## Collins Amateur Equipment Guarantee

The Collins Amateur Equipment described herein is sold under the following guarantee:

Collins agrees to repair or replace, without charge, any equipment, parts, or accessories which are defective as to workmanship or materials and which are returned to Collins at its factory or its designated Service Agency, transportation prepaid, provided:
(a) Buyer presents properly executed Warranty Verification Certificate.
(b) Notice of the claimed defect is given Collins or an authorized Service Agency, or an authorized Distributor, in writing, within 180 days from the date of purchase and goods are returnedin accordance with Collins instructions.
(c) Equipment, accessories, tubes, and batteries not manufactured by Collins or from Collins designs are subject to only such adjustments as Collins may obtain from the supplier thereof.
(d) Any failure due to use of equipment for purposes other than those contemplated in normal amateur operations or in violation of Collins applicable Instruction Book shall not be deemed a defect within the meaning of these provisions.

This Warranty is void with respect to equipment which is altered, modified or repaired by other than Collins or Collins Authorized Service Agencies.

Collins reserves the right to make any change in design or to make additions to, or improvements in, Collins products without imposing any obligations upon Collins to install them in previously manufactured Collins products.

No other warranties, expressed or implied, shall be applicable to said equipment, and the foregoing shall constitute the Buyer's sole right and remedy under the agreements contained in these paragraphs. In no event shall Collins have any liability for consequential danages, or for loss, damage or expense directly or indirectly arising from the use of the products, or any inability to use them either separately or in combination with other equipment or materials or from any other cause.

NOTICE: With each equipment or set of equipments purchased, the distributor should furnish a Warranty Verification Certificate. It is necessary that this certificate accompany the equipment when it is returned for warranty repairs. Be sure that you receive it from your distributor.

## Warranty Repairs

On the opposite page are listed the Service Agencies authorized to perform warranty repair on Collins Amateur Equipments.

If you should wish to returnmaterial or equipment direct to Collins under the guarantee, you should notify Collins, giving full particulars including the details listed below, insofar as applicable. If the item is thought to be defective, such notice must give full information as to nature of defect and identification (including part number if possible) of part considered defective. Upon receipt of such notice, Collins will promptly advise you respecting the return. Failure to secure our advice prior to the forwarding of the goods or failure to provide full particulars maycause unnecessary delay in handling of your returned merchandise.

ADDRESS:
Collins Radio Company Amateur Product Office Cedar Rapids, Iowa

## INFORMATION NEEDED:

(A) Type number, name and serial number of equipment
(B) Date of delivery of equipment
(C) Date placed in service
(D) Number of hours of service
(E) Nature of trouble
(F) Cause of trouble if known
(G) Name of distributor from whom the equipment was purchased.
Equipment returned to the Service Agency or Collins for warranty repair must be accompanied with the Warranty Verification Certificate.

## ( Mul-of-warranty Repair, Modifications,

For information on service of this type write to the address shown below. If you wish to return your equipment for repairs, etc., without prior correspondence, be sure to include the following information attached to the equipment inside the packing carton:
(1) Complete instructions detailing work to be performed.
(2) Your return address.
(3) Method of shipment by which the equipment should be returned.
(4) Special instructions.

## DIRECT YOUR CORRESPONDENCE TO:

Collins Radio Company
Product Support Division
Cedar Rapids, Iowa

## Addition of Accessories, Alignment, ete. HOW TO ORDER REPLACEMENT PARTS:

When ordering replacement parts, please furnish the following information insofar as applicable:

## INFORMATION NEEDED:

(A) Quantity required
(B) Collins part number (9 or 10 digit number) and description
(C) Item or symbol number obtained from parts list or schematic
(D) Collins type number, name andserial number of principal equipment
(E) Unit subassembly number (where applicable)

### 1.1 Unpacking.

Carefully lift the transceiver out of the packing material. Examine for visible damage. If transceiver has been damaged in shipment, save box and packing material, and notify the transportation company. Fill out and mail the equipment registration card. Check that all tubes and crystals are properly seated in sockets. Check tuning controls and switches for freedom of action. Check the equipment included with the receiver against table 1-1.

### 1.2 Mounting and Cabling.

### 1.2.1 GENERAL.

For fixed station installation, refer to figure $1-1$ or 1-3. For mobile installation, refer to figure 1-4. Traveling station interconnections are shown in figure 1-2.

### 1.2.2 FIXED STATION INSTALLATION.

### 1.2.2.1 EQUIPMENT INTERCONNECTION.

Connect associated equipment to the KWM-2 or KWM-2A as shown in figure $1-1$ or 1-3. ANT. SW connector J25 supplies band information in the form of grounds for each $3.5-17$, 14 -, $21-$, and $28-\mathrm{mc}$ operating band. This system provides
a convenient method of providing band information to automatically tuned antenna systems for both mobile and fixed station use.

### 1.2.2.2 PHONE PATCH INSTALLATION.

The KWM-2/2A is set up for a high-impedance phone patch input (at the PHONE PATCH input, J11) such as the phone patch supplied in a Collins 312B-4 and 312B-5Station Control. A low-impedance phone patch, such as a Collins 189A-2, may be used by making the following change in the KWM-2/2A. Disconnect the two brown-white wires from pin $F$ on terminal board E60 (refer to figure 7-2). Using an ohmmeter, determine which of the two wires is connected to PHONE PATCH jack J11. Connect this wire to pin 7 of V1. Resolder the other brown-white wire as originally connected.

### 1.2.3 MOBILE INSTALLATION.

a. Select a location in the car to install the transceiver. Allow clearance on all sides to assure adequate ventilation. If vox operation is desired, leave enough space above the transceiver to allow opening the top cover for adjustment of VOX GAIN and ANTIVOX GAIN controls, S-meter zero, etc. If a 351D-2 Mobile Mount is to be used, drill holes and fasten the adapter bracket to transmission hump with self-tapping screws. Attach the mount to the bracket. Swing the

TABLE 1-1. EQUIPMENT FURNISHED WITH KWM-2/2A

|  | Key SCH screw \#4 | Alignment | $024-2900-00$ |

Figure 1-2. Traveling Station Interconnections with 30L-1
cantilever supports forward. Install the side slides in KWM-2/2A according to 351D-2 Mobile Mount Installation Instructions. Remove the plastic dust covers from the 351D-2 plugs, and store them in the recesses of the mount. Slide the transceiver onto the mount and push back until the mount plugs have entered the transceiver sockets. Tighten the wing nuts on the sides of the transceiver. See 351D-2 Instruction Sheet for mobile mount installation.
b. Select location in car for mounting MP- 1 Power Supply. This location must be as clean and dry as possible. Location in luggage compartment, under seat, or on passenger side of fire wall is satisfactory. Mounting in the engine compartment is not recommended.
c. Determine necessary length of power cable (furnished with 351D-2 Mobile Mount) to connect the MP-1 to the KWM-2/2A, and cut to required length. Connect power supply, speaker, and microphone as shown in figure 1-4.

## CAUTION

Before making connections to the automobile electrical system, make sure the primary circuits in the MP-1 are connected for proper ground polarity. Correct connections for either positive or negative ground systems are shown in figure 1-4.

## SECTION 1

Installation

Figure 1-4. Mobile Station Interconnections

The 440E-1 Power Cable may be used to connect the power supply to the transceiver when the 351D-2 is not used. See table 5-2 for ordering information.
d. If operation is to be in boat or plane having a 115 -volt, 400 -cps power supply, use 516F-2 Power Supply with C1 ( 0.05 uf ) removed from across L1 in the filter circuit. If operation is to be in a boat or plane having a 24 -volt d-c power source, use a 516E-2 D-C Power Supply with a 440E-1 cable to connect it to the transceiver. The 516F-2 can also be used with the 24 -volt d-c power source by using a dc-to-400-cps converter capable of handling at least 1-4
a 475 -watt load (C1 should be removed from across L1 in the 516F-2 when using 400-cps power for its operation).
e. No mobile speaker is supplied. If desired, the speaker leads may be connected in parallel with the car radio voice coil terminals. If the car radio has a transistor output stage, connect the terminals of the car speaker as shown in figure 1-4. Break voice coil lead, and install a switch for transfer of speaker from car radio to KWM-2/2A. If installation is in boat or plane, use any good 4 -ohm speaker and mount as desired.
f. For suppression of noise encountered in mobile operation, the following suggestions may be helpful:
(1) Use resistor-type spark plugs.
(2) Install coaxial bypass capacitors at ignition coil, generator, and voltage-regulator leads. Use bracket-mounted coaxial capacitors in the battery and generator leads to the voltage regulator and a $0.005-$ uf (or smaller) disc ceramic or mica capacitor from the field lead to ground. DO NOT use larger than 0.005 -uf capacitor here unless a 4 -ohm resistor is placed in series with it.
(3) If capacitor bypasses are not satisfactory, remove them, and use chokes in series with the leads from field and armature terminals of generator. Place these chokes as close to the voltage regulator as possible.
(4) For the field lead choke, wind 12 turns of no. 18 wire on a $1 / 4$-inch diameter powdered-iron core. For the armature lead, wind 12 turns of no. 14 or larger wire on $1 / 4$-inch diameter powdered-iron core.
(5) Ground the rear end of the exhaust pipe to the car body with copper braid, using a radiator hose clamp to secure the braid to the tailpipe. General information concerning noise suppression is available in current handbooks.

