity sound is very expensive. However, the cheap A/D converter is the central part of the

Discover
the ~~best~~ **worst**
kept secret in
wireless mic's—**NADY SYSTEMS**

The word is out!

After only a few years on the market, Nady wireless mic's are already the only choice of the top pop and rock entertainers. Now the expanded Nady line is rapidly becoming the choice in wireless in video and film production.

What's the secret? Nady Systems' U.S. Patent #4,215,431—the biggest breakthrough in wireless mic performance ever. Sure, others claim to be the best, but only Nady Systems delivers the proof so obviously in any A/B comparison. Discover for yourself Nady Systems' full line of superior wireless mic's and wireless intercom systems. Discover for yourself matchless performance that is surprisingly affordable.

Nady Low-Noise circuitry is covered by U.S. Patent 4,215,431.

TIRED OF BROADCASTING FROM A PRESSURE COOKER?

SOL-6800

THE BROADCASTING SYSTEM DESIGNED TO TAKE THE PRESSURE OFF.

- ✓ Reduces make goods drastically
- ✓ Increases prime time dollar return
- ✓ Improves operators' efficiency
- ✓ Minimizes operator training
- ✓ Improves master control work environment

- Controls up to eight VTR machines using remote connectors
- Programs real time or asynchronous events
- Offers built-in multi-configuration audio-video switcher
- Features built-in keyboard and alphanumeric display
- Provides manual override
- Furnishes optional software for communication link with master computer
- Offers optional software to link with station master clock
- Provides programmable fill in and emergency inputs

DIGITAL TEST GENERATOR

DTG-1000N

- The DTG-1000N features five identical and independently microprocessor controlled 10-bit test signal data stores with precision D/A converters.
- Each data store contains 35 computer generated, standard and new test signals in EPROMs.
- Menu style listing of all available test signals on local and remote control panels together with full status indication makes test signal selection easy.
- Internal RS170A sync generator for genlock and accurate system phasing maintains zero SCH at all times.
- Five standard trigger signals can be locked to any test signal selection from data store #5 and retained in memory.
- Auto correlation of auxiliary trigger signals to data store #5.
- Power down memory.
- Remote control up to 1000 feet for each data store.

Real time subtitles for the Royal Wedding were inserted by the BBC to help the hearing impaired. This was the second time in history for such captioning, the first being for President Reagan's Inaugural Address.

The Cromemco Z-2H Computer System.

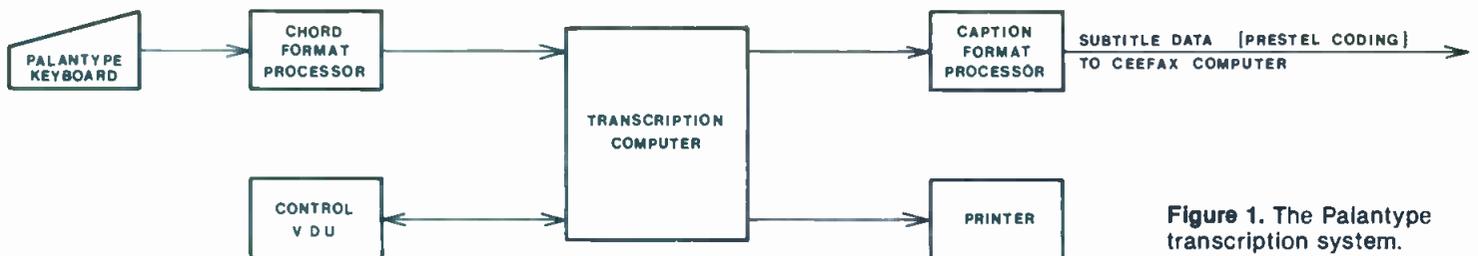

Figure 1. The Palantype transcription system.

Real time subtitles for TV

By Bill Hawkins, head, Recording Section, Designs Department, BBC, London

The wedding of his Royal Highness Charles Philip Arthur George, Prince of Wales, and Lady Diana Spencer on July 29, 1981, provided a unique opportunity for a nationwide broadcast for the benefit of the entire hearing impaired community in the United Kingdom. As part of the celebration, arrangements had been made for the marriage ceremony in St. Paul's Cathedral to be broadcast on BBC1 together with the procession before and after the service. It was also decided to broadcast the same 3-hour program on BBC2 with open captions.

Although it was fairly straightforward to prepare subtitles containing information on known situations, the live commentaries presented a serious problem that had to be solved.

Fortunately a technique is being developed in the BBC's Engineering Designs Department that promises real time, verbatim transcription of

speech using Palantype machine shorthand. When completed, it should prove to be a useful tool in subtitling live and recorded programs as part of the Ceefax services for the hearing impaired. Subtitled programs are usually broadcast on the nationwide teletext service of Ceefax and Oracle in the United Kingdom. (There are 300,000 teletext sets in use.) The BBC's Ceefax pages 170 and 270 regularly provide such programs.

In all, four caption generators were used on the wedding day. Two were operated in a conventional manner using material prepared on floppy disc before the broadcast, and two others were used for the verbatim transcription. The palantypist keyed the speech phonetically into a special keyboard syllable by syllable. Its output was fed to a transcription system that matched the syllables to the contents of a dictionary held in store on a 10Mbyte Winchester hard disc. As each completed word was found, it was passed to a small output formatting microcomputer that assembled the words into a single line of text and then to an Aston II character generator. The system was completely duplicated and included changeover arrangements should any part fail. But, during the wedding those reserve arrangements were not required.

The three palantypists used for the work had spent some time before the

broadcast practicing on their normal mechanical keyboards with audiotapes of the same commentator's work on previous state occasions. With just two days to go, the installation was completed and it was only then that they could try out their keystrokes using the computer system in its final form. They rehearsed their changeovers about every 10 minutes.

However, during the wedding, the rate of speech was much faster than the audiotapes had suggested, and this, coupled with the atmosphere of a special occasion, caused the error rate to be higher than expected. Under more relaxed conditions, the error rate is lower, and the palantypists can easily correct their work during the subsequent typing of the shorthand records.

Real time, verbatim transcription offers no such second chance: the subtitles have to go out as they are. Nevertheless, the gracious response from many hearing impaired people was encouraging and, at times, moving—even though the operation took place during a development program.

Extended usage

There are, of course, two possible uses for a machine shorthand system in this context: subtitling unscripted, actuality broadcast; and subtitling recorded programs more efficiently than at present. The BBC Palantype

Editor's note:

As with its teletext developments, the British broadcasters and industries have taken an active interest in creating meaningful captions for television to aid the hearing impaired. Just three weeks before the Royal Wedding, I toured England and discovered that the BBC was developing a new system to implement captioning in real time to report this popular event...a system new in scope and dimension even though portions of the system had been used once before.

When I was in England, the BBC staff was not sure that the updated captioning system would be ready for the Royal Wedding coverage. But it was, even though development work on the system continues. Because of its pioneering nature, we asked the BBC to report here on the success of this effort.

Storeel is dedicated to conserving energy. Yours.

Energy conservation is much in the news these days. Like the weather, many talk about it but few do anything about it. We haven't figured how to change the weather, but we do have several systems specifically engineered for broadcasters that both conserve energy and add efficiency. The very latest (shown installed) is called STOR-MAX.™

Save energy (yours) by converting your overcrowded film and VTR libraries to the new "Instant Access" high-density systems engineered and distributed only by Storeel. Modular Rapid Transit Storage™ maximizes units stored per square foot of floor space, minimizes retrieval time, optimizes energy efficiency.

Our many years of design and engineering pay off in solutions to your storage problems.

Call or write "The Railriders" at Storeel today for free estimate. No obligation, of course.

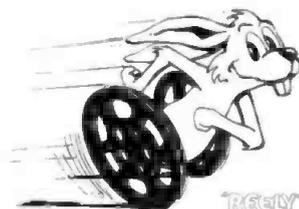

Illustrated catalog of Storeel's "confusion eliminators" available upon request. Write on your letterhead or telephone for your free copy.

See us at the NAB in Dallas, Booth 3205.

Subtitles

transcription system is a result of a collaboration between the BBC Engineering Designs Departments and Leicester Polytechnic where various transcription programs were written. The work at Leicester Polytechnic continued work begun in the mid-'60s by Dr. Wyn Price at the National Physical Laboratory. However, the latest computer programs, originally developed on mainframe computers, are now running on a Cromemco Z-2H microcomputer using 192kbytes of random access memory and a 10Mbyte Winchester disc system.

Before this broadcast, the transcription dictionary held in the machine contained a significant number of errors because of changes in operating techniques since it was first compiled. As a result, the commitment to subtitle the Royal Wedding meant that it had to be updated with 20,000 new entries. These entries were merged with the old, and a new dictionary tree was reconstructed by Lyndon Thomas at Leicester Polytechnic on the large computer. The results were then downloaded onto the hard disc of the microcomputer. Unfortunately, the scale of the update was such that it became available only a few days

before the broadcast. The producer of the subtitled program had researched the subject thoroughly and provided the Palantype team with a number of specialized words that were fed into the transcription computer. Also, he prepared the floppy discs for the conventional system, capable of naming the occupants of carriages and notable personalities, and displaying all the words of the wedding service in the Cathedral.

These captions were composed using black-edged, yellow letters to differentiate them from the black-edged, white letters of the verbatim subtitles. There was a high degree of redundancy in the commentary when one viewed the picture and linked it with the prepared factual subtitles from floppy disc, but the words of the commentator gave an air of spontaneity to the broadcast so that the hearing impaired audience felt involved. It is possible that any attempt at concise summary under these circumstances might lead to a series of bald statements which, although being accurate, would not convey the atmosphere of the occasion.

Problems remaining

There are still a number of problems that are minimized: the delay of approximately five seconds before the tran-

scribed subtitle appears; the difficulty of handling a large number of proper names that may be unfamiliar to the palantypist; and the improvements that should be made to make the captions more acceptable to the audience. As much as possible should be done to improve the accuracy of the transcription. Even though the dictionary was updated to ensure that its contents conformed to modern operating practice, some characteristic errors remain and must be investigated. The operators will need sufficient practice to become accustomed to the live broadcast environment.

The automatic compilation of 2- and 3-line captions should be provided to enable easier reading and understanding of the material; in displaying complete packets of meaning on the screen the viewer will become more relaxed. It may be that a special commentator speaking somewhat slower than normal speech will significantly reduce the number of transcription errors, allow the audience time to perceive the subtitles, and give the operator experience in this new broadcasting field. If the technique is to become widespread, a comprehensive training scheme for more operators will be essential and, perhaps using a larger transcription computer, error correcting techniques

INTRODUCING MINI-TP

U.S. PATENT No. 4199220

An entirely new revolutionary mini-size testing device with 72-77-86 mm adaptors for mini-cameras that greatly facilitates camera set-up and registration in the field:

MORE THAN A TEST PATTERN!

MINI-TP is a precision optical instrument that checks over 14 parameters between camera and optical system. Indispensable for cameramen and maintenance men: presents an infinity target for precise back-focal adjustment and associated yoke rotational

adjustment. MINI-TP is compact, lightweight and practical for field or studio use. It attaches to the lens for fast, accurate, optical and electrical adjustment, and performs more vital new services for all cameramen. Find out for yourself what it can do for you from:

may be incorporated.

Clearly, those viewers who saw the broadcast as an example of the automatic generation of accurate captions were disappointed at the results. They are accustomed to programs that they can understand with the help of the picture and sound channels. They look upon the printed word more often as supplemental, which is not the case with the hearing impaired. The positive response indicated that the hearing impaired audience enjoyed the broadcast because they understood what was going on. They also saw it as a promise for the future, even though it took place during a development program and was only the second of its kind; the first being the live verbatim transcription of President Reagan's Inaugural Address in January 1981 on the BBC1 Ceefax service.

Perhaps it is appropriate to quote from two of the letters received as a result of the broadcast. For example, "On behalf of those 50 or more deaf people from the Borough of Bromley who were gathered around four large televisions to watch the coverage of the Royal Wedding, I would like to thank you and your team for such splendid subtitling cover of the day's main event. Prior to BBC2's plans, it had been our intention to interpret into sign language the whole of the procession and service. What a marathon it would have been for us to interpret the procession and service into sign language! We are pleased to say you made us almost redundant. The more elderly in our gathering had more problems in understanding some of the Palantype, and some words produced amusement. However, for me it was good to see an actual translation of the commentary. Please pass on our thanks, particularly to the palantypists who made the day complete for thousands of deaf people."

Or again, "Please accept my sincerest thanks for subtitling the Royal Wedding from start to finish. As a person to whom a hearing aid is of no use for the spoken word, I was glued to the screen all the time. It was really wonderful to feel that we (the deaf) could enjoy the proceedings with so much knowledge of what was happening."

The equipment is still in the development and experimental stage and has made two live broadcasts because of the special opportunities and broad interest presented by those occasions. But at least one consideration is clear: The needs of the hearing impaired audience are special and must not be judged by everyday TV audience criteria. □

Problem solving: Stereo tape cartridge phasing

By Dave Howe, president, Howe Audio Productions Inc., Boulder, CO

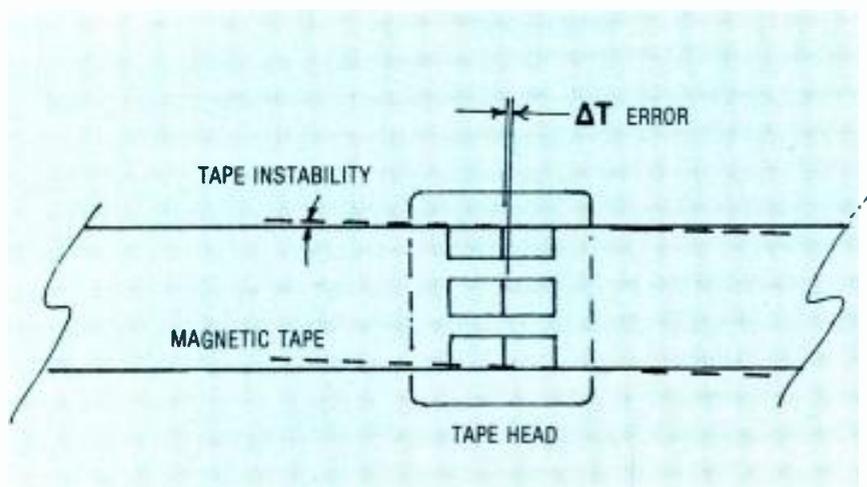

Figure 1. Instability in the motion of the tape past a tape head causes a subsequent time (hence, phase) error between audio tracks.

The convenience and improving quality of tape, tape cartridge, and cassette formats have led to their increased use in broadcasting. Although many advancements have been made in tape drive technology, the problem of aligning and stabilizing the audio phase relationship between two playback channels of a stereo tape format still exists. The effect of bad cart phasing appears most obvious when taped stereo channels combine in the playback process. Audio information originally in phase in both channels is played back more or less in phase along with relative phase fluctuations caused by instabilities of the tape moving past the heads (both in recording and playback stages). Figure 1 shows a track-to-track time error caused by this instability.

For a listener, the channels most often combine in the space in front of a pair of loudspeakers. Of course, direct combining occurs when the playback is rendered in monaural. In FM stereo, some receivers introduce a direct combining of signals at high frequencies (*hi-blend*), trading separation for lower noise. Increased noise is considered more objectionable than loss of high frequency stereo separation.

Channel-to-channel phase instability appears in the combining process as an easily distinguishable loss or change in the high frequencies, a "whirling" effect, or even a hollowness in the medium frequencies. A time-delay error between channels causes high frequency audio signals to be combined out of phase. The frequency at which out-of-phase cancellation occurs becomes lower and more noticeable as the time-delay error increases.

Matrixing

The problem of phasing has become so severe in tape cartridge formats that some manufacturers of cartridge machines are advocating matrix recording and playback. This process records $L + R$ in one track and $L - R$ in the other. There are possible problems with this approach.

First, matrixed 2-channel cartridge recording does not solve the fundamental problem. It simply reintroduces it in another form. If there is phase instability, there will be instability in the matrix decoder, hence a poor stereo image for the listener.

Second, signal-to-noise is considerably degraded. Most stereo material has more $L + R$ than $L - R$

This article expresses the personal views of the author, not necessarily those of this publication nor its advisory board. The author's views are presented here as information for BE's readers, and readers are urged to write concurring or opposing views to our *Feedback* column.

Vital Industries has instituted a cost-saving manufacturer-financing program - applicable to any Vital equipment purchase.

In accordance with our longterm commitment to more responsive television industry service, equipment purchases are being directly financed by Vital Industries itself **at 10% interest.**

Recognizing the barriers raised by prohibitively high interest rates, this financing program is offered well below prime — to permit prompt acquisition, without delay, of the advanced programming and operational systems so essential to productivity and profitability.

This bottom-line economy adds to the special advantage Vital offers TV management: **a complete line of switching, video effects and station automation equipment, available from one single source** — 25 sophisticated system options, totally line compatible. Including production and post-

production mixers and switchers, plus our exclusive digital video manipulation system, the versatile Squeezoom[®]. All are state-of-the-art products of Vital's innovative technology; and all are now available with Vital 10% financing.

This low-interest opportunity is made possible by Vital Industries' unique financial strengths, solidly established by nearly two decade's stable performance and continuing growth. Now the largest U.S. independently-owned manufacturer of TV switching, effects and distribution systems, Vital can draw on corporate resources available from few other suppliers.

For full program details, contact our Finance Department:

Stereo

audio. A voice announcement driving both left and right equally in-phase has no L-R audio. The L + R track must be recorded 6dB lower in this case vs. the conventional L and R 2-track method (because L + R equals twice L or R). Furthermore, additive noise from the L-R track is directly mixed into the output. Being random, its contribution is a 3dB increase in noise. The net effect is a 9dB degradation in signal-to-noise for a common cartridge presentation.

Dynamic noise reduction has also been recommended to solve the noise problem of matrixed 2-channel formats. This suggestion leads to questions. Which noise-reduction technique should be used? What about the highly discussed issue of the audio effect and quality of all approaches? How much will this cost? Is it compatible with non-noise-reduced playback systems? Matrixing may have reached a point of diminishing returns.

Active phase correction

Over the years, tape cartridge and tape machine manufacturers have made strides in stabilizing head assemblies, the tape path and tape-to-head uniformity and stability. These are goals worth pursuing, but problems still exist. As the industry strives to make improvements to the hardware, another solution for tape instability would be the introduction of electronic compensation to the audio.

Two stumbling blocks have plagued designers of such devices in the past. The first is the question of building a circuit (voltage-controlled time delay with adequate linearity, range and stability) to correctly compensate for all the possible tape variations routinely encountered. The second stumbling block is phase sensing. Conventional phase-detection techniques fail mainly because almost all music material contains intentional, random phase variations. However, it is known that human ears can separately perceive a phase problem, so it is reasonable to assume an electronic circuit can do the same.

Such a circuit has been developed. This electronic solution to the phase problem between channels of a stereo audio signal provides stable, time-aligned output signals for optimum combining either spatially by stereo loudspeakers or for monaural compatibility. No other audio parameter is affected.

The device incorporates four separate voltage-controlled time delays, two per channel. This lowers

STUDIO OR STADIUM, FUJINON'S NEW BCTV LENSES PLAY ALL THE ANGLES.

From super-wide to ultra-tele. in the studio or the stadium, Fujinon BCTV lenses are the clear winners . . . from any angle.

NEW. Fujinon's P28x15 ESM — the super studio lens. It gives you a wall-to-wall 15mm wide angle and a maximum aperture of F/2.2 which is maintained out to ten times. Even at 420mm, the F/4.2 allows you to keep your lighting levels reasonable. And for the tightest shots, the built-in 1.7X extender takes you to 714mm. Naturally, it has a built-in diascope for near instant computer setup. But range and speed do not reveal the incredibly sharp, bright, high contrast image the new 28X delivers. Its superior resolution and color performance place it ahead of any lens in its class.

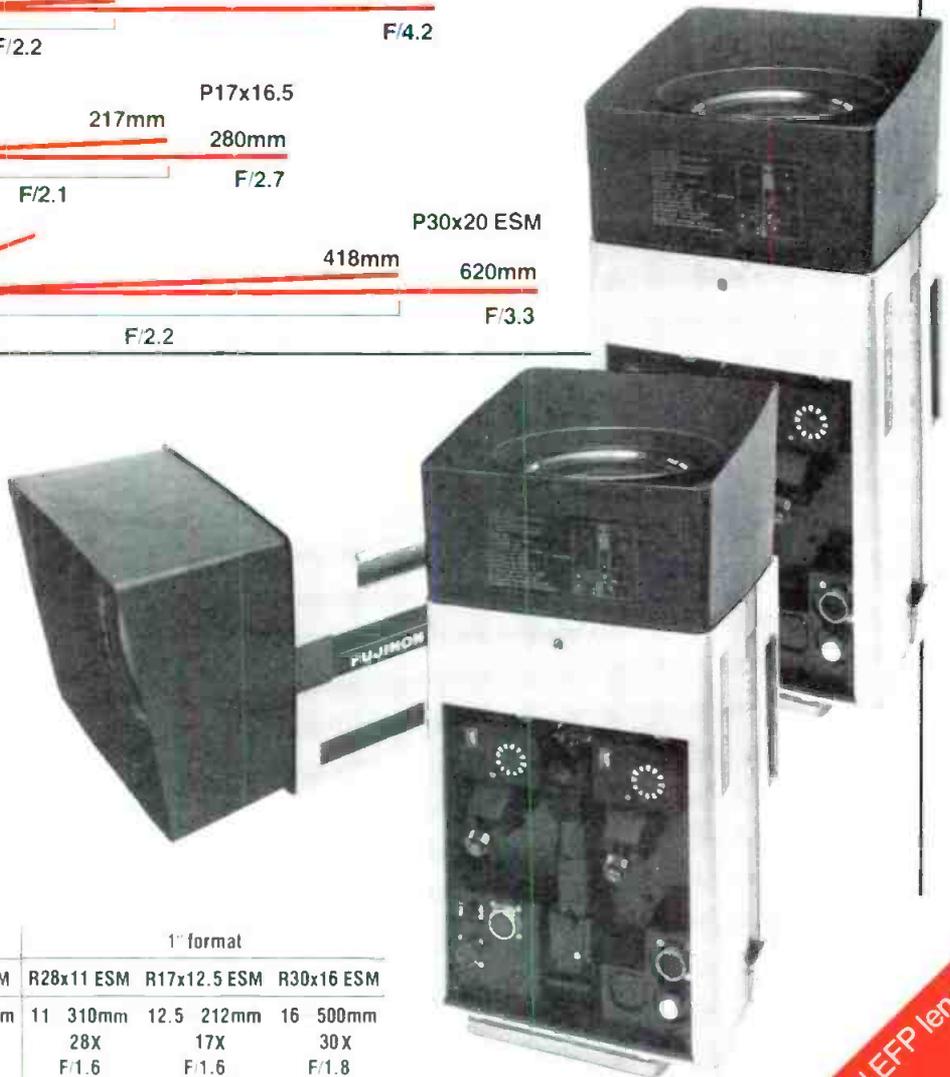

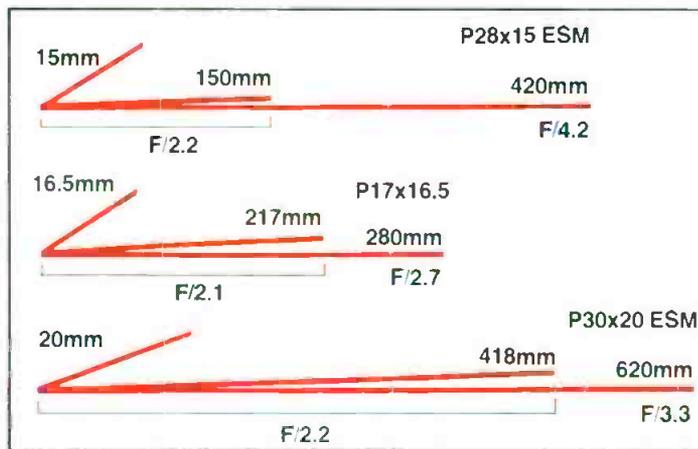

NEW. Fujinon's P17x16.5 ESM — the standard studio lens. With a zoom range from 16.5 to 280mm, an aperture which will remain flat at F/2.1 out to 217mm and built-in 1.5X and 2X extenders, here's the lens destined to be the industry workhorse for years to come. Simply put, it offers virtually every performance and operating feature — including built-in diascope — you're likely to need.

Not new. Fujinon's P30x20 ESM — the super field lens. Whether picking up the clearest shot of the space shuttle lifting off or a concert stage from the back of the top balcony, it goes out farther and flatter to deliver outstanding images . . . especially under lighting conditions that leave other lenses in the dark. Total zoom range, with the built-in 2X extender

is an incredible 20 to 1240mm. The F/2.2 aperture remains flat from 20 to 418mm — and at 620mm is giving you F/3.2. No wonder the 30X lens is acknowledged by the industry as the finest field zoom available.

For more information on the newest

and finest BCTV lenses, and why they are the best performance investment for your new or existing cameras, contact Fujinon. Large format zoom lenses are another reason why the world sees itself more clearly through the eyes of Fujinon.

