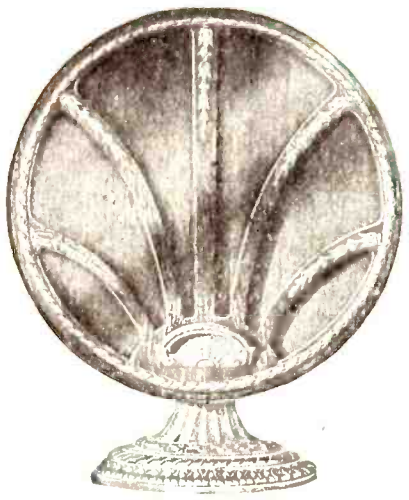
Thorola

SPEAKERS & RECEIVERS



Model 9
Cone Speaker
Rich Walnut and Old Gold.
17" high, 14" wide.
Price..... $20.00

SPEAKER styles may change, but the standards of tonal quality were fixed by musical art and acoustic science long before radio. It was only the most advanced radio engineering which always enabled Thorola speakers to meet the established critical standards of tone.

That is why the introduction of a cone speaker bearing the Thorola name first caused Radio to concede that scientifically true reproduction was possible in instruments of this type. Here was another outstanding Thorola attainment—based on the Thorola double-diaphragm principle. With two diaphragms, the Thorola Cone Speaker is able to cover the entire range of reproduction without sacrificing accuracy for either the high or the low end!

Thorola thus literally built this popular kind of speaker around the most popular thing in radio—*tone*—THOROLA TONE. Here is perfect reception of music and speech embraced in a beauteous instrument of irresistible modern style. You want an improved set this year—you will get it with a Thorola speaker on your present set.

This Tudor Model 59 with its exclusive combination of the Thorola 4 Speaker on one side, the Thorola Cone Speaker on the other, and the large non-directorial sound openings, insures the finest possible radio reproduction, with glorious musical timbre.

It is just what a radio receiver should look like—a genuine antique high-lighted walnut console of Tudor design. Ideal for the small apartment or spacious house.
Price..... $185.00

You know how Thorola Low-Loss Doughnut Coils—and Thorola Golden Tone Transformers transferred public interest from the confusion of circuits to the realities of performance. These transformers, with their incredibly fine balance and precision construction, brought characteristic Thorola tonal perfection to the field of complete receivers.

And Thorola Low-Loss Doughnut Coils made selectivity a certainty instead of an argument. The self-contained field of Thorola Doughnut Coils banished uncontrollable "pick-up," and internal interferences as well. A whole train of circuit refinements followed because the old radio uncertainties and variables were no longer able to upset every scientific calculation.

All these fundamental Thorola advancements in tone and power have received another year of intensive development. Naturally, results are improved, and they are attained with certainty and simplicity. Modern two dial control is now used. Sooner or later all really selective sets must come to it.

Just look at the beauty of latest Thorola radio furniture. Listen to the sure artistic musical effects. And you will know why each Thorola receiver invariably produces a whole neighborhood of Thorola enthusiasts. The dealer who shows you Thorola radio is abreast of the best.

REICHMANN COMPANY, 1725 West 74th Street, *CHICAGO, U. S. A.* · Member R. M. A.

THOROLA JUNIOR

At a moderate price there is only one way to obtain Thorola character — the Thorola Junior Speaker. Its size is somewhat smaller, but its voice is fine. Price....$15.00

The smaller Thorola Console, Model 58, in Antique, High-Lighted Genuine Walnut, is a triumph of craftsmanship in the cabinet, circuit and speaker.
Price..... $125.00

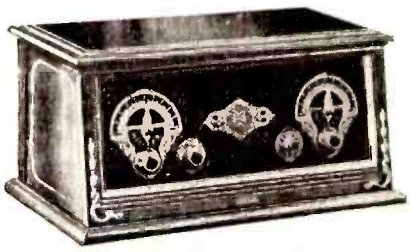
Thorola Doughnut Coils, with their patented indented wiring and true low-loss construction, go far beyond other type theories in improving reception..... $2.00 each (set of 3)..... $6.00

THOROLA 4

Thorola reputation for artistic leadership began with the Controlled Mica Diaphragm of this speaker, and its exclusive Separix, which brought true music to radio by making it possible to reproduce overtones faithfully.

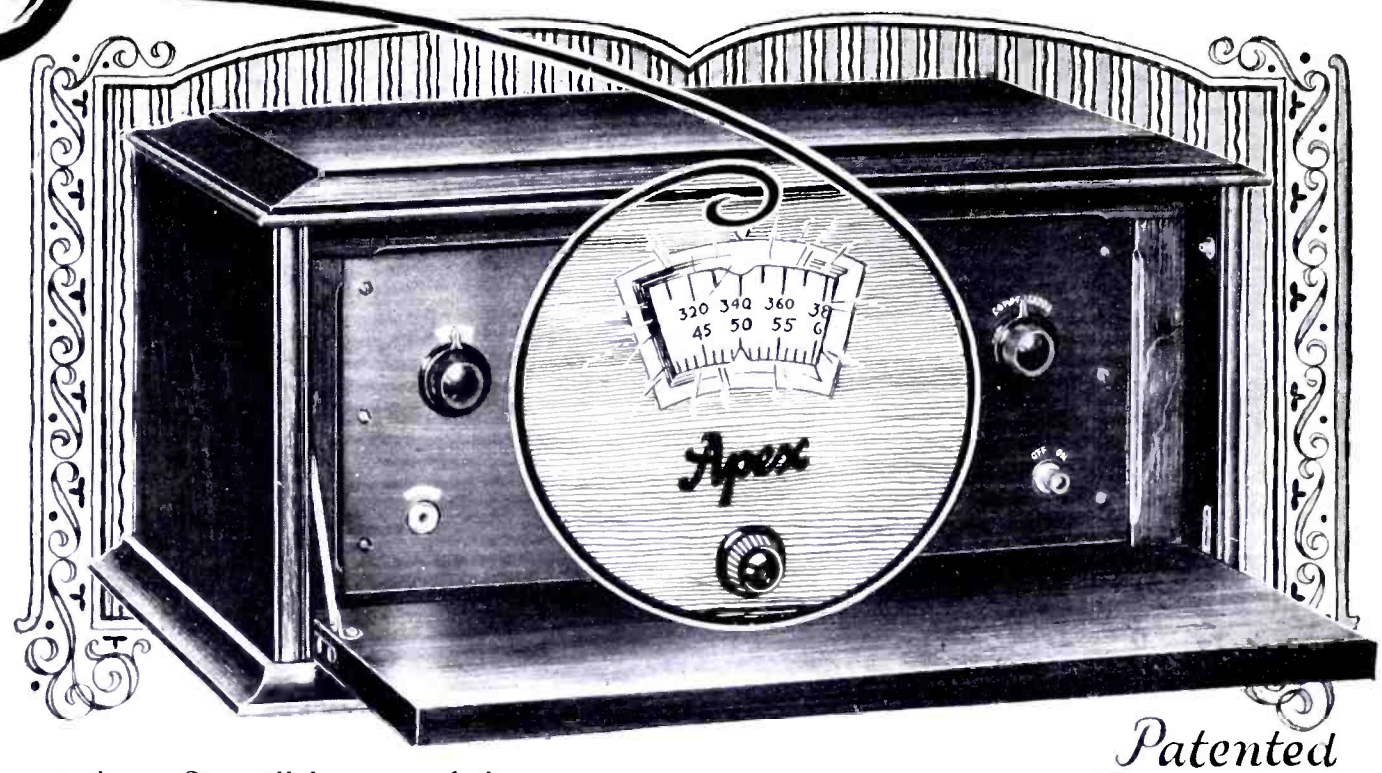
The matchless beauty of the Thorola Bakelite bell and Classic base, is why thousands will actually have no other type of speaker. Thorola 4 performance, made possible by double "push-pull" amplification and other features is why this speaker is more than ever the leader of its type. Price..... $25.00

The Thorola Model 57, of the compact type, puts finest radio within the reach of all. Workmanship and finish is the same as in the luxurious console models. Performance is uncompromisingly Thorola!
Price..... $60.00



All prices slightly higher West of the Rockies

Just One



Patented Compensator

That the new Apex Six will be one of the most popular sets on the market this season and for many seasons to come—is a foregone conclusion.

Consider these important improvements: Patented Compensator (patented in 1924 and withheld from the market until its merits had been established beyond all question)—one dial control—impedance coupled—the entire sphere of radio at the command of the turn of a single dial—all distortion eliminated—automatic filament control.

This notable receiver is housed in furniture worthy of its quality and in combinations which enable you to acquire one of the most attractive sets ever designed at a small initial cost. You may purchase an Apex Receiving Set—and later on one of the handsome Apex Cabinets. For example—receiver No. 6 combined with cabinet No. 100 makes set No. 106.

Sixteen years of unimpeachable manufacturing activities vouch for the value of Apex products.

A demonstration of the new Apex Model Six will convince you of its superiority. Ask your dealer.

FROST-RADIO
Super-Variable Resistance

Two new **FROST-RADIO** units for controlling volume, tone, regeneration, grid bias, etc. These units have none of the objectionable features of wire wound types but have many new and exclusive advantages. They work smoothly and noiselessly and give any graduation of resistance from zero to maximum. Resistance element is designed for large current capacity. It will not overheat and when set the resistance does not vary. See these units today at your dealer's.

And finally —

"Here is the latest embodyment of all that is good in the Inverse Duplex System. I have spared no pains in making its quality of material, workmanship and performance the best. It justifies my years of study, research and accomplishment."

DAVID GRIMES

GRIMES OWN KIT

100% Shielded Inverse Duplex

TRUTH will out! The real rich values of the David Grimes Inverse Duplex System can be realized to their utmost only when quality parts, workmanship and design are present. Here is a master-made kit easily assembled into a master radio instrument that should last for a life-time.

The Grimes Own 5 Tube Storage Battery Kit (or the 4 Tube Dry Cell Kit) is built, sold and guaranteed by David Grimes. In addition each standard part is guaranteed by its own manufacturer, forming a double guarantee to the constructor. It is 100% shielded and when assembled, the finished aluminum castings form a sturdy artistic cabinet. The kit incorporates the latest improvements in the art, bringing the famous Inverse Duplex System to a point of utmost efficiency in selectivity, volume and tone. David Grimes has rightly called this kit his "own" because he is proud of it.

HIGHSPOTS

The Grimes Own is the only completely shielded kit set in existence. It is the first David Grimes Inverse Duplex Kit ever sold. It embodies three stages of radio, detector and three stages of audio frequency. Designed for power tube operation.

Connections furnished for loop or antenna.

Study These Parts With Care!

Two Samson Audio Transformers.
One Grimes special resistance coupling.
Five Benjamin non-microphonic UX sockets.
Three semi-straight line Lind vernier tuning condensers and coils.
One Grimes RF Choke Coil to equalize all wave-lengths.
One Grimes RF Fixed Transformer for added amplification and equalization.
One DeJur Rheostat.
One Electrad Potentiometer.
One drilled artistically etched black and gold metal panel, 7 x 18.
Grimes complete aluminum shielding cabinet.
One Grimes antenna switch.
Six Sangamo fixed condensers
Three Arthur Lynch Grid Leaks.
Three Grimes fixed filament resistances.
Acme flexible spaghetti wire in five colors.
Battery Cable.
Blueprints and instructions.

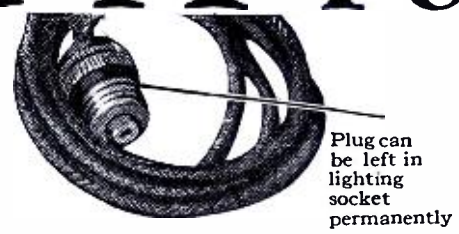
Selective Charging

A new feature in "A" Power Units

The Willard "A" Power Unit

& "B" Battery Charger



Here's an "A" Power Unit you don't have to worry about. It gives you trickle charging for ordinary use of your radio set, and there's a two ampere rate for emergencies.

The colored balls in the sight gauge inform you which rate is needed to keep its genuine Willard Threaded Rubber "A" Battery fully charged at all times. A double throw switch enables you to *select* this rate. Another switch serves to throw the "A" Battery on the set, or the unit on charge, while another takes care of recharging up to 96 volts of "B" Batteries.

WILLARD STORAGE BATTERY CO.

CLEVELAND, OHIO, U. S. A.

The Willard Selling Plan for Radio Dealers

Your local Willard Service Station will act as your jobber on Willard Radio Products.

This means a quick source of supply for strictly fresh material which you can turn over to your customers in the pink of condition.

Your local Willard Service Station also assumes the responsibility for service, if needed.

Months of operation have proved that this plan is effective, and profitable for all concerned.

Willard Radio Products will be advertised extensively this fall. Doubles and full-pages in The Saturday Evening Post and other leading publications.

Have your local Willard Service Station explain the details of this practical plan for advertising and selling radio products. The advertisements are signed:

Sales and Service through
The Willard Battery men
and their
Authorized Radio Dealers

Appropriate signs and window cards will identify you as an Authorized Dealer. Booklets and other valuable selling helps will be furnished.

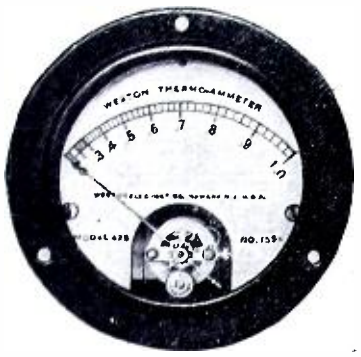
Your Nearest Willard Service Station is Your Nearest Willard Jobber

WESTON—*The Radio Authority*

INSTRUMENTS FOR RADIO MEASUREMENTS

As in every field of electrical endeavor, now, in Radio, Weston contributes the most accurate knowledge of measurement. The instruments Weston gives to this great new industry, make possible the great success of broadcasting and more pleasurable and more economical radio reception. ¶ Today, no broadcasting station could satisfactorily operate without electrical measuring instruments. ¶ Now, more than ever before, radio enthusiasts are learning that their radio sets cannot be expected to perform satisfactorily without instruments to control the voltage that safeguards tubes and prolongs battery life.