### 1.3 Initial Checks. (Refer to figure 2-1.)

Set MIC GAIN control (4) full counterclockwise until the switch clicks. Set OFF-ON-NB-CAL switch (1) to ON. Set meter switch (8) to PLATE, and EMISSION switch (2) to LOCK. The transceiver is in receive condition during warmup, so the meter will read full scale until filaments have come to temperature. This is normal S-meter action. When the S-meter falls back to zero, the circuits will have switched to transmit condition, and the meter will indicate PA plate current. Read the no-signal PA plate current. It should be approximately 40 ma . If plate current is other than 40 ma , adjust BIAS ADJUST potentiometer on the power supply to set plate current to 40 ma . If the transceiver is to be used with a linear amplifier, set bias to produce $50-\mathrm{ma}$ idling plate current.

## operation

### 2.1 Receiver Tuning.

a. Refer to figure 2-1. Set function switch(1) to ON. This is the swtich labeled OFF-ON-NB-CAL. See table 2-1.
b. Set EMISSION switch (2) to desired sideband (USB or LSB position). Set BAND switch (3) to desired band. If KWM-2A, set crystal board selector (12) so desired set of bands appears in window.
c. Set the MIC GAIN control (4) full counterclockwise. Set R.F. GAIN control (10) full clockwise.
d. Set VOX GAIN control (under top cover) full counter clockwise.
e. Set ANTI-VOX GAIN control (under top cover) full counterclockwise.
f. Adjust the A.F. GAIN control (5) until some receiver noise is heard in speaker.
g. Adjust the EXCITER TUNING control (6) to white portion of scale indicating the desiredband. Rock this control slightly to peak the receiver noise output. The transceiver is now ready to receive and the selected 200-kc band may be tuned with the tuning control. Dial frequency can be determined by adding the dial reading to the BAND switch setting.
h. Turn function switch to CAL position. Tune dial to nearest $100-\mathrm{kc}$ point ( 0,100 , or 200 ), and decrease R.F. GAIN control as necessary for comfortable listening level. Adjust tuning until the calibrate signal is zero beat. When the calibrate signal is zero beat in the receiver, set the hairline on the $100-\mathrm{kc}$ mark with the zero set knob. Set function switch to ON and tune dial to the desired portion of the $200-\mathrm{kc}$ band selected. If checking calibrate circuit against WWV is desired, see paragraph 4.5.2.3.

Figure 2-1. Operating Controls

SECTION 2
Operation

Figure 2-2. Logging Scale Calibration Curves

## WARNING

During amateur operation, DO NOT operate transmit circuits while the transceiver is tuned to receive outside the a mateur band inuse. The transmit frequency is always locked to the receive frequency. Return tuning to within the band before transmitting.

### 2.2 Transmitter Tuning.

### 2.2.1 GENERAL.

a. Set up for receive function as in paragraph 2.1.
b. Set EMISSION switch to TUNE position.
c. Set P.A. TUNING control to white portion of dial indicating the desired band (for amateur operation). If the transceiver is being operated outside amateur bands, ignore the amateur band markings on the dial scale, and set the control according to the logging scale charts of figure 2-2.
d. Set meter switch (8) to PLATE position.
e. Advance the MIC GAIN control full clockwise, and rock the EXCITER TUNING control until maximum plate current is obtained.
f. IMMEDIATELY dip the plate current with the P.A. TUNING control.
g. Return the MIC GAIN control to full counterclockwise position.
h. Set meter switch to GRID position.
i. Advance MIC GAIN control until grid current is obtained.
j. Rock the EXCITER TUNING control to obtain a peak in grid current indication.
k. Turn MIC GAIN to OFF.

1. Set EMISSION switch to LOCK position.
m. Advance MIC GAIN to provide a grid current reading of approximately $1 / 3$ scale.
n. Set meter switch to PLATE position.
o. Alternately dip plate current with P.A. TUNING control, and adjust loading with INCR LOAD control until plate current is 230 ma at the dip. When operating the transceiver with a linear amplifier, load to only 200 ma .
p. Set EMISSION switch to desired operating position.

If transceiver frequency is changed by any great amount, be sure to redip the power amplifier plate current and check the loading. This will be most important on the 80 - and 40 -meter bands. Some operating experience will indicate the amount of frequency excursion possible without readjustment.

### 2.2.2 SINGLE-SIDEBAND OPERATION.

a. Set up receiver operation and transmitter operation completely as in paragraphs 2.1 and 2.2.1.
b. Close-talk into the microphone, increasing VOX GAIN control setting until vox relay just operates. For vox operation, it is desirable to close-talk the microphone to prevent background noises from tripping the KWM-2/2A into transmit function.
c. Set meter switch to ALC position. Increase setting of MIC GAIN control to obtain S6 average reading on voice.
d. Leave MIC GAIN control as set in step c above. Leave microphone in normal operating position. Set function switch to CAL position, tune in calibrate signal, and adjust A.F. GAIN control for comfortable listening level.
e. Adjust the tuning control for approximately 1000cps beat note. If the vox relay trips, increase ANTIVOX GAIN setting to minimum point necessary to prevent speaker output from tripping vox. It may be necessary to increase VOX GAIN setting slightly after this antivox gain adjustment in order to compensate for the antivox gain.

## NOTE

Do not use more vox gain or more antivox gain than necessary to control vox operation. If vox circuits transfer between words, increase the release time constant by turning VOX TIME CONSTANT control (under top cover) clockwise. If less release time is desired, turn the control counterclockwise.
f. Set function switch to ON position. The KWM-2/2A is now ready for transmit operation in SSB service. Speaking into the microphone transfers from receive function to transmit function through the vox circuit action. If the receiver is tuned to a different frequency, the transmitter is tuned to the new receiver frequency.
g. After changing frequency on the lower bands (below 10 mc ), set EMISSION switch to LOCK position, and make the following checks:
(1) Set meter switch to GRID position.
(2) Rock EXCITER TUNING control slightly to check that PA grid drive is peaked.
(3) Set meter switch to PLATE, and check dip in PA plate current with P.A. TUNING control.
(4) Set EMISSION switch back to the desired operating position.

### 2.2.3 CW OPERATION.

a. Set the function switch to ON.
b. Set up receiver and transmitter operation completely as in paragraphs 2.1 and 2.2.1.
c. Depress key and adjust A.F. GAIN control for comfortable monitoring level.
d. Hold key down, and increase VOX GAIN control setting until the vox relay operates. If it is desired to
change the release time constant, adjust the VOX TIME CONSTANT potentiometer, R43. Clockwise rotation of this control increases the release time. This control is located on a bracket under the top cover, behind the meter.
e. Set ${ }^{-}$meter switch to ALC position. While sending a series of dots, adjust MIC GAIN control for S2 meter indication of alc.
f. When receiving, leave the A.F. GAIN control set for comfortable monitoring level, and adjust the receive level with the R.F. GAIN control. When the KWM-2/2A is receiving, the received signal is indicated in S-units. The S-meter will read correctly with the R.F. GAIN at less than maximum setting, provided the received signal level is high enough to actuate the $S$-meter. For example, if the R.F. GAIN control is set for no-signal reading of $S 8$ and reads S9 with signal, the received signal is S9.

## NOTE

The CW output signal frequency is 1500 cps higher than the dial reading.

### 2.2.4 MOBILE OPERATION.

Vox and antivox circuits will operate in mobile operation, but push-to-talk operation is recommended, since high-level background noises will produce undesirable vox switchover. Set VOX GAIN and ANTI-VOX GAIN controls full counterclockwise before installation. If vox operation is desired, leave clearance in installation so top cover can be opened. For mobile operation, load the power amplifier to 230 -ma plate current.

### 2.3 Operation Outside Amateur Bands.

### 2.3.1 SELECTION OF CRYSTALS.

The crystals supplied provide for complete coverage of all amateur bands except the 10 -meter band for which only one crystal is furnished (for 28.5 to 28.7 mc ). Two extra sockets are provided for additional crystals in the 10 -meter band. Figure $2-3$ shows crystal socket locations. Select these crystals as follows:
a. If the lower edge of the desired $200-\mathrm{kc}$ band is 11.8 mc or less, the required frequency is equal to the lower edge of the desired band plus 3.155 mc . As an example, if the desired band is 4.0 to $4.2 \mathrm{mc}, 4.0 \mathrm{mc}$ plus 3.155 mc equals 7.155 mc .
b. If lower edge of desired $200-\mathrm{kc}$ band is 12.00 mc or higher, the required crystal frequency is half the sum of the lower edge of desired band plus 3.155 mc . As an example, if the desired band is 14.4 to 14.6 mc :

$$
\frac{14.4+3.155}{2}=8.7775 \mathrm{mc}
$$

The plate circuit of the oscillator is tuned to twice the crystal frequency when required injectionfrequencies are this high.