Stereo

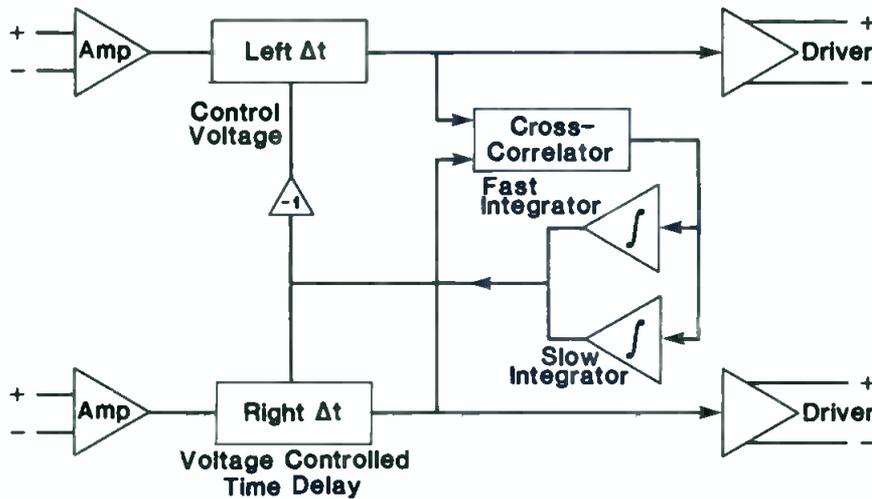

Figure 2. Block diagram of the active phase corrector. Output signals are time-aligned, thus eliminating a stereo phase error. A detector performs a time-phase analysis on regular program material to sense a phase error. Feedback loops to analog display lines correct the error.

the demand on each delay and thus improves performance. A wide variety of digital and analog delay techniques exist. The digital approaches are useful where long delays are needed, but for short delays of less than 1ms, as encountered in tape phasing errors, the analog approach has the advantage of simplicity.

The device uses only program material to determine the existence of a phase or, more accurately, a time error. No reference tones, encoding or special track formats are needed. The device uses time and phase analysis of program material in order to apply a correction.

This new circuit can be accurately described as an *active phase corrector*. The active phase corrector discussed here is aptly referred to as a phase-chaser. For comparison, a passive phase corrector describes a fixed delay network used to compensate for a fixed error such as in the matching of stereo telephone line remotes.

Phase-chasers

The phase-chaser automatically aligns the time relationship of two audio signals. It uses the audio program material to sense a uniform time difference between the signals, then applies a correction time delay (via feedback loops) to one signal to compensate for a system-related time lag.

Figure 2 shows a block diagram of the phase-chaser. The audio terminations are active balanced. The left and right audio paths are separate. Both left and right channels have analog time-delay devices whose delay times are voltage-controlled.

A relative phase difference at the outputs of the left and right analog delays is analyzed by a phase-sensitive detector. If a phase error exists, a dc signal is applied to two integrators, which add up the errors as they are sensed. The outputs of the integrators are summed, forming a correction or "steering" voltage to the time delays. The delays are controlled in opposing directions so that relative time be-

"WHY USE WELLFLEX"

Optimum Design

Cablewave Systems offers Wellflex Transmission Lines designed to meet your most stringent electrical and mechanical requirements.

Highly reliable, the unique Wellflex construction provides a combination of strength and flexibility with optimum performance.

Outstanding electrical parameters include extremely low RF loss, smooth impedance co-efficient, and conservatively rated power handling capability.

Wellflex is available with either air or foam dielectric with copper corrugated outer conductor, solid and corrugated inner conductor (depending on size), and with a tough, durable, corrosion resistance polyethylene jacket suitable for burial and prolonged life.

Air Dielectric Wellflex in smaller diameters, ($\frac{1}{2}$ " and $\frac{7}{8}$ ") offer a field proven, fixed helix design called Spirafil II - a single, continuous extrusion which locks the center conductor coaxially within the outer conductor, resulting in a near perfect impedance coefficient throughout the entire length of line.

RF transmission lines with welded and corrugated conductors are also manufactured by our associated companies in West Germany and Brazil.

Optimum Performance

Larger Diameter Air Dielectric Wellflex Cables, ($1\frac{1}{8}$ ", 3", $3\frac{1}{2}$ " and $4\frac{1}{2}$ ") feature a unique vertebra helix design to achieve optimum crush and tension strength. Its "pillar effect", using less volume of dielectric, provides lower loss and higher power handling capability due to the more rapid dissipation of heat from the center conductor.

Wellflex has it all: low loss, low VSWR, higher power handling, smoother impedance coefficient, and rugged, long dependable life.

Cablewave System's Wellflex is type accepted for sampling systems in accordance to FCC Part 73.68.

Stereo

tween the channels will advance or retard. Feedback loops then drive the time difference to zero equilibrium. Fast and slow feedback loops are incorporated, because the instabilities are best characterized by a fixed relative delay along with fast time fluctuations in limited range.

For the fixed (or offset) time delay, the slower correction loop establishes a nominally zero phase difference. The time constant for this zero point reference platform is user adjustable from 0.5 to 10 seconds. The faster loop responds within a millisecond to quickly varying phase fluctuations around the zero point. It has a limited range of $\pm 20^\circ$ measured at 5kHz.

Figure 3 shows X-Y oscilloscope displays of the input and output of the phase-chaser for a tone at 5kHz. Left channel is the vertical axis; right channel is the horizontal axis. Figure 3a shows the input phase relationship to have an error greater than 90° . After correction, left and right outputs show a minimal error (Figure 3b).

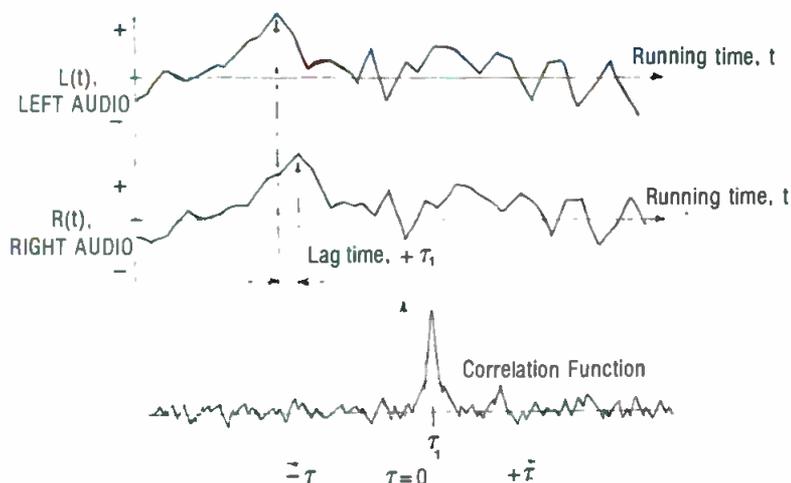

Figure 5. The detection of time and phase errors using the cross-correlation method.

A cross-correlator is a device whose output is a function of relative time difference (lag time). The output represents the degree of coherence (or signal similarity, both real and imaginary components) between two signals. Given signals $L(t)$ and $R(t)$, the correlation at a given lag time τ is described by:

$$\text{Corr}(\tau) = L(t) \cdot R(t + \tau)$$

and the correlation function (C.F.) is the integration over all possible τ values.

$$\text{C.F.} = \int_{-\infty}^{\infty} L(t) \cdot R(t + \tau) d\tau$$

For two random signals, $L(t)$ and $R(t)$, having some coherent (in-phase) components, the correlation function might look like that shown above.

Circuitry has been developed that will quickly find τ_1 , the maximum value of C.F. for $L(t)$ and $R(t)$ signals. The method involves finding the maximum value of C.F. by computing its first derivative.

All maxima and minima for C.F. exist at values of τ where

$$\frac{d(\text{C.F.})}{d\tau} = 0$$

To find the dominant maxima, one of the signals, either $L(t)$ or $R(t)$, is continuously sampled in time through a 1ms interval. A peak detection circuit then tags the value for τ by sensing two parameters. First, the largest maximum is separated out, and second, the point at which the first derivative goes to zero is established.

This value (τ_1) is converted to a voltage and subsequently used to servo τ_1 to zero. This represents an in-phase condition for $L(t)$ and $R(t)$.

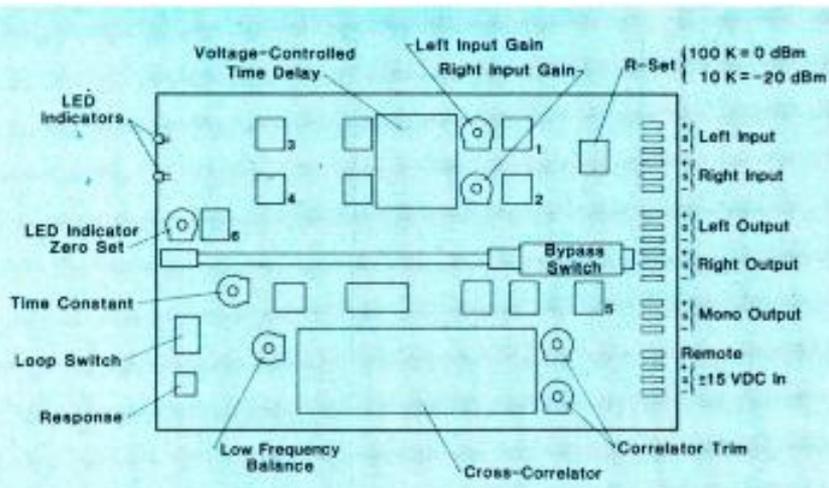

Figure 6. Phase chaser electronic layout.

Stereo

displays with a 20Hz to 20kHz white noise source. The noise was recorded on a cartridge with both channels in phase at equal levels. The output of the tape cart is shown in Figure 4a. Figure 4b shows the same signals after phase-correction.

Circuitry

Three notable circuit advances led to the creation of the phase-chaser:

- a dual response error correction feedback loop having a long-term correction of $\pm 360^\circ$ and instantaneous correction to $\pm 20^\circ$ (typical of stereo tape cartridge playback conditions). Measurements at 5kHz.
- a voltage-controlled time-delay network modeled to *real world* time delay errors encountered in stereo tape formats.
- a wideband time error detector accurate to within 0.5% at all frequencies from 20Hz to 20kHz.

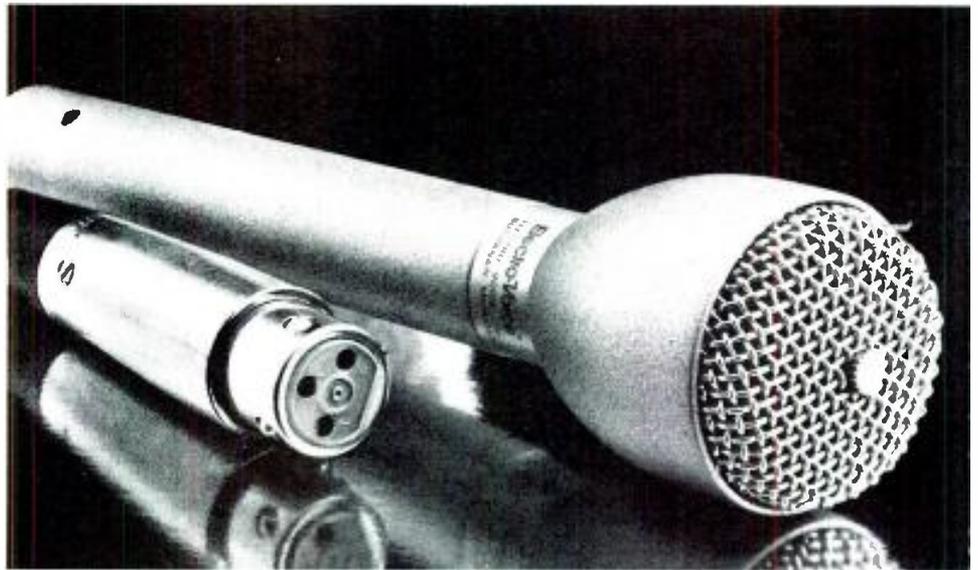

A unique feature of the circuitry is its ability to discriminate between a systematic time delay (such as cart tape misalignment) and normal phase fluctuations in music material. Consider what happens if a music selection has a string section (violins) with reverberation along with another instrument, for example, a trumpet solo, (in phase, both channels driven) with very little reverberation. An extended single note played by the strings with reverb may cause the left and right relative phase to randomly move. If this moving random phase of the strings is aligned, phase errors will be introduced in the solo.

The phase-chaser virtually eliminates this effect in two ways. First, the user sets his own error-correction averaging time to as long or short as his program material will allow. He reduces the sensitivity to program-related phasing effects. Second, the phase detector used is not just a zero-crossing sensor coupled to a synchronous detection scheme. Rather, it is also a circuit that senses phase error as a function of frequency. The phase-chaser looks for errors that model as a time delay in one channel vs. the other. Correction is applied only if a phase error exhibits a specific known phase-to-frequency relation over the audio spectrum. The detection technique uses a cross-correlator. (See Figure 5.)

Other uses

Along with correcting stereo tape phase errors, the phase-chaser may be used to correct for fixed systematic time differences, such as in stereo telephone line remotes. To achieve

Think of us as your mike expert.

The 635A – Perfect design from the start

The Electro-Voice 635A is probably the most widely used broadcast microphone currently available. Yet it was introduced back in 1967! There are microphone companies that haven't been around as long as the 635A! What makes a microphone continue to be the broadcasters' favorite after 15 years in the field?

The 635A was designed to be used anywhere. Its screw-machined steel case and mechanically nested parts set standards for durability and ruggedness that the competition still strives for. It was the first omnidirectional microphone designed to have a shaped, rather than flat, frequency response. A rolled off bass response combined with a slightly rising high end make it perfect for vocal reproduction. And it was the first microphone of its type to feature an elastomer

encased head capsule for reduced handling noise and additional protection from severe mechanical shock.

Despite all the technological advances in the broadcast, recording and sound reinforcement industries, the 635A continues to be the "audio man's screwdriver" – a microphone tool that can be used anytime, anywhere, for almost anything. When a product is designed right to start with, there's no need for it to become obsolete. All Electro-Voice professional microphones are designed with the same goal in mind. That's why people think of Electro-Voice as their microphone expert.

Stereo

greater correction, more than one phase-chaser may be wired in cascade.

LED indicators on the phase-chaser may serve to monitor stereo tape head alignment and tape stability in both production and playback studios. The indicators show the degree of error and its activity. This allows a check on playback system quality while it is in operation.

The system may also apply while recording or airing live stereo stage performances. If spatially separated microphones are not optimally positioned equidistant from a source, a time delay will exist in one channel. One phase-chaser will correct for a microphone lead-to-lag range of six feet.

It is noteworthy to point out that the phase-chaser performs a relative time correction for any 2-channel source. Thus, it is compatible with proposed phase error correction schemes using reference or subcarrier tones. One technique being tested at WSM, Nashville, TN, involves mixing with tape audio a 19kHz tone at -25dB with 297Hz square-wave amplitude modulation. The modulated tone is sensed by a 19kHz detector. The 297Hz components in each channel are driven to an in-phase condition using voltage-controlled delay lines.

Likewise, the phase-chaser will read tones and/or subcarriers contained in the audio channels and will use this information (along with program material) to apply a time correction. The only requirement is that the tones and subcarriers be recorded in phase, a generally true initial condition.

The WSM system aligns the 297Hz components. The phase-chaser will also time-align the 19kHz tone used as a subcarrier. Along with program material, this amount of information given to the phase-chaser is probably overkill, but it is useful nonetheless.

In practice, we know that tape alignment and stability problems exist. Good mechanical designs and good products are often at the mercy of heavy-handed operators in 24-hour per day facilities. Alignments will drift, parts will wear out, things will age and change.

It could easily be argued that a stereo phasing problem will always exist to a greater or lesser extent, now and in the future. For the stereo phasing problem, the phase-chaser is a solution that seems to avoid drawbacks of other concepts. □

Complete phase-chaser specifications can be obtained from the author at: Howe Audio Productions, P.O. Box 383, Boulder, CO 80306.

Don't let your station sound like a phone booth.

Every broadcaster knows the problems of on-air telephone links. The garbling when announce-feeds go out simultaneously through the board and the phone. Or the mysterious cutoffs in the middle of an important interview when line noise or sibilants generate 2600 Hz for a disconnect signal.

A lot of stations—network flagships and others—who've had to face the problems have also found the answer: the Studer Telephone Hybrid.

With sidetone attenuation of up to 40dB, producing maximum isolation between send and receive circuits through an active self adjusting bridge network, and a 12-Henry choke on the input to ensure positive exchange lock-in, the Studer Telephone Hybrid is simply designed to do the job right. 30dB/octave receive and 12dB/octave transmit filters eliminate unwanted signals that would muddy the on-air clarity you've built into your station. All phone line requirements are automatically matched, and a built-in limiter

and white-noise generator are included to give you adjustable overload protection and privacy. All in a 1 $\frac{3}{4}$ inch rack mount unit.

Studer can ensure a clean link for all your console feeds. The Telephone Hybrid maintains air quality on telephone talk shows, news feeds, and phone interviews. And our active-circuit Stereo Balancing Unit couples balanced ins and outs to single-ended recorders, equalizers, limiter/compressors or other unbalanced gear.

For more information on how to keep your station from sounding like a "wrong number," call or write today.

Field report:

Spectra Sonics bandpass filter and oscillator

By Brad Dick, director of engineering, KANU, Lawrence, KS

510 bandpass filter and 802 signal generator

Editor's Note:

The field report is an exclusive BE feature for broadcasters. Each will be prepared by the staff of a broadcast station, production facility or consulting firm. The intent is to have the equipment tested on-site. The author is at liberty to discuss his research with industry leaders and to visit other broadcasters and/or the manufacturer to track down pertinent facts.

In each field report, the author will discuss the full applicability of the equipment to broadcasting, including personal opinions on good features and serious limitation—if any.

In essence, these field reports are prepared by the industry and for the industry. Manufacturer's support will be limited to providing loan equipment and to aiding the author if support is requested in some area.

It is the responsibility of Broadcast Engineering to publish the results of any piece tested, whether positive or negative. No report should be considered an endorsement by Broadcast Engineering for or against a product.

Spectra Sonics recently introduced two pieces of test equipment that should be of interest to broadcast and audio engineers. The equipment includes a low distortion, selectable frequency, variable output oscillator and a 20Hz to 20kHz bandpass filter.

(Translation: The cassette broke.)
(Solution: Maxell U-Matic cassettes.)

If jammed U-Matics ever make you yearn for the days of live television something is wrong with the brand of U-Matics you're using. A lot of things are very right with Maxell U-Matic cassettes.

They're built to stand up to the toughest handling and editing conditions you can dish out. The unique Maxell Epitaxial™ tape formulation gives you an extremely dense magnetic coating that yields superior chroma and luminance. The proprietary Maxell binder system makes

sure the formulation, and everything you record on it, stays up to your standards, indefinitely.

That's why every one of the networks, hundreds of independent television stations and just about every major producer, director and cameraman in the business who tries Maxell U-Matic cassettes, buys Maxell.

Your Maxell supplier can make sure your programming isn't interrupted. Ask him for Maxell U-Matic cassettes. Or ask us for more information.

swintek

The Leading Name In
Cordless Microphone Systems

Transmitters small enough to be hidden almost anywhere, tiny microphones that are so unobtrusive that they probably won't even be noticed, hand-held microphones without the encumbrances of hundreds of feet of wire — that's what cordless microphone systems are all about. But there's one more factor of prime importance — reliability. If you're in television, radio or film and you want a cordless microphone system that not only offers the most advanced state-of-the-art electronics but the highest reliability rating in the industry, Swintek is the answer. There's a Swintek transmitter and receiver to fit your specific needs, no matter what your requirements. Check with us today about the greatest name in cordless microphone systems — Swintek.

Field report

These two devices form a useful test set.

The model 802 Oscillator has only three controls: frequency select, output control and a power switch. The output is available on the rear panel in the form of an XLR connector. The oscillator has five selectable output frequencies: 50, 100Hz and 1, 10 and 15kHz. The output level is adjustable from off to +4dBm, with the approximate output levels marked on the front panel. The remaining control is simply a toggle switch for power with the accompanying LED indicator.

The oscillator was tested in several ways, and a summary of the tests is shown in Table I. The output frequencies were first measured for accuracy as shown in the first column. Each of the selected frequencies was sufficiently accurate for broadcast and audio work. If tighter accuracy is desired, each frequency can be independently adjusted by an internal trim pot.

Next, the output response was checked against the 1kHz reference. The second column shows that all outputs were within 0.3dB of the reference. With this consistency, the oscillator could be used to quickly spot check the frequency response of any piece of audio equipment in seconds.

The distortion was measured at +4dBm across 600Ω. In all cases the distortion was well within broadcast and audio tolerances. At 1kHz, the distortion was only 0.086%. Figure 1 shows the spectral output of the oscillator at 1kHz at +4dBm. (10dB, 1kHz/division). This amount of distortion is insignificant for most broadcast applications.

The output level indications on the front panel were not as accurate as might be expected at 600Ω, but were well within acceptable tolerances. Table II shows the measured output from the rear panel with the output

Manufacturer's specifications 802 Signal Generator

Output level	Continuously variable from infinity (−74dBm) to +4dBm (+11dBV, unterminated)
Output calibration	Panel calibrated, infinity, −10dBm, −2dBm, −0dBm, +2dBm and +4dBm
Frequency selection	50Hz, 100Hz, 1kHz, 10kHz and 15kHz
Frequency tolerance	Within ±10% of frequency selected
Total harmonic distortion and noise (+4dBm)	Less than .025% 100Hz to 15kHz Less than .04% at 50Hz
Stabilization time	Not more than 3 seconds at 50Hz, less than 3 seconds at all other frequencies
Power requirements	Three 9-volt batteries (NEDA #1604)
Physical dimensions	3¼" wide, 5" overall depth, approximately 1½" high.
Weight	2/3 pound

Table I.
Oscillator test results

Selected Frequency	Actual Frequency	Response Error	Distortion
50Hz	49.6Hz	-0.2dB	0.11%
100Hz	10.52Hz	-0.3dB	0.10%
1kHz	1.003kHz	Ref.	0.09%
10kHz	10.242kHz	-0.0dB	0.09%
15kHz	15.545kHz	-0.1dB	0.09%

MAGNECORD MC-II

Modern Performance with Traditional Quality

The Magnecord MC-II is a rugged, precision tool for the broadcast control room—be it fully automated or D.J. assisted. The MC-II is made that way, by design, in the Magnecord tradition. Of course, it meets or exceeds NAB standards with IEC equalization on request.

Superior dc Servo Drive

The dc servo, Hall effect motor with flutter-filter belt drive, provides exceptional speed stability (to 0.05%), totally unaffected by line voltage or frequency fluctuations. And it runs so cool, no ventilation is required.

Full Broadcasting Features

Unlike some other cart machines, the Magnecord MC-II comes with the extra features broadcasters desire at no added cost. Built-in full remote control capability. Automation compatible cue tones (stop, secondary, tertiary) with LED indicators and contacts for external cue switching. Cue track input and output access for FSK logging. A universal mic/line input and front panel headphone jack to "preview" or time new carts and for servicing convenience.

Flexible Broadcast Use

The MC-II is so flexible it virtually defies obsolescence. You can choose mono or stereo models, play only, or with record capability. Best of all, play models are field-convertible to record/play. The record electronics come in a separate housing for convenient, space-saving installations.

Rugged Magnecord Design

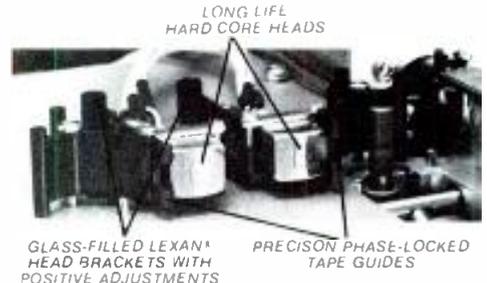

As with all Magnecords, the MC-II is designed to work long and reliably. For example, the woven polyester drive belt and polyurethane pressure roller are virtually indestructible. The regulated dc

power supply has universal line capability (100-140V, 200-280V, 45-65Hz), consumes nominal power and is brown-out proof. Computer grade push buttons are rated at 10 million operations. A single piece chassis and machined base plate assure positive alignment of all tape transport parts. Hard core, long life heads are mounted on unique, glass-filled Lexan® head brackets with precision, phase-locked tape guides. Carefully designed circuit boards and a Mu-metal shield make the MC-II immune to RFI, even when operated directly under a transmitting tower.

Convenient Service Access

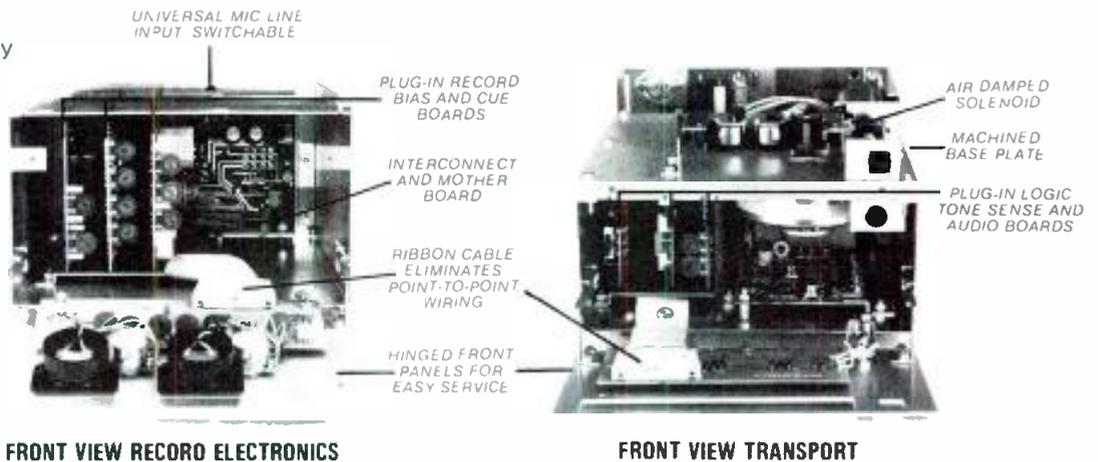

When a Magnecord MC-II needs service, downtime is minimized. The covers and front panels are hinged for convenient access. All solid state circuitry is on plug-in

epoxy boards. Plug-in ribbon cables eliminate point-to-point wiring. And, of course, the Magnecord MC-II is made in the U.S.A. so parts are readily available.