Transmission



Above—Weston Model 425 Thermo-couple type ammeter is an outstanding factor in the success of radio transmission. It is another of the famous line originated and developed by this corporation, which owns all controlling patents. This instrument eliminates entirely the many objections to the "hot wire expansion" type for the measurement of antennae currents—such as sluggish indications, zero shifts with consequent errors and lack of compensation against temperature changes. Weston Model 425 perfectly solves the problem of measuring High Frequency Currents. With equal facility it will measure A. C. of low frequency, and it is accurate on D. C., being a remarkable flexible instrument which may be checked on both A. C. and D. C.

Below Model 425 Thermo-galvanometer—a sensitive thermo-milliammeter of low resistance, especially designed for use in a wave meter circuit for the measurement of wave length and decrement. It is used for the measurement of high frequency resistances by the resistance and re-actance variation method having a large overload capacity.

You will be interested in a study of the free booklet "Weston Radio Instruments" which you can get by writing to us. It describes the various Weston instruments for radio work clearly so that it may be easily understood by both the amateur and the expert. The great manufacturers of receiving sets today know that the use of a control instrument on the panel of a radio set is the best device to protect themselves and their products. These instruments insure intelligent operation. Write us for the booklet describing them.

Reception

Of the many Weston instruments for improving radio reception and giving greater economy, the new Weston Model 506 "Pin-Jack" Voltmeter with High Range Stand is an especially valuable contribution. It is two instruments in one—a "Pin-Jack" Voltmeter and a High Range Stand. Just plug the "Pin-Jack" Voltmeter into the pin-jacks mounted on the panel and you can measure filament voltage—remove it—plug it into the High Range Stand and you have an instrument that will measure battery voltage up to 160 volts. The High Range Stand is equipped with a pair of 30-inch permanently attached flexible tinsel cables for battery testing or locating circuit troubles. ¶ This unique combination makes possible set operation at the proper filament voltage, gives better reception, makes tubes last longer and prolongs battery life. No operator of a good radio set should overlook the savings and the added pleasure he can get with his instrument.

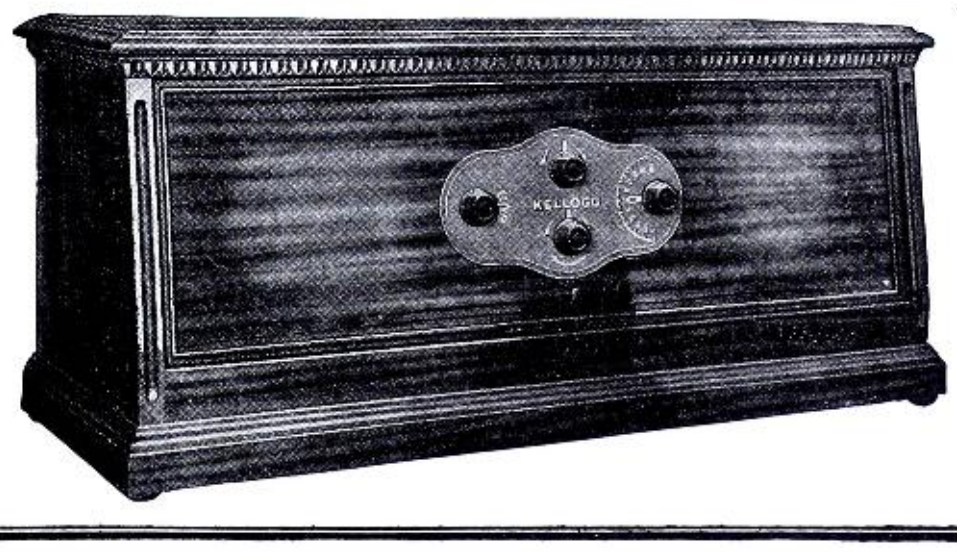
KELLOGG Radio

Flawless Reproduction



Licensed under application for letters patent of Radio Frenquency Laboratories, Inc. [R. F. L.]

Backed by 29 Years' Telephone Experience

Model 508 includes the apparatus of the table model and the famous Kellogg speaker, with ample space for all batteries or power supply units.

FLAWLESS, faultless radio reproduction such as Kellogg has attained can come from experience alone. In radio set building, nothing — absolutely nothing — matches experience.

Model 507 receiver is the finished result of our 29 years' experience in voice transmission — a set that cannot squeal or howl — that brings them in with a "punch" to delight the most critical radio fan.

Heavy shielding around and between the coils prevents interference, and three stages of radio frequency give maximum range and selectivity. Take our word for it — here's a receiver that's as perfect as can be made.

Mail this Coupon *Now* for full details of the new Kellogg 507 receiver with the refinements and improvements possible only from an experienced institution like Kellogg.

The New Balkite Charger
with both Trickle and high charging rates

MODEL J. Has two charging rates. A low trickle charge rate and a high rate for rapid charging. Can thus be used either as a trickle or as a high rate charger. Noiseless. Large water capacity. Rates: with 6-volt battery, 2.5 and .5 amperes: with 4-volt battery, .8 and .2 amperes. Special model for 25-40 cycles. Price $19.50. West of Rockies $20. (In Canada $27.50.)

Balkite Trickle Charger

MODEL K. With 6-volt "A" batteries can be left on continuous or trickle charge thus automatically keeping the battery at full power. With 4-volt batteries can be used as an intermittent charger. Or as a trickle charger if a resistance is added. Charging rate about .5 amperes. Price $10. West of Rockies $10.50. (In Canada $15.)

A New Balkite "B" at $27.50

Eliminates "B" batteries and supplies "B" current from the light socket. Three new models. Balkite "B"-W at $27.50 for sets of 5 tubes or less requiring 67 to 90 volts. Balkite "B"-X for sets of 8 tubes or less; capacity 30 milliamperes at 135 volts—$42. Balkite "B"-Y, for any radio set; capacity 40 milliamperes at 150 volts—$69. (In Canada: "B"-W $39; "B"-X $59.50; "B"-Y $96.)

Balkite Combination
supplies automatic radio power

When connected to your "A" battery supplies automatic power to both "A" and "B" circuits. Controlled by the filament switch on your set. Entirely automatic in operation. Can be put either near the set or in a remote location. Will serve any set now using either 4 or 6-volt "A" batteries and requiring not more than 30 milliamperes at 135 volts of "B" current—practically all sets of up to 8 tubes. Price $59.50. (In Canada $83.)

All Balkite Radio Power Units operate from 110-120 volt AC current with models for both 60 and 50 cycles.

Operate your radio set from the light socket

Either with a Balkite Charger and Balkite "B" or with the new Balkite Combination Radio Power Unit.

Now you can operate your radio set from the light socket. Merely by adding the new Balkite Radio Power Units—either by adding a Balkite Charger and Balkite "B," or by adding the new Balkite Combination Radio Power Unit.

In either case the result is the same—light socket operation, maximum convenience, and smooth silent power.

Balkite Light Socket Power is noiseless. There is no hum. It is never low and never runs down, but is always exactly what is required by the set. It is permanent. Balkite Radio Power Units are permanent pieces of equipment. They employ no bulbs, and have nothing to replace or renew. They cannot deteriorate from either use or disuse. Other than a negligible amount of household current their first cost is the last. With sets of high current requirements their use is highly desirable for the saving alone. They require no changes in your set.

Over 600,000 radio receivers—one of every ten—are already Balkite equipped. Equip yours with Balkite and convert it into a light socket receiver. Know the pleasure of owning a set always ready to operate at full power.

FANSTEEL

Balkite

Radio Power Units

Manufactured by FANSTEEL PRODUCTS COMPANY, INC., NORTH CHICAGO, ILLINOIS

KFKA Colorado State Teachers' College, Greeley, Colo. 273 meters, 1100 kilocycles, 100 watts, class A. Wed, 10 am, chapel exercises. (Schedules to be announced.) Mountain time.

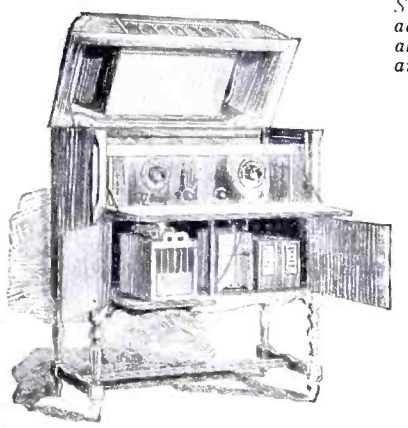
A Fine Piece of Furniture to Contain Your New Radio Set— or Your Old One

The Excello Radio Console embodies years of experience in fine cabinet making.

Console, Style No. R-23, with Bench to match

THIS Console is designed in three compartments, the tone chamber, the receiver compartment and the battery space. The tone chamber is of wood with metal throat for perfect tone production. The receiving set compartment has adjustable filler pieces to accommodate any panel not exceeding 10½" x 32". The battery space measures 14" x 32" and the A battery sets on a leaf which pulls forward for easier filling or testing. Matched wood door panels of Butt Walnut, two-tone effect.

Ask to see the Excello at your dealers or write for catalog.



Sketch showing accessibility of all parts of set and equipment

Distributors and dealers —attractive territory still open. Write for interesting proposition.

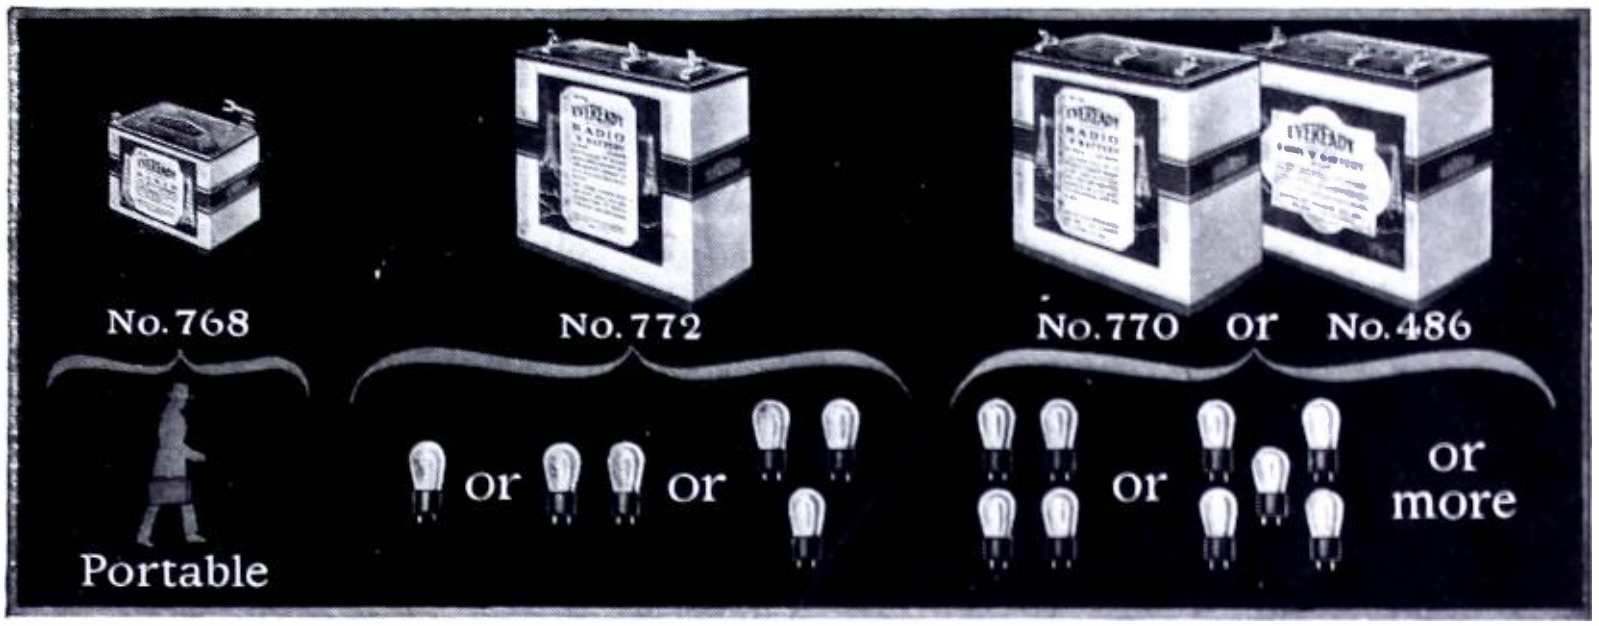
Thurs, 9:15-10:45 pm, dance program. Sun, 11 am-12:30 pm, 7:30-9 pm, church services. Mountain time. Slogan: "The Pike's Peak Station."

Perhaps you, too, can cut your "B" battery costs in half. Just follow the chart. It gives you the secret of "B" battery economy.



THOUSANDS of people have made the discovery that Eveready "B" Batteries, when used in the proper size, and on sets equipped with a "C" battery*, are a most economical, reliable and satisfactory source of radio current.

Here is the secret of "B" battery economy, reliability and satisfaction:

On all but single tube sets —Connect a "C" battery. The length of service given below is based on its use.*

On 1 to 3 tubes—Use Eveready No. 772. Listening in on the average of 2 hours daily, it will last a year or more.

On 4 or more tubes—Use the Heavy-Duty "B" Batteries, either No. 770 or the even longer-lived Eveready Layerbilt No. 486. Used on the average of 2 hours daily, these will last 8 months or longer.

These figures are based on the average use of receivers, which a country-wide survey has shown to be two hours daily throughout the year. If you listen longer, of course, your batteries will have a somewhat shorter life, and if you listen less, they will last longer.

Eveready's give you their remarkable service to the full only when they are correctly matched in capacity to the demands made upon them by your receiver. It is wasteful to buy batteries that are too small. Follow the chart.

In addition to the batteries illustrated, which fit practically all the receivers in use, we also make a number of other types for special purposes. There is an Eveready Radio Battery for every radio use. To learn more about the entire Eveready line, write for the booklet, "Choosing and Using the Right Radio Batteries," which we will be glad to send you on request. There is an Eveready dealer nearby.

Manufactured and guaranteed by

NATIONAL CARBON CO., Inc.
New York San Francisco

Canadian National Carbon Co., Limited
Toronto

*NOTE: A "C" battery greatly increases the life of your "B" batteries and gives a quality of reception unobtainable without it. Radio sets may easily be changed by any competent radio service man to permit the use of a "C" battery.