Figure 2-3. Crystal Socket Locations

Avoid transmitter operation between 5.0 and 6.5 mc . In this range, the second harmonic of the vfo and the variable i-f frequency is nearly the same as the desired frequency. In transmit function, some of this energy will pass through the tuned circuits and become spurious emission.
c. Plug substitute or extra crystals into the appropriate socket on the mounting board according to bandswitch position and total coverage columns in table 2-2. The example cited in step babove calls for placement of the crystal in one of the sockets marked C. If two additional 10 -meter crystals are used, they must be plugged into the sockets marked E. Table 2-2 lists crystal socket designations, switch positions (BAND), crystal frequencies furnished, and frequency range limitations. For extra coverage crystals available, see section 6, Parts List.

The KWM-2A is equipped with an extra crystal mounting board and a front-panel switch to allow selection of either board. The crystal mounting board for extra-band operation is located on the top of the chassis. If amateur band operation is not needed, extra-band crystals may be substituted in the crystal mounting board under the chassis. BE SURE the crystals are plugged into appropriate sockets according to information of table $2-2$ and figure 2-3. The transmitter can be operated at other frequencies outside the specified amateur bands or at other 10 meter frequencies by plugging the proper crystals into the mounting boards.

TABLE 2-1. KWM-2/2A OPERATING CONTROL FUNCTIONS

| CONTROL | FUNCTION |
| :---: | :---: |
| $\begin{aligned} & \text { Function (S11) } \\ & \text { OFF } \\ & \text { ON } \\ & \text { NB } \\ & \text { CAL } \end{aligned}$ | Removes a-c power from power supply. <br> Connects a-c power to power supply. <br> Turns on accessory noise blanker when used. <br> Turns on $100-\mathrm{kc}$ crystal calibrator. |
| MIC GAIN (R8, S10) | Controls audio amplifier gain for SSB operation, and controls tone level for CW operation. |
| EXCITER TUNING | Controls all ganged slug-tuned circuits in receiver and exciter portions of transceiver. |
| Crystal board selector (S15) (in KWM-2A only) | Selects second bank of crystals for additional coverage, and changes scale on BAND switch. |
| BAND (S2 through S8, S13) | Selects capacitors and crystals needed to tune transceiver to desired $200-\mathrm{kc}$ band. S13 grounds a different pin on J25 for each band for remote antenna selection. |
| P.A. TUNING (C150) | Resonates PA plate circuit to operating frequency. |
| A.F. GAIN (R92) | Controls receiving audio amplifier gain. |
| R.F. GAIN (R84) | Controls gain of receiver-transmitter r-f amplifier and receiving i-f amplifiers during receiving. |
| Meter switch (S12) <br> plate <br> GRID <br> ALC | Measures PA plate current by measuring PA cathode voltage changes. Measures PA grid current. <br> Shows alc action by measuring cathode voltage changes at transmitter i-f amplifier V4A. |
| EMISSION (S9) LOCK TUNE LSB USB CW *ANTI-VOX GAIN (R45) *VOX GAIN (R39) *VOX TIME CONSTANT (R43) | Grounds key line for continuous output in CW mode at full power. Used for tuning. <br> Reduces PA screen voltage with series resistor, and produces CW carrier for tuneup. <br> Selects LSB bfo erystal, and raises vfo frequency for LSB operation. <br> Selects USB bfo crystal, and lowers vfo frequency for USB operation. <br> Selects USB bfo crystal, raises vfo frequency, and turns on tone oscillator. Keyed tone is applied to balanced modulator instead of voice signal. <br> Controls level of anti-vox signal fed to vox circuit. <br> Controls gain of vox amplifier for voice-controlled operation. <br> Controls hold-in time of vox circuit. |
| These operating controls | nside the cabinet. |

Mark the desired lower band edge information on the white card in the band-switch windows. Make sure this information is marked in the appropriate switch positions.

### 2.3.2 ADJUSTMENT OF TUNED CIRCUITS.

For operation outside amateur bands, disregard amateur band markings on EXCITER TUNING and P.A. TUNING scales, and use logging scales. Figure 2-2 shows logging scale calibration curves. Operation at frequencies outside the amateur bands will result in slightly decreased receiver sensitivity and transmitter PA grid drive unless the tuned circuits of the transceiver are retuned to peak their responses in the desired portions of the high-frequency spectrum. For moderate excursions from the amateur bands, the decrease in performance is minor, and realignment of the $r$-f circuits is usually not necessary unless optimum performance is desired. Adjustment of the trimmer capacitors only will normally be sufficient to peak the response outside the amateur bands. Figure $4-1$ shows the location of these adjustments. The letter portions of the capacitor designations correspond to the frequency ranges listed in the total coverage column of table 2-2. For example, the Etrimmers are normally peaked on 10 meters, but may be reset to favor another portion of band $E$ which covers 22.0 to 30.0 mc .

At the extremities of some bands the PA loading may be either too heavy or too light. This condition can be corrected by the following procedure:
a. Remove the top cover from the PA compartment.

## WARNING

Be sure that all power is disconnected before working in this compartment. Dangerous voltages are present with power on.
b. Temporarily disconnect the existing wire from the rear stator terminal of the 2-gang loading capacitor.
c. Connect a jumper wire between front and rear stator terminals, and replace the compartment cover.

## NOTE

The $50 \Omega$ mark on the loading control will no longer be correct after this modification is made.

TABLE 2-2. CRYSTAL FREQUENCIES AND OFERATING BANDS

| $\begin{aligned} & \text { BAND-SWITCH } \\ & \text { POSITION } \end{aligned}$ | FREQUENCY BAND | CRYSTAL SUPPLIED | CRYSTAL SOCKET CONNECTED | TOTAL COVERAGE |
| :---: | :---: | :---: | :---: | :---: |
| 1A-3.4 | 3.4-3.6 mc | 6.555 mc | 1A |  |
| 2A-3.6 | $3.6-3.8 \mathrm{mc}$ | 6.755 mc | 2 A | A 3.4-5.0 mc |

## principles of operation

### 3.1 Block Diagram.

Refer to figure 3-1. The KWM-2/2A is an SSB or CW transceiver operating in the range between 3.4 and 30.0 mc . It consists of a double-conversion receiver and a double-conversion exciter-transmitter. The transmitter and receiver circuits use common oscillators, and a common mechanical filter, as well as a common r-f amplifier. The transmitter lowfrequency i-f and the receiver low-frequency i-f is 455 kc . The high-frequency i-f for both is 2.955 to 3.155 mc . This is a band-pass i-f which accommodates the full $200-\mathrm{kc}$ bandwidth. Figure $7-1$ is a schematic diagram of the KWM-2/2A.

### 3.2 Transmitter Circuits.

### 3.2.1 A-F CIRCUITS.

Microphone or phone-patch input is connected to the grid of the first audio amplifier, V1A, amplified, and coupled to the grid of the second audio amplifier V11B. Output from V11B is coupled to the grid of cathode follower V3A through the MIC GAIN control, R8. Output from the cathode follower is fed to the resistive balance point of the balanced modulator. In TUNE, LOCK, and CW positions of the EMLSSION switch, output from the tone oscillator, V2B, is fed to the grid of the second audio amplifier. The amplified tone oscillator signal is taken from the plate of V11B and coupled to the grid of the vox amplifier V14B to activate the vox circuits in CW operation. This signal is also fed to the grid of the first receiver a-famplifier, V16A, for CW monitoring.

### 3.2.2 BALANCED MODULATOR AND LOWFREQUENCY I-F CIRCUITS.

Audio output from the cathode of V3A and the bfo voltage are fed to a diode quad balanced modulator (CR1, CR2, CR3, and CR4). Both upper and lower sideband outputs from the balanced modulator are coupled through i-f transformer T1 to the grid of the i-f amplifier, V4A. Output from the i-f amplifier is fed to the mechanical filter, FL1. The passband of FL1 is centered at 455 kc . This passes either upper or lower sideband, depending upon the sideband selected when the EMISSION switch connects bfo crystal Y16 or Y17. The single-sideband output of FL1 is connected to the grids of the first transmitter mixer in push-pull.

### 3.2.3 BALANCED MIXERS.

The 455-kc single-sideband signal is fed to the first balanced mixer grids in push-pull. The plates of the mixer are connected in push-pull, and vfo signal is fed to the two grids in parallel. The mixer cancels the vfo signal energy and translates the $455-\mathrm{kc}$ single-sideband signal from the balanced modulator to a 2.955 - to $3.155-\mathrm{mc}$ single-sideband signal. The T2-L4 combination between the first and second mixer provides broadband response to the $200-\mathrm{kc}$ variable i-f output ( 2.955 to 3.155 mc ) from the first transmit mixer V5. The band-pass i-f signal is fed to one of the grids of the second balanced mixer, and the high-frequency injection signal energy from crystal oscillator V13A is fed to the cathode and the other grid. This arrangement cancels the high-frequency injection signal energy within the mixer and translates the band-pass i-f signal to desired operating band.