HEAD ASSEMBLY

When you compare performance, reliability, and cost, the MC-II is indeed a modern tool worthy of the name Magnecord, because it's made in the tradition of rugged excellence.

Field report

control set at the corresponding indication.

The model 510 Bandpass Filter is unique in the area of broadcast work. The device is a 20Hz-20kHz filter with 60dB of gain to make possible low level noise measurements without the accompanying problem of extraneous noise. The filter simply plugs into the measuring meter and becomes a selectable amplifier/filter or straight wire input. By turning off the filter, the input is directly connected to the measuring device so the input signal is unaffected. Turning on the switch provides 60dB of gain and inserts the bandpass filter.

The audio passband is shown in Figure 2. The 3dB points were

Shure makes the mixer to fit the need.

Need a deluxe broadcast remote mixer?

The M267 is ideal for live broadcasts of sports, conventions, other remotes.

- Built-in limiter prevents overload distortion
- Mic/Line Capability on each input and output

Want professional mixer features at minimum cost?

The M67 is the most popular model for remote broadcast and production work.

- AC or battery operation
- Transformer balanced inputs and outputs

Want to expand your sound system?

The M268 is great as an independent mixer or for adding inputs to existing sound systems.

- Built-in simplex power for condenser microphones
- Quieter operation than competing models

Need a low cost, versatile PA mixer?

The lightweight, portable M68 is a great buy as a basic mixer.

What if input levels vary?

The SE30 is the only combination mixer/gated compressor unit with an adjustable response rate that prevents "pumping."

- Automatic gain riding keeps levels constant
- Lowers background music automatically in paging systems

Need an 8-channel mixer, but short on space?

The SR109 is popular in large hotel paging systems, as well as small post-production rooms.

- 8 channels with bass and treble tone controls
- Built-in limiter

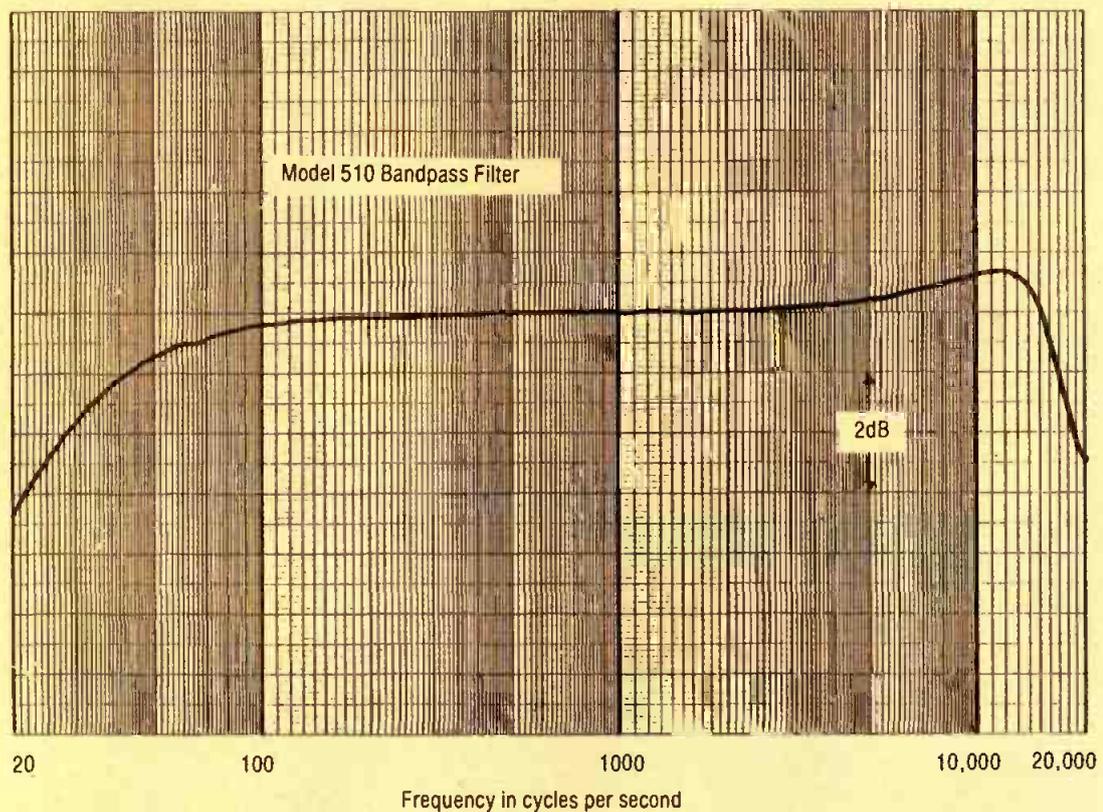

Figure 2. Audio passband of 510 Filter.

Field report

measured to be 21Hz and 20.5kHz with skirts falling close to the 18dB/octave specification.

The usefulness of the filter comes from its capability of discriminating between signals within the audio passband and those outside of it. In regular maintenance, the standard procedure for measuring the signal-to-noise ratio is to apply a steady state tone to the input of the device and adjust to a reference output. The tone is then removed, and the remaining noise is measured. The difference between the two levels is then considered to be the signal-to-noise ratio. One of the possible problems with this procedure is the capability of extraneous noise to cause inaccurate readings.

For example, most noise meters (distortion analyzers) contain only a low pass filter, usually with a cut-off of about 100kHz. This means that fre-

quencies such as tape recorder bias can cause audio noise readings to appear higher than they really are. With the Spectra Sonics filter in place, those high frequencies will not fool the engineer. Naturally, some consideration must be made when the filter is used for the conditions present in the test. It is, however, better to know about the audio signal-to-noise ratio than not to know because of the lack of a filter. In high noise environments, it is possible to miss significant noise problems in audio equipment without an audio filter.

Table III shows some typical readings obtained by using the 510 in everyday measurements. The first column shows the reading obtained on a Fluke model 8050A DVM without the filter. The second column shows the same DUT (Device Under Test) signal-to-noise ratio with the Spectra Sonics filter in place. The third column

shows the difference in measurements. Notice that, in one case, the measurements were made in a high RF environment. The extraneous noise caused the noise meter to be fooled by the RF signals. However, the filter eliminated the interference and provided more informative readings.

According to Spectra Sonics, the main reason for the development of the oscillator and filter was to prevent the common problem of ground loops from developing in test measurement. Typically, the oscillator will be somewhat removed from the DUT and the accompanying ground loop that can develop can be difficult to eliminate, especially at 3 a.m. By using a battery-powered oscillator, ground loops are not a problem, and the battery-powered filter provides the same feature. For those engineers who do any amount of audio testing, this battery feature alone will far outweigh the cost of the devices.

The 802 Oscillator retails for about \$150 and the 510 Filter retails for about \$130. Any engineer needing easy to use, accurate, battery-powered test equipment should consider these additions. □

Table III.
Typical readings
obtained with 510 Filter

Signal-to-Noise without Filter	Signal-to-Noise with Filter	Improvement
42dB	46dB	4dB
41dB	48dB	7dB
56dB	60dB	4dB
46dB	74dB	32dB
50dB	62dB	12dB

WHO SAYS 3 INTO 1 WON'T GO?

The Thomson-CSF 9100 Digital Video Processor. It's three systems in one black box. Noise reducer. Frame synchronizer. Time base corrector.

1.

Emmy-winning noise reduction technology delivers up to 15 dB of S/N improvement in six presettable settings. So satellite signals are clearer. Film-to-tape transfers are less noisy. ENG signals are sharper. It's no wonder a 9100 was used in the space program to dramatically improve signals from the orbiting Space Shuttle.

2.

And as if that weren't enough, we've also packed an optional, built-in time base corrector into the 9100. Plus a 4x1 switch that frees valuable crosspoints. And a processing amplifier for complete output signal control.

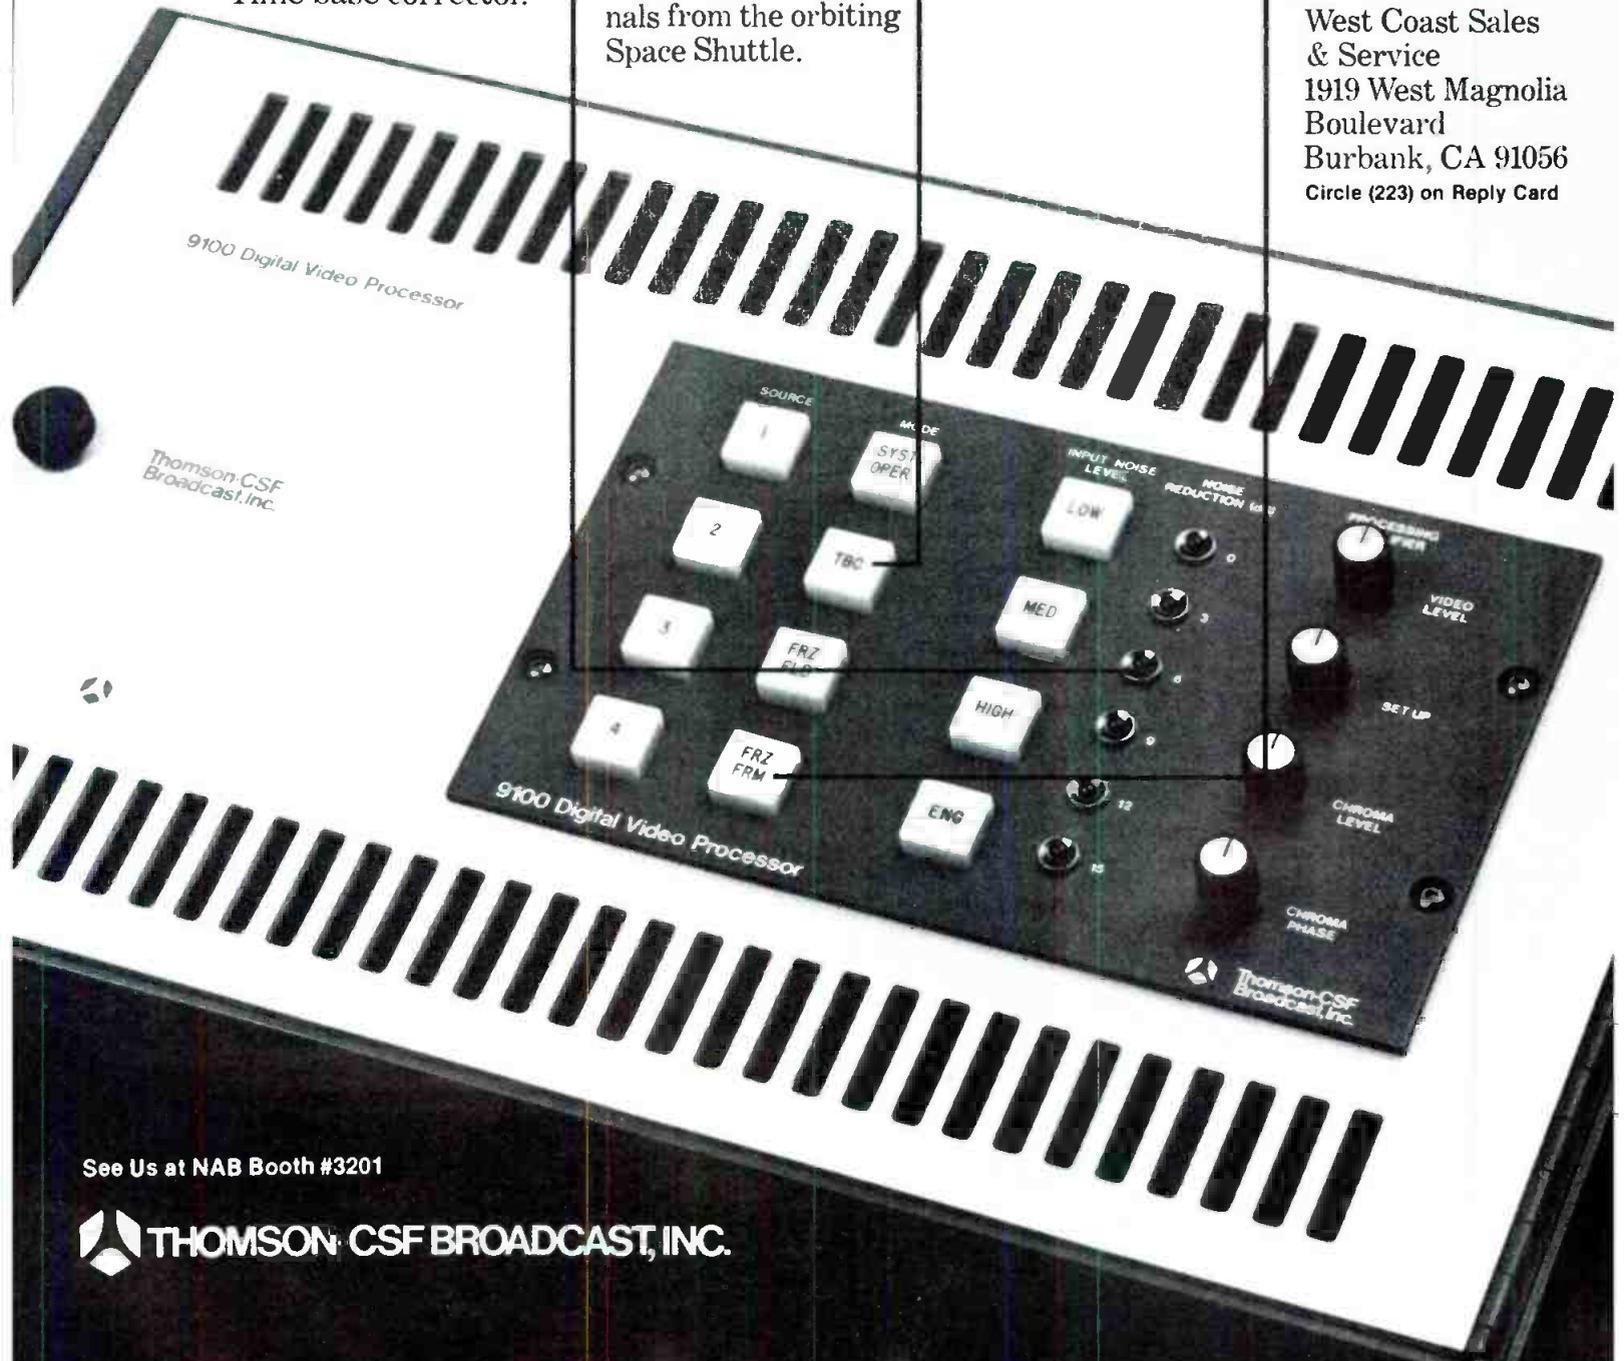

3.

And a frame synchronizer.

The 9100 Digital Video Processor. Three systems. One package. A perfect fit. Write today for complete technical information and specifications.

TV studio lighting systems

By Robert J. Nissen, vice president, Hubert Wilke Inc., New York, NY

Nissen has a 38-year background in the communications industry. For 25 years, he was associated with radio and TV broadcast stations in various engineering and management capacities. For the past 13 years he has been engaged in consulting and design activities in the TV field and has designed more than 200 studio facilities during that time.

Hubert Wilke Inc. is an international communications consulting firm with offices in New York, Los Angeles and London.

Few elements of TV production have as direct an impact on the quality of the final picture as does lighting. With effective lighting control, meaning and mood can be established, attention can be directed, and size and shape can be identified or altered. And, despite the inherent 2-dimensional reality of the TV image, a

3-dimensional illusion can be created in the viewer's mind.

The designer of a TV studio lighting system must be concerned with both the technical and the artistic objectives of a lighting system. The technical objective requires control of light intensities and scene contrast ratios. The artistic objective requires a system that permits a broad range of lighting techniques to be used to achieve a variety of visual impacts.

This article is not about lighting techniques or the selection of particular luminaires to achieve an effect. Rather, its purpose is to provide guidelines for the design of studio lighting systems that will permit the

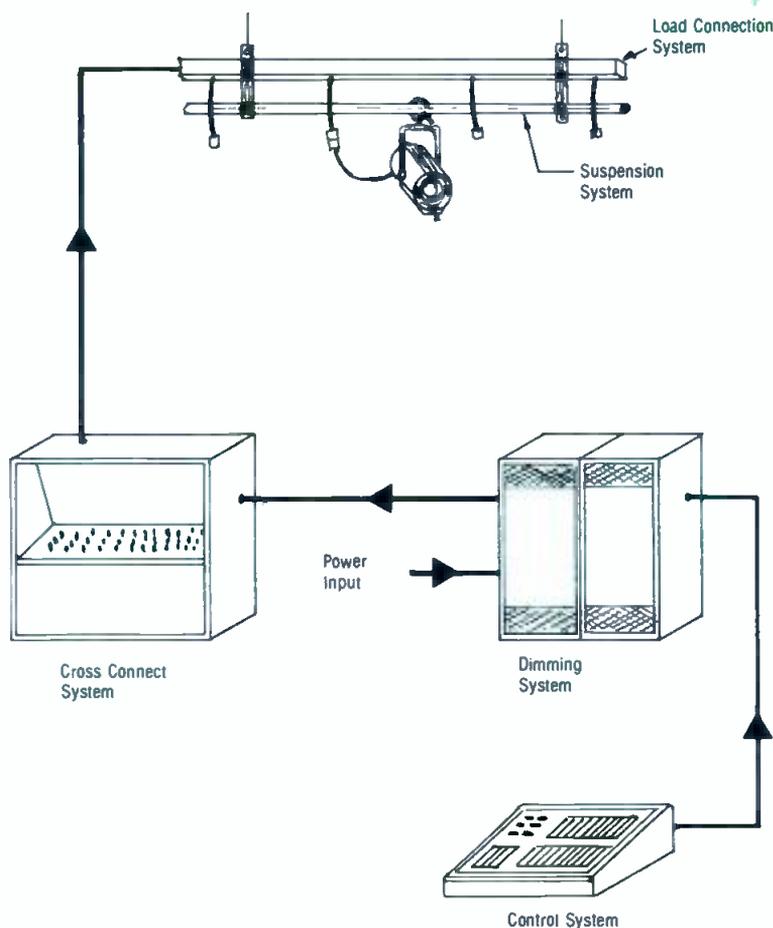

Figure 1. Lighting system components.

Cherokee Studios, Hollywood, California

JBL 4313 Studio Monitor. It flattens the competition.

Introducing the 4313.

Flat frequency response. It means accuracy. Naturalness. Reality.

JBL gives it to you without the bigger box that you'd expect along with it, since the 4313 only measures about 23" x 14" x 10"!

This new, compact professional monitor produces deep, distortion-free bass. And does it with a newly developed 10" driver. Its massive magnet structure and voice coil are equivalent to most

12" or 15" speakers. Yet it delivers heavy-duty power handling and a smoother transition to the midrange than most larger-cone speakers.

The 4313's edge-wound voice coil midrange accurately reproduces strong, natural vocals and powerful transients.

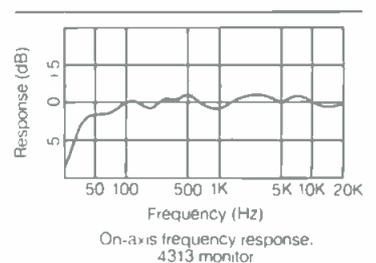

Up top, a dome radiator provides high acoustic output with extreme clarity and wide dispersion. A large 1" voice coil gives it the ruggedness needed in

professional use. Working together, these precision matched speakers offer superb stereo imaging, powerful sound levels and wide dynamic range.

Audition the 4313 soon.

We think you'll agree that its combination of flat response, power and moderate size flattens the competition.

NEW! BOOK VIDEOTAPE EDITING

Videotape Editing-Communications With Pictures And Sound answers every videotape editing question:

When to edit? When to (and when not to) use a dissolve or wipe? How to cut? How to use complex sync role editing and audio sweetening? How to affect the mood and pace of a show? Why and how to perform computer editing without losing creative control? It even takes the mystery out of time code and user bits.

Beginning editors, experience pros, film editors, and media managers will all appreciate **Videotape Editing**. This new book is your guide through the world of computer assisted videotape editing.

TV lighting

use of any desired lighting technique.

Lighting systems components

A typical TV studio lighting system consists of five major components:

- the suspension system, which provides the means to mount the lighting fixtures;
- the load connection system, which provides connection receptacles for the fixtures;
- the cross connect system, which interconnects the power from the dimmers to the receptacles;
- the dimming system, which varies the power to the receptacles; and
- the control system, which controls the power of each dimmer.

Figure 1 illustrates these five systems. In a dimmer-per-circuit system, the cross connect system is eliminated.

The suspension system

The nature of multiple-camera TV production dictates that the lighting fixtures be suspended overhead to permit freedom of camera movement on an unobstructed floor space. This is in contrast to motion picture production techniques, where a single camera shoots only short segments of film that are later edited together. Accordingly, for such film production, lighting instruments can be mounted on floor stands because the movement of the camera is carefully limited for a particular segment. A similar technique can, of course, be used with a

single TV camera and post-production editing, but this is seldom done in a studio environment.

This difference in production technique accounts for the absence from most film studios of an overhead suspension system for light fixtures, and the universal use of such systems in TV studios. Because of this difference, film production can effectively take place in a TV studio, but TV production is greatly restricted in a film studio not equipped with an overhead lighting suspension system.

The lighting suspension system can also support the power connector strips for the fixtures, the cyclorama track system, and can serve as a framework from which to hang set and scenery elements.

There are two basic types of overhead suspension systems: grids and battens.

Grid systems

The majority of TV studios use a fixed-height grid suspension system for the lighting fixtures, consisting of a cross matrix of pipes that are hung from the ceiling structure by means of steel rods, chain or cable, as shown in Figure 2. The rows and columns of the grid pipes are placed at right angles to each other and cover the entire production area of the studio. The lighting fixtures are typically mounted to the grid pipes by means of "C" clamps that are secured to the pipe by tightening a single screw.

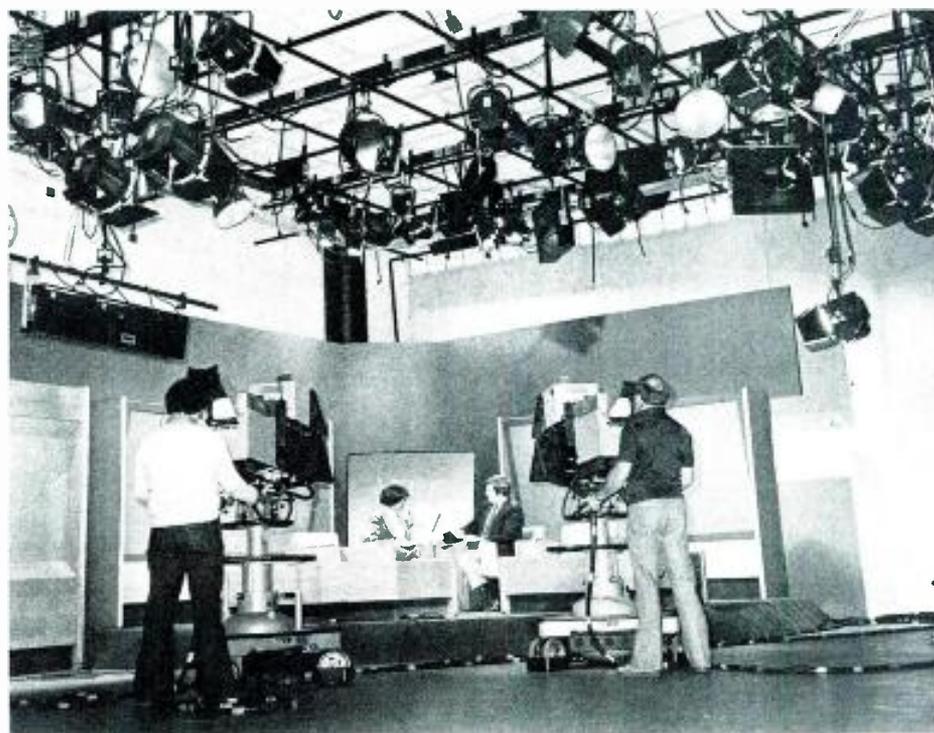

Figure 2. Grid suspension system.