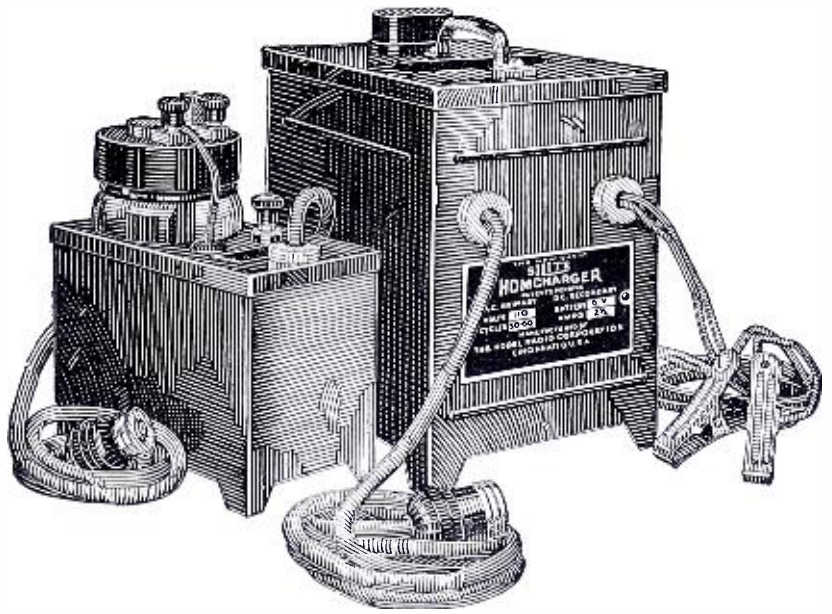
A-B & C Radio Power
from your light socket

SILITE

TRICKLE CHARGER

.6 ampere charging rate. Absolutely noiseless—no bulbs—makes a power unit of your battery.

$10.00



SILITE

HOMCHARGER

Charges at 2½-3 ampere. Absolutely noiseless—no bulbs—can be used while set is operated.

$19.50

Your battery troubles are over at last! Now ALL radio power is in your light socket, for ALL circuits, A, B, and C.

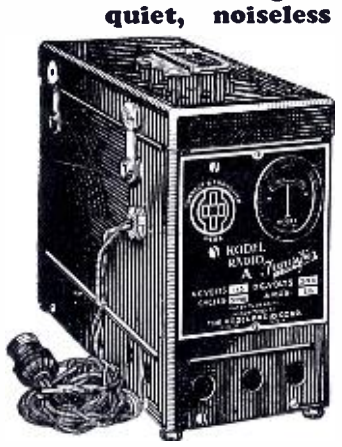
Silite, the marvelous new metallic glass rectifying element, provides perfect rectification of light socket current into "A" battery power. Leave the Silite Trickle Charger permanently connected to your storage battery and on charge—then forget battery charging forever. Silite Trickle makes a power unit of your battery—insures constant, never-failing "A" current that operates your set at highest efficiency. For very large sets, where a higher charging rate is necessary, Silite Homcharger is recommended. Either model may be used while the set is operated.

Kodel A&B Transifiers

Kodel A and B Transifiers actually supply all A, B, and C current direct from the light socket—no batteries of any kind are needed. Just plug the Transifiers into the wall socket and turn on your receiver—smooth, uniform A, B, and C power operates your set as it has never operated before. Watch the new life, new pep it gives your set—the longer range, the much greater volume. Transifiers give quiet, noiseless reception that was never before possible, even with fresh, new batteries.

Vastly different from and superior to the ordinary power units, Transifiers consume electric current only while you operate the set—maintenance cost is much less—it costs less than one-half cent for every hour the set is operated, for all A, B, and C power.

Ask any radio dealer to show you the Silite Chargers and Kodel Transfiers.



MODEL 10 "A" TRANSIFIER—Supplies 2, 4, or 6-volt "A" current direct from the light socket. For sets using up to 10 tubes $42.50

MODEL 10 "B" TRANSIFIER—22½ to 150 volts "B" current; 4 to 10 volts "C" current for any size set. Operates power tubes $42.50

MODEL 61 "B" TRANSIFIER—22½ to 90 volts noiseless "B" power for sets up to 6 tubes..... $28.50

(Bulbs extra)

"Behind the Scenes in a Broadcasting Station" an interesting 24-page booklet, will be mailed free on request, together with literature describing Silite Chargers and Kodel Transifiers.

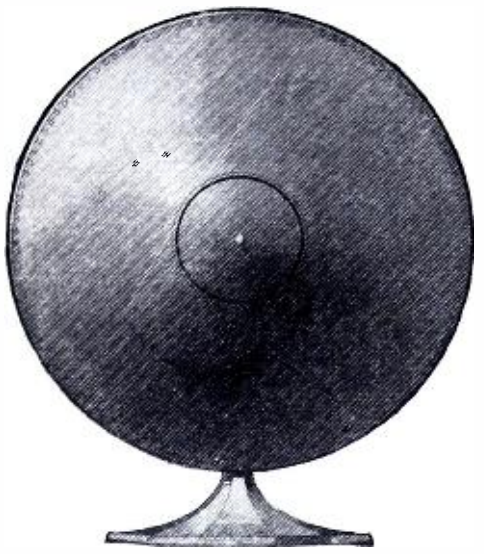
The Trimm Line is Ready

It is Complete—A Speaker For Every Purpose



The New Trimm Cone

It reproduces with true definition every instrument, every tone, every pitch of voice or instrument, throughout the entire scale of audible sound. It brings to radio the deeper and higher tones so frequently missing from radio amplification.

The Trimm Cone embodies an entirely new principle of vibratory transmission, here used for the first time. Unquestionably the last word in radio reproduction. This will be the season's biggest money maker for every retailer and jobber.

$16

More Advertising

The Trimm Sales and Advertising Program is as complete as the line. As always, The Trimm Line will be heavily advertised, to trade and public, local newspaper advertising placed when representation permits. Consumer demand and acceptance for Trimm Products, built up for years, will be still further increased.

The Trimm Line for 1926-27 offers as always a real opportunity for substantial, profitable Speaker Business. There is a Trimm Speaker particularly suited to every set, a complete line of all accepted types—at prices to meet the wishes of all buyers.

Better Values Than Ever

Since the beginning of this business Trimm Speakers have been noted as outstanding values—giving the radio user more for his dollar than he could possibly get elsewhere, yet always and at all times returning to the trade, wholesale and retail, a satisfactory and substantial margin of profit. This year Trimm Speakers, refined and still more improved, are greater values than ever and your profit is assured.

Trimm Policies Protect You

The Trimm Policies of providing adequate distribution and stocks advantageously located, makes overloading unnecessary and Trimm control on current stocks and production assures maintenance of dealers' profits and the complete elimination of any possibilty of Factory dumping.

A lifetime guarantee on our products, full dealer support and a fair and square deal for trade and public, make Trimm Speakers easiest to sell and keep sold.

Let us send you full information as to our line, prices, policies and sales program. It will pay you. Write us today.

HEADSETS

Professional	$5.50
Dependable	4.40

PHONODAPTERS

Giant Unit	$10.00
Little Wonder	4.50

SPEAKERS

Trimm Cone	$16.00
Concert	25.00

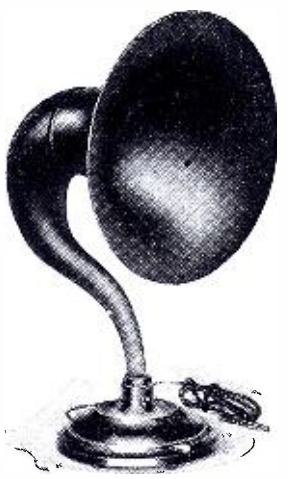
Home Speaker	10.00

(Prices slightly higher west of Rocky Mountains)

Trimm Concert

The leading high grade horn reproducer, still further refined and improved for this season. Extra large diaphragm. Reproduces faithfully and with tremendous volume and beautiful tone every note of voice or instrument. No finer Horn Type Radio Reproducer has ever been made. Volconite Horn, 22 inches high—15 inch bell. Famous Trimm Adjustment for tone and volume.

$25



Trimm Entertainer

Slightly smaller than the Trimm Concert, a quality reproducer medium priced. Also has Volconite Horn, goose neck type, stands 19½ inches high, 12 inch bell. Large diaphragm gives marvelous sweet, full musical tone and wonderful volume. Trimm Lever Adjustment for tone and volume.

$17.50

Trimm Homespeaker

The most popular low priced goose neck speaker ever produced. Tens of thousands in use and every user pleased. It out-performs speakers selling at prices twice or more the price of Homespeaker. Big volume, fine tone—a thoroughly satisfactory speaker at a wonderful price. Stands 18 inches high, has 12 inch bell, real Volconite Horn. Factory adjusted unit, no blasting, distortion or false tones. You can make money on this one.

A Low-Priced But High Grade Cabinet

MADE BY

THE SOUTHERN TOY COMPANY, Inc.

HICKORY, NORTH CAROLINA

N. Eng. 6.
ADDRESS BUREAU OF ENGINEERING NAVY DEPARTMENT
AND REFER TO No

NAVY DEPARTMENT,
ENCLOSURES BUREAU OF ENGINEERING,
WASHINGTON, D C.

16 November 1925.

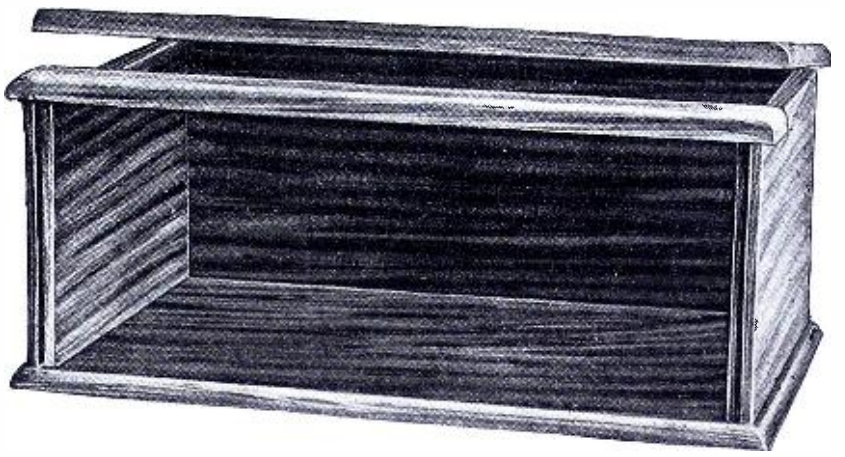
Southern Toy Company,
Hickory, N. C.

Gentlemen:-

It is a pleasure indeed to send the enclosed check in amount of $5.50 as payment in full for the two cabinets which you forwarded with such promptness. The cabinets were entirely satisfactory and received such favorable comment from those who inspected them in this office, that you may expect some additional orders in the near future.* * * *

Signed_____
(name on request)

We challenge anyone to show us as good at such a low price. Sold direct to you. No jobber's or dealer's profits for you to pay—(the jobber usually gets 15% and the dealer from 30% to 50%—you save all this).

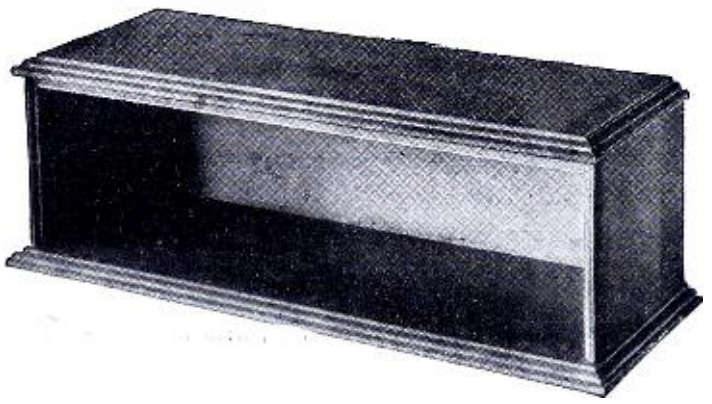


"PIEDMONT"

A new way to sell cabinets. Your choice of our stock sizes at the same price. It is a little secret among manufacturers that there is only a few cents difference in the factory cost of different sizes of this type, and we are the first to discard the old way of pricing.

The price is very low and we will make only a few cents on each cabinet, **BUT WE EXPECT TO SELL A LARGE QUANTITY OF THEM.**

SPECIFICATIONS



"IVEYLINE"

Hardwood with mahogany finish. Three coats of the new lacquer finish and then rubbed down to a smooth, glossy, piano-like finish that is very hard and durable.

Nickel plated hinges—2.

Made only in the following sizes and mahogany finish:

7"x18"x10" deep
7"x21"x10" deep
7"x24"x10" deep
7"x26"x10" deep

Your choice $2.65 ea., f.o.b. Hickory Cash with order. No C. O. D. at this price

Thousands of Set Builders Last Season Stopped Paying Fancy Prices and Bought Our Cabinets—Why Not You?

Shipped direct to you and you save jobber's and dealer's profits

Made in both hardwood, mahogany finish rubbed and solid walnut.
Lid splined both ends to prevent warping.
Nickeled piano hinge, full length.
Nickel lid support, fancy design.
Rubber anti-vibration feet.
The same cabinet that others charge double our price.

SIZES AND PRICES

	Hardwood Rubbed Mahogany Finish	Solid Black American Walnut
7x18x7½ or 10 in. deep	$3.50	$5.00
7x21x7½ or 10 in. deep	3.75	5.25
7x24x7½ or 10 in. deep	4.00	5.50
7x26x7½ or 10 in. deep	4.75	6.25
7x28x7½ or 10 in. deep	5.50	7.00
7x30x7½ or 10 in. deep	6.00	8.00

REMEMBER that we give each cabinet two coats of fine varnish over shellac and then rub to a smooth, glossy finish.

FREE with each cabinet a ½-inch non-warping BASEBOARD. Cabinets are rabetted for 3/16, panel. Panel is screwed to both ends and top of cabinet, making a strong, rigid job. If your panel is less than 3/16, back it up with cardboard until it is flush.

PHONE PLUG. Add only 20 cents for an "E-Z" plug, one of the best on the market.

CASH WITH ORDER or C. O. D. if half price is sent with order. We ship by express as it is usually cheaper and the Express Company is responsible for any damage in transit.

Now Owns a Radio Store

"The Radio business is rushing just now. Building many Super Heterodynes, also doing installation and repairing. To your course I owe all my success in the Radio profession." A. J. Ommodt, Bowman, N. Dak.