### 3.2.4 R-F AND ALC CIRCUITS.

The slug-tuned circuits coupling V6 to V7, V7 to V8, and V8 to the power amplifier are ganged to the EXCITER TUNING control. The signal is amplified by the r-f amplifier, V7, and the driver, V8, to drive the power amplifier, V9 and V10. Output from the parallel power amplifiers is tuned by a pinetwork and fed to the antenna through contacts of transmit-receive relay K3. Negative r-f feedback from the PA plate circuit to the driver cathode circuit reduces distortion in the output signal. Both the driver and PA stages are neutralized to ensure stability. When r-f driving voltage to the PA becomes great enough that positive peaks drive the PAgrids positive, the grids begin to draw current and the signal is detected. This produces an audio envelope. The audio is rectified by the alc rectifier, V17A, which is connected to produce a negative d-c voltage. The voltage is filtered by C159, C160, R118, and R119 (which also determine the alc time constants), and used to control the gain of V4A and V7. This system allows a high average level of modulation without driving the PA tubes well into the grid current region, which would result in increased distortion.

### 3.3 Receiver Circuits.

### 3.3.1 R-F CIRCUITS.

Signal input from the antenna is connected through relay contacts to the tuned input circuit, T3. The

## SECTION 3

Principles of Operation
signal is applied from T3 to the grid of the receivertransmitter r-f amplifier, V7. Amplified signal from V7 is applied from the tuned circuit, consisting of L10 and band switch selected capacitors, to the grid of the receiver first mixer, V13B.

### 3.3.2 RECEIVER MIXERS.

The input r-f signal is fed to the grid of V13B, and the high-frequency oscillator injection signal is fed to the cathode of V13B. The difference product of the first mixer is applied from the plate of the tube to variable i-f transformer T2. Output of T2 in the range of 2.955 to 3.155 megacycles is applied to the grid of the second receiver mixer, V17B, across parallel-tuned trap circuit $Z 5$. This trap circuit minimizes a spurious response which would otherwise result from harmonics of the high-frequency crystal oscillator. When signal input is applied to the grid of V17B and vfo injection signal is applied to the cathode of V17B, the $455-\mathrm{kc}$ difference product is fed from V17B plate to mechanical filter FL1.

### 3.3.3 I-F CIRCUITS.

The output from FL1 is applied to the grid of the first i-f amplifier, V1B. The i-f signal is amplified by V1B and V3B and applied through T5 to avc rectifier V15A and to the grid of product detector V15B. Beatfrequency oscillator signal is applied to the cathode of V 15 B , and the product of mixing is the detected audio signal. Output of the avc rectifier circuit is applied to the two receiver i-f amplifiers and through contacts of relay K 4 to the receiver-transmitter r-f amplifier. This avc voltage controls the gain of the receiver and prevents overloading.

### 3.3.4 A-F CIRCUITS.

Output from the product detector is applied through the A.F. GAIN control, R92, to the grid of the first a-f amplifier, V16A. Amplified audio output of V16A is coupled to the grid of the a-f output amplifier, V16B, which produces the power to operate a speaker, headphones, or phone patch.

### 3.4 Oscillators.

The transceiver contains the tone oscillator, the beat-frequency oscillator, the variable-frequency oscillator, the high-frequency crystal oscillator, and the crystal calibrator.

### 3.4.1 TONE OSCILLATOR.

The tone oscillator operates when the EMISSION switch is in LOCK, TUNE, or CW position. It is a phaseshift oscillator operating at approximately 1500 cps . Its output is fed to the transmitter audio circuits for CW operation. Some of the output from the tone oscillator is applied to the receiver audio circuits for sidetone monitoring in CW operation. Due to the $1500-\mathrm{cps}$ tone applied to the balanced modulator during CW operation, the actual transmitted CW signal will be 1500 cps above the KWM-2/2A dial reading. 3-2

### 3.4.2 BEAT-FREQUENCY OSCILLATOR.

The bfo is crystal controlled at either 453.650 or 456.350 kilocycles, depending upon whether Y16 or Y17 is selected by EMISSION switch section S9H. The unused crystal is shorted out by this switch section. These crystal frequencies are matched to the passband of the mechanical filter, FL1, so that the carrier frequency is placed approximately 20 db down on the skirts of the filter response. This $20-\mathrm{db}$ carrier attenuation is in addition to the $30-\mathrm{db}$ suppression provided by the balanced modulator.

### 3.4.3 VARIABLE-FREQUENCY OSCILLATOR.

The vfo uses fixed capacitance and variable inductance to tune the range of 2.5 to 2.7 mc . The series combina tion of capacitor C308 and diode CR301 is connected in parallel with capacitor C303. The diode switches C308 into or out of the circuit, depending upon the polarity of a bias voltage impressed across the diode junction. When USB emission is selected, the bias is positive and C308 is switched into the circuit. The capacitor then is adjusted to shift the vfofrequency by an amount equal to the frequency separation of bfo crystals Y16 and Y17. This allows the selection of either sideband without upsetting tuning or dial calibration.

### 3.4.4 HIGH-FREQUENCY CRYSTAL OSCILLATOR.

The high-frequency crystal oscillator, V13A, is crystal controlled by 1 of 14 crystals selected by BAND switch S2. Output from the high-frequency crystal oscillator is fed to the transmitter second mixer and to the crystal oscillator cathode follower. The cathode follower provides isolation and impedance match between the crystal oscillator and the receiver first mixer cathode. The output frequency of this oscillator is always 3.155 mc higher than the lower edge of the desired band. This high-frequency injection signal is the crystal fundamental frequency for all desired signals below 12 megacycles. For operating frequencies higher than 12 mc , the crystal frequency is doubled in the plate circuit of the oscillator. Instructions for calculating crystal frequencies for the desired bands are given in section 2.

### 3.4.5 CRYSTAL CALIBRATOR.

The $100-\mathrm{kc}$ crystal calibrator, V 12 A , is the pentode section of a type 6U8A tube. Its output is coupled to the antenna coil, T3. The calibrator may be trimmed to zero beat with WWV by adjustment of capacitor C76.

### 3.5 Vox and Antivox Circuits.

Audio output voltage from the second microphone amplifier, V11B, is coupled to the VOX GAIN control R39. A portion of this voltage is amplified by vox amplifier V14B and fed to the vox rectifier, which is one of the diodes of V14. The positive d-c output of the vox rectifier is applied to the grid of vox relay amplifier $V 4 B$, causing it to conduct current and
actuate the vox relay, K2. Contacts of K2 switch the receiver antenna lead, the other relay coils, and bias voltage. Relays K 3 and K 4 switch the metering circuits from receive to transmit, the low plate voltages from receive to transmit tubes, and the ave and alc leads.

The antivox circuit provides a threshold voltage to prevent loudspeaker output (picked up by the microphone circuits) from tripping the KWM-2/2A into transmit function. Some of the receiver output audio voltage is connected through C235 to the ANTI-VOX GAIN control, R45. Signal from the slider of this
potentiometer is rectified by the antivox rectifier, which is the other diode of V14. Negative d-c output voltage from the antivox rectifier, connected to the grid of V4B, provides the necessary antivox threshold. ANTI-VOX GAIN control R45 adjusts the value of the antivox voltage threshold so that loudspeaker output will not produce enough positive d-c output from the vox rectifier to exceed the negative d-c output from the antivox rectifier and cause V 4 B to actuate K 2 . However, speech energy into the microphone will cause the positive vox voltage to overcome the negative antivox voltage and produce the desired action of K2.

## service instructions

## 4. 1 General.

Included in this section are signal tracing procedures, alignment and neutralization procedures, and voltage and resistance measurements. If any soldered parts are removed or replaced at terminals to which semiconductor diodes are connected, be sure to attach an alligator clip to the diode lead. This acts as a heat sink to protect the diode.

To remove the transceiver chassis from the cabinet, lift the lid, and remove the two Phillips-head screws located between the lid fasteners. Remove the four feet and the screw located midway between the rear feet. From the rear, push the chassis forward until the front panel protrudes from the cabinet about an inch. Grasp the front panel at the edges, and carefully slide the chassis out of the cabinet.

### 4.2 Transmitter Signal Tracing.

Table 4-1 lists appropriate signal generator connection points and normal signal levels. Figure 4-1 shows location of adjustments. Before making measurements, set EMISSION switch to USB, disable the power amplifier by disconnecting the jumper between J 5 and J6, and remove the high-voltage rectifier tube from its socket. Set meter switch to GRID. Peak EXCITER TUNING, and turn VOX GAIN control full counterclockwise. Short PTT jack J16 to ground to key the KWM-2/2A to transmit. Connect signal generator output to points indicated in table 4-1, and adjust signal generator output attenuator until PA grid current just begins to show on the meter. Attenuator reading is signal voltage necessary at that point. Voltages given in the table are nominal and may vary

TABLE 4-1. TRANSMITTER SIGNAL LEVELS

| SIGNAL GENERATOR CONNECTION POINT | $\begin{aligned} & \text { BAND-SWITCH } \\ & \text { POSITION } \end{aligned}$ | SIGNAL GENERATOR FREQUENCY | SIGNAL GENERATOR OUTPUT VOLTAGE |
| :---: | :---: | :---: | :---: |
| V8-2 (grid) | 3.8 | 3.9 mc | 0.5 volt |
|  | 7.2 | 7.3 mc | 0.41 volt |
|  | 14.2 | 14.3 mc | 0.5 volt |
|  | 21.4 | 21.5 mc | 0.2 volt |
|  | 28A | 28.6 mc | 0.75 volt |
| V7-1 (grid) | 3.8 | 3.9 mc | 40,000 microvolts |
|  | 7.2 | 7.3 mc | 22,000 microvolts |
|  | 14.2 | 14.3 mc | 43,000 microvolts |
|  | 21.4 | 21.5 mc | 30,000 microvolts |

*Frequency of internal tone oscillator.
$\pm 20$ percent. Each time, be careful to set signal generator to frequency shown in the table. Oscillator output voltage may be measured with a vacuumtube voltmeter.