Swintek[®] Mark 200/CPS Wireless Headset Joins the NASA Aero Space Team

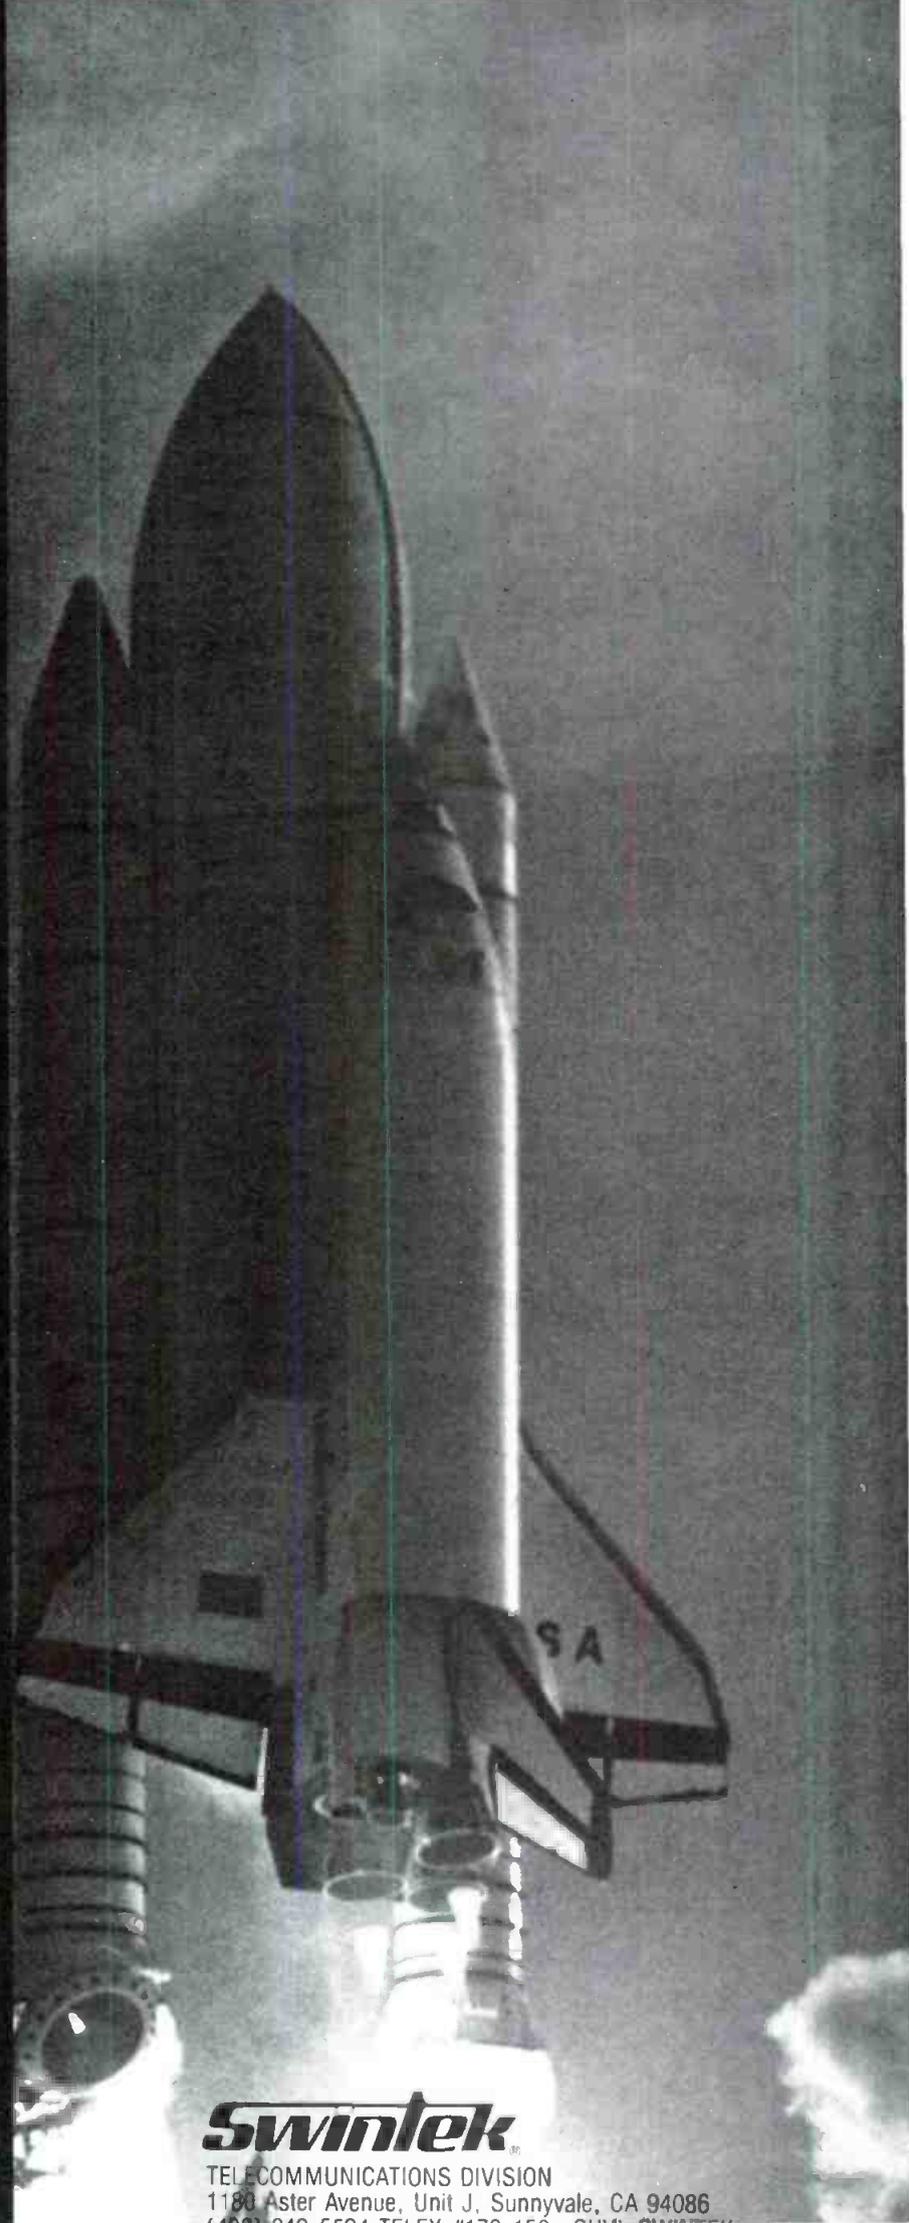

With the proper headset a space crew can communicate with the commander in ambient noise exceeding 120dbA **WITHOUT WIRES**. Unlike a conventional walkie-talkie, no transmit buttons have to be depressed to establish communications between two remote stations. This mode of operation limits false triggering of the transceiver system, thus blocking interfering signals. Any break in communication is immediately apparent at all stations due to loss of voice sidetone information.

We're proud of the fact that NASA selected us over the competition for their most important venture. . .
The Space Shuttle.

TELECOMMUNICATIONS DIVISION
1180 Aster Avenue, Unit J, Sunnyvale, CA 94086
(408) 240-5504 TELE FAX 4130-150 CIRCLE 229

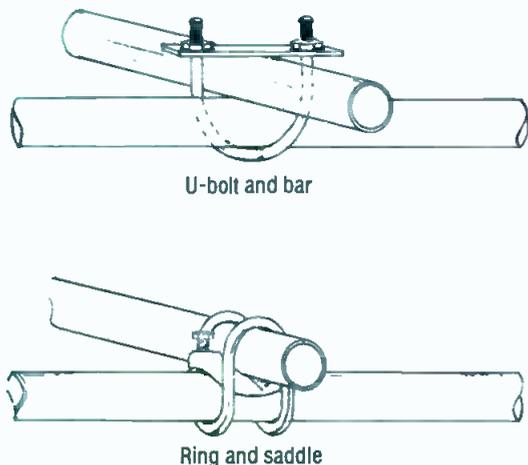

Figure 3. Grid crosspoint joints.

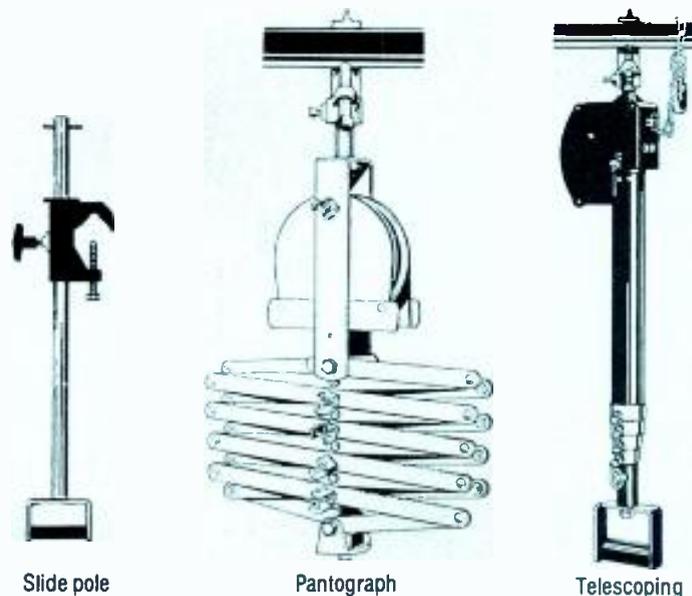

Figure 4. Vertically adjustable fixture hangers.

TV lighting

The spacing of the grid members depends on the height of the grid above the floor (the higher the grid, the wider the spacing can be) and the production requirements of the studio (the more complex and sophisticated the lighting, the closer the spacing). Typical studios will have a 4- or 5-foot spacing between grid members.

The pipe recommended for grid structures is 1½-inch "schedule 40" black iron pipe. If properly suspended, 1½-inch pipe has the strength and rigidity to support virtually any density of lighting fixtures. Maximum load figures per lineal foot may be calculated by assuming side-by-side lighting fixtures, the weight of the grid pipe, the weight of cyclorama tracks and drapes (if suspended from the grid), and a weight allocation for scenery elements that may be hung from the grid. In addition, a factor should be added for a suddenly applied downward thrust to represent the weight of a person hanging a lighting fixture who finds it necessary, in an emergency, to grab the grid for support. Given these load requirements, a qualified structural engineer can specify the type and spacing of the suspension rods, chain or cable.

There are a number of methods of anchoring the crosspoints of the grid members, two of which are shown in Figure 3. The classical method is the U-bolt and bar, which applies compression at only a single point between the two pipes. A preferred device is the "ring and saddle" joint, which is specifically designed for joining pipes. It is structurally more sound than the U-bolt and bar and

eliminates the problem of protruding bolts.

Because a fixed grid system cannot be adjusted vertically for height, other means must be used to adjust the height of the lighting fixtures. Three types of vertically adjustable hangers are available, as shown in Figure 4. The first is a simple slide pole that clamps to the grid. A sufficient amount of space must be available above the grid to allow for upward protrusion of the pole. The second device is the pantograph "scissors" type hanger. The pantograph can have considerable vertical range, but for large fixtures it is bulky and difficult to maneuver. The third device, which is generally preferred, consists of a series of telescoping concentric tubes with an internal counterbalance system. This telescoping device usually has less vertical range than the pantograph.

The height of the fixed grid above the studio floor is determined by a number of factors. If the grid is too low, lighting fixtures cannot properly illuminate the set and talent with the optimum 30° to 45° lighting down angle. A low grid also restricts the height of set background elements. If the grid is too high, hanging and adjustment of the fixtures can be difficult if not dangerous. In addition, if the grid is too high, most of the fixtures will have to be mounted on vertically adjustable hangers to achieve the desired lighting angles.

Practical experience with hundreds of studios indicates that the size of the studio virtually dictates the optimum height of the lighting grid. Table I gives the recommended grid heights

for several representatively sized studios, assuming that there are no unusual production requirements.

Batten systems

A batten suspension system is similar to the grid system except that there are no cross member elements. The system consists of a series of parallel pipe battens running in one direction only, as shown in Figure 5. The main advantage of a batten system is that it allows each of the pipes to be independently adjusted in height and permits them to be lowered to the studio floor for mounting the fixtures. Although many studios have been built with fixed-height battens, they offer no operational advantage over the fixed grid system and have less mounting space for the fixtures.

Three methods are available for raising and lowering the adjustable battens: counterweights, hand winches and motorized winches. The counterweight and hand-winch systems require a considerable amount of studio floor space, which may reduce the usable production area. Motorized winches are normally installed near the studio ceiling and require no floor space.

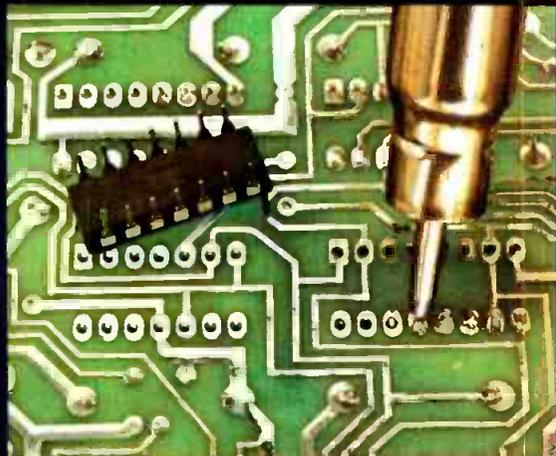

Batten systems are especially appropriate in large studios that must accommodate a wide variety of production requirements that entail frequent movement of fixtures. It is claimed that mounting the fixture to a pipe batten at the floor level, rather than from a ladder, increases the speed of lighting setups. However, the saving in setup time may not be as great as anticipated because the fixtures will always require final adjust-

TV lighting

ment after the pipe batten is raised to its proper operating position.

The choice between a fixed-height grid system and an adjustable height batten system depends on a careful analysis of production requirements and cost. Adjustable batten systems are invariably more expensive than fixed grids. Experience shows that a fixed-height grid system is entirely adequate to meet the production needs of a typical broadcast or corporate studio. On the other hand, an adjustable batten system can provide considerable advantages in a large studio that must be capable of the ultimate in production flexibility.

The load connection system

The usual method of providing power to fixtures mounted on the grid or batten pipes is by means of a connector strip consisting of a metal wireway with pigtail connectors, as shown in Figure 6. The connector strip is mounted above or alongside the pipe elements. The use of pigtails on the connector strip—rather than flush-mounted receptacles—permits flexibility in the location of the fixtures without requiring the fixtures themselves to have inordinately long connecting cables.

Each connector and its associated wiring should have a 20A rating to permit the connection of 2kW light fixtures. In large studios with high grids, 5kW light fixtures may be required, necessitating 50A connectors and circuits. In most studios of less

than 2500 square feet, 50A outlets are no longer required because of the increased sensitivity of modern cameras and the higher efficiency of modern lighting fixtures.

The total number of outlet drops depends on the nature of the studio production. The density of outlets is determined by the space concentration of lighting fixtures and is unrelated to the total amount of power being provided for lighting. This density can range from one outlet for every 10 square feet of net production area to one outlet for every 20 square

TABLE I. Recommended lighting grid heights.

**Zeppelin[®]
wind screen**

The Zeppelin Wind Screen insures rumble-free sound recording under windy conditions. Your video recorded sound will be virtually studio-clean despite noisy air movement. The Zeppelin aerodynamic design screens the microphone, filtering the wind, allowing the sound in. Although extremely lightweight, the Zeppelin is nearly indestructible and can be boom mounted or hand held with the Anti-Rumble Shock Mount. There are Zeppelins available to house Sennheiser 816, 416 and K3U; AKG CK-8 and CK-9; Schoeps and other similar microphones.

TV lighting

feet. The higher density is desirable for a production studio that requires maximum lighting flexibility and scene lighting changes. The lower density is ample for a minimum studio with little need for other than basic fixed lighting.

Assuming a typical studio, with connector strips having outlets every four feet and with connector strips spaced four feet apart, the outlet density would be one outlet per 16 square feet. As a rule of thumb, the number of outlets provided for a typical grid system should equal the number of grid cross points.

There should be a heavier concentration of outlets around the periphery of the studio, along the cyclorama track system, to provide power for both cyclorama light fixtures and talent backlights.

In addition to the outlets provided for overhead suspended light fixtures, receptacles can be installed on studio walls at the floor level to accommodate floor-mounted fixtures, ground row lighting, and other special effects lighting. Many studios dispense completely with these wall receptacles and obtain power for floor-mounted fixtures from lighting

grid connectors via dropped extension cables.

For safety (and code) reasons, it is essential to use grounded 3-conductor connectors. At one time, the round pin, in-line rectangular connector (developed for theatrical stage lighting) was almost universally used. In recent years the 3-conductor "twistlock" type connector has become preferred because it provides a more secure connection and requires less maintenance than the round pin connector. Both types of connectors are shown in Figure 7.

The cross connect system

As can be seen from the foregoing, studio lighting systems require a large number of connection outlets. A typical 30' x 40' studio may require from 75 to 100 outlets with only a portion of them being used for a particular scene.

Ideally, the power for each of these receptacles would be provided by its own separate dimmer. This approach is called a dimmer-per-circuit system and will be discussed later. Where a dimmer-per-circuit system is not feasible, some means must be provided to feed power to only those outlets being

ONE UP ON THE WORLD

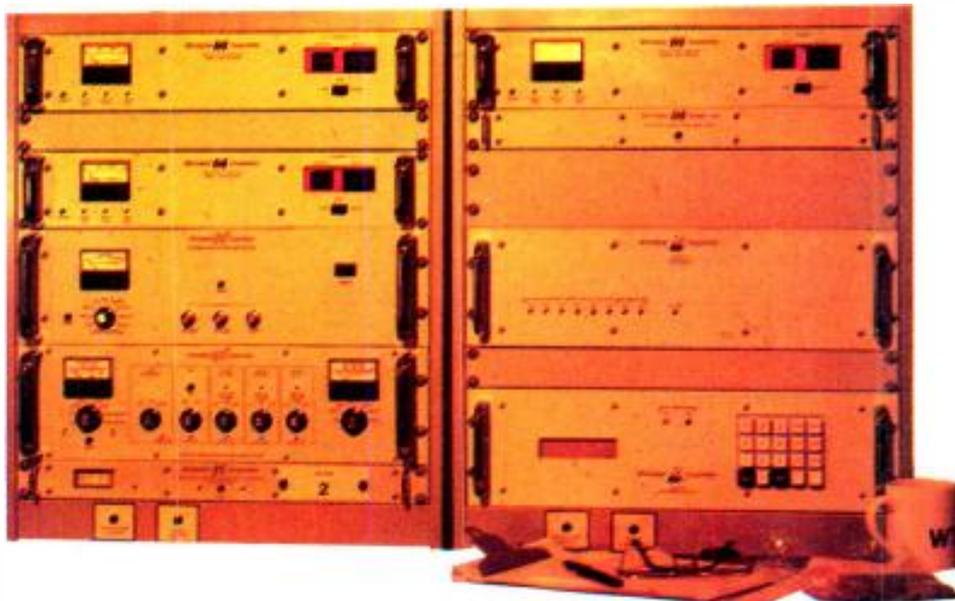

SATELLITE PROGRAMMING SIMPLIFIED

Microdyne's satellite receiving systems simplify program acquisition. Our receiving systems expand your program selection, minimize beveled tapes and simplify satellite selection. We continually develop systems that set the pace for the Broadcast Industry with our advanced technology and expertise.

Microdyne's receiving systems offer satellite delivered programming to your market. Our systems include an X-24 B-2 receiver with applications in commercial and public broadcast television stations, special events and teleconferencing, a 7-meter parabolic antenna with motorized mount and a Single Channel Per Carrier (SCPC) System for radio broadcast application. Microdyne's most recent innovation, the MAPS II (Microdyne Antenna Positioning System), is designed to simplify satellite selection. Options are available for our X-24 B-2 receiver to operate with RCA's Optimized Video Transmission (OVT) and other reduced deviation transmissions.

For more than a decade, Microdyne has manufactured satellite communications systems. We are recognized as the leading manufacturer of satellite receiving systems in the Broadcast Industry and our expertise is used for government, military and corporate communications.

As a leader in the industry, Microdyne is one up on the world in technology, manufacturing and service.

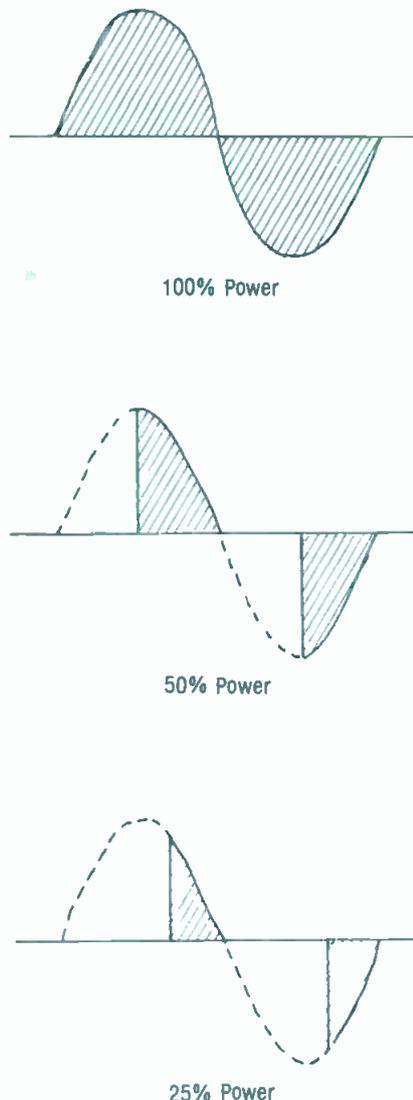

Figure 11. SCR dimmer output waveforms.

table weighted cords, while those for smaller systems have hanging cords.

Each outlet is connected via wireway or conduit to one patch cord on the patch panel. Accordingly, there are as many patch cords as there are outlets in the studio. To connect an outlet, the patch cord plug is inserted into a source receptacle on the panel. These source receptacles provide controlled power from either dimmers or non-dim sources. Each dimmer or non-dim source usually has three to six patch receptacles to allow several load circuits to be grouped together.

Individual circuit breakers must be provided for each of the load circuits. This is required for protection of the load circuit, because it may be rated at a lower current than the source to which it is patched. Thus, for example, a 20A load circuit may be patched into a dimmer that is capable of providing 50A.

The patch panel should be located in the studio because constant access to it is required by lighting personnel during the lighting of the set. The panel should be placed against a studio wall that will not be covered by scenery or cyclorama drapes. It should also not impede personnel traffic or production activities. In other words, its location should satisfy the sometimes contradictory requirement of being out of the way but easily accessible.

The dimming system

The ability to control light intensity is essential for even the simplest TV production. The intensity of illumination falling on a scene can be varied by five methods: lamp wattage, flood/spot control of the fixture, fixture-to-subject distance, diffusing material placed in front of the fixture, and dimmers. If used alone, the first four methods have limitations in terms of degree of control and the time required to effect an intensity change. The fifth method, the dimmer, permits immediate and remote control of light intensity. It is only in small studios (with relatively fixed lighting plans for repetitive programming of a simple nature) that dimmers are not essential for adequate TV production.

Effect of dimming on color television

When the power to an incandescent lamp is decreased, the filament temperature lowers and the spectral distribution of the emitted light shifts to the red end of the spectrum. Conversely, as the power is increased, the filament temperature increases and

the spectral distribution shifts to the blue end.

The spectral distribution of an incandescent light source can be related to Kelvin temperature, which is the actual temperature of the filament on the absolute Kelvin scale. The higher the Kelvin temperature, the bluer the light. The lower the Kelvin temperature, the redder the light, as shown in Figure 9. It is an interesting psychological anomaly that what we normally think of as a cool blue light is actually caused by a hotter filament, and what we normally associate with heat—that is, “red”—is caused by a cooler filament.

During the early years of color television, there was great concern over this color shift because the apparent colors of objects being illuminated change toward the red when lights are dimmed. The TV industry has found that the original concern regarding dimmers and color television was greatly overstated. As a matter of practice, lamp dimming is now considered not only acceptable for color TV production, but necessary for proper aesthetic control of production values.

Unlike motion picture film—which has a fixed emulsion color characteristic—TV cameras can be easily adjusted to accept a wide range of Kelvin temperatures. 3200° Kelvin lamps have become a *de facto* standard in TV studios not because of their particular color temperature, but mainly because they provide a good compromise between high light output and long lamp life.

The limits imposed on the amount that a light can be dimmed for color television are determined by the ability of the TV viewer to detect a color shift. It has been found that the average viewer will be unaware of a color shift that does not exceed a Kelvin temperature change of about 200°. In terms of light intensity, a lamp may be dimmed almost 40% before the 200° Kelvin shift occurs. This amount of acceptable dimming allows the lighting director a considerable leeway for intensity control.

Moreover, this amount of color shift is really noticed only on human skin tones, for it is only skin tones that are recognized by the viewer as “right” or “wrong”. Other elements in the scene—sets, backgrounds, furniture, etc.—can be almost whatever color appears on the TV monitor. The viewer, not knowing the actual color of these elements, is not disturbed by a color shift in these non-human portions of the picture. Accordingly, light striking these elements can go far beyond the

200° limit indicated above. As a practical matter, only the light striking faces (or products that must be displayed in true color) need be held within the 200° Kelvin limit.

Types of dimmers

Many devices have been used to control the amount of power applied to a lamp, and hence, to change the intensity of the light. One of the earliest devices was the salt water dimmer, which consisted of two rods immersed in a crock of salt water. By mechanically changing the depth of the rods in the salt water, the resistance was changed and the current to the lamp was varied. A rather messy way of dimming lights!

For many years, large wire-wound variable resistance dimmers were the standard. As power control technology advanced, there followed a number of dimming devices including autotransformers, saturable reactors, thyratrons, and magnetic amplifiers. With the advent of a transistor-type device called the silicon controlled rectifier (SCR), shown in Figure 10, all the preceding dimming methods became ineffectual competitors.

The SCR has the ability to control large amounts of power, with a high degree of efficiency, by the application of a small electrical control signal to the gate of the SCR. This efficiency arises from the fact that the SCR acts as a fast electronic switch that turns the power on and off at selected times during each cycle of the alternating current.

Accordingly, virtually no power is absorbed by the SCR, in a manner similar to the way a light switch absorbs no power. The amount of power delivered to the lamp will depend on the length of the "on" time as compared with the "off" time, as shown in Figure 11. Because the switching rate is 120 times a second (for 60Hz power), there is no flicker from the light source.