Controls First Car by Radio

"I operate the portable broadcasting station in rear car, driving front car by Radio control. Will operate this car from New York to Frisco—13 months trip. Then we take the car around the world—a three years' tour. I owe it all to you." Leo Paul, New York City.

You Can Do What These Men Did!

I Will Train You at Home to Fill a Big-Pay Radio Job

Get into the great new Big-pay Industry—Radio. If you're earning a penny less than $50 a week, clip coupon now. Send for AMAZING FREE BOOK, "Rich Rewards in Radio." Why go along at $25 or $35 or $45 a week, when you could earn $50 to $250 in the same six days, as a Radio Expert? Hundreds of N. R. I. trained men are doing it—why can't you? I'll train you just as I trained them—just as I trained the men whose letters you see on this page. I'll teach you quickly at home in your spare time to be a Radio Expert, and draw down big money for the easiest and most fascinating work in the world.

HERE'S WORK THAT IS ALMOST ROMANCE!

$50 to $250 a Week as a RADIO EXPERT

It's the trained man, the Radio Expert, who gets the big jobs of this profession—paying $75, $100, $200 a week and up. Free book gives all the facts. Every day N.R.I. trained men are taking good places in the Radio field—men like you—men like those whose stories I show you here. You can prepare just as they did by new practical methods, learn right at home in your spare time. Lack of experience no drawback—common schooling all you need. Our tested clear methods make it easy for you. We guarantee to train you successfully. Big Free Book contains all the proof.

Read the true stories printed in this border—of men who got out of the rut

Chief Engineer Station WEMC

"Please communicate with my two junior operators here who want to increase their knowledge of Radio. Being a graduate of your course I know they could do nothing better for themselves than study it for it is the way to success in this profession." John E. Fetzer, Chief Engineer, Station WEMC, Berrien Springs, Michigan.

Photo shows Graduate E. F. Spadoni in his own Radio store at Chicago, Ill. "Your course gets the credit," says Spadoni.

These Instruments Given FREE of Extra Cost

All instruments shown here and others sent to all my students free of extra cost under short time special offer. Clip coupon now—find out all about this big unequalled offer while you still have time to take advantage of it. This training is intensely practical—these instruments help you do the practical work.

My Radio Training is the "Famous Course That Pays for Itself"

Make more money quick when you take up this practical course.

I show you how to increase your earnings almost from the start of your course through practical pointers I give you.

Howard B. Luce of Friedens, Pa., made $320 in 7 weeks during his spare time. D. H. Suitt of Newport, Ark., writes "While taking the course I earned in spare time work approximately $900." Earl Wright of Omaha reports making $400 in a short time while taking his course—working at Radio in his spare time only! Sylvester Senso, 207 Elm St., Kaukana, Wis., made $500. These records not unusual—these men are a few of hundreds.

And when you graduate, my big Free Employment Department helps you get the job. You get just the same preparation and assistance toward success we gave C. C. Gielow, Chief Operator of the Great Lakes Radio Telegraph Co., E. W. Novy, Chief Operator of Station WRNY, Erle Chambers, Radio Engineer for Stewart-Warner, J. E. Fetzer, Chief Engineer of Station WEMC. The National Radio Institute, established 1914, today offers you the same opportunity these men had under a bond that guarantees you full satisfaction or money refunded. It's your big chance to get into the great Radio field—mail coupon TODAY for my big Free Book and proof!

$70 in one Day for T. M. Wilcox

"I am in business for myself and recently made $70 in one day. I was an electrician of rich experience and was occupying a splendid position as telephone superintendent when I enrolled with your course believing it would open up greater opportunities—have not been disappointed. Estimate that Radio will be worth tens of thousands of dollars to me in the next few years." T. M. Wilcox, Belle Island, Newfoundland.

do you want a *new thrill* from *radio* " " " "

Give that set of yours the power it needs—power for any variation in tone. Then you'll have a new appreciation of radio. You will have one delightful program after another—summer evenings—winter evenings—***all the time!*** That's when your set is equipped with Majestic "B" Current Supply. Your set seems ***alive*** with marvelous energy. You sense a new joy in radio.

And it is an easy matter to obtain this power. You can get it direct from your light socket, if you use Majestic "B" Current Supply. You can get ***clean, constant, dependable*** power—all without fuss or worry. No acids. No "hum." You at last can be free of the most bothersome mechanics of radio!

Majestic "B" Current Supply

delivers pure direct current From your light socket

All the Majestic "B" Current Supply units are manufactured complete in our factory and are equipped with the famous Raytheon Tube (endorsed by numerous radio engineers and editors) which is a non-filament tube with full wave rectification, no acids or back surge. Tests of the Majestic "B" on the oscillograph demonstrate that all A-C hum is entirely eliminated.

GO TO THE DEALER FROM WHOM YOU BOUGHT YOUR SET or any other reliable dealer and get a Majestic "B" Current Supply.

Attach it to your set. If you are not fully satisfied your money will be refunded by your dealer. Fully guaranteed. Its low purchase cost and the saving it will mean to you in just a short time makes it an investment that soon pays for itself.

The new model—the Master-B, is especially adapted for sets not only using the regular power tubes UV-112 or UV-120, but also for the new super power tubes UV-171 requiring 180 volts. Unequalled for sets having a very heavy current draw. These three models will take care of practically ***any*** set on the market.

Don't delay — see your dealer at once or write us for free booklet.

GRIGSBY-GRUNOW-HINDS COMPANY

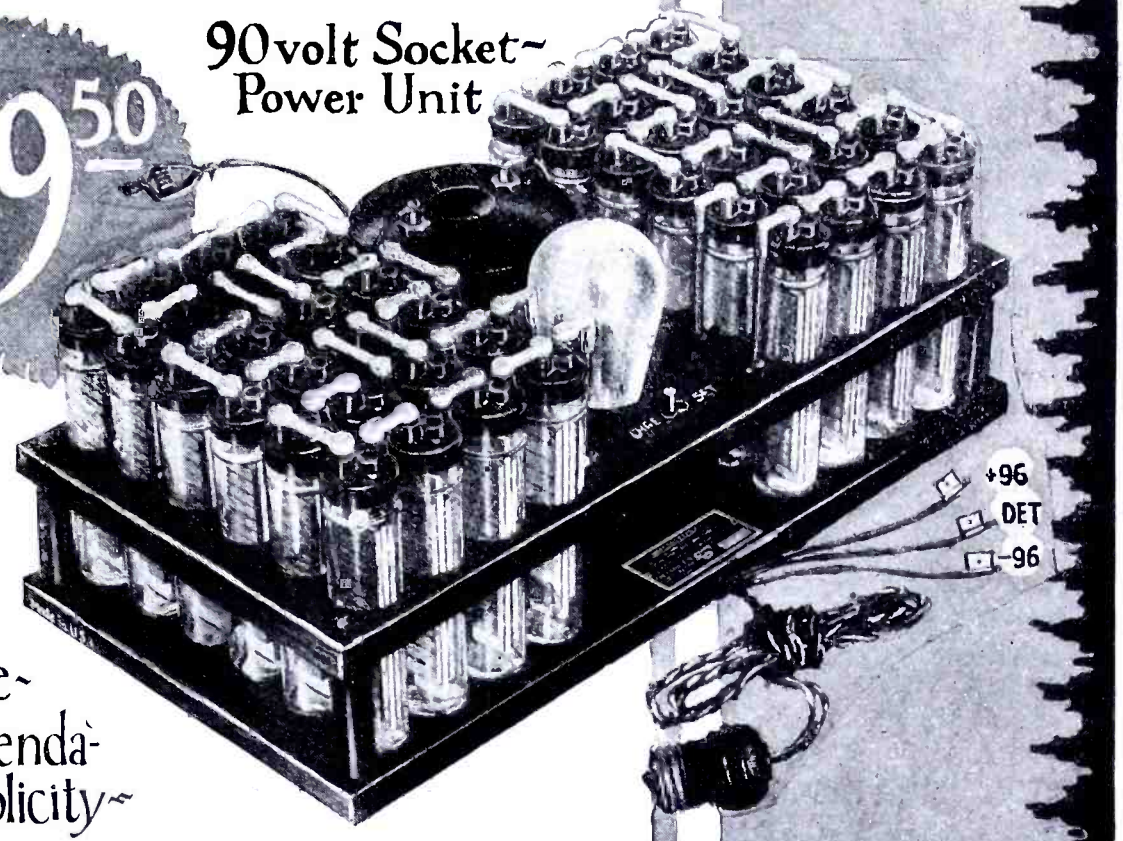
Fulfillment of every wish~

$29.50

90 volt Socket~ Power Unit



for
..economy~
..convenience~
..“B” power dependability *and* simplicity~

Good reception is not possible unless one has constant and efficient "B" power supply.

The indirect socket power principle is the efficient answer to perfect reception.

A. C. hum, line surges and dry battery static are positively eliminated in the Graynie because a perfect direct B current is taken from a stored supply altho unit is permanently connected to the house current. The mere throwing of a switch at convenient intervals, replaces the current used.

The unit frame constructed of steel has rubber feet and is beautifully finished in Duco.

A cabinet which completely encloses the unit and makes it conveniently portable can be furnished at an extra cost of $3.75.

The convenient Storage "B" battery

The Graynie single unit storage battery requires less space than dry cells and charging at intervals of approximately one month is simply accomplished in the same manner as the charging of an "A" battery. The Graynie battery is constructed with extra heavy glass cells with patented brown glazed porcelain tops. The special design of the cells and cell tops positively assure a clean battery even after years of service.

The cells are firmly and positively supported with a Duco finished steel frame. Water need be added only at intervals of about three months.

This unit is built in two sizes, 90 volts listing at $19.85, and 135 volts listing at $32.50.

All Graynie B units are guaranteed for two years.

Be sure to specify GRAYNIE when purchasing devices for "B" current. Your dealer has them or will glaldly order them.

$19.85 90 volts

What I would do if I wanted more money

By J. MATHESON BELL

FIRST of all I'd make up my mind definitely that I was going to get it.

I don't believe any man living can get things worth while without ***firmly believing*** that he can. Determination will conquer failure anytime, anywhere.

"Busted" and Blue

I'll work harder on my present job to make the boss feel that he owes me more.

But I won't stop there.

I'll put my spare time to work.

I'll quit losing money by making my evenings pay.

I wouldn't give up my present job but I'd make more money by working longer hours.

I'd find something that could be sold evenings, either in my home or some one else's home.

That something would have to be a little out of the ordinary because it would have to be of special interest in the evening.

That would be the time of day when both the man and his wife are at home so I'd find something that would be of interest to both of them.

Decides to Work Harder

I feel sure that such an article would have to be something for the home, something they would both use and enjoy.

So far so good, but what will that something be.

Piano?

Fine, but come to think of it I can't even play one myself so that's out.

Automobile—

Sounds better, guess I could learn how, but seems to me that everybody I know has one. At any rate the auto sounds good—let's see if there is anything better.

Phonograph—

Doesn't sound near so good as the auto.

Vacuum Sweeper—

How Can I Make More?

Not so much interest to the man and I don't see just how I'd show up dust at night.

Radio—

Why, the Sam Hill didn't I think of that before, but let's see if it will do—let's see what its good points are as well as its bad ones.

True—I don't know anything about radio, but I have lots of friends who have learned something about it, so I think I could. What sounds good to me is, that I can demonstrate in the home in the evening, the very time of the day for me, and that's just when all the music is being broadcasted.

I'll have competition. I expect it. I'll have to know just what my demonstration will do that the other fellow's won't, so lets see what would make the biggest appeal.

Thinks Hard!

Of course, they would be impressed with music from our nearby stations but I feel sure that if I bring in great distances they will be more impressed. It will have to bring in music loud enough so they can sit away back in the room and enjoy it. It must have volume.

They may be satisfied with music from nearby stations, but they'll ask me for distance, so I must be able to get "by" our powerful nearby station. The radio I want must be selective so I can tune out our nearby station if I desire.

I can picture myself in some prospect's home with a radio that will do that, but I wonder if that is enough—maybe my competitor will be there also—maybe he can do all those things as well as I can.

Then where am I?

I've got it—I'll tell you what my radio must do—I want one that my prospect can do all the tuning, so that ***he*** will get the thrill of bringing in the music from a distance ***clear*** and ***loud*** and with a tone that will please.

After all he is the one who is going to operate it, so why wouldn't it be better and best if all he had to do was sell himself. I'll admit I'm not much of a salesman, so if I find a radio that will sell itself then I'll not only whip competition but I'll do it easily.

Gets An Idea—

Best of all, I'll make that extra money I want.

Who knows, I may be so successful at it that I can give up my present job and give it all my time—Gee that sounds too good to be true, but other men have done it so why can't I—I can and I will.

But what radio can I sell that will do what I want and yet sell at a reasonable price—I don't want one so high that my people can't buy—but it must be a good one.

Then when I do sell it, they will want me to fix anything that goes wrong so somebody must teach me how to service radio—that's something I can't afford to overlook.

Where is such a radio?

Where is a manufacturer who will teach me how to sell and how to demonstrate—where I can learn this business, both selling and servicing radio — there must be someone.

Writes to Mr. Bell

There is—Ozarka Incorporated of Chicago—the sign of the long distance goose—they have a 64-page book "The Ozarka Plan" which they will send me if I tell them about myself and mention the name of my county. Where is my pen and some paper? I'm going to make ***more money*** and I'm going to start ***right now*** by writing for this book.