### 4.3 Receiver Signal Tracing.

Table 4-2 lists significant test points and normal signal levels. Figure 4-1 shows location of test points and adjustments. All r-f and i-f measurements were made by connecting a vacuum-tube voltmeter to the avc bus and increasing signal generator output until the avc threshold is reached. The avc threshold voltage is the point at which the d-c vtvm indication just changes with increased signal level. The receiver was tuned to 14.1 mc for these measurements, and a test signal injected at indicated test points. Signal voltage values are taken from signal generator output attenuator. All values are nominal and may vary $\pm 20$ percent without degrading performance.

### 4.4 Voltage and Resistance Measurements.

Table 4-3 lists voltage and resistance of all tube sockets of the KWM-2/2A except that of the vfo tube, V301. DO NOT OPEN the oscillator can. Refer to figure 7-2 for location of tube sockets. Measurements were made under the following conditions:
a. All measurements made with a vtvm and with all tubes in sockets. Unless otherwise noted in table, all measurements made with R.F. GAIN at maximum, A.F. GAIN at minimum, EMISSION switch in USB position, BAND switch in 14.2 position, vfo dial at 100, OFF-ON-NB-CAL switch in ON position. All voltages on transmitter tubes are taken with PTT jack J16 shorted to ground and MIC GAIN control full counterclockwise, but not far enough to close S14.
b. Resistances of less than 0.9 ohm listed as zero.
c. Resistance measurements made with power supply plug removed from J13.

TABLE 4-2. RECEIVER SIGNAL LEVELS

TABLE 4-3. VOLTAGE AND RESISTANCE MEASUREMENTS

| TUBE | PIN NUMBER |  |  |  |  |  |  |  |  |  | $\begin{aligned} & \text { PLATE } \\ & \text { CAP } \end{aligned}$ |

d. All measurements made from tube socket pins to ground.
e. When two voltages are given for same tube pin, the first is for receive condition and the second for transmit condition.

## WARNING

800 volts d-c is present on rear power connector J13 (pin 2) and inside PA compartment.

### 4.5 Field Alignment Procedures.

### 4.5.1 FIELD ALIGNMENT.

Field alignment consists of a few simple adjustments and is intended as a means of restoring peak performance of a working KWM-2/2A. No alignment procedure should ever be performed just for the sake of alignment. Adjustments should be made only when there is reason to suspect that performance is not up to standard. All field alignment adjustment points can be reached by raising the cabinet lid, and the KWM-2/2A does not have to be removed from its cabinet. See figure 4-1 for adjustment locations.

### 4.5.2 TEST EQUIPMENT REQUIRED.

Test equipments required for field alignment of the KWM-2/2A are a 50 -ohm, 100 -watt dummy load and a receiver with a $100-\mathrm{kc}$ crystal calibrator and an S-meter.

### 4.5.3 R-F CIRCUITS PEAKING.

a. Connect dummy load to KWM-2/2A output jack J1. Set KWM-2/2A controls as follows: OFF-ON-NB-CAL to ON, BAND to 28A, EMISSION to LSB, MIC GAIN to OFF, INCREASE LOADING to $50 \Omega$, and tuning dial to 100.
b. After 5 -minute warmup period, set EMISSION switch to TUNE and meter switch to GRID. Adjust MIC GAIN and EXCITER TUNING to produce midscale indication on meter. Set meter switch to PLATE, and dip plate current with P.A. TUNING. Reset meter switch to GRD. Peak the four (E)28 trimmer capacitors for maximum grid current. See figure 4-1 for trimmer locations.
c. Set BAND switch to 21.2 and tuning dial to 100 . Adjust MIC GAIN and EXCITER TUNING for midscale grid current. Set meter switch to PLATE, and dip plate current. Reset meter switch to GRD. Peak the four (D)21 trimmer capacitors for maximum grid current.
d. Set BAND switch to 14.0 and tuning dial to 150 . Adjust MIC GAIN and EXCITER TUNING for midscale grid current. Set meter switch to PLATE and dip plate current. Reset meter switch to GRID. Peak the four (C) 14 trimmer capacitors for maximum grid current.
e. Set BAND switch to 7.0 and tuning dial to 150 . Adjust MIC GAIN and EXCITER TUNING for midscale grid current. Set meter switch to PLATE, and dip plate current. Reset meter switch to GRID. Peak the four (B) 7.0 trimmer capacitors for maximum grid current.
f. Set BAND switch to 3.6 and tuning dial to 100 . Adjust MIC GAIN and EXCITER TUNING for midscale grid current. Set meter switch to PLATE, and dip plate current. Reset meter switch to GRID. Peak the four (A)3.5 trimmer capacitors for maximum grid current.
g. Set EMISSION switch to LSB.

### 4.5.4 VFO SIDEBAND FREQUENCY SHIFT ADJUSTMENT.

Do not make this adjustment unless switching from one sideband to the other makes readjustment of tuning dial necessary to keep output signal from shifting. It will always be necessary, after this adjustment, to make carrier balance (null) adjustment given in paragraph 4.5.5.
a. Set EMISSION switch to LSB, meter switch to PLATE, BAND switch to 14.0 , and tuning dial to 100. Turn VOX GAIN (under top cover) full counterclockwise until switch clicks.
b. Rotate CARRIER BAL potentiometer R15 to one end to allow carrier feedthrough.
c. Adjust EXCITER TUNING control for maximum plate current, and dip plate current with P.A. TUNING control.
d. Tune station receiver to zero beat with transmitter.
e. Set EMISSION switch to USB, and adjust trimmer C 308 (top of vfo can) for zero beat.

### 4.5.5 CARRIER BALANCE (NULL) ADJUSTMENT.

a. Set BAND switch ${ }^{\text {to }} 3.6$ and tuning dial to 100 .
b. Set EMISSION switch to LSB, and turn MIC GAIN fully counterclockwise until it clicks. Key KWM-2/2A by turning VOX GAIN counterclockwise until it clicks or by grounding push-to-talk (PTT) line at jack J16.
c. Loosely couple receiver antenna lead to dummy load, and peak EXCITER TUNING and P.A. TUNING to obtain a midscale reading on receiver $S$-meter.
d. Adjust CARRIER BAL potentiometer R15 and trimmer capacitor $C 9$ for minimum indication on receiver S -meter. These adjustments interact, so adjust first one and then the other until neither produces any further decrease in $S$-meter indication.
e. Switch EMISSION switch back and forth between USB and LSB to see that the carrier suppression is
about the same for either sideband. If it is not, repeat step d until carrier suppression is about equal for both sidebands.
f. Remove receiver antenna lead from near dummy load, and remove short from PTT line.

### 4.5.6 ALC ZERO ADJUSTMENT.

a. Set EMLSSION switch to TUNE position. Tune and load transmitter to 14.1 mc . Set EMISSION switch to USB.
b. Set MIC GAIN control to minimum, and set meter switch to ALC position. Short PTT jack J16 to ground.
c. Adjust ALC ZERO potentiometer (inside cabinet) until meter indicates zero. Remove PTT short.

### 4.5.7 FIRST MIXER BALANCE ADJUSTMENT.

a. Set BAND switch to 21.0 and tuning dial to 0 . Tune and load KWM-2/2A into dummy load, then set EMISSION switch to LSB and MIC GAIN to counterclockwise limit until switch clicks.
b. Loosely couple receiver antenna lead to dummy load. Tune receiver across 21.455 mc until signal is heard.
c. Adjust mixer balance potentiometer R24 and trimmer capacitor C21 for minimum signal. These adjustments interact, so adjust first one and then the other until neither produces any further decrease in output.

### 4.5.8 S-METER ZERO ADJUSTMENT.

a. Set BAND switch to 14.2 and tuning dial to 100. Connect output of $100-\mathrm{kc}$ crystal calibrator in test receiver to 50 -ohm dummy load. Peak KWM-2/2A EXCITER TUNING for maximum KWM-2/2A S-meter indication. Set R.F. GAIN to clockwise limit, and turn off $100-\mathrm{kc}$ crystal calibrator.
b. Short RCVR ANT. jack J2 to ground. Adjust S METER ZERO potentiometer R121 for zero indication on S-meter.

### 4.5.9 CRYSTAL CALIBRATOR ADJUSTMENT.

a. Tune KWM-2/2A to zero beat with carrier of station WWV at 15.0 mc at a time when station WWV is not transmitting a tone.
b. Set OFF-ON-NB-CAL switch to CAL. Adjust CAL ADJUST trimmer C76 (inside cabinetonchassis) for zero beat of calibration signal.