Dimmer-per-circuit systems

Lighting systems that use one dimmer per outlet circuit (and thus eliminate the patch panel) are not new. Hundreds of studio and theatrical facilities have used this technique. Dimmer-per-circuit systems, however, have not gained widespread use up to this time because of four factors: higher equipment cost, unwieldy control systems, reluctance to provide equipment (dimmers) that may seldom be used, and inaccurate estimates of the total installed system cost.

X-24

1100 Television Receiver

Microdyne's 1100-Television Receiver X-24 has ultimate quality and cost-efficiency. It is Microdyne's sixth generation satellite receiver.

This 24-channel receiver can be tuned manually by using front panel controls or remotely via a wide choice of remote tuning methods, including computer control.

Invest in Microdyne's X-24 for high performance satellite reception.

UNSURPASSED VIDEO QUALITY!

Tech Camera Video tailors the finest equipment to meet your most exacting professional requirements.

We are currently offering the superior video performance of the Hitachi FP-22 and the Hitachi FP-21. In both, the horizontal resolution is 580 lines and a signal-to-noise ratio of 55dB. Sharp, clear pictures are assured by a built-in H and V image enhancer, producing excellent results even in low-light conditions. In addition to a 9dB or 18dB high-gain switch, the rugged FP-22 and FP-21 feature Hitachi's Automatic Beam Optimizer circuit. Add the optional 5-inch viewfinder and a remote operation unit (ROU), and both become high quality studio cameras.

TV lighting

Two important changes have occurred in recent years that require a lighting system designer to seriously consider the advantages and cost-effectiveness of a dimmer-per-circuit system as compared to the conventional patch panel/dimmer system.

The first of these changes is the reduced cost of dimmer modules and dimmer racks as a result of standardization and improved manufacturing methods. Second, the use of inexpensive microprocessors now enables the sophisticated control that is essential to the flexible operation of a dimmer-per-circuit system.

In comparing the cost of dimmer-per-circuit systems vs. patch panel/dimmer systems, the following factors must be considered.

- The cost of the dimming equipment will be greater because of the increased number of dimmers required.

Courtesy of Kiegl.

Figure 12. Dimmer rack.

- The cost of the patch panel and its installation will be eliminated.
- The number of wires (and possibly the size of the conduit) to the lighting outlets will be reduced. It is possible to reduce the number of wires because in a conventional patch panel/dimmer system, separate neutral wires are required for each load circuit, whereas for a dimmer-per-circuit system, 3-phase, 4-wire runs can be made to groups of three outlets.
- A dimmer-per-circuit system may require a larger main service feed because the potential connected load is greater than for a patch panel/dimmer system. This larger service feed is an electrical code requirement and does not relate to actual power that will be used.

A proper cost analysis of the total lighting system—including installation—may indicate that a dimmer-per-circuit system is not significantly more expensive (and in some cases, costs less) than a patch panel/dimmer system. To determine the real cost differences, it is recommended that the lighting system designer obtain proposals from lighting equipment manufacturers for total installed system costs for both a patch panel/dimmer system and a dimmer-per-circuit system.

What are the operational advantages of a dimmer-per-circuit system? First, a dimmer-per-circuit system reduces setup time by eliminating patch panel operation. Second, it permits a rapid means of assigning—at the control console—any outlet to any controller. Third, it allows any number of dimmers to be controlled by one controller. Finally, and most important, it permits storage in memory of a great variety of lighting scenes with random control delegation of any outlet.

Size and number of dimmers

Dimmer manufacturers provide a variety of sizes of SCR dimmers, typically ranging from 2.4 to 12kW. The number of dimmers and the power capability of each depends on the size and function of the studio, the power of the largest light fixture to be used, the degree of production sophistication required, and the lighting system budget.

With a dimmer-per-circuit system, the number of dimmers required is normally equal to the number of outlet receptacles in the studio. Although it is possible to permanently wire more than one outlet to a dimmer, this approach, if carried to an extreme, defeats the operational advantages of

a dimmer-per-circuit system. If the studio does not require larger fixtures than 2kW, all the dimmers should be rated at 2.4kW (20A). If the studio is of a size that will require 5kW fixtures, a worst-case estimate should be made for the number of 6kW (50A) dimmers required for those fixtures, with the remaining outlets to be powered by 2.4kW dimmers.

With a patch panel/dimmer system, calculating the number of dimmers and their power ratings is a bit more complicated. The problem is mainly one of determining how many fixtures can be appropriately grouped together for simultaneous control. A logical starting point is to draw up light plots of the maximum size productions that might be encountered, and to assign all the required lighting fixtures to dimmer groups. This obviously should be done by a person with considerable lighting experience. The advantage of using high capacity dimmers (for example, 6 or 12kW units) is that only one control is necessary to dim several light fixtures. The advantage of using low capacity dimmers (for example, 2.4kW units) is that there will be a greater degree of individual fixture control. For the majority of TV studios, the best compromise is often a combination of 2.4kW and 6kW dimmers.

It is important to keep in mind that the maximum power capability of the total dimmer system should be approximately the same amount of power as calculated in the original design of the studio. (For the calculation of this total power load refer to the article "Power and Cooling Loads for TV Studios and Control Rooms," in the November 1981 issue of **Broadcast Engineering**, pp. 48-56.)

Suppression of interference

SCR dimmers operate on the principle of rapidly turning the power on and off 120 times a second (for a 60Hz system). The turn-on time for a typical SCR is only a few microseconds. The resulting extremely fast current rise time will cause lamp filaments to vibrate and acoustically "sing," and will also generate radio frequency radiation that will interfere with the audio and video systems in the studio. This interference is readily detected by listening to an AM radio in the same room in which an inexpensive consumer-type room light dimmer has been installed.

This radio frequency interference can be effectively eliminated by using a large inductive filter in the output of the dimmer. These filters will increase the current rise time from a few

microseconds to several hundred microseconds. A typical specification for a high-quality filtered SCR dimmer unit will require that the current rise time of the dimmer shall not be less than 500 μ s as measured at the 90° conductive angle from 10% of rise to 90% of rise when the dimmer is operating at full rated load. Units meeting these specifications will seldom produce lamp filament sing or radio frequency disturbances.

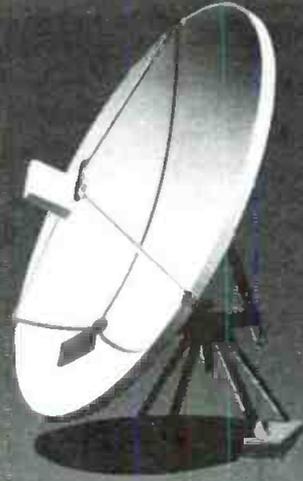

Some engineers in the industry believe that this traditional rise time method of specifying a dimmer is inadequate. They point out that the generation of radio frequency interference is proportional to the rate of current rise. Accordingly, two dimmers of different current capacities can have the same current rise time but a different rate of rise, and hence generate different amounts of interference. Furthermore, they point out, radio frequency interference can be generated when the SCR first turns on; and because the traditional method of specifying rise time does not take into account what occurs during the first 10% of the rise curve, a rise time specification does not necessarily guarantee an interference-free system.

The author strongly recommends that lighting specifications contain the performance requirement that the system shall produce no objectionable interference under any normal operating conditions.

Many other dimmer characteristics in addition to radio frequency generation must be considered. Among these are load and line regulation, fully magnetic circuit breakers, plug-in modules, capability to withstand hot-patching of cold loads, ease of servicing, and mechanical construction. The major reputable lighting equipment manufacturers provide roughly equivalent equipment with respect to these requirements. As with most technical equipment you get what you pay for, and the buyer should be wary of inexpensive equipment from manufacturers with marginal track records.

Location of dimmer racks

The dimmer equipment racks, shown in Figure 12, containing the SCR modules, should never be located in the studio proper. There are three reasons for this. First, dimmers radiate a magnetic field that can interfere with cameras and microphones, either directly or through their associated cables. Second, although modern SCR dimmers are relatively quiet, they do generate

12-Foot Antenna

Rely on Microdyne for excellent reception. Microdyne's 12-foot parabolic antenna has ideal reception in EIRP contours between 36 and 33 dBW and delivers sparkle-free reception.

Complete your receiving system with a 12-footer from Microdyne for high performance capabilities.

some acoustical noise that may be objectionable in the studio. Third, dimmer racks can occupy a significant amount of floor space, which is usually at a premium in a studio.

The most logical location for the

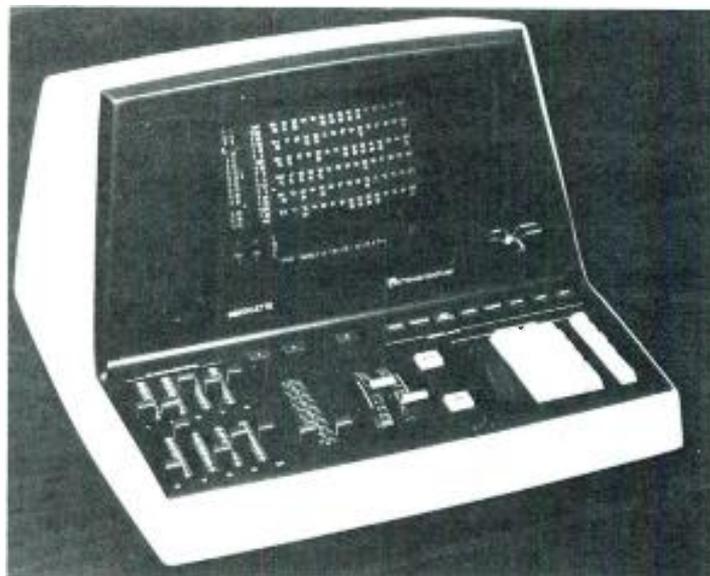

dimmer racks is in an area adjacent to the studio where the magnetic radiation and acoustical noise are not objectionable. Such areas as the prop storage room, mechanical rooms, and large electrical closets are often ideal.

In selecting such an area, keep in mind that normal wall construction does not impede magnetic fields. Accordingly, the dimmer racks should not be located on the opposite side of a studio wall or control room wall

where the magnetic field penetration could interfere with equipment in the studio or control room.

The control system

The lighting control system is the final remaining element to be considered in the total studio lighting facility. Its purpose is to provide low-voltage control signals to the dimmers to regulate the amount of power they provide to the fixtures. A control system typically consists of a remote control console with faders and switches and, in more sophisticated systems, CRT displays and magnetic disc memories. See Figures 13 and 14.

An almost infinite variety of control configurations are offered by lighting equipment manufacturers. It is beyond the scope of this article to attempt a comparative analysis of available control systems. What is important to grasp are the fundamentals of control systems so that particular units can be properly evaluated.

Those who do not have an on-going working relationship with lighting control systems may be confused by the proliferation of terms that are not familiar to those outside the lighting field, such as scenes, presets, masters, sub-masters, grand masters, independent, pile-on, bypass, X & Y, and A & B faders, etc. The recent introduction of microprocessor-based control systems with memory can compound the confusion.

Manual control systems

It is essential to keep in mind that, regardless of the sophistication or complexity of the control console, the function of a control system is to provide each dimmer with an adjustable voltage (usually from zero to about 10V) to control the amount of power that the dimmer is delivering to its load.

In the simplest form of control system, each dimmer has one controller (also called a fader). The overall control voltage for all the dimmers is varied by a master controller (see Figure 15). This system is seldom used in studio facilities because of its minimal control flexibility.

The next higher level of control flexibility provides basic 2-scene preset control, as shown in Figure 16. Each dimmer has two controllers—one for Scene A and one for Scene B. The control voltage provided to all Scene A controllers and all Scene B controllers is adjusted by the respective scene masters. A preset system enables the lighting operator to establish the intensity of any or all dimmers in the system in advance of the next lighting

TV lighting

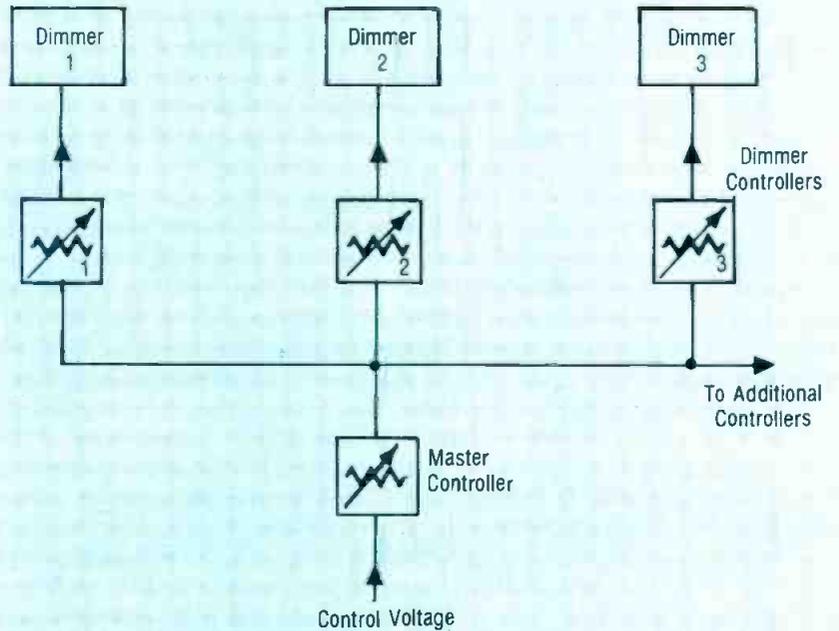

Figure 15. 1-scene control system.

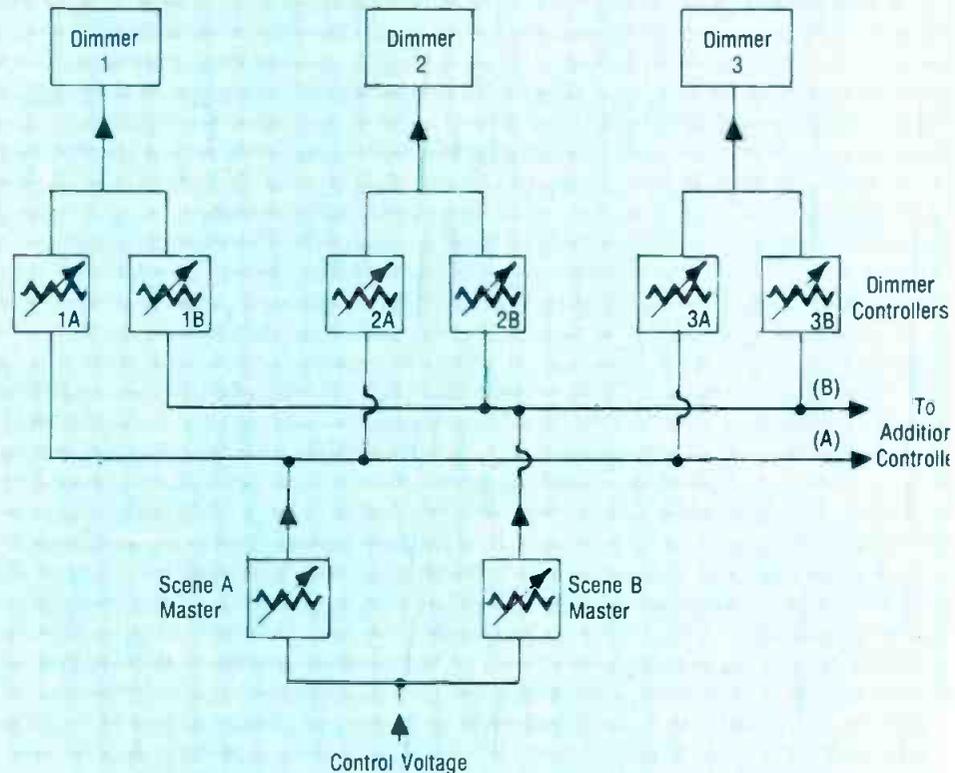

Figure 16. Basic 2-scene preset control system.

change. The transfer to the following light scene is accomplished by lowering one scene master while raising the other scene master.

Building on this basic scene preset concept, Figure 17 illustrates the addition of a grand master, an independent master, and delegation switches for the controllers. The functions of the various controls can be understood by tracing the control voltage paths on the diagram. This type of control system (or a variation of it) has been installed in the majority of TV studios constructed in the last 20 years.

The particular design shown in Figure 17 is not necessarily universal because different manufacturers circuit the control functions in different ways and provide other features not illustrated. Different terms may also be used. For example, the "scene master" may be called a "preset master" or a "sub-master." However, regardless of the complexity of various design approaches, it should be remembered that a dimmer control system will provide a control voltage to each of the dimmers that is varied by a chain of one or more controllers.

Large studio facilities that must accommodate highly sophisticated productions with numerous lighting changes will require additional control flexibility. For example, additional scene presets, beyond the two shown in Figure 17, will normally be required. However, because each dimmer must have an additional controller for each scene, there is a point of diminishing returns in adding manually controlled scene presets. The control console simply becomes too large and uncontrollable. This fact alone has been the major impetus for the introduction of microprocessor-based lighting control systems.

Microprocessor-based control systems

Lighting control for sophisticated systems consists of making a great number of rather simple decisions. This type of control requirement is ideally suited to the abilities of a computer that can remember thousands of commands, call them up as required, and perform actions with extreme speed. The recent availability of powerful microprocessors at a reasonable price has made a microprocessor-based lighting control system imperative for systems beyond a certain size and sophistication. Microprocessor-based control systems reduce the size of the lighting control console to a small unit with only a few (if any) manual type controllers. Some systems can control

X1-S

1100-FFC

Microdyne's 1100-FFC X1-S is our seventh generation satellite receiver. It has high performance features including threshold circuitry which insures optimum video performance in the presence of low carrier-to-noise ratios.

Rely on Microdyne expertise. Our X1-S offers excellent video-audio performance for your communication needs.

TV lighting

more than 500 dimmers and can store information (internally or on magnetic disc) for thousands of scene changes. Once programmed during rehearsal time, any of the preset scenes may be called up by simply pressing one or more buttons.

Although small or medium size TV studios may not require all the control power available from a microprocessor-based system, such systems should be investigated because of their greatly decreased cost in the last few years. □

**What
the Shadow
doesn't know
...it learns.**

The BTX Shadow System:

- synchronizes and controls ATRs and VTRs to sprocket-lock, subframe accuracy
- learns each recorder's dynamic characteristics to optimize machine control
- maintains minimal offset during GO TO and CHASE functions
- runs independently, allowing hands-off synchronization in all control modes
- uses standard RS 232C interface to permit present and future computer automation, including electronic editing
- available with optional control console, which displays time and status data and allows keypad entries of destinations, GO TO and FOLLOW commands, and data storage/retrieval
- priced to permit each transport to have its own Shadow

Our Agile 24 satellite receiver system makes things perfectly clear.

Standard Communications' new Agile 24M/S satellite receiver system does everything a broadcast studio model does—except cost as much.

The Agile 24M is a highly cost-effective, reliable satellite receiver featuring advanced circuitry like a fully synthesized phase-lock-loop tuning system, a pre-selector tracking filter, and a PLL demodulator. Dual conversion design converts the incoming signal twice for better selectivity and image rejection. The threshold extension circuit reduces noise by as much as 2 dB on dark scenes, delivering a static threshold as low as 5.5 dB carrier-to-noise. That means blacker blacks in dark scenes, with reduced sparkles.

The Agile 24M is a 24-channel, stand-alone master receiver with sufficient gain to drive as many Agile 24S

slave receivers as required to satisfy any satellite communications system. The unique Agile 24S slave receivers offer all the operating features of the Agile 24M with the exception of the first block down converter. The active amplifier loop-through design of the Agile 24S is cost-effective, eliminating need for redundant passive power dividers.

Nearly all critical adjustments and test functions can be accomplished by accessing the front or rear panel of Agile 24/S receivers. The multi-function front panel meter permits zero tuning as well as carrier-to-noise metering, eliminating the need for special test equipment. Channel indicators display both transponder number and frequency in MHz.

The Agile 24 receiver system carries Standard's full technical support. System installation and alignment is facilitated by enlarged schematic diagrams and an illustrated technical manual. Standard's field engineers offer operator training as well as on-site repairs. Where factory service may be required, 48-hour turn-

around and a loan equipment plan are available to minimize system downtime.

Look to Standard to handle all your TVRO system needs with a complete line of LNAs, down converters, earth station antennas and microwave interference filters.

station- to-station

Central Dynamics VA 2035 Video DA

By Edgar Lee Howard
Supervisor
Special Projects
WOSU-TV, Columbus, OH

The Motorola IC power regulator MC1460R, used, among other places, in early versions of the CD video DA is no longer available. A newer device, the Motorola MC1469R is a pin-for-pin equivalent to the older device, with one exception. The new device requires one outboard silicon NPN

transistor and one 0.001μf capacitor to properly implement the regulator's current-limiting capability.

When installing the new regulator, pin 4 is isolated from existing foil traces and is connected to the new transistor as indicated in the drawing. Should there be no interest in preserving the current-limiting capability of the regulator, pin 4 may be left floating.

The new regulator, while having a slightly lower maximum device dissipation, has a higher applied voltage rating, which may reduce the occasional failure of these devices after power surges. □

SAVE TIME

For fast, accurate service, please remove the Peel-Off Label which is used to address your magazine) and affix it to the Reader Service Card, the Address Change Card, or to any correspondence you send us regarding your subscription.

TV test equipment from the inventors of the Plumbicon® tube.

At long last a new, reliable source of TV test equipment. One that offers fast, predictable delivery. One with a name all the world trusts—Philips. Four quick examples:

PM5565 Waveform Monitor

Enjoy the luxury of examining one line and one field at a time. On top of this, there's a convenient front probe input so you can use the monitor as a troubleshooting oscilloscope.

PM5567 Vectorscope

If you want more accurate decoding and the ability to have an external reference from composite video signals, choose our vectorscope.

Both waveform monitor and vectorscope mount side by side, fit all existing hardware and use less power than the competition.

PM5539 Color Analyzer

Take it on a quick trip through your studio or control room and adjust all monitors to the same color temperature in a matter of minutes.

With four different memories, there's no problem in quickly calibrating four different phosphors.

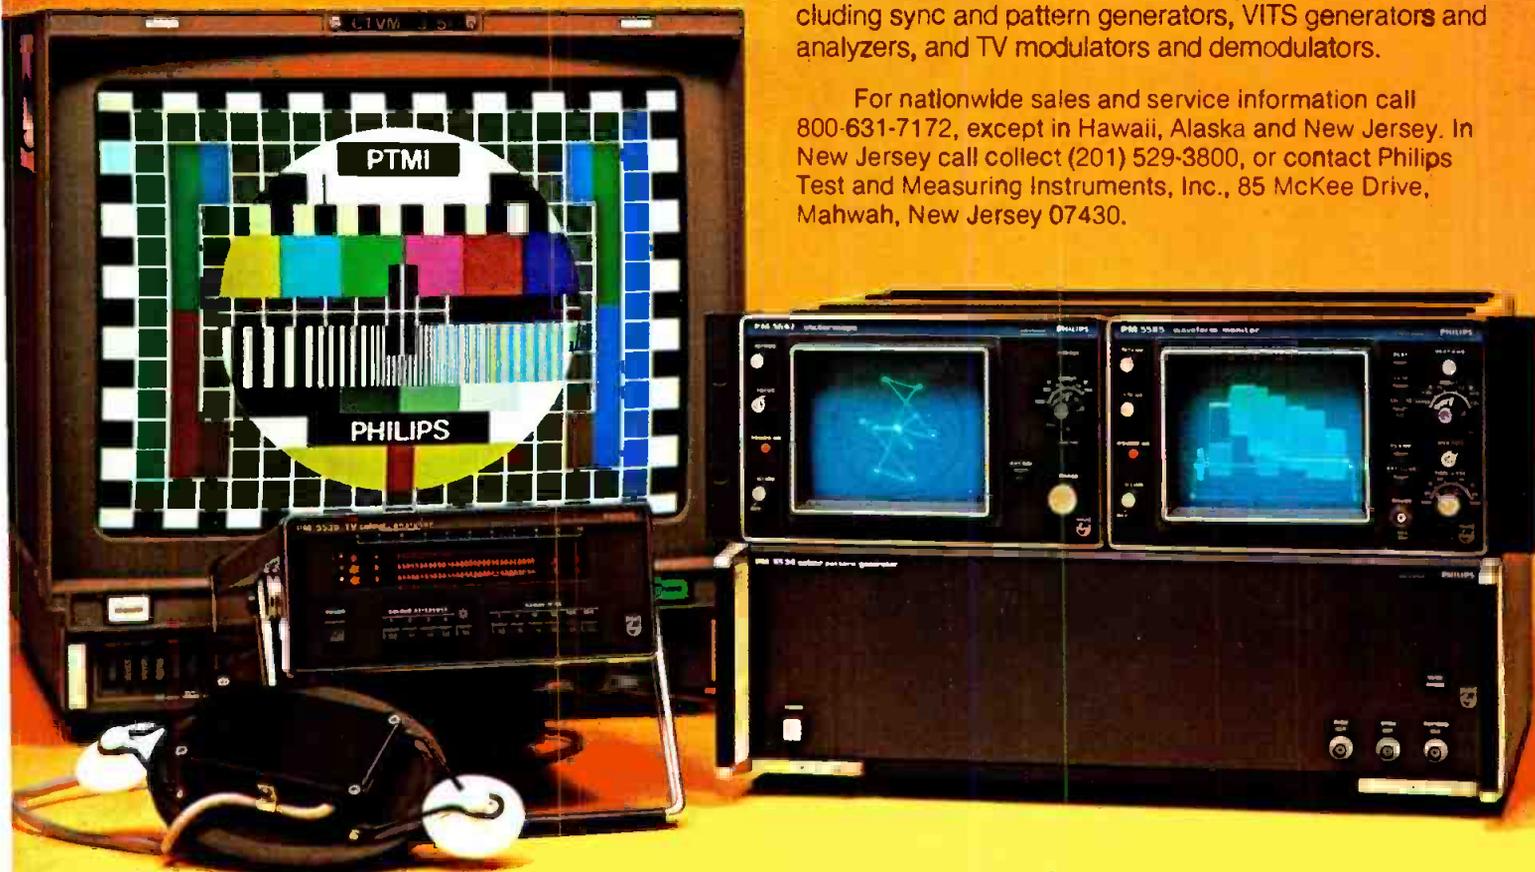

Variable full-scale, from less than set up to more than reference white, allows measurement of color tracking as a function of APL.