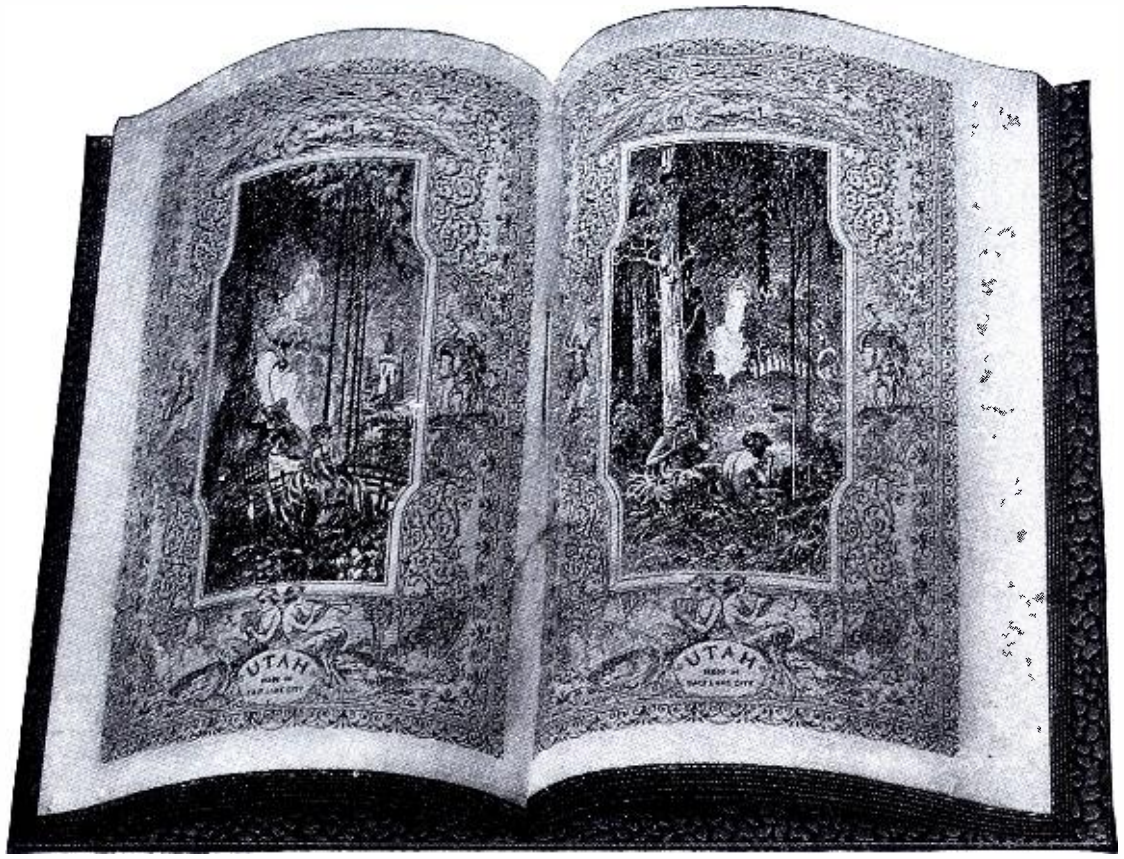
The UTAH Book
Sensation of 1926

$19 **$19**



The Open Book of Radio

TRY a UTAH Book Speaker, the newest Radio development. Looks like an open book—ornamental, efficient. If it does not produce clearer reception than any other speaker using same kind of construction in diaphragm regardless of price, return it and your money will be cheerfully refunded. Has greater tone range than any other speaker using the paper diaphragm. Brings out all low tones as well as high tones. Stands strongest amplification without blasting or distortion. Ask your dealer about the Utah line — sold on the unconditional Utah guarantee.

GUARANTEE
Buy a **Utah** and use it for two weeks. Compare its tone with the best the others are able to produce. **If the Utah does not give better reception** return it to your dealer and **he will refund your money.**

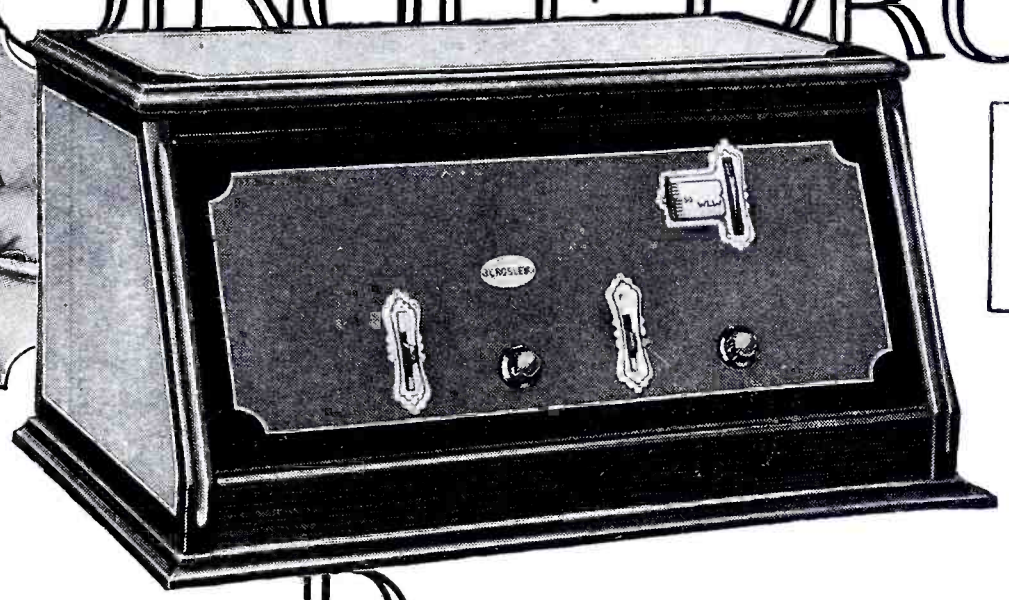
5 tube SINGLE DRUM STATION SELECTOR RADIO RECEIVER



6 Other Crosley Radio Achievements

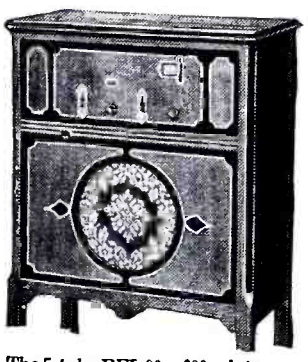
The Crosley 1-tube "Pup"—$9.75—a double-circuit set, with which laymen have heard radio signals probably the greatest distances.

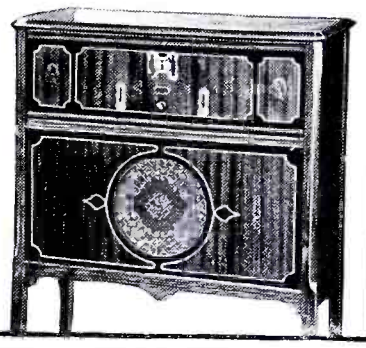
The 4-tube 4-29—$29—a 4-tube receiver of amazing efficiency. Already proven its right to a permanent position in the Crosley line. CRESCENDON equipped!

The 5-tube 5-38—$38. The 5-tube tuned radio frequency set incorporating the CRESCENDON—a spectacularly popular model.

The 5-tube RFL 75—$65—true cascade amplification: non-oscillating—non-radiating, regardless of how it may be mishandled.

The 5-tube 5-75—$75—embodying the 5-tube single control, with drum station selector, as offered in a table model at $50. SOLID MAHOGANY cabinet. Musicone built-in—41 inches high.



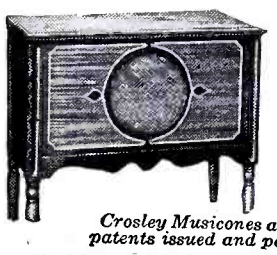


The 5-tube RFL 90—$90—introducing the double drum station selector! Solid mahogany cabinet. Musicone built-in—ample room for batteries and all accessories, 41 inches high, 30 1-2 inches wide.

Prices slightly higher West of the Rockies.

Crosley manufactures radio receiving sets which are licensed under Armstrong U. S. Patent No. 1,113,149 or, under patent applications of Radio Frequency Laboratories, Inc., and other patents issued and pending.

The CROSLEY MUSICONES



The announcement of the new Super-Musicone is predicated on the success of the Regular (12 inch cone) Crosley Musicone in replacing hundreds of thousands of old type loud speakers. **Musicone Regular 12 inch cone $12.50. Super-Musicone 16 inch cone $14.75. Musiconsole with built in Musicone $32.00.**

Crosley Musicones are manufactured under basic patents issued and pending, controlled by Crosley.

$50.

Contrast the surpassing performance of this new type of Crosley Radio with what has hitherto been considered radio perfection.

The cabinet is solid mahogany, beautifully finished in two-tone and striped in gold. Metal fittings are rose gold finish.

The metal shielded chassis is divided into three compartments. The units shielded from each other, prevent interstage as well as external coupling. This improves stability of circuit and increases selectivity. This has never before been offered in sets of moderate price.

Crescendon Control affords unusual volume from distant stations.

Heretofore single dial control sacrificed selectivity. By means of the Acuminators, very sharp tuning is accomplished where the reception from local stations spreads broadly over the dial. Under average conditions, when once adjusted, these acuminators do not have to be touched again.

With the Graphic Station Selector, Stations from one end of the wave band to the other, are easily brought in at all times—IN THE SAME PLACE.

BE A RADIO EXPERT!

The Opportunity of a Lifetime

Amazing money-making possibilities—Big Salaries—fortunes and independence await wide-awake, ambitious men entering the Radio field

Earn $3,000 to $10,000 a year

Everyone knows that the men who got in on the ground floor opportunities of the locomotive, the telephone, electricity, the automobile, moving pictures, etc., have been handsomely rewarded—many of them made millions. Now science contributes the greatest opportunity of the age—a discovery so marvelous and so easily within the means of all that even the humblest home seeks its possession and benefits.

From a business and money-making standpoint Radio fairly staggers the mind of anyone who gives it a moment's thought. Even men with little or no knowledge of its principles are making $3,000 to $10,000 a year. Radio is the fastest growing industry in the world. Everywhere people are crying for radios. Manufacturers are swamped with orders that cannot be filled. And yet anyone of average intelligence can learn at home in spare time how to construct, install, repair and sell dependable sets.

Train at Home in Three Months

If you are in a routine job with poor pay and no future, here is truly *the chance of a lifetime.* Don't miss it. In a few short months at home by mail we can make you an expert representative of our Association. Become the radio expert of your town or neighborhood. Find out how the Radio Association of America throws the doors of opportunity wide open for you. We will show you the way to swing big salary jobs or to get into business for yourself and be your own boss.

No Previous Experience Necessary

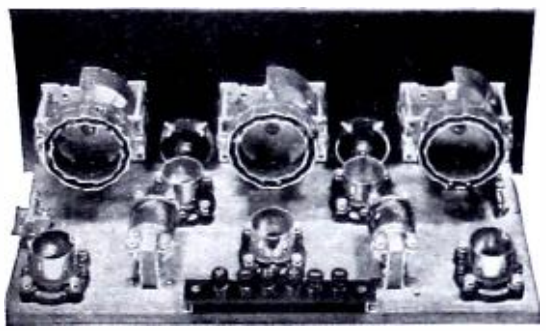
Get your share of the big money to be made in the most rapidly growing business of all time. Mail the coupon below for our big free book, which tells how in your spare time at home, without giving up your present position or losing a dollar of pay, you can become a thoroughly trained radio expert in a few short months.

No previous experience is necessary. For the man who prefers a salary, big pay jobs are waiting with the U. S. Government, Steamships, Railroads, and thousands of corporations and business houses. For the man who wants to start in business on a full or spare time basis, with little or no capital, grow and become independent, Radio offers an easy way to unlimited money-making opportunities. In no other line can ambitious men find an easier road to success.

You can train under one of America's leading Radio authorities. Read Mr. A. G. Mohaupt's offer to train you personally in everything about constructing, installing, repairing and selling Radio Sets and Accessories. By enrolling with us now, you get the benefit of the direct personal guidance of this well-known Radio expert.

A. G. MOHAUPT, B.A., M.S.
Head of the Radio Association of America, Graduate Electrical Engineer, University of Wisconsin, Former Radio Instructor for U. S. Government. Author of "Practice and Theory of Modern Radio."

"I give my personal attention to every student taking my course. Your individual problems and questions are answered by myself. I work with you at every stage of the course, guiding you, directing you to your goal to be a Radio Engineer in the big-pay class. My course prepares you to successfully pass Gov't examination for Operator's License."



FREE—FIVE-TUBE TUNED RADIO FREQUENCY KIT

This set when completed has a range of over 1,000 miles on the loud speaker. It is very selective and gives excellent tone quality. Given free to every member taking our course. The building of this set gives you excellent practical experience—it combines the theory of the course with actual practice. The set becomes yours, and you can sell it at a price that will practically pay the cost of your training. Write about it now.

Get the Facts—Mail Coupon

Our training is not only easy and interesting, and supplies knowledge you can always use in operating your own set, but is the most cashable knowledge a man can possess. Let us prove to you that there is nothing difficult about Radio—that any intelligent person can easily learn it right at home by mail under our simplified and approved methods. Mail the coupon now for our big, free Radio Book, which gives all the facts. Let us prove that Radio is easier to learn and offers bigger money than any other business or profession you can get into. Don't wait—act while our Free Ocer of a 1000-mile radio oufit is still in effect.

LAYOUT & WIRING DIAGRAM

HIGH QUALITY AUDIO AMPLIFER

RESISTANCE TRANSFORMER RESISTANCE WITH IMPEDANCE LEAK

ACME *for amplification*

The slogan "Acme for amplification" has become a promise that Acme can be depended upon for amplification without distortion. In the research laboratories here at Cambridge we have made countless experiments on audio amplification and the diagram above gives the latest results of these endeavors. This audio amplifier is of three stages, first resistance coupling, second transformer coupling and last resistance coupling with impedance leak. On account of the high B-voltages now in common use one of the objections to resistance amplification has been overcome but with the impedance leak the last objection has been swept aside. Without this leak rectification occurs in the amplifiers making all speech and music fuzzy and indistinct.

Power tubes such as the UX 171 can be very successfully used in the last stage of this amplifier and orchestra volume be obtained without the desire to turn it down.

Add this amplifier to any set after the detector and radio broadcasting will bring you new thrills, all the notes, tones, and inflections can be produced. You will then realize that after all, "How well you can hear" is the only thing that really counts.

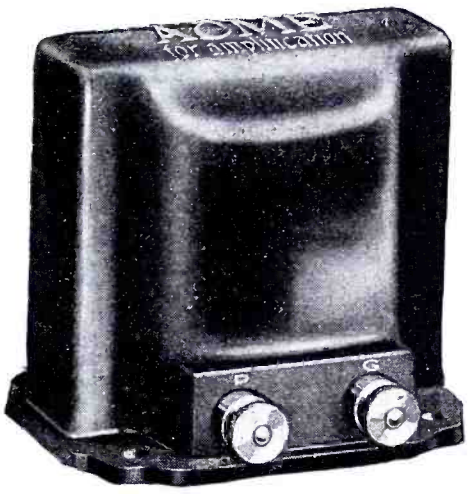
More amplification
—without distortion

With the Acme MA-2 transformer more amplification without distortion can be had than with any other transformer. This transformer is enclosed in a metal case and has a ratio of 5 to 1.