### 4.5.10 VFO END-POINT ADJUSTMENT.

The calibration of the KWM-2/2A vfo mustbe checked against a receiver with a $100-\mathrm{kc}$ crystal calibrator. With the BAND switch set to 3.6 , the KWM-2/2A output should be in zero beat with the calibrator signal at 3600 kc ( 0 on the KWM-2/2A dial) and 3800 kc (200 on the KWM-2/2A dial). The hairline indicator should be vertical in the dial window. If there is no end-point spread, but the hairline is slanted to left or right, loosen the setscrews on the dial hub,
and slip the dial mechanism on the oscillator shaft until zero beat occurs with the hairline vertical.

If there is end-point spread, correct it as follows before correcting a slanting hairline:
a. Zero beat KWM-2/2A output against 100-kc calibrator signal at 3800 kc , and set KWM-2/2A hairline right on 200.
b. Zero beat KWM-2/2A output against $100-\mathrm{kc}$ calibrator signal at 3600 kc . Note difference in kilccycles between hairline and 0 on KWM-2/2A dial (for example, -1.5 kc ).
c. Without moving hairline, move dial to opposite side of 0 by an amount equal to frequency difference noted above (for example, +1.5 kc ).
d. Adjust L302 for zero beat. It is located on top of vfo can.
e. Set KWM-2/2A hairline over 0 .
f. Check zero beat at 200 on dial ( 3800 kc ). If zero beat does not occur at exactly 200 , repeat steps a through $e$.
g. If, after adjustment of end points, hairline is not vertical in dial window, loosen setscrews on dial hub, and move dial with respect to the oscillator shaft so that zero beat occurs with end points ( 0 and 200) set at center.
h. After these adjustments of vfo calibration, recheck ufo sideband frequency shiftadjustmentaccording to paragraph 4.5.4.

### 4.5.11 VFO DIAL CENTERING.

a. Tune the KWM-2/2A to 14.3 mc LSB, and set function switch to CAL.
b. Tune the KWM-2/2A to zero beat.
c. With the hairline vertical, 100 should be exactly under the hairline. If not, loosen the two setscrews on the dial hub (accessible from the bottom of the chassis with the cabinet removed), and set 100 exactly under the hairline.
d. Retighten the setscrews.

### 4.5.12 VFO OVERTRAVEL.

a. With the hairline vertical, turn the main tuning dial to the end stop past 0 .
b. Note the overtravel between the hairline and 0 .
c. Turn the main tuning dial to the end stop past 200 , and note the overtravel.
d. If the overtravel is not equal, loosen the two setscrews in the vfo end stop collar (accessible from the bottom of the chassis with the cabinet removed).
e. Set the main tuning dial for half the total difference, and tighten the setscrews.
f. This completes the field alignment of the KWM-2/2A.

### 4.6 Laboratory Alignment Procedures.

### 4.6.1 LABORA TORY ALIGNMENT.

Laboratory alignment of the KWM-2/2A is performed only when extensive component replacement

Figure 4-2. Ceramic Trimmer Capacitors
has taken place or when the KWM-2/2A is being placed in service after a long period of storage. These adjustments should be performed by a skilled technician. Laboratory alignment requires the KWM-2/2A to be removed from its cabinet. Refer to paragraph 4.1 for removal instructions.

### 4.6.2 TEST EQUIPMENT REQUIRED.

Test equipments required for laboratory alignment of the KWM-2/2A are a 50 -ohm, 100 -watt dummy load, a receiver with a $100-\mathrm{kc}$ crystal calibrator and an S-meter, an $r$-f signal generator with a calibrated output attenuator, and a vtvm with an r-f probe.

### 4.6.3 TRANSMITTING 455-KC I-F ALIGNMENT.

a. Disable the screen circuit of the PA tubes by unsoldering one end of the jumper between PA DISABLE jacks J5 and J6. Remove V301 from its socket.
b. Connect an r-f vtvm from pin 2 of $V 5$ to ground.
c. Set OFF-ON-NB-CAL switch to ON. Set EMISSION switch to TUNE. Turn MIC GAIN off.
d. Any voltage reading on the vtvm is due to carrier. Roughly adjust carrier balance potentiometer R15 and capacitor C9 for minimum vtvm indication.

## e. Set MIC GAIN to full on.

f. Adjust the bottom slug of T1 for peak vtvm reading. Adjust filter input trimmer C54 for peak vtvm reading.
g. Disconnect vtvm, and replace V301.
h. After performing the above procedure, adjust the carrier balance according to paragraph 4.5.5.

### 4.6.4 BANDPASS I-F ALIGNMENT.

a. Set OFF-ON-NB-CAL switch to ON. Set EMISSION switch to TUNE. Tune and load KWM-2/2A into a dummy load at 14.3 mc . Switch meter to GRID position.
b. Make a swamping tool by connecting a 1000 -ohm resistor and a 0.01 -uf capacitor in series and connecting clips to their free pigtails. Connect the
swamping tool across terminal 3 (secondary winding) of T2 to ground. This terminal is connected to the T2 end of coupling capacitor C25.
c. Keep grid current to approximately midscale or lower by adjusting MIC GAIN control, and peak the primary of T2. The primary slug for $T 2$ is at the bottom of the can. Usegrid current as peakindication.
d. Remove the swamping tool from the secondary of T2, and connect it across terminals 1 and 2 (primary winding) of T2 (between pins 1 and 6 of the first mixer, V5). Peak the secondary of T2 (slug at top of shield can). Remove the swamping tool.
e. Retune and reload at 14.255 mc . Without swamping any of the tuned circuits, peak L4for grid current indication.

### 4.6.5 R-F CIRCUITS ALIGNMENT.

a. Adjust all ceramic trimmer capacitors, including the three below the chassis, to $1 / 2$-maximum capacitance, except as follows: DO NOT change the setting of CARRIER BAL capacitor, and set $3.8-\mathrm{mc}$ trimmers C70, C37, C109, and C130 to two-thirds maximum capacitance. Maximum capacitance of these trimmers occurs when the large square notch is set midway between the two mounting screws. One-half capacitance occurs with the notch pointed directly at the front or rear of the unit. Two-thirds capacitance occurs with the notch turned off the half-point toward the mounting screws. Refer to figure 4-2.
b. Connect the KWM-2/2A output to a 50 -ohm dummy load. Set the dial to 100 , BAND switch to 3.6 , and EXCITER TUNING control to 2.1 on the logging (lower) scale. Set meter switch to GRID and EMISSION switch to LOCK.

Keep MIC GAIN setting low to protect PA. Check frequently to be sure the PA is resonated.

Figure 4-1. Location of Adjustments
c. Adjust MIC GAIN control for approximately $1 / 4-$ scale grid current. Tune and load the PA into the dummy load.
d. Adjust all slugs except the rear one for maximum grid current. Reduce MIC GAIN setting as necessary to keep the grid current indication below $1 / 4$ scale. Make no adjustment to rear slug L14 at this time. Return MIC GAIN control to minimum setting.

## NOTE

If slugs must be turned more than two turns in either direction, the unit has a defect other than alignment. Troubleshoot the unit.
e. Set dial to 150 , BAND switch to 7.0 , and EXCITER TUNING to 3.6 on the logging (lower) scale.
f. Adjust MIC GAIN for $1 / 4$-scale grid current. Tune and load the PA into the dummy load. Adjust the 7 -mc trimmers for peak grid current, keeping grid current below $1 / 4$ scale with MIC GAIN control. Return MIC GAIN to minimum position.
g. Set BAND switch to 140 , dial to 150 , and EXCITER TUNING to 6.1 on logging (lower) scale. Adjust MIC GAIN for $1 / 4$-scale grid current. Tune and load PA into dummy load.
h. Tune rear slug L14 for maximum grid current, keeping the current at $1 / 4$ scale or less with the MIC GAIN control.
i. Adjust all 14 -mc trimmers for peak grid current, keeping current below $1 / 4$ scale with MIC GAIN control. Return MIC GAIN control to minimum setting.
j. Set BAND switch to 21.2 , dial to 100 , and EXCITER TUNING to 7.6 on logging (lower) scale. Set grid current to $1 / 4$ scale, and tune and load the PA into the dummy load.
k. Adjust all $21-\mathrm{mc}$ trimmers for peak grid current, keeping grid current at $1 / 4$ scale or less with the MIC GAIN control. Return the MIC GAIN control to minimum setting.

1. Set BAND switch to 28A, dial to 100 , and EXCITER TUNING to 9.0 on the logging (lower) scale. Set grid current to $1 / 4$ scale with MIC GAIN control, and tune and load the PA into dummy load.
m . Adjust all $28-\mathrm{mc}$ trimmers for maximum grid current, keeping grid current at $1 / 4$ scale with the MIC GAIN control. Return MIC GAIN to minimum position.

### 4.6.6 CRYSTAL OSCILLATOR ALIGNMENT.

a. This procedure is a refinement which peaks the oscillator plate circuits in the center of the $200-\mathrm{kc}$ tuning range. Turn the tuning dial to 100 .
b. Set BAND switch to 28A. Set EMLSSION switch to TUNE. Increase MIC GAIN setting, if necessary, to obtain grid current indication. Adjust EXCITER TUNING control for a peak on the PA grid current meter.
c. Repeak the (E)28 trimmer in the crystal oscillator plate circuit.
d. Set the BAND switch to 21.2, and adjust EXCITER TUNING control for peak in grid current.
e. Repeak the (D) 21 trimmer in the oscillator plate circuit.
f. Repeat this procedure with BAND switch settings of $14.0,7.0$, and 3.6 , adjusting crystal oscillator plate circuit trimmers (C)14, (B)7.0, and (A)3.8 respectively.