PM5534 Color Pattern Generator

Our universal pattern contains all the signals needed to verify overall system operation—directly from the picture. No wonder virtually every set manufacturer uses our pattern for their TV set alignment.

Of course our TV test equipment line doesn't end here. Today Philips offers a wide range of equipment including sync and pattern generators, VITS generators and analyzers, and TV modulators and demodulators.

For nationwide sales and service information call 800-631-7172, except in Hawaii, Alaska and New Jersey. In New Jersey call collect (201) 529-3800, or contact Philips Test and Measuring Instruments, Inc., 85 McKee Drive, Mahwah, New Jersey 07430.

Philips, of course.

3V chip

dbx Inc. has announced the development of a new integrated circuit (IC) for dbx noise reduction that operates from 3V nominal power. The dbx NRX Chip is viewed by the company as a major factor in narrowing the gap between the performance of analog and digital signal processing techniques for audio and recording industry applications.

The chip will operate from a 3V nominal supply with good performance down to battery end-life of 1.8V. Each chip contains the active components for stereo dbx noise reduction packaged in a 20-pin miniature flat pack. It is now being prepared for production by a major Japanese IC manufacturer.

Automated broadcasting system

The SOL-6800, introduced by Solutec Ltd., controls up to eight VTR machines using standard remote connectors. Its audio-video switcher configuration can be varied to meet customer requirements.

Designed for automatic use, the unit constantly detects the video signal and if needed, will switch automatically to emergency or fill-in inputs until the following event in the sequence is

reached.

The keyboard allows the operator to program sequential real time or asynchronous events and to monitor them on the alphanumeric display. The SOL-6800's communication link allows the unit to be integrated into a master computer control system.

Carefully planned software facilitates operation and provides fast operator training. The unit also features manual override.

Circle (985) on Reply Card

Audio-video multicables

Wireworks Corporation has introduced a new series of audio-video multicables, the HVT series, which incorporates audio and video cables in one outer jacket, simplifying installa-

tion. The HVT series multicables are hardwired multicables (single unit systems) that incorporate one or two video lines in the same cable with one, three or five audio pairs: HVT2, one audio/one video; HVT4, three audio/one video, both Siamese cable construction; and HVT7, five audio/two video, conventional round cable.

HVT series multicables are suited for broadcast, ENG, EFP and CCTV applications, transmitting sound and picture for monochrome and color TV cameras, as well as for remote control, and monitor/cue line systems.

HVT cables are configured with BNC-type connectors on all audio pairs. Audio channels consist of standard twisted pairs to reduce crosstalk and a 100% foil shield that guards against EMI and RF interference. Video channels are made of flexible RG59/U-type cable.

Circle (986) on Reply Card

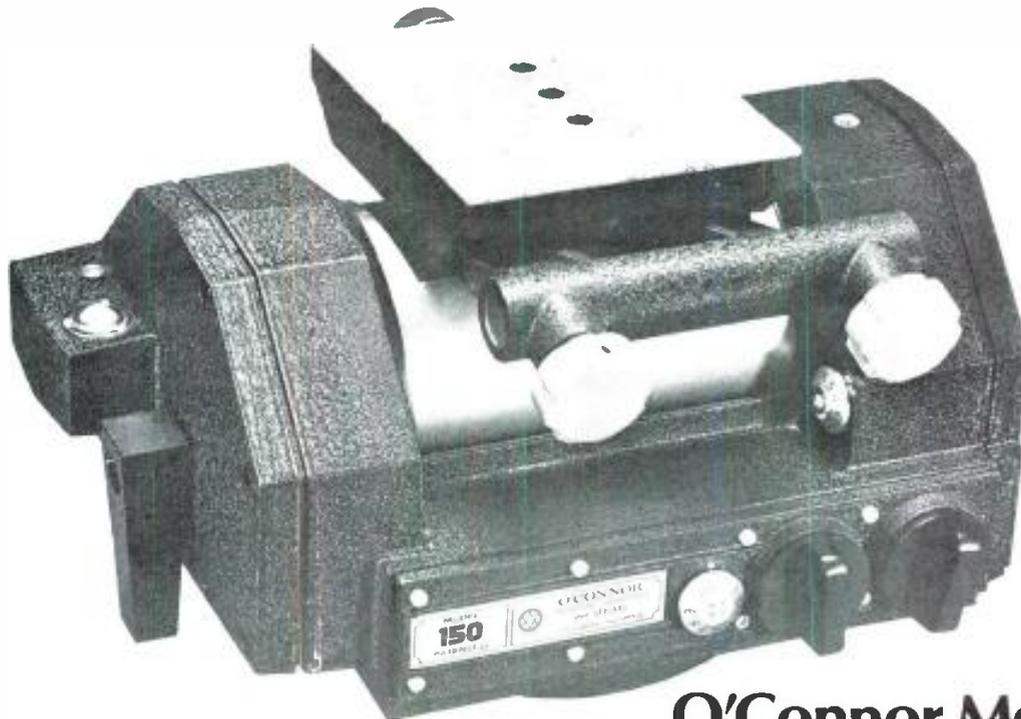

AM transmitters

The Broadcast Division of Harris Corporation will introduce four major new products, including a new line of solid-state AM transmitters, at the upcoming NAB Convention.

Harris will introduce a new line of solid-state AM transmitters, offering broadcasters up to a 36% savings on annual power bills. Named the SX Series, the new line includes the SX-1 (1000W), the SX-2.5 (2500W), and the SX-5 (5000W). All deliver increased long-term stability and reduced maintenance requirements.

Each model offers built-in diagnostics and pre-programmed microprocessor control and status monitoring. All of the SX transmitters employ a unique convective cooling system that protects components from dirt build-up. The SX Series transmitters are designed for AM stereo and easily interface with most remote control and facility control products. They

EXCEPTIONAL.

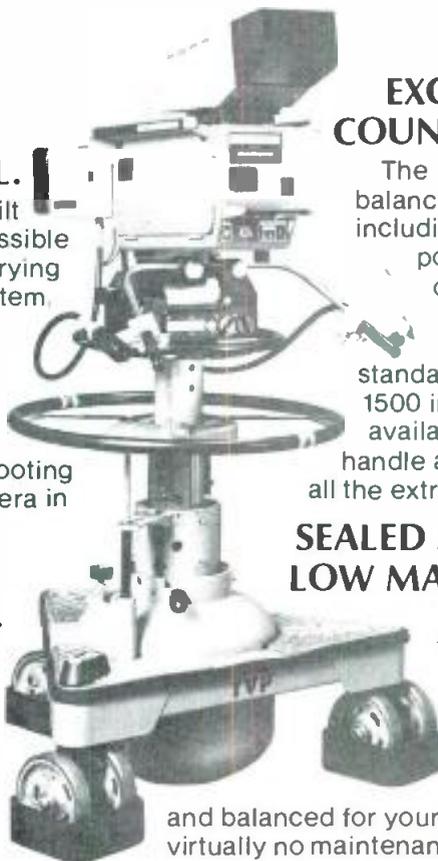

O'Connor Model 150. Exceptional fluid control for heavy television cameras.

INFINITELY VARIABLE DRAG CONTROL.

Exceptional pan and tilt drag control is made possible with the 150's unique varying overlap fluid control system. Between the minimum and maximum levels of drag, the drag force is infinitely variable—enabling cameramen to adjust the drag while shooting without jerking the camera in any way.

PRECISE DRAG REPEATABILITY.

Separate pan and tilt drag dial indicators are provided to aid the cameraman when precise repeatability of a motion is needed. The dials also aid in matching the tilt and pan drag for exceptionally smooth horizontal shots.

EXCEPTIONAL COUNTERBALANCE.

The 150 is counterbalanced at all times, including extreme tilt positions, making operation much easier. A 1000 in-lb spring comes standard with an optional 1500 in-lb spring also available so the 150 can handle any TV camera with all the extras up to 150 lbs.

SEALED SYSTEM FOR LOW MAINTENANCE.

Like all O'Connor fluid heads, the Model 150 is fully sealed off from all contaminants. Once the head is properly adjusted and balanced for your camera, it requires virtually no maintenance whatsoever.

EXCEPTIONAL QUALITY THROUGHOUT.

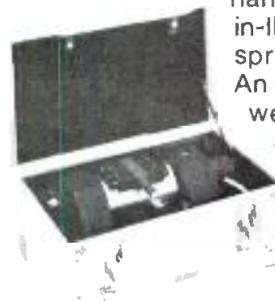

The 150 is built of lightweight aluminum and magnesium castings, weighing only 25 lbs.

The pan and tilt locks are fully independent of the pan and tilt drag adjustments.

The tilt range is $\pm 45^\circ$.

THE EXTRAS COME STANDARD.

The Model 150 comes equipped with an O'Connor adjustable and removable platform with double handles. The 1500 in-lb counterbalance spring is optional. An exceptionally well-constructed carrying case is probably the only accessory your Model 150 will need.

New products

also employ extremely efficient MOSFETS (Metal Oxide Semiconductor Field Effective Transistors) and Polyphase PDM (Pulse Duration Modulation), a 4-phase sampling system in which the audio input of the transmitters is sampled four times during each PDM cycle for exceptional audio performance.

Also introduced will be a new Harris earth station controller system called the Harris 9165. Up to 24 pre-programmed antenna positions and earth station configurations are available. The advanced unit allows on-site and remote access to the antennas, receivers and uplink electronics.

A third new product is a tabletop-sized computer for script preparation, news room use and word processing. The desktop computer, the Infowriter, greatly increases the word processing capabilities of the Harris Autotron Star business automation system. Offered in three models, the basic Infowriter consists of a single CRT workstation with detachable keyboard, dual 650k bytes of memory, and one synchronous line for general communications purposes.

A new line of UHF TV transmitters will be introduced that includes 30kW, 55kW, 110kW and 220kW models. Notable features include a new exciter and greatly improved efficiency. Harris will display the 55kW model at NAB.

Circle (987) on Reply Card

Lavalier microphone

The Isomax Pro introduced by Countryman Associates is a new directional lavalier microphone offering up to 20dB better rejection of feedback and unwanted sound when compared

to other lavaliers. It operates with equal ease on phantom power or internal batteries and has a balanced output with standard XLR-3 type connector

Standard features include switch selectable low frequency rolloff and presence peaking making it equally at home in voice or music applications. Its ability to handle 150dB sound levels without distortion allows it to be used on horns or amplified instruments without possibility of overload. An optional tie clip that holds two microphones is available.

Circle (988) on Reply Card

Video squelch

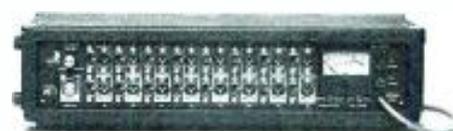

Video Aids of Colorado has introduced the VAC Video Squelch, which provides a new dimension of convenience to operators of video distribution systems. Basically an electronic video switch, the instrument constantly monitors the main video source line to determine whether video is indeed present, and whether the signal-to-noise ratio exceeds a preset level. If both of these conditions are met, the device passes the main video on to the output. If either condition is not met, the alternate source of video is connected to the output.

Other features include an ac relay, with normally open (or normally closed) contacts, which can be activated when the main video source is operational. The unit also provides a visual and aural warning to the operator when it senses a fault on the main video.

Circle (989) on Reply Card

Audio distribution system

Bonneville Productions has introduced the model PC-1 audio distribution system, which offers state-of-the-art electronic design featuring the 990 op amp and Jensen transformers. This combination provides for exacting performance specifications with the flexibility of transformer isolation. Each of the 16 outputs are selectable to line or microphone level. The PC-1 is suited for use in mobile recording on location, interfacing large audio systems at conventions and media-covered events, and isolating feeds in applications where ac ground

Never build an editor that can become obsolete...

And it goes for every Z editor ever built.

Considering all the advancements made in videotape editing systems in just the last three years, you might think your Mini-Z or Z-6 editing system is becoming obsolete. Well, it's not.

In fact, even though we're introducing a whole new line of Z6000 editors, the very first Z editor we ever built can be fully upgraded to Z6000 capability for less than \$4,500!

So, if you own a Videomedia editing system, hang on to it. For a surprisingly low cost, you can expand its capabilities whenever you want.

Frame accurate editing, for under \$11,000.

Don't buy a system with more features than you need. If you do, you're paying for "extras" before you can use them. Instead, invest in a system that can grow with you.

For example, start with a Z6000-A, a cuts-only editor with four-way split edits, auto extend and tag, four-event swap/recall, printer output, and the ability to select in and out points on the fly. Like all Z6000 editors, it has distributed intelligence, which controls each transport with an

individual microprocessor, thus eliminating timing discrepancies... all for less than \$11,000!

What's more, you'll be able to add features, such as our new KR6000 character generator for integrated graphics control, when you need them, at a fraction of the cost of a new system with the same capabilities.

Keep up to date at your own pace.

Whenever we build a new product or add a new capability, we make sure that it adapts to all our previous systems.

That's why, when you buy any Videomedia product, you're investing in a system with a future.

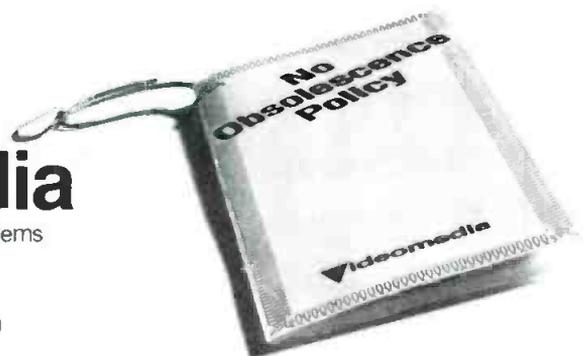

For complete details on our entire line of editing systems, post-production equipment, and a copy of our exclusive No-Obsolescence Policy, call or write today.

Transmitter update package

Marcom has announced the introduction of its Synergistic FM transmitter update package. The system is intended to yield new performance from older FM transmitters at significantly lower costs than new transmitter purchases.

System components include the following:

- the new programmable audio processor, with five remotely selectable processing regimes;
- the Rood/Marcom stereo generator that produces approximately 70dB stereo separation; and
- the new HPA-4635 FM exciter with ultra-linear modulator.

Circle (991) on Reply Card

SCA generator

Broadcast Electronics has introduced the model FC-30 SCA Generator, which ensures high-performance and reliability in audio and data subchannel multiplex transmission.

Although specifically designed as a companion unit for the BE FX-30 Synthesized FM Exciter, the FC-30 is compatible with other FM exciters and is recommended as an effective means of upgrading existing SCA operations.

Audio frequency response is ± 0.5 dB, 10 to 10,000Hz, exclusive of the audio lowpass filter. Data information low-frequency response extends to dc. Total harmonic distortion is less than 0.5% within the audio passband, with 0.5% or less intermodulation distortion, 60Hz/7kHz; 4:1 ratio (audio lowpass filter bypassed). FM noise is 67dB or greater below ± 6 kHz deviation at 400Hz.

All adjustments are made by recessed, front panel controls. Continuous signal level monitoring is afforded by front panel LED modulation indicators. The FC-30 is capable of full remote control operation, using unique optically isolated interface for either positive or negative polarity control logic.

Memory logic ensures operating mode status for primary power interruption up to one hour, with automatic restart upon restoration of power.

The FC-30 subcarrier operating frequency is 67kHz. Other frequencies in the 39 to 95kHz range can be supplied. Fully shielded, with extensive RFI filtering, the FC-30 occupies 1.75 inches of standard EIA 19-inch rack space.

Circle (992) on Reply Card

DTMF receiver

Teltone has introduced the M-927, a DTMF receiver that accepts all 16 digits of the Dual Tone Multi-Frequency (DTMF or Touch-Tone) standard. It provides a complete Central Office grade DTMF and rotary dial receiver in a reliable low cost part. The digital output of the M-927 can be used directly with CMOS and with simple transistor drivers.

Digit information interpreted by the M-927 is presented at the output pins along with a strobe and can be user formatted as binary, 2 of 8, or 1 of 12. Other features include three handy clock outputs, enable and clear pins.

Packaged as a 40-pin DIP hybrid, the sophisticated signal processing power of the M-927 is in the proprietary LSI devices used. The unit requires no more than an inexpensive TV color burst crystal (3.579MHz) and a single 12V power supply to operate.

Circle (993) on Reply Card

Rolling color changer

ColorMax, a computerized rolling color changer that enables the lighting designer to use a band of 12 separate colors, is now available from The Great American Market.

ColorMax is a self-contained unit that slides into the gel frame holder of the lighting fixture. It plugs into a 120Vac non-dim circuit for motor and fan power. The control signal is programmed from an external controller, and up to 100 units may be slaved to a single control channel. Maximum color change time is 2.5 seconds, using all 12 color squares.

The ColorMax controller can address any channel individually, or all channels together with a single, preset signal. It is available in 4- and 15-channel models. Custom consoles of up to 100 channels can be built.

ColorMax is offered in two configurations: 8x10 for fixtures with 8-inch lenses, and 6x7½ for fixtures with 6-inch lenses. Weight of the unit is 10 pounds.

Circle (994) on Reply Card

Routing switcher

HEDCO will introduce a small, 100-input, 100-output routing system, the TransPath I, at NAB-82. The switcher is based on a 3-stage, non-blocking system that radically reduces the number of crosspoints. A standard 100x100 routing switcher now requires 10,000 crosspoints; TransPath I uses only 5700, increasing the MTBF of the overall switcher. Because of the reduced number of crosspoints, the matrix has been packaged in 22 rack units. A complete audio or video 100x100 switcher can be assembled with its power supply and control computer in 29RU of a standard 19-inch rack.

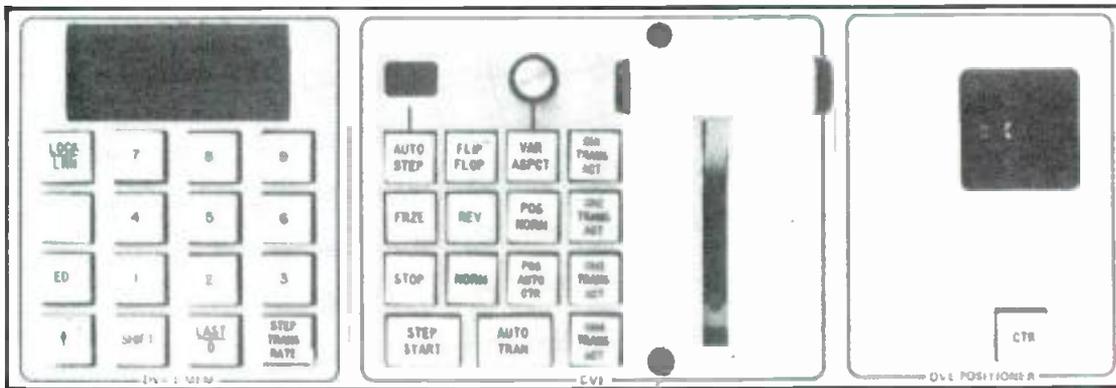

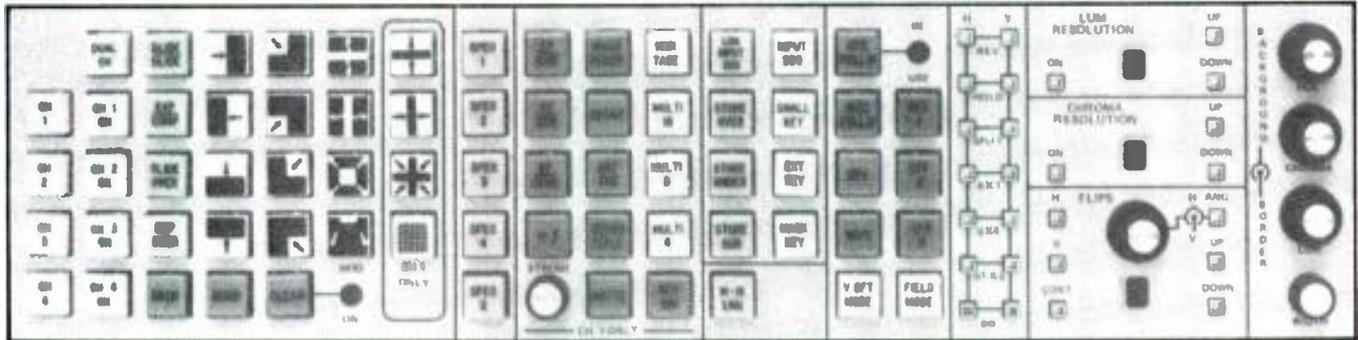

TransPath I can be configured as video, audio, AFV, or AFV with breakaway. Up to three levels of audio or time code can be used with a video system for stereo AFV operation. A central terminal provides bus control or diagnostic information in parallel with individual remote panels.

The physical construction of the matrix uses mother-board construction and ZIF connectors to minimize crosstalk and wiring variables. Only three basic types of PC boards are used in the main switcher. The basic 100x100 configuration can be reduced in size by removing boards in modular increments and later field expanded by station personnel.

A central MC68000 microprocessor handles the internal switching and interface to the switcher. Operational paths are stored by a unique use of EEROM to ensure absolute system recovery following station power outage. To provide additional reliability, TransPath I is equipped for redundant path computes and redundant power supplies. Communication between remote panels and the central processor is via coax cable. A serial bi-directional bit stream transfers all requests for input switching. Various types of control panels using the MC68701 microprocessor are available as standard items: an X-Y system, individual keypads with numeric or alphanumeric designations, and a CRT display of paths and system control. □

April 2-3

The *International Association of Satellite Users (IASU) Second Annual SATCOM Conference* will be held at the Hyatt Regency Hotel at Reunion in Dallas, TX. This conference, which precedes the National Association of Broadcasters Conference that opens April 4, will feature programs by experts and opinion leaders that will interest satellite users.

SATCOM '82 will bring the realities of new satellite application advances to the forefront. Topics include direct broadcast satellites, interconnection of satellites and interactive cable systems, assessments of teleconferencing, enhanced broadcast station services, training and educational applications to military, business and medicine.

April 4-7

Dallas will be the site of the *60th Annual National Association of Broadcasters Convention*. The convention will feature radio seminars, discussions of TV trends, demonstrations of innovations in television, exhibits, and a spouse program. Glen Campbell will perform on Sunday, April 4 and Jonathan Winters will appear on Wednesday, April 7. For more information, contact NAB, Convention Information, 1771 N St. NW, Washington, DC 20036.

April 20-23

The Institution of Electronic and Radio Engineers will hold its *Fourth International Conference on Video and Data Recording* at the University of Southampton, Southampton, England. Aimed at engineers and physicists in manufacturing and user industries and universities, 45 papers will be presented in four days by authors from France, Germany, Italy, Japan, The Netherlands, United Kingdom and the United States.

A feature of the conference will be a forum on digital standards. Seven manufacturers and broadcasters from Europe, the United States and Japan will put forward their own positions. The speakers and audience will then take part in an open debate. A trade exhibition will be held in conjunction with the conference. Co-sponsors of the conference are the AES, IEE, IEEE, IoP, RTS and SMPTE. More details and registration forms are available from the Conference Registrar, IERE, 99 Gower St., London WC1E 6AZ.

April 29-May 1

The *1982 Electronic Distribution Show and Conference* will be held in the New Orleans Hilton Hotel in New Orleans, LA. The conference will encompass the Electronic Distribution Show trade exhibits, the *EDS '82 Industrial Distribution Conference*, and the *Third Annual National Sound and Electronic Systems Conference (NDESC)*. The NDESC encompasses the EDS exhibits as well as marketing and technical sessions for contractors sponsored by the National Sound and Communications Association in conjunction with the Show Corporation.

The National Electronic Distributors Association will conduct industry seminars in conjunction with EDS. NEDA's activities will begin with an "Outlook" program on the future of industrial distribution during the afternoon of Wednesday, April 28, the day before the show opens. Concurrent programs for distribution management will be conducted each show morning from 8:30 to 9:45 a.m. In addition, NEDA will conduct a separate

educational program for distributor middle management personnel (sales and purchasing) from 12:45 to 2 p.m. Friday.

For more information, contact David L. Fisher, executive vice president, Electronic Industry Show Corporation, 222 S. Riverside Plaza, Suite 1606, Chicago, IL 60606; (312) 648-1140.

May 3-5

"Cable Delivers!" will be the theme at the *National Cable Television Association 31st Annual Convention and Exposition* in Las Vegas, NV. Exhibit hours at the convention will be increased 24% from last year. In addition to hundreds of exhibits planned for the convention at the Las Vegas Convention Center, there will be dozens of panels featuring technical, management and programming discussions. Daily luncheons will include guest speakers on topics vital to the cable industry.

Exhibits featuring cable programming and hardware will open with a special ceremony at 11 a.m. on May 3 and close at 6 p.m. that day. They will be open from 8 a.m. to 6 p.m. May 4 and 5. A reception and sneak preview of exhibits is set for Sunday evening, May 2.