MA-2 A. F. Transformer.....$6.00
A-2 A. F. Transformer..... 3.00
Z-3 A. F. Resistance and Impedance.... 5.00

Many people are turning to Acme for amplification so that the extremely and extremely high frequencies can also be amplified. The Acme impedance amplifier shown is just right.

Z-2 Amplifying Impedance.....$4.50



Now! add "balloon tires and shock absorbers" to your own radio set

YOURS is probably one of the 5,000,000 radio sets that's passed its first birthday—maybe its second or third.

Like your old car, it's worth more to you in pleasure and value, than the price some one else would pay to buy it. And, like the old car, you hate to give up such a loyal old friend.

It really isn't necessary—less necessary than in the case of your car. Balloon tires and *real* shock absorbers have made your car ride as comfortable as any in the land. We can show you how to make your old set as free from noise and distortion as a church at 4 A. M.

Our method is that of "more amplification without distortion" (shown above).

Write for your copy of the 13th edition of "Amplification without Distortion," a little book written by a prominent radio engineer in non-technical, easily followed style. 500,000 friends of Acme have found the first twelve editions valuable—the thirteenth contains the facts on the newest methods of securing strong, clear radio reception—of eliminating causes of distortion. It describes in particular the new Acme amplification method, and in addition includes details of the new Acme free edge cone speakers and A, B and C power supply units (which can make your set a lamp socket receiver—overnight). Write your name on the margin of this page, and mail it with a dime, to cover costs of your copy, to Acme Apparatus Company, pioneer radio and transformer engineers and manufacturers, Dept. 07, Cambridge, Mass.

ACME *~for amplification*

WJAR The Outlet Company, 174 Weybosset St., Providence, R. I. 305.9 meters, 980 kilocycles, 500 watts, class B. Daily ex Sun, 1:05 pm, musical; 1:30, weather reports. BARKELEW
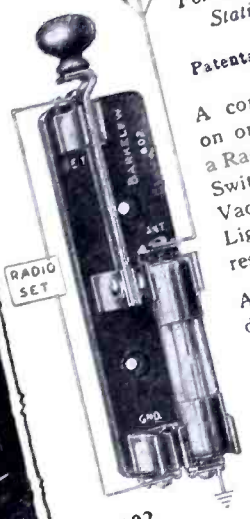
RADIO ACCESSORIES

LIGHTNING ARRESTER SWITCH
For Receiving Stations

Patents Pending



A combination on one base of a Radio Ground Switch and a Vacuum Tube Lightning Arrester.

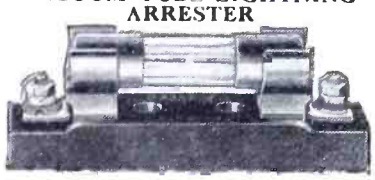
A distinctive device for those who know and demand the best lightning protection.

Price $2.50

No. 602

Approved by the Underwriters Laboratories.

VACUUM TUBE LIGHTNING ARRESTER



No. 606 **Price $1.50**

Required on the antenna of every Receiving Station. Approved by the Underwriters Laboratories.

GROUND SWITCH

No. 600 **Price $2.50**

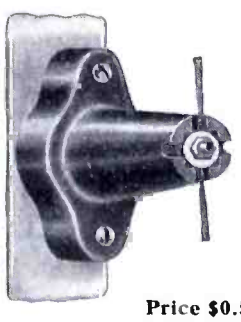
Required on all Transmitting Stations—Built of 60 Ampere Copper.

"LEAD-IN" INSULATOR
For Receiving Stations

No. 612 **Price $0.60**

Spaces the "Lead-In" Wire 5 inches out from the wall.

PORCELAIN PEDESTAL
Brown Glaze



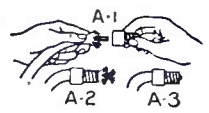
No. 611 **Price $0.50**

An insulator with a rigid clamp for the lead-in wire. A pedestal for spacing Ground Switches or other apparatus, 5 inches clear of the mounting surface.

Screw Grip
DONT SOLDER
Cord Tips!

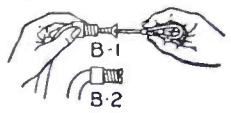
PATENTS PENDING

PIN TIP No. 630
Price 5c each



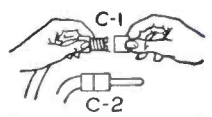
The Universal Sleeve "A" has an internal thread. Screw it on end of wire.

EYE TIP No. 631
Price 7½c each



Expose ¼" of bare wire. Insert wood screw "B" locking wire to sleeve.

FORK TIP No. 632
Price 7½c each



Screw on any of our standard Screw Grip Tips shown at left.

A cord tip that requires no solder, no wrapping of the insulation and no tools other than a pen knife and a small screw driver.

CONFIDENCE

THE annual increase in the number of dealers selling Barkelew Accessories expresses the confidence of the Radio Public in our product.

Special attention is called to the No. 605 Antenna Selector Switch and the Screw Grip Cord Tips. Both items were introduced late last year but will have their best run during the present season.

All radio material is packed in paper cartons and well labeled, making excellent shelf stock.

The design is good, materials are carefully selected and workmanship by skilled mechanics.

Prices and discounts are right for a fast moving line. This means a profitable stock.

For full description of each item, see our new Radio Catalog at your dealer. If he hasn't his copy, we have one for him.

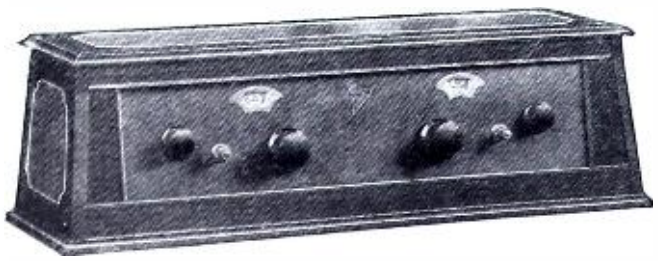
Sun, 11 am-12:30 pm, church services; 4-5:30 pm, church; 6:20-10:15, musical. Mon, Tues, Wed, Thurs, Fri & Sat, 6:45 am to 11 pm, varied. Eastern standard time. Slogan: "The Voice of the Capital."

WRCO Wynne Radio Co., Raleigh, N. C. 252 meters, 1190 kilocycles, 100 watts, class A. Sun, 10:45 am. Irregular programs at present. Eastern standard time.

WREC Wooten's Radio & Elec. Co., Coldwater, Miss. 254 meters, 1180 kilocycles, 10 watts, class A. Sat, 9:30-10:30 pm. Sun, 4-5 pm. Central standard time. Slogan: "The Most Powerful 10-Watt Station in the World."

WREO The Reo Motor Car Co., Lansing, Mich. 285.5 meters, 1050 kilocycles, 500 watts, class B. Daily ex Sun, 6-7 pm, 10 pm Tues, Thurs, 8:15-10 pm. Sat, 10-12 midnight. Sun, 10 am, chimes; 10:30 am & 7:30 pm, church. Eastern standard time. Slogan: "Watch Reo."

These Valley Units Mean Better Radio



The Valleytone Receiver
Model 52

Model 52 Valleytone Radio Receiver is a two-dial control, five-tube, tuned radio frequency receiver.

Employing the exclusive Valley Potential Balance method of suppressing oscillation and distortion, the Valleytone provides reception which is clear and mellow—free from the howls and squeaks and the thin, hard, metallic sounds which have been the plague of radio.

The tone quality of the Valleytone is indeed unusual, and so good that we welcome the opportunity to have it compared with any other receiver, regardless of price. The Valleytone thrives on comparison.

The true two-dial control of the Valleytone is so accurately assembled that the set can be tuned with precision and sharpness. The selectivity of the Valleytone is one of its best known features.

The Model 52 is equipped with an antenna control which is operated by the small switch on the left of the panel. With this control, super selectivity is possible among the stations on the lower wave lengths, and on the higher wave lengths, distance and volume are assured.

A striking feature of the Model 52 Valleytone is the provision for the use of a power tube in the last stage. A simple switching arrangement built into the set makes the use of the power tube optional. The change from regular to power tube or back again can be made in a moment at any time.

In appearance, the Valleytone is distinctly a step ahead. A beautiful panel contains the controls mounted symmetrically.

The two dials are set behind the panel. The dial readings show through art metal windows. Two large knobs, comfortable and satisfactory to the touch, turn the dials and condensers. Of the two smaller knobs, one controls the filament of the two radio frequency tubes and the detector. The other governs the volume control which may be set at any desired point. Two small switches complete the panel assembly. The loud speaker connection is made through the rear of the set.

The Valleytone is mounted in a solid walnut cabinet finished in two tones with inlaid narrow gold stripes.

Price .....$90.00 F.O.B. St. Louis

The Valley B Power Unit
(Raytheon Tube Type)

The Valley B Power Unit or B-Eliminator provides B voltage from the house lighting circuit, absolutely without hum.

This unit provides the plate voltage for all standard tubes such as the 201-A. It is also wired to provide the higher plate voltage necessary when a power tube is used in the second audio stage.

The unit is equipped with "high" and "low" taps to be used as follows: The "low" tap is plugged in for all ordinary five tube sets and smaller sets; the "high" tap is plugged in for sets using the power tube or for larger than five-tube sets.

Because the Raytheon Tube is essential to satisfactory operation. we have designed the Valley B Power Unit to use only this tube.

Mounted in a handsome black grained metal case. Toggle switch controls flow of line current into unit. Detector and Intermediate controls, marked "Det" and "Int", are mounted at the bottom. The terminal panel extends vertically at the left of the unit.

Price, Complete with Raytheon tube, $40.00 F.O.B. St. Louis

A Step Ahead in Radio

Not just to keep abreast of the times, but to keep a step ahead—that has been and is the ideal and policy of the Radio Division of the Valley Electric Company.

And this year, as in former years, that policy has produced improvements in Valley Radio products which constitute a distinct advance in radio.

The Valley Charger
(Type T.B.C.—Twin Bulb)

The new Valley Type TBC Charger embodies a new feature of bulb type charger design. The twin bulb construction overcomes the only objection to this type of charger, i.e., the slow charging rate.

The twin bulb design of this Valley Charger produces a charging rate of 5 amperes—about as high as the charging rate should be carried.

It has this added advantage: Where a charging rate of only 2½ amperes is satisfactory, only one bulb need be bought and used.

Simple. Absolutely noiseless. Minimum current draw. Indicating ammeter shows rate of charge. Black grained metal case.

Price, with bulbs, $15.00 F.O.B. St. Louis
Bulbs, $4.00 each

Valley Type ABC Charger

The universal vibrating type charger charges 6-volt A batteries at 6-ampere rate and 12-volt batteries at 3-ampere rate. Contact points are adjustable and can be replaced easily and cheaply.

The pioneer of radio battery chargers. The fundamental principles of this charger were in successful operation in Valley Chargers long before radio became popular. Now there are nearly a quarter of a million of them in use.

Price, complete, $19.50

The MODERN "B" Power Supply Solves Your Battery Problems!

MODERN
"B" Power Supply Unit will operate any receiver

MODERN
"B" Power Supply Unit is economical. It pays for itself

MODERN
"B" Power Supply Unit improves reception

MODERN
"B" Power Supply Unit is ideal for DX

MODERN
"B" Power Supply Unit is scientifically constructed

MODERN
"B" Power Supply Unit is unqualifiedly guaranteed

MODERN
"B" Power Supply Unit is bought on competitive tests

The Modern "B" Power Supply Unit was developed, tested, and perfected in our laboratories. It goes to you as a finished product. It is unqualifiedly guaranteed.

It will operate any receiver satisfactorily, even improving in most instances the tonal quality. All types and designs of receivers, from the "super" to the neutrodyne, have been operated from it. The four-tube Reflex, which is the stumbling block for the ordinary power supply unit, performed beyond all expectations from the Modern.

Ask your dealer to perform this test: Disconnect your ground and aerial; turn on your receiver; and then hold a Western Electric Speaker close to your ear. If your power supply unit is a Modern you will ***not*** be able to tell the difference; if your power supply unit is not a Modern you will perhaps hear a hum.

The Modern "B" Power Supply Unit can supply 150 volts, thereby permitting the use of the big power tubes. It has an extra 90-volt tap for radio frequency tubes. Optional connections are provided. The customary difficulties that beset the average power supply unit are totally absent from the Modern. Moisture seepage is prevented; electrical depreciation of the elements is completely overcome; each Modern "B" Power Supply Unit is thoroughly tested at 2,500 volts; and it is housed in an attractive, highly polished steel cabinet.

Furthermore, the Modern "B" Power Supply Unit is built by radio manufacturers of national reputation, manufacturers of standard equipment. List price, $50.00 west of the Rockies.

Ask your dealer or write direct for complete information.

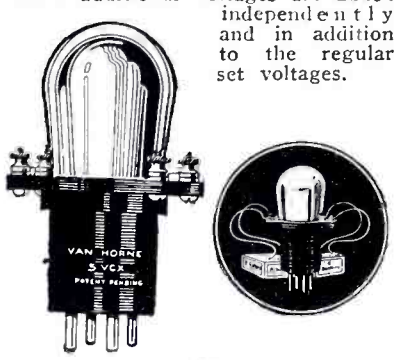
Van Horne Tubes are manufactured in both the Selected and Certified brands.

The Van Horne Certified tube is wrapped in a glassine wrapper and sealed. A characteristic curve sheet, covering the actual readings of the tube, being enclosed.

They are in a number of types for all receiving purposes, part of them being illustrated below.

*Adapted Mogul 5 VCX, 5 Volt .50 Ampere Audio Amplifier

To eliminate any necessity of changing set wiring the Mogul 5 VCX is equipped with a Patented Adapter to which additional voltages are added independently and in addition to the regular set voltages.



5 VC, 5 Volt .50 Ampere Audio Amplifier

This model is not equipped with the patented Van Horne Adapter found on the model 5 VCX.

It is designed for those receiving sets in which provision has been made in the circuit for the use of the power tube at extra voltages in the last audio stage.