### 4.6.7 VFO SIDEBAND FREQUENCY SHIFT ADJUSTMENT.

Refer to paragraph 4.5.4 for vfo sideband frequency shift adjustment procedure.

### 4.6.8 CARRIER BALANCE (NULL) ADJUSTMENT.

Refer to paragraph 4.5.5 for carrier balance (null) adjustment procedure.

### 4.6.9 ALC ZERO ADJUSTMENT.

Refer to paragraph 4.5.6 for alc zero adjustment procedure.

### 4.6.10 FIRST MIXER BALANCE ADJUSTMENT.

Refer to paragraph 4.5.7 for first mixer balance adjustment procedure.

### 4.6.11 VFO DIAL CALIBRATION.

Refer to paragraphs 4.5.9 through 4.5.12 for vfo dial calibration and adjustment procedures.

### 4.6.12 PA NEUTRALIZING.

a. Disconnect the high voltage ( 800 volts) from the transmitter by removing the high voltage rectifier tube from the power supply.
b. Disable the screen circuit of the PA tubes by unsoldering one end of the jumper between PA DISABLE jacks J5 and J6.
c. Connect a 50 -ohm, noninductive, 100 -watt dummy load to RF OUT jack J1.
d. Connect a vtvm r-f probe across the 50 -ohm dummy load.
e. Set the OFF-ON-NB-CAL switch to ON; set the BAND switch to 28A; and set the EMISSION switch to LOCK and the tuning dial to 100 . Set the meter switch to GRID.
f. Advance the MIC GAIN control as necessary, and adjust the EXCITER TUNING control for maximum grid current.
g. Adjust the P.A. TUNING control for a maximum r-f voltage indication on the vtvm. Adjust the MIC GAIN control to keep this indication below 0.5 volt.
h. From the bottom of the chassis, adjust PA neutralizing capacitor C184 (refer to figure 6-3) for a minimum r-f indication on the vtvm. This voltage is the PA plate circuit feedthrough and is minimized by neutralization.

SECTION 4
Service Instructions
i. Remove the vtvm r-f probe from the dummy load, and reconnect the jumper between the PA DISABLE jacks.

### 4.6.13 DRIVER NEUTRALIZING.

a. Set the OFF-ON-NB-CAL switch toOFF. Remove heater voltage from driver tube V8 by unsoldering L29 from C241 (see figure 6-3), or, if an old 6CL6 tube having no short circuits is available, clip off its filament pins, and substitute it for V8.
b. Connect r-f probe to dummy load. Set OFF-ON-NB-CAL switch to ON, BAND switch to 28A , and tuning dial to 100. Set EMISSION switch to LOCK and meter switch to PLATE.
c. Increase MIC GAIN setting, and adjust EXCITER TUNING and P.A. TUNING controls for maximum voltage across dummy load. This level should be less than 0.3 volt.
d. Adjust driver neutralizing capacitor C117 for a voltage dip. This capacitor is located on the shield partition closest to the shield can. Refer to figure 6-3.
e. Set the OFF-ON-NB-CAL switch to OFF, and replace V8 in its socket.

### 4.6.14 FEEDBACK NEUTRALIZING.

a. Set BAND switch to 28 A position and tuning dial to 100 , EMISSION switch to TUNE, and meter switch to PLATE position.
b. Adjust EXCITER TUNING control for a peak in PA plate current.
c. Dip the PA plate current with the P.A. TUNING control.
d. Switch to LOCK, and repeat steps $b$ and $c$.
e. Adjust feedback neutralizing capacitor C120 (on driver-PA shield below chassis and farthest from shield cans; see figure 6-3) until PA plate current dip and grid current dip coincide. Readjust the MIC GAIN as necessary to hold PA grid current at about half-scale during this adjustment.
f. Set BAND switch to 21.2 , peak EXCITER TUNING control, and dip PA plate current with P.A. TUNING control.
g. Check that PA plate current dip and grid current dip occur at same setting of P.A. TUNING control.
h. Repeat this check on bands 14.2, 7.0, and 3.6.

### 4.6.15 PA LOADING TRIMMER ADJUSTMENT.

These trimmer capacitors are adjusted to provide the required total output capacity for matching 50ohm antenna loads on the amateur bands with the INCR LOAD control set at the $50 \Omega$ mark. Normally, they will not need readjustment since, when the PA is properly loaded, the tuning is relatively broad. If it is determined that adjustment is necessary, proceed as follows:
a. Refer to figure 7-2 for location of the loading trimmers.
b. Connect a 50 -ohm nonreactive dummy load to the transceiver RF OUT jack.
c. Set INCR LOAD control to $50 \Omega$ mark.
d. Tune up at 21.3 mc , and set EMISSION switch to lock.
e. Set MIC GAIN to the point which begins to produce PA grid current. This is gridcurrent threshold.
f. Adjust C155 until PA draws 230-ma plate current at the dip.
g. Tune up at 28.6 mc , and check plate current. If not 230 ma , readjust C155 for best compromise between 21.3 and 28.6 mc .
h . Tune up at 14.150 mc , and set MIC GAIN as in step e.
i. Adjust C152 as in step f.
j. Tune up at 7.150 mc , and set MIC GAIN as in step e.
k. Adjust C153 as in step f.

1. Tune up at 3.700 mc , and set MIC GAIN as in step e.
m. Adjust C154 as in step f.
n. Set OFF-ON-NB-CAL switch to OFF.

### 4.6.16 RECEIVING 455-KC I-F ALIGNMENT.

a. Remove vfo tube V301 from socket, and set OFF-ON-NB-CAL switch to ON.
b. Set EMISSION switch to USB.
c. Connect signal generator to pin 8 of V17B, and set to 455 kc . Increase signal generator output until S -meter shows slight indication (S3). Rock the signal generator frequency to center the signal at the approximate center of the filter passband.

## NOTE

If a vtvm is available, it may be connected to avc bus and used as alignment peak indicator.
d. Adjust the slugs of L9 and T5 for peak indication on the S-meter. Reduce signal generator output as necessary to keep $S$-meter indication low. Repeak L9 and T5 as in any standard alignment procedure. e. Replace vfo tube.

### 4.6.17 RECEIVER R-F GAIN AND S-ME TER ZERO ADJUSTMENT.

a. Set receiver to 14.3 mc , and peak EXCITER TUNING control for maximum output. Set R.F. GAIN control (front panel) to maximum clockwise position. Tune calibrated signal generator to same frequency as receiver.
b. Short RCVR ANT. jack J2 to ground; adjust S METER ZERO potentiometer R121 so S-meter reads zero.
c. Remove shortfromJ2. Using a 50 -ohm calibrated signal generator, apply 25 uv to the circuit shown in figure 4-3. Adjust RCVR GAIN ADJUST R132 untilsmeter just moves off zero ( $1 / 2 \mathrm{~S}$-unit or less). d. Repeat step b.
e. This completes the laboratory alignment of the KWM-2/2A. Replace it in its cabinet.

Figure 4-3. Receiver Gain Adjustment Setup
4.7 Dial Cord Replacement. (Refer to figure 4-4).

### 4.7.1 BAND-SWITCH CORD.

a. Remove the power cable from the KWM-2/2A. b. Using a knife blade or small screwdriver, pry open the tabs, and remove the broken or defective cord from the two band-switch pulleys. The bandswitch pulleys are located near the front panel, one above and the other below the chassis. Loosen the idler pulley so it will not be in the way during restringing.
c. Place the BAND switch in position 1A, and rotate the PA band-switch pulley to the approximate position shown in figure 4-4.

NOTE
The band detent pulley may not be in the exact same position shown in figure 4-4. Do not reposition this pulley, but assume it to be in the correct position during restringing.
d. Replace the old cord with three feet of new cord, Collins part number 432-1009-00. When ordering dial cord, be sure to state the desired length in feet. String the cord according to the band-switch cord illustration in figure 4-4. Make sure cords do not overlap on the pulleys. Pull cord tight, and tie to the tab. Mash the tab down to clamp the cord securely. Tighten the idler gear to bring the cord to tension.

Figure 4-4. Dial Cord Stringing Diagram

SECTION 4
Service Instructions
e. Turn the band switch to position 3 E , and check to see that the movable contact (rotor blade) of both S7 and S8 (refer to figure 6-1 for location of S7 and S8) are at position' 1 and 2. This may be determined by counting clockwise on the wafer from the X -mark. The X-mark should be visible on the left side of S8 (as viewed from the front of the KWM-2/2A) without the PA cage removed. If the movable contacts are incorrectly positioned, loosen the PA band-switch pulley, and turn the switch to its proper position. Tighten the PA band-switch pulley.
f. Apply a little airplane cement on the dial cord knots to keep them tight. After the cement is dry, trim the loose end back NO CLOSER than one-quarter inch from the knot.