A dinner dance and national awards presentation will conclude the convention on May 5. Early registration will begin on May 1. Reservation forms are available from Trade Associates Inc., 4701 Willard Ave., Suite 105, Chevy Chase, MD 20815-4697. Space reservations cannot be made by telephone.

May 3-6

Video '82, Program International will be held in Berlin in the form of a congress with an exhibition and music market. It will deal with questions and problems concerning video software and is intended particularly for the specialist trade. The *International Music Market Seminar Berlin 1981*, which took place in September 1981, will be continued within the framework of this event.

May 8

The Chicago section of SMPTE will hold its *Seventh Annual All Day Meeting* at the Ramada O'Hare Inn in Chicago. This meeting will feature presentations on film and related technologies. Last year's program contained presentations on new film stocks, power sources for location lighting, super-16mm production, color dye stability and the interface of film and video.

Planning for the program is in progress. Those interested in submitting papers for consideration should contact: Program Chairman, Kenneth R. Knaus, Eastman Kodak Company, 1901 W. 22nd St., Oak Brook, IL 60521; or Publicity Chairman, Edward Blasko at the same address.

June 4-6

The forthcoming premier AES conference, titled "The New World of Digital Audio," will be held at the Rye Town Hilton, Rye, NY. The areas to be included as follows: an overview on the present state-of-the-art; the digital disc; high density magnetic recording; high density optical recording; digital data protection; digital data preservation; error correction; encoding and transcoding; and digital music. Also, planned participation by experts in the field of the digital disc from Europe

Nothing in The World Compares to The Quality, Performance and Feel of This Fine Swiss Instrument.

- Twin Capstan. Servo-controlled tape transport with interhead tension sensing.
- Detachable, individual control keyboard for full remote capabilities.
- Interchangeable head assembly.
- Keyboard selection of any one of four pre-set modes for speed, tape type and standard.
- Four speed operation — 30ips, 15ips, 7½ips, 3¾ips, plus variable playback speed control.
- High speed copying capabilities — ten m/s spooling.
- Servo-control editing with built-in cutter.
- AC/DC operation . . . even off your car battery.
- Matrix display for "record" and "output" modes.
- Power, phase-lock and tape tension warning display.
- 15¼"L x 15½"W x 9¾"H, compact: 44 lbs lightweight.

Calendar

and Japan is scheduled.

In addition to the scientific papers presentation, there will be a limited exhibition of digital technical products that are associated with the field of digital audio. This will allow the attendees to see today's digital products, to evaluate such products and to enable them to better plan a future equipment strategy. For registration information, contact the Audio Engineering Society, 60 E. 42nd St., New York, NY 10165; (212) 661-2355 or (262) 661-8528.

June 10-13, 24-27

The 1982 *National Video Festival* will take place in both Washington, DC and Los Angeles. Scheduled for June 10-13 at the Kennedy Center in Washington, DC and June 24-27 at the AFI campus in Hollywood, the 1982 *National Video Festival* will include premiere screenings with large screen video exhibition, seminars on current video issues, and a national student competition in videotape production.

The 1981 *National Video Festival*, held at the Kennedy Center on June 3-7, drew more than 550 independent, commercial and industrial producers, as well as artists, educators, funders and students. The five days of screenings (185 tapes) and presentations (eight panel discussions plus keynoter Erik Barnouw) drew extensive na-

tional press coverage, broadcast and print.

July 18-22

Communications and the Future, the Fourth General Assembly of the World Future Society, will be held at the Sheraton Washington Hotel in Washington, DC.

The assembly will cover the spectrum of the communications field, including the future of telecommunications, computers, broadcasting, films, newspapers, libraries, magazines, advertising, and interpersonal communication and new research into the process of human communication. It will explore how the revolution in communications will affect a wide variety of other areas such as business, government, human values, economics, family life, education and environmental issues.

For more information, write 1982 Assembly Committee, World Future Society, 4916 St. Elmo Ave., Bethesda, MD 20814.

July 21-23

The *Second Annual WOSU Broadcast Engineering Conference* will be held at the Fawcett Center for Tomorrow, Ohio State University, Columbus, OH. Papers are invited and full details can be obtained from John H. Battison, director of engineering, WOSU AM/FM/TV, 2400 Olen-tangy River Road, Columbus, OH 43210.

Shook distributes mobile production system

Shook Electronics, now incorporated as Shook Electronic Enterprises Inc., recently distributed its third mobile TV production system to Mexico. This unit is similar in design to the one that has been shown in the Philips Booth at the NAB Convention for the last two years. It is designed on a 22-foot Chevrolet chassis with a 14-foot production area, able to house up to four cameras plus a full complement of audio and video equipment.

The company custom designs mobile TV production systems that are manufactured, racked and cabled, ready for customer equipment or built with a full array of equipment. The units range in size from ENG film-style vans to large trailers equipped for broadcast production.

In addition to manufacturing vehicles, the company designs studio layouts, offers equipment installation and is available for consultation.

Ikegami names Cinema Products distributor

Cinema Products Corporation has been appointed Western states distributor for Ikegami's new EC-35 video camera for electronic cinematography.

Designed and engineered by Ikegami to handle and perform like a professional portable 35mm motion picture camera, the EC-35 uses $\frac{1}{2}$ -inch low capacitance diode-gun Plumbicon tubes and a unique optical system designed to deliver outstanding picture quality.

The EC-35 was designed for using film production and lighting techniques when shooting video. The optical system accepts a variety of prime and zoom lenses designed by Canon and Fujinon for the EC-35, with viewing angles similar to those of professional cine lenses. The EC-35 primes are interchangeable without affecting registration and color balance.

Of special interest to cinematographers is the fact that the EC-35 optical system permits full use of the T1-5 capability of the Canon set of five high speed prime lenses. This capability, together with its signal-to-noise ratio of 57dB minimum, makes the EC-35 ideal for shooting in low light situations.

Taft Broadcasting adopts British standard teletext

Taft Broadcasting Company has become the second major US broadcaster to adopt British standard teletext. Taft will use the Context system, supplied in the United States by Logica Inc.

Teletext uses spare capacity present in every TV signal to deliver an auxiliary text-and-graphics magazine to TV sets. Viewers are able to select from an index what information is displayed.

The Federal Communications Commission recently notified broadcasters that it expects to adopt an open-market approach to teletext technical standards, rather than adopting a specific standard. Such an approach will substitute manufacturer, broadcaster and viewer decisions—the marketplace—for traditional government regulation.

Victor Duncan consolidates offices

Victor Duncan Inc., a film and video production equipment company, has announced the completion of a corporate 5-year plan of locating departmental directors in one administrative office.

The executive team includes Lee A. Duncan, president; Victor Duncan, vice president of Technical Planning and

Development; Frank Marasco, vice president of Branch Operations and director of Rentals; Jack Zavitz, corporate secretary and treasurer and director of Finance; Bob Burrell, director of Engineering; Norm Bleicher, director of Marketing; and Alan Sheffield, director of Video.

The company will continue to base its administrative office in Dallas with branch operations in Chicago and Detroit.

Ramko announces financing program

Ramko Research has announced a 10% interest financing program. Called the "Bottomline Plan," it features up to two years' financing for any Ramko or Technics professional series product with a 20% down-payment. The program is being announced in the broadcast trades with a large direct mail effort and through Ramko's sales representatives.

RKO buys Modulation Associates terminals

Modulation Associates Inc. recently received an initial order from RKO Radio Network for 25 Stereo SAT Demodulator Terminals. The terminals will permit the RKO affiliates and perspective affiliates who have their own satellite earth stations to receive RKO radio network programming in stereo.

The units are fully compatible with the UPI satellite earth stations and with the newly introduced Modulation Associates Economy Small Aperture Terminals (E-SAT).

SMN purchases Express Limiters

Audio & Design Recording Inc. has announced the sale of a large, undisclosed quantity of its Express Limiters to the Satellite Music Network. The limiters will be used on the various uplinks to provide high fidelity processing and overall protection of equipment. The Express Limiter is a versatile compact multiratio compressor/limiter/expander. A soft clipper can be switched in following the limiter for absolute peak control.

Matthews receives achievement award

The American Society of Lighting Directors recently presented Matthews Studio Equipment Inc. with a plaque for outstanding achievement in engineering development. The company was chosen for its accomplishments in the design and manufacture of lighting control and production support equipment and its close work with other manufacturers, equipment designers, lighting directors, individuals, rental houses, and major motion picture and TV studios.

Edward Phillips, president of Matthews, was honored with the Board of Directors Award for Individual Achievement, recognizing his efforts to establish industry-wide standards that would create compatibility between different brands of lighting and support equipment; his responsiveness in solving specialized problems on lighting projects; and his donations of services on behalf of charitable activities.

New audio consoles unveiled

Neve has recently unveiled* several new ranges of audio consoles, including an all-digital console. The com-

pany has accomplished two main objectives with this launch:

- First, its three new analog consoles for the radio, TV, music recording and film industry represent a continuing commitment to the analog console market, which the company believes will predominate in the majority of studio applications for a long time to come.
- Second, the new, all-digital DSP (Digital Signal Processing) console gives the industry a look at the possibilities, probably restricted initially to the larger studios or broadcast organizations, for a totally digital approach to sound mixing and dubbing.

Speaking at the introduction of the new products, Dr. M. H. Jones, group technical director at Neve, stressed the importance of the latest type of integrated circuit—the ubiquitous silicon chip—to the design and reliability of analog and digital circuitry, which allowed the building of sophisticated consoles at a lower cost in comparison to the older discrete transistor models. This has allowed the company to hold down the price of the new systems which, in a time of economic recession, is of great importance.

Versatility is the keynote of the new 51 series of analog console systems, the result of application of appropriate op amp chips combined with the latest ribbon interconnectors to provide what the company believes to be the ultimate in flexibility. This flexibility exceeds that

achieved with older generations of discrete component assemblies, and allows standard production modules to be used as the basis of customizing. Designed as radio or TV production consoles, this series has three standard models, but also has the flexibility of being easily adapted to a customer's specifications. The 5104 is a 4-mixing bus, 2-output mixer, offering from 12 to 48 inputs, with provision for simple or comprehensive facilities.

Intermediate in size, the 5106 is an 8-bus, 4-output mixer with standard consoles available providing 24, 36 or 48 input channels. Up to eight of the channels may be used as fully equipped and equalized groups, yet when one of these channels is selected to function as a group it is still available as an input, but with reduced facilities.

The third model in the series is the 5116, which has the same basic format of the 5106 model, but has the added benefit of 24-track monitoring and metering, with comprehensive over-dub facilities. This model has been designed for use by the growing number of radio and TV production studios requiring sophisticated multi-track mixing, but where a conventional multi-track recording console is inappropriate because of lack of facilities or layout design for this type of work.

All 51 series models are available with VCA faders, or with full NECAM 1 or NECAM 2 automation systems. (NECAM 2 is Neve's automation system designed for television and film post-production mixing.)

Particularly suited to the requirements of radio stations, the second new series of mixing consoles an-

Business

nounced by the company is the 5322 on-air console. The 5322 caters to a wide diversity of operational requirements with the minimum of top panel controls. This is achieved by using a flexible design with the provision of preset links and switches, enabling the configuration to be matched to the requirements of the user.

The third of the new analog consoles announced is the 8128, a range produced for the professional multi-track recording industry. Designed as a follow-on from the 8108 range, the 8128 features formant spectrum equalization, which the company claims is the key to providing the distinctly musical sound of its consoles.

Maximum serviceability and reliability is claimed for the 8128, with all electronics accessible on plug-in cards employing back-plane type circuitry, and solid-state switching under microprocessor control. Available in 32-channel, 24-track; 48-channel, 32-track; or 56-channel, 48-track configurations, each with reverberation modules, the 8128 has provision for including VCA systems or NECAM 1 or NECAM 2 automation.

51 series broadcast console

The most technically advanced console introduced is the DSP (Digital Signal Processing) console designed for applications in which the user requires the ultimate in modern control systems. Totally remote from the signal processing equipment, the control console offers CCR (Complete Control Reset), full control assignability and memory of all control functions.

Neve included in its announcement the news that the British Broadcasting Corporation had declared its intention to purchase a 48-channel DSP console, for use in a fully digital remote truck containing two ¼-inch fixed head digital tape machines with provision for a digital multi-track machine.

DSP consoles carry out signal processing digitally, and can receive and output analog signals without the studio being aware that the processing is carried out in the digital-domain (in the same way that many analog studios today use digital delay lines, echo devices, etc.). DSP mixers will also operate analog in and digital out, to feed multi-track machines like the future Studer, Sony, 3M or Mitsubishi models. They can also operate digital-to-digital for mix-down between digital multi-track and digital master tape recorders.

Neve is listing with digital tape recorder manufacturers about interfaces. As an example, Neve and Studer International have announced that signal interfaces between the DSP system and future Studer digital tape machines will be guaranteed. The preferred sampling rates for

Neve's DSP consoles are 44.1 and 48kHz, although versions can be built for other standards.

Versions of the DSP mixer are also available for disc mastering applications, using digital delay to achieve the advance signal required for analog cutting lathes. With the three new analog consoles, and its digital desk, the company claims to have a console to meet almost any requirement in the broadcast industry, both now and in the future.

*BE was invited to attend Neve's press conference in England, but prior commitments made our attendance impossible. Instead, we invited Neve to set forth the scope of its announcement here.

California Microwave receives COMSAT contracts

California Microwave Inc. has announced receipt of \$3.9 million in contracts from Communications Satellite Corporation (COMSAT) for satellite earth station upgrades to be provided by the company's subsidiary, Satellite Transmission Systems Inc. (STS).

STS will expand the capacity of the COMSAT earth stations located in Brewster, WA, and in Andover, ME, and will prepare the stations for operation with new international satellites. These earth stations are the US international gateways to the Atlantic and Pacific for telephone, TV and data traffic via satellite.

KVUE-TV uses helicopter in ENG coverage

Station KVUE-TV, the Austin, TX, ABC affiliate, is the first in the area to add a helicopter to its electronic news gathering (ENG) operation for local and network broadcasts.

The Bell Jet Ranger III, leased from Omniflight Helicopters of Janesville, WI, provides KVUE with a quick response facility to transport cameramen and reporters anywhere within a 100-mile radius to cover fire, floods and other news events.

The chopper has been used in covering such stories as the devastating floods that recently swept through Texas. Although its primary function is ENG coverage, the helicopter frequently is loaned out to local law enforcement officials. It is also used for emergency evacuations of injured persons.

Telex buys antenna rotor business

Telex Communications Inc. has acquired the antenna rotor business of Cornell-Dubilier Electric Corporation in North Carolina. Financial terms of the acquisition were not disclosed.

The antenna rotor production will be continued with a minimum of disruption as manufacturing is transferred to the company's Hy-Gain division antenna plant in Lincoln, NE. Telex acquired the assets of Hy-Gain Electronics, a producer of communications antennas, in April 1978.

No significant changes are foreseen for the rotor products. They will be sold under the Telex/Hy-Gain label and marketed through the Telex Amateur Radio Products Group based at the company's head office in Minneapolis.

Compact Video, Fernseh enter licensing agreement

Compact Video Inc. has entered into a licensing agreement with Fernseh Inc. The agreement makes Fernseh the first broadcast equipment manufacturer to incorporate Image Vision technology, a new patented process relating to high definition television, developed and owned by Compact Video Inc.

Compact Video plans to license the encoder and decoder system to other major manufacturers of cameras,

videotape recorders and professional broadcast equipment. The system can also be used to shoot movies electronically and transfer them to film with quality similar to 35mm. The system was first demonstrated fully on Oct. 28, 1981, at the new \$20 million Compact Video Entertainment Center in Burbank, CA.

KSTS-TV installs Cetec CP antenna

KSTS-TV of San Jose, CA, has recently installed the highest power circular polarized transmitting facility in the world. Located at the 2550 foot level of Monument Peak, eight miles North of San Jose, the station transmits with 4.6 megawatts ERP CP (4.6 megawatts each H & V) to provide reception to the San Francisco Bay area and Silicon Valley.

The antenna is a Cetec Ring Panel consisting of two arrays of four panels mounted on a triangular tower section to produce a bent peanut pattern. This pattern was selected to provide best use of the 110kW transmitter power while meeting the FCC requirements for signal strength over San Jose and restricting radiation in undesired areas.

The antenna was supplied with a waveguide input to match the transmitter output although standard transmission line feed is also available. The installation uses both electrical and mechanical beam tilt to provide optimum coverage. A 1° mechanical beam tilt combines with a 0.3° electrical tilt to cover San Jose from the antenna site. The mechanical tilt lessens in other directions, aiming the antenna beam at the population centers further away.

Sony restructures US operations

"Sony's presence in the United States has expanded rapidly during the past several years. We have been actively building our business in many areas, adding top caliber executives to manage our various operations. We will now structure our US company into five operating groups, each with a great deal of autonomy," Akio Morita, chairman and co-founder of Sony Corporation said recently, announcing Sony Corporation of America's reorganization, which includes the addition of a new company.

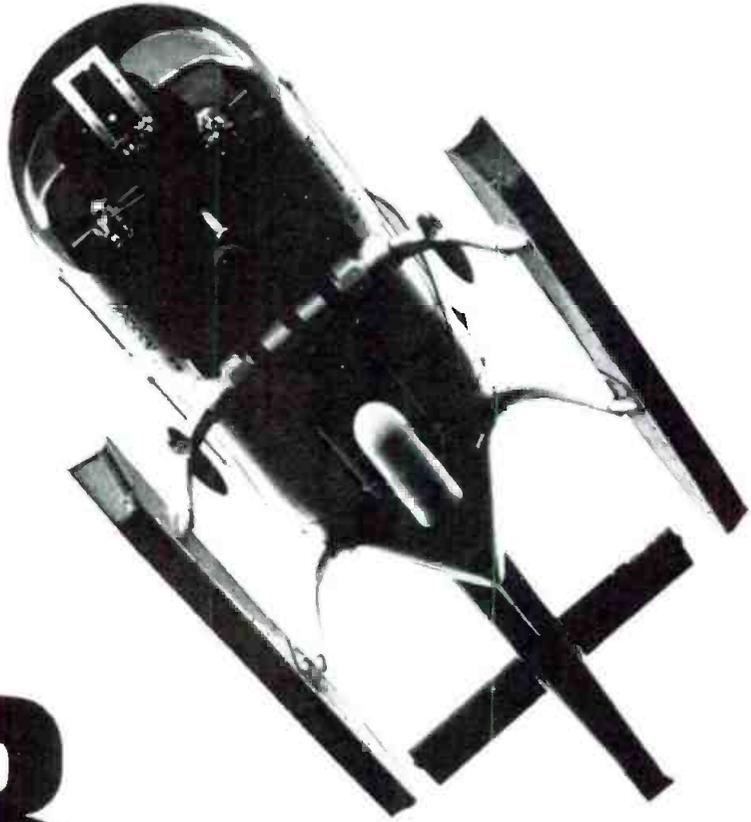

The new company, the Sony Broadcast Products Company, will be headed by Neil Vander Dussen, president and chief executive officer. The company was formed to better serve the expanded market in the United States. Vander Dussen comes to Sony after a 25-year career with RCA Corporation, where he had been executive vice president of RCA's diversified businesses since 1979. The company will be headquartered in New York City, while the engineering, training and warehouse will remain in San Jose, CA.

The Broadcast Products Company will be included in the marketing and sales group, one of the five in the reorganized structure. The other four are the manufacturing, service, engineering laboratories, and diversified operation groups.

The marketing and sales group includes the following companies: Sony Consumer Products Company, Joseph A. Lagore, president and chief executive officer; Sony Communications Products Company, Koichi Tsunoda, president and chief executive officer; Sony Tape Sales Company, Eiji Tanaka, vice president and general manager; and the Sony Broadcast Products Company.

The following companies are included in the manufacturing group: Sony Manufacturing Company of America, Shiro Yamada, president; and Sony Magnetic Products

Business

Inc. of America, Clinton Michaelis, president.

Service operations are handled by the Sony Consumer Service Company, Tsukasa Kimura, president.

The engineering laboratories group includes the Sony Technology Center Inc., Grant Smith, executive vice president; and the Sony Consumer Electronics Laboratories.

The diversified operations group covers the Sony Aviation Inc. organization, which leases aircraft in the United States and coordinates the sale of Falcon Jet aircraft, through Sony's parent company, in the Japanese market. Other functions under diversified operations include a liaison office for Sony Trading Company that exports a wide variety of American-made products for sale in Japan and other businesses still in the developmental stage.

Executive promotions include the appointment of Kenji Tamiya as president and chief operating officer for Sony Corporation of America, filling the office made vacant in 1978 at the death of Ray Steiner. Tamiya, as executive vice president, has guided the company's growth from 1977 annual sales of \$500 million to nearly \$1.3 billion during the fiscal year ending in 1981. Also promoted was Robert E. Dillon, Jr., to executive vice president for Sony Corporation of America. Dillon has been with Sony since 1973 and has been senior vice president, finance and administration.

ADM Technology relocates

Groundbreaking ceremonies were held in September for a modern building in Troy, MI, which will be the new home of ADM Technology Inc. The company, a manufacturer of audio consoles and components, expects to move from its present facility in Roseville, MI, to the new building this January. The new building will provide more than twice the space the company now occupies.

Teleprompter van begins production

Teleprompter of Grosse Pointe Woods, MI, recently received its new M1-101 2-camera production van. The ¾-ton GMC Truck was custom built by the Mobile Unit Group of Midwest Corporation.

The Teleprompter unit is equipped with two Hitachi FP40S Color Cameras with studio viewfinder and rear conversion kits for the lenses. Support equipment includes generator, full video monitoring and an audio package.

The production van is currently used for shooting local programming and civic projects. Future plans call for using the M1-101 in commercial production.

Modulation Associates receives Mutual order

Modulation Associates Inc. of Mountain View, CA, will produce audio distribution amplifiers for Mutual Broadcasting System Inc.'s nationwide satellite network. The AD01 amplifiers plug into the existing Mutual satellite earth terminals and will be used to distribute multiple audio program channels from the terminals at the Mutual affiliates to other nearby stations who use the company's services.

Toshiba America relocates offices

Toshiba America Inc. has announced the reorganization and relocation of its divisional headquarters to Tustin, CA. The reorganization, which was effective in July, was the result of the company's growth and diversification.

Under the new alignment, Toshiba America Inc. contains two independently operating business groups. The

The brightness you need to show it big

General Electric Professional Large Screen Video Projection

With General Electric's exclusive sealed light valve and sealed Xenon lamp system, in both color and monochrome General Electric Professional Large Screen Video Projectors, you can depend on sharp pictures from 2 to 25 feet wide. New high brightness models allow the room lighting viewers need to take notes and refer to written material.

The color projectors reproduce every color accurately, with the convenience of inherent color registration. General Electric's exclusive single gun, single optical path light valve system eliminates the need for manual color convergence.

Portable and flexible, the projectors are being used for a wide variety of applications, including front and rear projection. Our applications experts will tell you whether yours can be added to the growing list, which includes:

Education: Medical, dental, engineering, computer science instruction.

Business: Sales meetings, industrial training, product presentations, real-time display of computer-generated data, teleconferences.

Aerospace and Defense: Situation displays, simulator training.

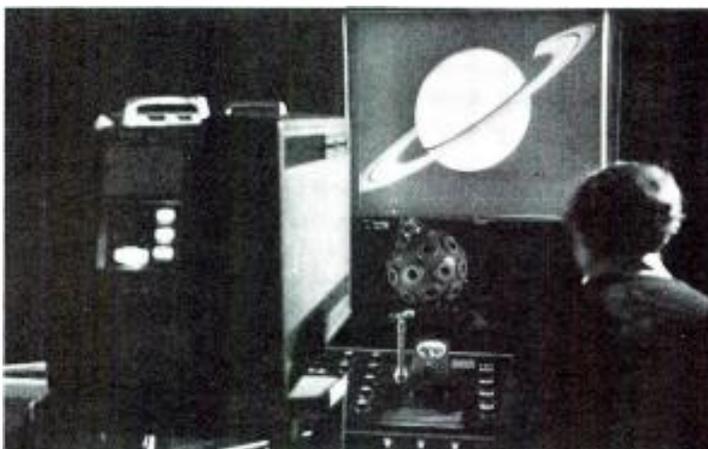

Entertainment: Theatre television, closed-circuit TV events, overflow crowds, special effects.

Television Production: Backgrounds for news programs, special effects, data display, program previewing.

Call or write: General Electric Company, Video Display Equipment Operation, Electronics Park 6-206, Syracuse, NY 13221. Phone: (315) 456-2152.

NEWS BACKGROUND at WTMJ-TV, Milwaukee, is displayed rear screen by General Electric projector.

SELL-OUT CROWDS at Fiske Planetarium, Boulder, watched live NASA transmission presented by General Electric projector.

TV-120 wins high ratings...

The first film care system designed for the broadcast industry! Now you can time... preview... edit... inspect... and clean your films in one fast, easy operation. Broadcasters nationwide are finding that TV-120 does the job they need.

"The machine has cut my editing time and time spent getting film air-ready almost in half. Our on-air problems have been almost zero now that we use TV-120." So says WLUK-TV, Green Bay.

Find out more about the TV-120. Write or call us toll-free 800/323-7520 (in Illinois call 312/677-3000).

- saves time, labor costs
 - improves on-air quality
 - cuts embarrassing on-air film failures
 - detects misplaced cue tabs, film defects, poor splices

A SUBSIDIARY OF

Business

Consumer Products Business sector has maintained its headquarters offices in Wayne, NJ.