5 VAX, 5 Volt, ¼ Ampere Detector Amplifier

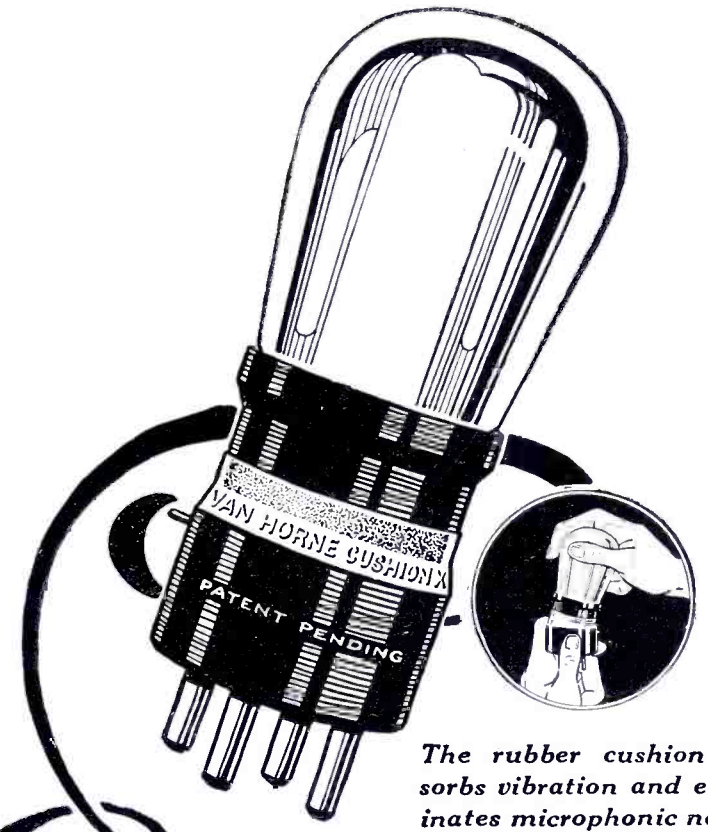
The improved manufacturing process, the use of patented thoriated wire and the precision and care with which this tube is made and tested makes it noticeably superior. Packed in both Selected and Certified Brands.

3 VBX Dry Cell Detector Amplifier

An unusually high reading dry cell tube due to the use of patented thoriated tungsten filament. Exceptionally satisfactory where volume with clearness and signal carrying capacity is desired.

NOTE

All Van Horne Tubes are Unconditionally Guaranteed.



The rubber cushion absorbs vibration and eliminates microphonic noises

Cushioned

to stop vibration— that's why the Cushion Base Tube makes such a wonderful improvement in reception

Knowing how much tube vibration impairs the tone quality of reception, fans everywhere are equipping their sets with Cushion Base tubes.*

Equip your set with Cushion Base tubes and note the surprising softness and fullness of tone of reception that follows the elimination of vibration. Order your set from your dealer today.

*These two unusual tubes, the Adapted Mogul 5 VCX Power tube and the Cushion Base tube, offer the greatest possible improvement in reception. They are manufactured exclusively by the Van Horne Company under patents pending to J. S. Van Horne.

For a great many years the Van Horne Company has manufactured vacuum products. The highly skilled workmanship that goes into every Van Horne tube is the result of years of experience and is one of the factors that make Van Horne tubes the highly efficient and dependable tubes that many thousands of users have found them to be. You are urged to become acquainted with the complete line of Van Horne Selected and Certified tubes. Your dealer will supply you with further information—or write for descriptive matter.

THE VAN HORNE COMPANY, Inc.

1000 CENTER STREET, FRANKLIN, OHIO

Steady "B" power without batteries

Pure full tone is possible only with "B" voltage kept constantly *up to standard;* All-American "Constant-B" *gives it to you*

YOU'VE had your "B" battery troubles; everybody has. Here's a permanent end to them—install an All-American "Constant-B," attach it to a light socket, and turn on the switch. You get a dependable, permanent supply of uniform, constant plate current; insuring full, pure tone.

There's no acid to ruin things; no annoying hum. And all inside units are permanently sealed against atmospheric conditions.

"Constant-B" has taps for 135, 90 and 67½ volts; and a 10 to 60 volt tap varied in output by a "Detector" control.

PRICE
$37.50
Complete with Raytheon Tube

The "High-low" switch insures uniform voltage, regardless of the number of tubes used; "Low" for 2 to 5 tube sets, "High" for sets with 6 tubes or more.

"Constant-B," after passing the highest laboratory tests, carries the seal of approval of the Popular Science Institute of Standards and other testing laboratories. It measures up in every way to All-American's high standards of painstaking workmanship and satisfying performance.

Descriptive folder and interesting booklet showing how to build a "B" Power Supply similar to "Constant-B" sent free on request. Specify bulletin B-82.

ALL-AMERICAN RADIO CORPORATION
4221 BELMONT AVE., CHICAGO, U. S. A.

Station WENR—266 *Meters—is owned and operated by the All-American Radio Corporation*

Tune them out and KEEP *them out with* Filtrola STATION ELIMINATOR

This attractive compact unit, complete in itself, makes it a simple matter to tune out interfering stations you don't want—even the most powerful. No tubes, batteries or other units to install. A typical All-American product in its precision and quality of workmanship.

Price $15

RADIO CELEBRITIES

SINCE its introduction over two years ago, extreme distance getting ability has always been associated with the name Browning-Drake, and the good-will of a hundred thousand Browning-Drake fans we consider our greatest asset.

The research at the Cruft laboratory of Harvard University, begun in the summer of 1923 by Glenn H. Browning and Frederick H Drake, has set the mathematical standard of design for radio frequency transformers and is universally recognized as the scientific authority on this most important subject, justly called the "heart of any circuit."

One stage of scientifically designed radio frequency, followed by tickler feedback detector and three stages of resistance-coupled audio has yet to be improved upon for range, selectivity and tone quality. Our research facilities are such that minor refinements are constantly being made without the necessity of yearly models becoming obsolete.

We produce one model, fairly priced, and handled by the highest grade dealers and jobbers. Consistent performance has produced country-wide confidence in the Browning-Drake name and its standards, with the knowledge that it represents a laboratory standard of development which will not be superseded or radically changed for many years.

For further information address the Browning-Drake Corporation, Brighton, Mass.

The
BROWNING-DRAKE FIVE

BROWNING-DRAKE

Jack Nelson, Announcer and Director of WJJD, Mooseheart, Ill. A native of Chicago; 28 years of age and married. Became famous as an announcer over WDAP. Mr. Nelson has also written a number of song hits

J. L. Fox, Announcer of KFH, Wichita, Kan. Formerly a musician and salesman of musical instruments. Native of Green, Kan. 37 and married

Franklin Ford, Announcer and Studio Manager of WHAP, N. Y. City. Native of Allegheny, Pa. Graduate of Princeton University of 1913. Formerly in the newspaper and advertising game. Is also a music composer and writer

Miss Vanna G. Patterson, Piano Soloist and accompanist of Station KFPW, Carterville, Mo. Known as "Pat." Formerly piano teacher. 20 years of age and single

George S. Carson, Jr. Announcer of KFQP, Iowa City, Iowa

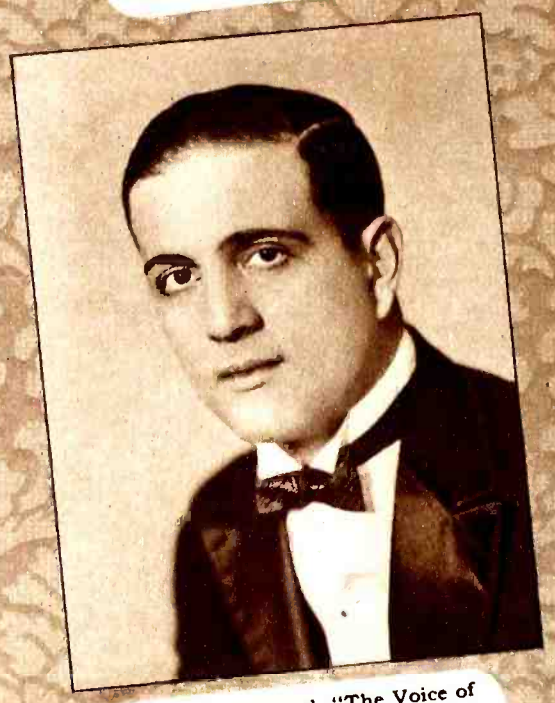
A. R. Meier, Announcer of KFQO, Russell, Kan. Known as "Marconi." Formerly motion picture operator. 22 and single

Edward P. Dempsey, Singer heard over WBCN, Chicago. Known as "The Chauncey Olcott of Radio." 34 and married

Edgar Harold Twamley, Announcer and Studio Director of WOC, Davenport, Iowa. Native of Dublin, Ireland. Thirty years of age and married. Formerly a newspaper man in China and the Far East

L. R. Tucker, Big Brother of KPO, San Francisco, Calif. Conducts an educational kids' hour which he originated three years ago. Previous to radio work was a sales manager. 34 years of age and single

C. Leonard Hoglund, Announcer and violinist of WCAL, Northfield, Minn. Member of St. Olaf String Quartet and the St. Olaf Symphony Orchestra. When not broadcasting, Mr. Hoglund is engaged in the banking business



C. G. Livengood, "The Voice of the Hoosier State," South Bend, Ind., Station WSBT. Was formerly a newspaper man. Age 34 and married. Identified with stations WGAZ & WSBT since 1923

G. Wm. Haverty, Announcer of WHDI, Minneapolis, Minn. Known as "Friday." Also instructor in Vocational School, Dunwoody Institute, 27 and single

Capt. Alfred Thomas, Jr., Engineer in Charge of KOA, Denver, Colo. Widely known as a veteran radio instructor, government inspector and ship operator. Favorite diversions are fishing and fancy dogs. Is married and has three children

Dr. Geo. W. Young, Owner of Station WDGY, Minneapolis, Minn. Is a jeweler and optometrist when he is not broadcasting. Formerly identified with Stations KFMT, WHAT and WGWY

Harry Everist Shultz, Baritone heard over Station KUOA, Univ. of Arkansas, Fayetteville, Ark. Native of Clinton, Ky. Has a wide experience as concert and recital singer. Educated in U. S. and Europe. Formerly connected with Stations WBAP, WFAA, KTHS

Robert Whitney, Announcer of WMAQ, Chicago, Ill. 22 years of age and single. Is also pianist and composer

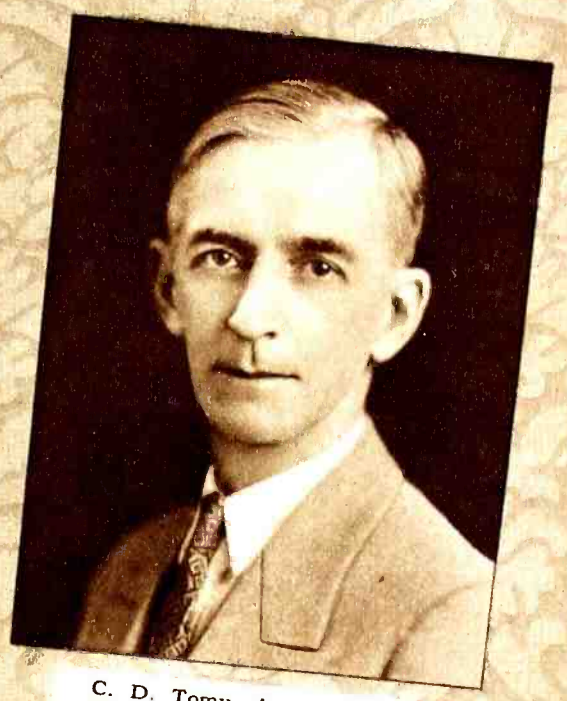
Richard V. Haller, Announcer and Station Director of KGW, Portland, Ore. Native of Wooster, Ohio. Formerly newspaper writer. 32 and married

G. B. Nichols, Spanish Announcer of KFDM, Beaumont, Tex. Known as "Static." Native of Chariton, Iowa. 49 and married

J. G. Cummings, Announcer of WOAI, San Antonio, Tex. Known as "Silent Joe." 40 and married

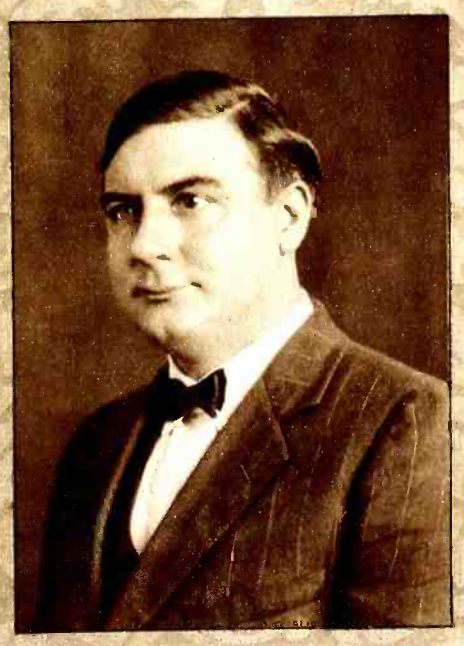
Dave Ablowich, Jr. Announcer and Program Director of Station KFPM, Greenville, Texas. Formerly connected with Station WOAF. 22 and married

Sydney Peck, Announcer and violinist of Station KSMR, Santa Maria, Calif. Native of Cleveland, O. Known as "Sir Syd." Also a writer and violin teacher



C. D. Tomy, Announcer of WCX, Detroit, Mich. Also organizer and Chief of Red Apple Club. Native of Fairfield, Iowa. Known as "The Chief." Formerly newspaper editor

Paul R. Heitmeyer, Announcer and Publicity Director of KGW, Portland, Ore. Formerly a commercial radio operator. 21 and married



Dirk Van Enmerik, Orchestra Director of Station WGHP, Detroit, Mich. Native of The Hague, Holland. Has been soloist with the Detroit Symphony Orchestra since 1920. Previously connected with well known European Orchestras. 40 years of age and married

Daniel Earl Noble, Announcer and Director of Station WCAC, Storrs, Conn. Student of the Conn. Agric. College. 24 and married

Forrest P. Wallace, Announcer and Assistant Program Director of Station WWJ, The Detroit News, Detroit, Mich. A native of Lansing, Mich. Formerly identified with stations WHAL and WABM. Served as radio operator in the World War. Married and 27 years of age

J. H. DePew, Announcer and Manager for WCBD, Shiloh Park, Zion, Ill. Is a native of Sherman, Texas. Previous to broadcasting he acted as Confidential Investigator for Gen. Geo. W. Goethals of Panama Canal

Howard E. Clark, Announcer and Station Manager for KQV, Doubleday-Hill El. Co., Pittsburgh, Pa. Twenty-five years of age and married. Known over the radio as "Howdy." Gave up a career as a newspaper and advertising man to take up broadcasting

Jack Perlman, Violinist regularly heard over Station WNAT, Philadelphia, Pa. A concert violinist of exceptional merit and leader of the Maze Cafe Dance Orchestra

Reuben A. Benson, Announcer and Banjo Soloist over WCAL, St. Olaf College Station, Northfield, Minn. Twenty-one years of age and a student. Known over the radio as "Ben"

Walter Hermann, 'Cellist with the U. S. Playing Card Station WSAI, Cincinnati, O. Native of Frankfort, Germany. Thirty-six years of age and married. Was conductor of Base Hospital Symphony Orchestra at Camp Sheridan, Ala. Makes guest appearances at WLW and WKRC

Charles D. Isaacson, Program Director for WRNY, N. Y. City. A native of Brooklyn. Was formerly a music critic and lecturer

Leatha Wenke, Announcer of Station WEMC, Berrien Springs, Mich. "The Radio Lighthouse"

Ernest Pack, Announcer of WSAI, Cincinnati, O. Thirty-nine years of age and single. Native of Prague, Czechoslovakia. Was formerly identified with Station WLW. Previously concert master of the Odessa City Opera, Russia

Linwood T. Pitman, Announcer and Manager of Station WCSH, Portland, Me. Was formerly a newspaper reporter. The first newspaper man to interview the around the world flyers on their landing on U. S. soil at Mere Point, Me.