### 4.7.2 LOADING CAPACITOR CORD.

a. Remove the power cable from the KWM-2/2A.
b. Remove the PA cage by unscrewing the five selftapping Phillips-head screws (located on the bottom side of the chassis) which secure the cage to the chassis.
c. Using a knife or small screwdriver, pry open the tabs, and remove the broken or defective cord from the two loading capacitor pulleys.
d. Manually position the loading capacitor to its fully meshed position and the INCR LOAD control to position 10 on the P.A. TUNING logging scale.
e. String the cord according to the loading capacitor cord illustration in figure 4-4. Make sure cords do not overlap on the pulleys. Pull cord tight, and tie to
the tab. Mash the tabdown to clamp the cord securely. Tighten the idler gear to bring the cord to tension. Check to make sure that the loading capacitor and INCR LOAD control are still in the positions set up in step d above. If not, loosen the shaft pulley, mesh capacitor plates manually, and retighten the pulley.
f. Apply a little airplane cement on the knots in the dial cords to help hold them tight. After the cement is dry, trim the loose ends back NO CLOSER than one-quarter inch from the knot.

### 4.8 Relay Maintenance.

Gradual accumulations of dust, lint, or oxidation may cause the contacts of relays to become highresistance connections and degrade switching functions. Relays K2 and K4 are plug-in types and can be removed for cleaning. Relay K 3 is wired in place and cannot be removed except by disconnecting all leads to it.

If cleaning of the relay contacts is necessary, use a relay contact burnishing tool. If such a tool is not available, use a piece of rough paper soaked in carbon tetrachloride. Be careful not to bend any of the contact springs. DO NOT use files, emery paper, or abrasives, as the silvered surfaces of the contacts are very thin. Observe the contacts in a dental mirror, and press the armature down with thumb or finger. Check that all normally closed contacts have opened before any of the normally open contacts close. If this is not the case, the relay may have to be replaced.
specifications

#### Abstract

5.1 KWM-2 and KWM-2A Transceivers.

The KWM-2 and KWM-2A tranceivers are capable of covering any frequency within the ranges of 3.4 to 5.0 mc and 6.5 to 30.0 mc . With crystals furnished, they cover the entire amateur bands of $80,40,20$, and 15 meters, the $28.5-$ to $28.7-\mathrm{mc}$ portion of the ten-meter band, and WWV at 15.0 mc . The KWM-2 is equipped with 14 crystal sockets which are selectable from the front panel and provide 14 operating bands, each 200 kilocycles wide. The KWM-2A differs only in regard to the number of crystal sockets furnished, the method of switching crystals, and slight electrical and mechanical differences related to crystal switching. It is equipped with an extra crystal-mounting board which doubles the number of selectable crystal sockets. Crystals for added coverage may be plugged into spare sockets in either transceiver, or crystals for other bands may be substituted for those furnished.

### 5.2 Requirements for Operation.

Either transceiver requires a 110 -volt, 50 - to $60-$ cps, a-c power source, and a power supply such as the $516 \mathrm{~F}-2$ for fixed-station operation. It consumes approximately 235 watts of power from the line in receive function and approximately 475 watts on peaks in transmit function. The transceiver may be operated mobile by using a power supply such as the MP-1 for 12 -volt d-c operation or a $516 \mathrm{E}-2$ for 24 - to 28 -volt operation. In mobile operation the transceiver requires 800 volts d-c at approximately $175 \mathrm{ma} ; 275$ volts d-c at approximately 210 ma ; a bias supply adjustable between -60 and -80 volts; and $6-, 12$-. or 24 -volt d-c filament supply at $11.0,5.5$, or 2.75 amperes respecttively. Any high-impedance crystal or dynamic microphone may be used. A 4 -ohm speaker is required. The antenna and feed system must present a 50 -ohm load with swr not exceeding 2.0 to 1 .

### 5.3 Specifications.

10 meters - 28.5 to 28.7 mc .

Mode . . . . . . . . . . . . . . . . Single sideband (either sideband selectable) or CW.

Type of service . . . . . . . . . . . SSB-continuous; CW-50\% duty cycle.

Power consumption from a-c line . . . . . . 235 watts in receive function 475 watts peak in transmit function.

Plate power input . . . . . . . . . . . . . 175 watts PEP on SSB, 160 watts on CW.

5-2

### 5.4 Tube and Semiconductor Complement.

TABLE 5-1. TUBES AND SEMICONDUCTORS

| SYMBOL | FUNCTION | TYPE |
| :---: | :---: | :---: |
| V1A | First microphone amplifier | $6 \mathrm{AZ8}$ |
| V1B | First receiver i-f amplifier | $6 \mathrm{AZ8}$ |
| V2A | Vfo cathode follower | 6U8A |
| V2B | Tone oscillator | 6U8A |
| V3A | Mic rophone amplifier cathode follower | 6 AZ 8 |
| V3B | Receiver second i-f amplifier | $6 \mathrm{AZ8}$ |
| V4A | Transmitter i-f amplifier | 6 AZ 8 |

### 5.5 Available Accessories.

TABLE 5-2. AVAILABLE ACCESSORIES

| ITEM | FUNCTION | COLLINS <br> PART NUMBER |
| :---: | :---: | :---: |
| 136B-2 Noise Blanker | Eliminates noise pulses when the noise components present on the antenna have energy distribution in the $40-\mathrm{mc}$ portion of the spectrum, and when the noise pulses have a repetition rate not in excess of 100.000 pulses per second. | 522-1661-00 |
| 312B-3 Speaker | Station speaker. | 522-1166-00 |
| 312B-4 Station Control | Speaker, phone patch, directional wattmeter, and station control switches. | 522-1167-00 |
| 312B-5 Station Control | Combination of features and functions of $312 \mathrm{~B}-4$ and 399C-1 accessories. | 522-1168-00 |
| 399C-1 External VFO | Speaker, extra 70K-2 vfo, and vfo control switches for operating transmitter and/or receiver in different portions of $200-\mathrm{kc}$ band. | 522-1597-00 |
| 351D-2 Mobile Mount | Mount for mobile operation. | 522-1726-00 |
| 351E-4 Mounting Plate | Mount on table or bench. | 522-1482-00 |
| 516F-2 A-C Power Supply | A-c power supply for fixed station operation (110-volt a-c). | 522-1170-00 |
| MP-1 D-C Power Supply | Mobile power supply for 12 - to 14 -volt d-c source. | 522-2750-00 |
| PM-2 A-C Power Supply | Portable power supply (110- or 220 -volt a-c) | 522-2639-004 |
| 516E-2 D-C Power Supply | Mobile power supply for 24- to 28-volt source. | 522-0984-005 |
| 302C-3 Directional Wattmeter | Measure forward and reflected power. | 522-1696-00 |
| 440E-1 Cable | Mobile power connections when 351D-2 is not used. | 522-2051-00 |
| SM-1 Microphone | Desk top, high impedance, nonmetallic dynamic microphone. Output level of -53 db . Finished in brushed satin chrome. Equipped with stand and five-foot length of Koiled Kord. Frequency response of $100-3500$ cycles. | 097-5944-00 |
| SM-2 Microphone | Slender, grey and chrome, desk top unit which blends with KWM-2/2A. Omnidirectional, frequency response of $200-3000$ cycles, output level of -53 db . Equipped with five-foot length of Koiled Kord. | 097-5946-00 |
| MM-1 Microphone | Pressure-operated dynamic microphone for mobile use. Equipped with mounting kit and five-foot length of Koiled Kord. Frequency response from 200 to 10,000 cycles with output level of -48 db . | 097-5945-00 |
| MM-2 Microphone | High-impedance resistance microphone and single earphone for fixed or mobile operation. Frequency response from 100 to 7000 cycles, output level -50 db . | 097-6027-00 |

TABLE 5-2. AVAILABLE ACCESSORIES (Cont)

| ITEM | FUNCTION | COLLINS <br> PART NUMBER |
| :---: | :---: | :---: |
| DL-1 Durmmy Load | 100 -watt resistor load with switching capabilities allowing for remote (from the operating position) or front panel operation. | 597-0361-00 |
| CC-2 Carrying Case | Carrying case to carry the KWM-2/2A plus PM-2, the KWM-2/2A alone, the $30 \mathrm{~L}-1$, $51 \mathrm{~S}-1$, or $62 \mathrm{~S}-1$. | 597-0393-00 |
| CC-3 Carrying Case | Carrying case for accessory components. Accommodates a 312B-5 (or 312B-4) Station Control Console, a 516E-2 (or MP-1) Power Supply, and a TD-1 Dipole Antenna, as well as a 90 -day supply of spare tubes and fuses. | 597-0403-00 |
| TD-1 Antenna | Dipole antenna designed for use when portability and operation on different frequencies are primary considerations. | 099-1106-00 |
| 399B-5 Crystal Oscillator Adapter | Crystal controlled oscillator which is used for frequency control in place of the VFO in the transmit function. | 522-1781-00 |
| 180S-1 Antenna Tuner | Basically a 1-kw pi network for matching various antenna impedances to a 50 -ohm coaxial transmission line in the range of $3-30 \mathrm{mc}$. |  |
| CT-1 Cable Trough | Housing of cables for KWM-2/2A interconnect. | 097-6192-00 |
| CP-1 Crystal Packet | Provides crystals to insert in the KWM-2/2A crystal oscillator circuit for operation throughout the entire range of the system. | 597-0404-00 |
| Logbook | Station logbook for general logging purposes. | 097-7629-00 |