The Industrial Electronic Business sector is headquartered in a new facility in Tustin, CA. Its operating divisions include:

- the Broadcast Electronic Systems Division—presently located in Sunnyvale, CA;
- the Business Equipment Division, presently located in Wayne, NJ;
- the Electronic Components Division, presently located in Irvine, CA, and Northbrook, IL;
- the Industrial Electronics OEM Division, presently located in Northbrook, IL;
- the Information Processing Systems Division, presently located in Tustin, CA;
- the Medical Systems Division, presently located in Carson, CA; and
- the Telecommunications Systems Division, presently located in Armonk, NY.

All of these Toshiba America divisions are being relocated and headquartered at the new Tustin office, 2441 Michelle Drive, Tustin, CA 92680; (714) 730-5000.

For more information, contact John Lesser & Associates, 420 Lexington Ave., New York, NY 10170; (212) 986-6660.

Dynatech, Utah Scientific merge

Utah Scientific recently became a subsidiary of Dynatech Corporation. The transaction was implemented as a merger, with Utah Scientific shareholders receiving Dynatech shares in exchange for their Utah Scientific shares.

The merger satisfied both the long-range objectives of Dynatech in acquiring a leading company in the growing telecommunications field, and of the Utah Scientific shareholders because they could capitalize on the substantial growth in their Utah Scientific equity, receiving publicly traded shares in a tax-free exchange.

J.P. Barger, Dynatech president, said the company views the merger as a logical extension of its involvement in the communications industry and as a forerunner to a broader involvement by Dynatech in broadcast communications. Utah Scientific will continue under its present management with its operations continuing essentially unchanged in Salt Lake City, UT. No changes are planned in the company's products or markets served.

Winegard expands product line

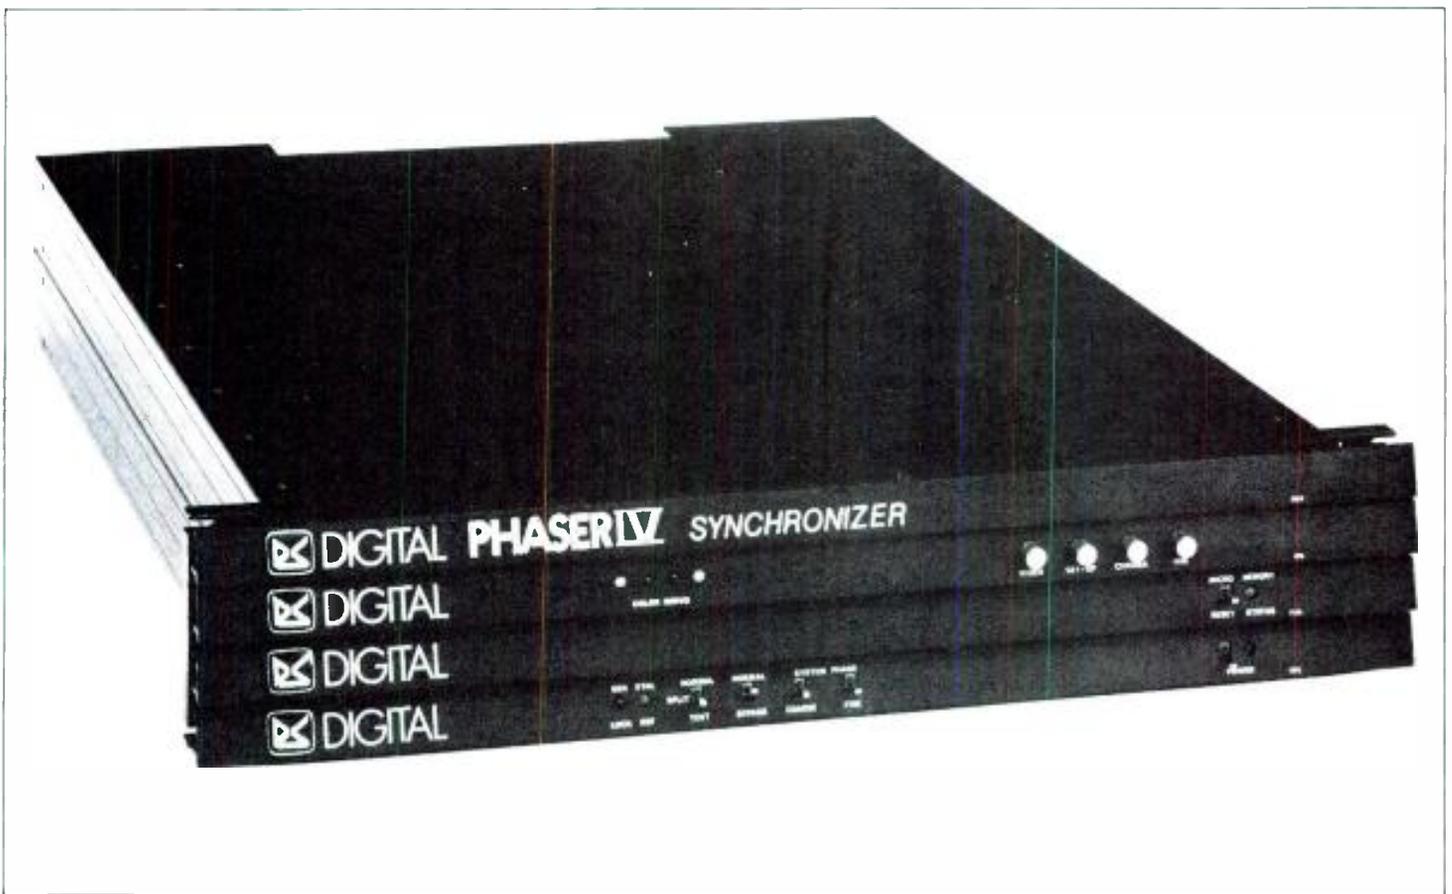

The Winegard Company has recently announced Winegard's expanded line of earth station products.

Winegard is offering four complete, commercial grade quality earth station packages ranging in list price from \$7995 to \$10,600. Each package includes two LNAs, 24-channel tunable receiver, polar mount, dual-polarized feed and segmented fiberglass antenna. Combination packages of 10-foot and 12-foot antennas and 120° and 100° LNAs are available. Customers can also buy components separately.

Winegard also has demonstrator units available for site surveys, which are complete earth station packages including trailers.

Hitachi Denshi announces reorganization

Hitachi Denshi America Ltd. recently announced its reorganization. The new structure will include a Broadcast and Professional Division, Test and Measurement Division and Visual Products Division.

The smart frame synchronizer. The Phaser IV. And for less than \$10,000.

You must see it to believe it. Advanced digital technology, microprocessor control, and many special features make this low-cost Phaser IV Frame Synchronizer an almost impossible combination to beat, at any price.

The Phaser IV synchronizes input color and black and white signals with the cleanest throughput you have ever seen.

It comes complete with an integral digital Proc Amp. So you get all the functions of a processing amplifier, such as inserting digitally generated sync and burst, adjustment of video gain, black level, chroma gain and hue. Plus a digital synchronizer, and all in one compact modular unit.

You get automatic memory fault diagnostics and concealment. Precision synchronization of noisy off-air signals. And a 1.5 million bit RAM fieldstore memory.

Plus an internal digital test/calibration generator which gives side by side comparison

of system throughput against a precision digital test signal output every 16 lines. System performance can be evaluated instantly and, if necessary, analog alignment adjusted easily without external test signals.

The Phaser IV also has 5 TV line hysteresis. Motion discontinuities due to frame deletion or insertion are virtually invisible.

And, of course, VTRS, closed caption subtitling, and teletext are passed without degradation. And, because the Phaser IV is modular, maintenance is simple. All Digital Video Systems' dealers selling this product carry service kits of replacement boards.

See for yourself what the Phaser IV can do for you. Call your local Digital dealer for a demonstration. There are more than 50 coast-to-coast. Or contact us directly.

The smart frame synchronizer. And for less than \$10,000. Need we say more?

Business

Bernard Munzelle, national sales manager, has been promoted to vice president of Hitachi Denshi America Ltd., as well as national sales manager of the Broadcast and type "C" VTRs and FP cameras.

Alex Orloff, sales manager of the Test and Measurement Department has become national sales manager of the Test and Measurement Division, handling oscilloscopes, waveform monitors and new products to extend the current product line.

The Visual Products Division, which includes GP cameras, the new 1/2-inch VHS portable recorder and tuner timer, monitors and black and white CCTV cameras, will be under Fred Posner, in the new position of national sales manager for Visual Products. Richard Alexander has been appointed product/marketing services manager for the FP and GP cameras and 1/2-inch VHS.

The purpose of the reorganization is to provide a strong base for future growth while strengthening dealer/sales support. The new structuring will allow for better servicing of dealers and end user needs.

Vital announces SqueeZoom sales

Vital Industries has announced sales of SqueeZoom systems now totaling 150 multichannel units worldwide. "Many areas of the world have virtually no specialty post-production houses and have to rely on their own facilities to turn out a reliable sophisticated product," said Christopher Donoyan, Vital's president. Worldwide sales efforts since 1980 have placed systems in 24 countries including Africa, Asia, Europe and South America. These sales reflect system use in all three major color standards: SECAM, PAL and NTSC.

Sony acquires MCI

Sony Corporation of America has recently acquired MCI of Fort Lauderdale, FL, a manufacturer and seller of professional recording equipment.

The privately owned Florida company, founded in 1955, is the largest manufacturer of multi-track recorders and studio mixing consoles in the United States. Its facilities include a main manufacturing plant and a precision service plant in the Fort Lauderdale area with 440 employees.

MCI will be an independent division within Sony Corporation of America. Daily operations of MCI will continue unchanged. MCI's founder, G.C. (Jeep) Harned will remain as president and chief executive officer of the MCI Division, and Michael Schulhof, a director of Sony Corporation of America, has been appointed chairman.

MCI announced last spring that it would adopt the common format for multichannel stationary-head digital audio recording system announced in 1980 by Sony Corporation and Willi Studer of Switzerland.

Officials of both companies noted that MCI is well-positioned to develop the major new market in professional audio equipment that will open with the introduction of stereophonic AM and TV broadcasting and the anticipated expanding consumer market for component television.

The new operation will join an existing broadcast video technology from Sony. The Sony Technology Center in Palo Alto, CA, is a manufacturer of broadcast VTR controls and a major research and development operation in the broadcasting field.

The MCI facility becomes Sony Corporation of America's fourth major manufacturing operation in the

United States. A color TV plant, established in 1972 in San Diego, CA, was the first such facility started here by a Japanese company. In 1977, Sony opened a magnetic tape plant in Dothan, AL, and the company announced plans last year to build a second color TV plant in Columbia, SC, which will become operational later this year.

Harris Farinon changes name

Farinon Video, an operation of the Broadcast Products Division of Harris Corporation, recently announced that the operation's name has been changed from Farinon Video to Harris Corporation, Broadcast Microwave.

James B. Murray, vice president and general manager of the company, said, "When the company was founded nine years ago, the name 'Farinon Video' was chosen to display our association with Farinon Electric, as well as with the TV industry. Many changes have occurred in the history of the company; in particular, the recent joining of our operation with the Broadcast Products Division and the formation of the Farinon Division. The name Broadcast Microwave is more descriptive of the kind of systems we market to the broadcast industry. We believe our customers will better identify our place in the business."

3M acquires ITC

International Tapetronics Corporation (ITC) of Bloomington, IL, and 3M recently announced an agreement for the purchase of ITC by 3M for undisclosed cash terms. The agreement calls for operation of ITC as a subsidiary of 3M's Magnetic Audio/Video Products Division.

ITC produces tape cartridge equipment for the radio/TV industry. 3M, since pioneering the introduction of magnetic tape in the United States in 1947, has become a worldwide producer of audio- and videotapes as well as audio- and videocassettes under its Scotch brand trademark. 3M company-wide sales of all products totaled \$6 billion in 1980.

ITC has operated as a privately held company since its founding in 1969. Principals in the sale to 3M are N. Elmo Franklin, board chairman; John P. "Jack" Jenkins, president; Andrew M. Rector, executive vice president; and W. Merle Wilson, a retired employee, and their families.

Franklin plans to pursue other business interests; Jenkins, Rector and other key ITC management personnel will continue to function in their present positions. Jenkins will assume overall management responsibility for the new 3M subsidiary, reporting to John E. Povolny, division vice president, Magnetic Audio/Video Products/3M.

Povolny's division is a part of 3M's Electronic and Information Technologies Sector, one of the firm's four major operating business units. Povolny said the ITC acquisition will provide 3M with a strong systems manufacturing and marketing capability for new cartridge technology, which has been under development in 3M's St. Paul laboratories for several years. He expects the combined ITC-3M expertise to result in an expanding line of products for the broadcasting industry, with some of these new products to be introduced in 1982. Systems manufacturing would continue to be centered in the Bloomington facility.

In addition to tape cartridge equipment, ITC also manufactures a line of reel-to-reel audiotape recorders and accessories for broadcasting and sound studio applications.

Assets of two ITC subsidiaries—ITC Communications of Arizona, which owns Radio Stations KJJJ-AM/FM. Phoenix, AZ; and Field Electronics, which is involved in electronic agricultural products—are not involved in the 3M acquisition. □

Turn any video monitor into a precision alignment instrument.

The Amtron AG 341 stand-alone display generator integrates three of the most useful test and production aids into a single rack-mounted unit. **Pulse Cross** Precision electronics delay incoming video into horizontal and vertical display elements in order to determine video timing alignment and permit accurate adjustment of video tape machine tracking and tension. **Micro-Mark Cursor** Digitally generated marker, calibrated in 1 microsecond intervals may be positioned within display to verify timing pulse information, or used with normal raster to aid in titling and speed special effects camera setup. **Safe Area/Safe Title** Dual reticules, digitally generated to SMPTE standards may be switched into picture to aid composition and confirm safe transmission of vital picture elements. An independent cross-hair marker pinpoints the exact center of any raster, no matter how the monitor may be adjusted horizontally.

AG 341 displays may be used separately or in combination . . . and for extra convenience in post-production, Safe Area/Safe Title, Center Marker and Micro-Mark Cursor may be selected by optional remote control box.

people

Anita K. Gold has been named eastern marketing manager for Intertec Publishing Corporation's Electronics Group of publications, including *Video Systems*, *Broadcast Engineering* and *Radio y Televisión*. The announcement was made by Cameron Bishop, group publisher. Gold joins the company with a strong background in sales and marketing. She is former president and general manager of AKG Consulting in New York City, and was advertising manager for *Art News* and *Portfolio* magazines. Before that she lived and studied Japanese art and archeology in Tokyo. Gold has held several faculty and lectureship positions at numerous colleges and universities. She received an MA from the University of Michigan and holds a PhD in Art History/Middle East Studies from New York University.

Terry A. Murphy has been named manager of marketing training for General Dynamics Communications Company (GDCC). Murphy is responsible for product and sales education functions.

Janet L. Fowler was recently appointed vice president and corporate controller of Central Dynamics Corporation and its American Data Division. Her responsibilities will include all accounting and financial operations at both American Data and the corporate offices of Central Dynamics. Fowler has been the chief financial officer and controller for American Data for the past eight years.

System Concepts Inc. has announced the appointment of **Joseph W. Hering**, Western regional sales manager; **Ronald Ward**, manager, Product Design Engineering; and **David Quebbeman**, technical writer.

Donald H. Haight has been appointed general manager of the Audio Products Group of the Ampex Audio-Video Systems Division. Haight will be responsible for the development, manufacturing and marketing of all Ampex audio products. He succeeds **Charles Coover** who has been named manager of product management for the Video Recorder Group in the Ampex Audio-Video Systems Division.

William H. Borman has been named vice president, marketing and sales for the ADDA Corporation. Borman was formerly director of marketing and has been with the company since 1980.

California Microwave Inc. (CMIC-OTC) recently announced three corporate and two divisional promotions.

Gilbert F. Johnson, executive vice president, has been designated chief operating officer of the company. **Howard Oringer**, president of the Telecommunications Division, was appointed a corporate executive vice president. **Joseph Russell** was appointed president of the Government Electronics Division and a vice president of the company. **Russell Hardy** was promoted to division vice president/defense equipment. Hardy is responsible for the engineering and manufacturing activities of the Government Electronics Division. **Herbert P. Radding** was promoted to director/operations for satellite communications.

Moseley Associates Inc. has announced the appointment of **Bill Ticen** as international sales manager. Ticen, formerly a sales engineer in the marketing department, will be responsible for the sales of all Moseley-manufactured products through a distributor network of 44 representatives and distributors in more than 80 countries worldwide.

Howard G. McClure has been appointed vice president of marketing, Townsend Associates Inc.. McClure will assume the responsibilities for domestic and international sales and product management. McClure comes to Townsend Associates from Fernseh Inc., where he was director of product management and applications engineering.

Richard Stevens has been named Southeastern regional sales representative for Sony's Professional Digital Audio Division. Stevens brings to his new position several years of experience as a recording engineer in addition to an extensive background in studio design and computerized acoustic research and analysis.

The appointment of **Donald E. Quinn** as vice president, Alascom Services and New Business Development for RCA American Communications Inc., has been recently announced. In his new position, Quinn will continue to serve as RCA Americom's liaison with Alascom, but will also be responsible for studying new business opportunities involving domestic satellite communications. Initial emphasis will be on the market potential for direct broadcast satellites.

MCI/Quantel has announced several promotions and new appointments. **Donald Prather** has been promoted from national sales manager to sales vice president, a new position. **Paul Kendrick**, formerly director of engineering, has been promoted to the new position of director of research and development. **George Hamilton**, formerly technical services manager of the company's Eastern region, has been promoted to director of engineering and technical services. **Judy Thoene**, formerly manager of marketing administration, has been promoted to director of administrative services, a new position that includes corporate as well as marketing responsibilities. **Joseph Hanf**, previously Eastern regional service manager for Consolidated Video Systems, has been named to the new position of Northwest district sales manager. **Laurence Biehl**, previously production/operation manager for ABC-TV's Detroit station, has been named to the new position of North Central district sales manager. **Gary Young**, previously sales vice president of Dallas Records, has been named to the new position of South Central district sales manager. □

classified

Advertising rates in Classified Section are 60 cents per word, each insertion, and must be accompanied by cash to insure publication.

Each initial or abbreviation counts a full word. Minimum classified charge, \$10.00.

For ads on which replies are sent to us for forwarding (blind ads), there is an additional charge of \$5.00 per insertion, to cover department number, processing of replies, and mailing costs.

Classified columns are not open to advertising of any products regularly produced by manufacturers unless used and no longer owned by the manufacturer or distributor.

The state of the art in Broadcasting for Systems Design, Engineering and Management Professionals is at ABC

VISIT OUR HOSPITALITY SUITE DURING THE NAB CONVENTION

Dallas Hilton Hotel, Silver Room, 1914 Commerce Street, on Sunday, Monday, and Tuesday, April 4th, 5th, and 6th, from 3 P.M. to 7 P.M.

ABC is aggressive and proud of its technical accomplishments in defining tomorrow's state of the art in Broadcasting.

You are invited to explore opportunities with a Network that offers challenging and exciting careers in the systems design and maintenance of TV and radio broadcast facilities.

Current opportunities exist for qualified RF and AV Systems Engineers for major events planning such as the 1984 Olympics, Conventions, etc.

If you're unable to visit our hospitality suite, contact **Bill Dixon, East Coast facilities, 40 West 66th Street, New York, NY 10023** or **Michael Sweet, West Coast facilities, 4151 Prospect, Los Angeles, CA 90027.**

Men and women of all races are encouraged to apply.

American Broadcasting Companies, Inc.

INTERNATIONAL SALES ENGINEERS

You can profit from the rapidly growing overseas sales of AM, FM and TV Transmitters manufactured by Singer Broadcast Products, and the related sale of RF accessories and studio equipment represented internationally by the Broadcast Division of Singer Products Company, Inc. We are looking for a Sales Engineer with a minimum of 5 years experience selling radio and TV equipment. Fluency in Spanish helpful, as this job involves travel 25% of the time. We are located in the heart of residential Nassau County, close to major parkways and airports, and only 45 minutes from Manhattan. Please send resume with salary history, in confidence, to the Personnel Director.

SINGER PRODUCTS

COMPANY INCORPORATED
875 MERRICK AVENUE, WESTBURY, NEW YORK 11590
TEL (516) 683-3000

SE NECESITA DIRECTOR TECNICO: La revista RADIO Y TELEVISION necesita un Director Técnico que tenga la habilidad de escribir y leer fuertemente el inglés y español para traducir terminología técnica. También debe tener amplios conocimientos sobre equipo de radiodifusión y teledifusión. Enviar las solicitudes conjuntamente con antecedentes profesionales y requisitos de salario a: Publisher, Radio y Televisión, P.O. Box 12901, Overland Park, Kansas 66212. 11-81-31

Engineering

Television Equipment Sales Representative

RCA Commercial Communications Systems Division is a leading designer/manufacturer of high technology Broadcast products and systems. We are planning to increase our staff with professionals who are seeking an excellent growth opportunity with a leader in the radio and television equipment field.

The successful candidates will have an engineering degree, or equal, and the ability to be a self-starter and well organized individual, who has the capability of displaying a "take charge" attitude in the pursuit of sales opportunities. Broadcast or Teleproduction technical experience is required, as well as the demonstration capability for oral, written and self-presentations. Previous sales experience is desired.

The opportunity requires frequent travel and affords an ambitious individual the scope for growth and advancement. The salary will be commensurate with the experience and previous accomplishments. Send your resume in strict confidence to:

Louise Wardach, Dept. BE-3
RCA Commercial Communications Systems Division
Front & Cooper Sts.
Bldg. 3-2
Camden, N.J. 08102

Television Systems/ Video Engineers

RCA "SelectaVision" VideoDisc Operations enters 1982 confident of continued success and growth. Our modern, fully integrated manufacturing, research and development facility in Indianapolis, Indiana continues to expand.

Senior level television systems/video engineers are needed to assure that future challenges, brought about by this expansion, are met. If you have a degree in electrical engineering (prefer M.S.), have experience in one or more of the following areas, and desire to engineer on a project that's future is limited only by one's imagination, we would like to talk to you.

- Design of high performance digital image processing equipment. Development of TV video frame synchronizers or time base correctors for video tape recorders. Ability to engineer and control synchronization and timing between subsystems; electro-mechanical, electronic memory and analog video processing.
- Circuit and system design of TV systems (NTSC, PAL, SECAM). Analysis of feedback systems and design of high-speed digital processors including A/D-D/A conversion. Knowledge of color t.v. systems, broadcast VTR/TBC, filters, signal processing and frequency/phase time relationships.
- Development and refinement of communication systems; linear systems and frequency/phase modulation principles. Knowledge of TV encoding systems, NTSC and PAL standard systems. Ability to use television techniques to improve system performance and develop system tolerance.

RCA offers an excellent compensation and benefit package along with substantial relocation assistance. Please send your resume to:

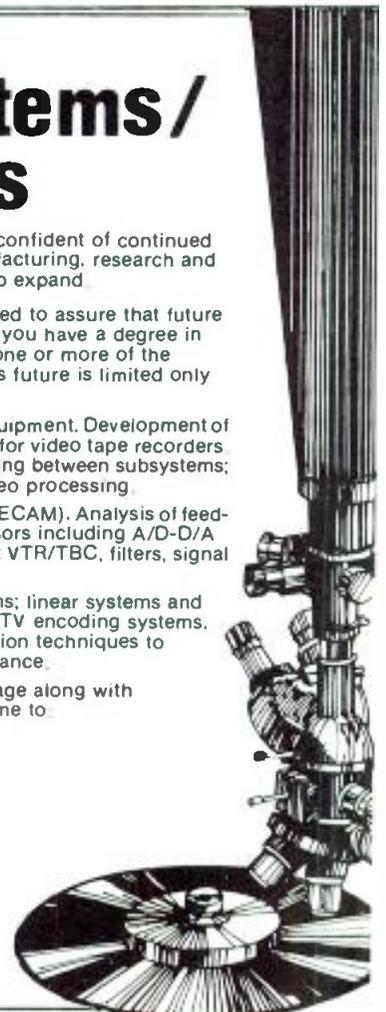

RCA Corporation
"SelectaVision" VideoDisc Operations
P.O. Box 91079, 7900 Rockville Road

QUALITY AUDIO.

Audio economy is born through quality—a high standard of excellence in design, components and manufacturing techniques. It is this level, maintained by McCurdy throughout their complete range of audio consoles, which results in decreased maintenance, less downtime, superior performance and an extended life expectancy. That's why McCurdy is your best audio investment for the future.

Our compatibility, flexibility and full range of standard audio products is also to your advantage, paying off in equipment which meets your exact requirements without a custom price tag.

Look to McCurdy for total quality in audio consoles.

SS8816

The McCurdy SS8816 is an unusually compact, fully modular 16 channel stereo console with all the features of larger consoles in a desk-mounting package.

Its size and level of sophistication make it perfect for 'on-air' control or small to medium production applications. Optional modules easily insert into the system, allowing a high degree of flexibility not otherwise found in this size of audio console.

SS8670

The McCurdy SS8670 21 channel stereo console is a fully modular, free-standing audio production system with full broadcast and other application capabilities. The new design, which incorporates an attractive blue facing, features superior performance and adaptability. Its compactness and flexible characteristics make the SS8670 perfect for use as an 'on-air', production or master control console.

In Our 4th Decade of Service To The Broadcast Industry

Where every word must be clearly heard...

At Hamilton's recently completed Convention Centre no effort has been spared to provide a total environment that is flawless in every detail, and with particular emphasis being placed on the quality of sound.

The very sophisticated, and critically balanced, audio system is controlled through a custom WBS 800886 console in the heart of the production control centre overlooking the great hall.

First by Design.

WBS 800886 Audio Console overlooks Convention Facilities.