Kenneth McCullough Fickett, Chief Announcer of Station WGR, Buffalo, N. Y. Native of Rochester, N.Y. He is "Pat" of the Radio Team of Pat and Moe 24 and single

James B. Jackson, Announcer and Soloist of WDAD, Nashville, Tenn. "Jimmy" is a native of Nashville and was formerly on the staff of WCBQ of that city. He was also Director and Pianist for the Tennessee Ramblers Orchestra. He is 19 years of age

Orville Andrews, who sings over KFAB, Lincoln, Neb. Is known as "The Buick Warbler." He is 22 years of age and to quote his own statement, "is married and happy." Before taking up broadcasting Mr. Andrews says, "Have been everything from a guide in Wisconsin and motion picture operator in Louisiana to gravedigging in a cemetery at Lincoln." Was formerly identified with station IFH

Dolph Thomas, Announcer and Director of Station KOIN, Portland, Ore. Has had years of experience and training as a singer and actor in light opera; also well fitted for radio work from a technical standpoint as he is a graduate in electrical engineering. President of the Portland Light Opera Association

Herbert B. Glover, Sports Announcer and Publicity Manager for Station WJZ, N. Y. City. Twenty-seven years of age and married. Formerly a writer. Was awarded the 1925 title by the Radio Voice Technique Committee as the best radio announcer for that year. Native of Brooklyn, N. Y.

Katherine E. Nelson, Assistant Announcer of Station WMC, Memphis, Tenn. Known as "Miss Kitty." Gives Home Economics lectures, in addition to announcing. Was formerly a stenographer

Wayne Myers, Announcer for WIBO, Chicago. Before taking up broadcasting was a salesman. Formerly with WEBH

Karl Scheurer, violinist of WCCO, Minneapolis, Minn. Native of Cologne, Germany. Formerly concert master of Minneapolis Symphony Orchestra, also head of violin Dept., of University of Minn.

auline Steffen Atlass of WBBM, Chicago, ho was formerly head of Violin Depart- ent of Southern College. Graduate of orthwestern University. Native of Kansas

Stan Lee, popular Announcer for WCAU, Philadelphia; 28 years of age and married. Before taking up broadcasting Mr. Lee was an actor

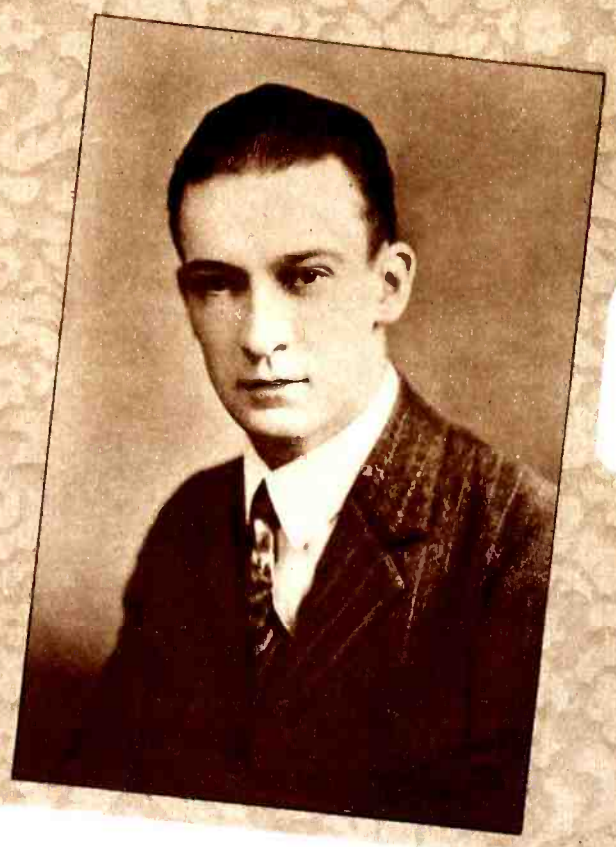
Miss Ina Rains, Soloist and Director of housewives' matinees over KOA, Denver, Colo. Miss Rains is the youngest church soloist in the Rocky Mountain West. She has a trace of Sioux Indian blood in her veins

Paul M. Oberg, Staff Pianist and Accompanist of WCCO, Minneapolis, Minn. Twenty-two years of age and single. Is also Church organist. Hobbies are tennis and golf

Kess B. Holeman, Announcer KSMR, Santa Maria, Calif. Formerly general manager of the Santa Maria Valley R. R. Also a newspaperman. Native of Smith Center, Kan. 47 and married

E. L. Tyson, Chief Announcer of WWJ, The Detroit News, Detroit, Mich. Native of Tyrone, Pa. Educated at Pennsylvania State College. Identified with college theatricals and later with local talent productions. Played semi-pro football and baseball for a number of years. Served in France and Belgium in the World War. "Ty" is 38 years of age and married

Luther J. Jensen, Chief Announcer, Studio and Program Director of KFOA, Seattle, Wash. Native of St. Paul, Minn. Formerly concert manager and press agent. 25 and married



Wilfred K. Bert, Announcer and Director of KFOA Seattle, wash. Also assistant radio editor of the Times. Native of San Francisco. Previous to radio work, he was radio instructor with U. S. Signal Corps in France. Known for clear enunciation of daily news bulletins. Remote control expert, arranging and announcing football and crew-race broadcasts

Miss Norma V. Carle, Pianist of WSVS, Buffalo, N. Y. Miss Carle is only 18 years of age and is studying piano with the intention of becoming a concert pianist. Formerly identified with stations WGR, WMAK, WEBR. Known over the radio as "Little Girl"

Allan N. Fairchild, Announcer of KNRC., L
Angeles. Calif. Native of New York. 37 years
age and married. Previous to broadcasting w
in the real estate business

Geo. W. Phillips, Minister of 10th Ave. Baptist Church, Oakland, Calif. Station KTAB. Native of Jamaica, West Indies. The church membership financed the building of Station KTAB and services are broadcasted every Sunday morning

Miss Helen Cutter, Soprano Soloist with KPO, San Francisco, Calif. She is a native of Meadville, Pa., and has been heard over Stations KFUU, KFWM, KTAB and KLX. 19 and single. Has also had some musical comedy and comic opera experience

Edward Ellingson, Tenor heard over KFAB, Lincoln, Neb. He is the "Eddie" half of the Harmony Boys "Gloomy and Eddie." 23 years of age and single. Native of Cambridge, Neb.

Mrs. Frederick Crowe, Program Director of Station KPO, San Francisco, Calif. Mrs. Crowe was formerly a concert pianist

Merton H. Bories, Pianist of KPO, San Francisco, Calif. Composer of popular songs. Native of Seattle, Wash. Formerly a realtor. 28 and single. Has been identified with all San Francisco Stations. Known as "Mert"

Edward James Ludes, Chief Announcer and Technical Director of Station KJBS, San Francisco, Calif. Native of Salina, Kan. Known as "Watts." Formerly connected with Stations KJQ, KFOB and KFRC. 21 and married

Dr. Frederick W. Pepper, Dentist in charge of the Health and Toothbrush Club of WHDI, Minneapolis, Minn. Native of Minneapolis, 47 years of age and single

Willard A. Darrow, Announcer and Violinist of Station WNAD, Norman, Okla. Is also a teacher of violin in the University of Oklahoma

Henry Field, Announcer and Manager of Station KFNF, Shenandoah, Iowa. Also Pres. of the Henry Field Seed Co. Mr. Field is 54 years of age; was born in Shenandoah; is married and has a family of eleven children. Held second place in contest for popular announcers in 1925

Clarence I. Dreisbach, Announcer and Studio Manager of Station WCBA, Allentown, Pa. Twenty-three years of age and single. Native of Union Hill, Pa. Known over the country as Larry. Is also an enthusiastic amateur operator

G. A. Rietz, Announcer of Station KFDY, S. Dakota State College, Brookings, S. Dakota. Twenty-one years of age and single

Karl Stefan, Announcer for Station WJAG, Norfolk, Neb. Home of the "Printer's Devil. Forty-one years of age and married. Formerly a newspaper reporter, telegrapher and world traveler

Charlie Middleton, Owner and Announcer of WRAF, La Porte, Ind. Joined the army when he was 15; soldiered in Philippines; fired tramp steamers; motorman on street cars and railroad telegrapher. Native of Decatur, Ind.

Fred E. Exum, Announcer for WDAD, Nashville, Tenn. A native of Ouray, Colo. Known as "Radio Dad"; 34 years of age and married

Harry F. Paar, Announcer and Owner of KWCR, Cedar Rapids, Iowa. "The Voice of Cedar Rapids." Was formerly in the furniture and hotel business. Native of Kansas City, Mo. Formerly identified with Station WKAA. 40 and married

Leonore Shetz, Assistant Announcer and Director and regular station pianist, WNAT, Philadelphia, Pa. Formerly leader of the Nomad Dance Orchestra. 19 and single

Charles A. Hayner, Announcer of KWCR, Cedar Rapids, Iowa. Native of Ft. Atkinson, Wis. Forty-three years of age and married. Formerly identified with Station WKAA. Known as "Charlie"

John W. Lovellette, Announcer KWCR, Cedar Rapids, Iowa. Thirty-eight years of age and married. A native of Chicago

W. I. Griffith, Program Director of WOI, Iowa State College, Ames, Iowa. Was formerly Supt. of Schools

F. A. Fish, Director of Station WOI, Iowa State Coll... Ames, Iowa. Is head of the Dept. of Electrical Engin... ing. Native of Milan, Ohio; married and 51 years of

Ferguson

IN MANY receivers one may experience excellent "tone quality." With FERGUSON you are conscious of something more: a degree of *fullness* that gives you *each* note from *every* instrument in perfect timbre. Not mere music, but the *soul* of the artist seems to come into your living room.

One Tuning Control—Calibrated in Meters gives you, in a moment, the program to suit your mood.

Complete shielding of all tuning elements gives this 6-tube Receiver its marked selectivity.

See, hear, compare!

The Gold Standard of Radio Receivers

Miss Bertha Brainard, Assistant Manager of Station WJZ, N. Y. City

Stanley W Barnett, Announcer of Station WBAL, Baltimore, Md. 28 years of age and married. Native of Pittsburgh, Pa. Formerly U. S. Naval Radio Operator and Announcer for WOC

Grace Adams East, Cornetist with Station KTAB, Oakland, Calif. Formerly heard from Stations KGO, KPO and KLX

Harry B. Sidles, Associate Announcer and studio director of Station KFAB, Lincoln, Neb. Was formerly a salesman. Known as "The Red Headed Announcer." 23 years of age and single

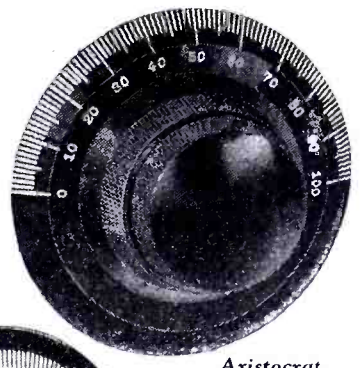
Ralph Freese, Announcer and Lyric Tenor, heard over Station KOA, Denver, Colo. Native of Kansas. Formerly a newspaper man. A keen student of North and South American history and a lover of the outdoors

Ada Allen, Lyric Soprano of Station WOK, Homewood, Ill. Was previously a concert artist. She is a native of Ohio

H. Dean Fitzer, Announcer and Director of Station WDAF, Kansas City, Mo. Also, Chief of the Nighthawks. Is known as the singing announcer. Formerly a newspaper man. Age 28 and married

An *amazing* Advancement!

Aristocrat Pointer Knob



Aristocrat E-Z TOON Vernier Dial

Aristocrat E-Z TOON Vernier Pointer

The NEW "*Aristocrat*" Vernier Port Dial

SINCE the birth of radio, Kurz-Kasch has been foremost with all important improvements—the leader in the field of plastic mouldings. The name *Aristocrat* has always signified radio parts—dials, knobs, pointers, etc.—of unsurpassed quality and efficiency.

Our newest improvement—the latest addition to the noteworthy *Aristocrat* family is no exception! This Vernier-Port Dial is of Bakelite. It will improve the appearance and efficiency of any set a hundredfold.

The vernier ratio is 14 to 1. There are no gears, no cogs, no chains—*no backlash possible!* Nothing to wear out or get out of order. Easily installed—in a few minutes! The famous Kurz-Kasch split bushing fits any condenser shaft.

In three beautiful, attractive finishes—black, walnut or mahogany. If you are to build your own radio, be sure to select this *Aristocrat* Vernier-Port Dial if you want and expect best results.

If you already operate a radio with old-fashioned dials—or dials of doubtful quality and origin—replace them with this improved, modern Vernier-Port Dial. You'll be surprised at the difference in appearance and you will enjoy better reception due to more accurate tuning—bringing in countless stations you've never heard before.

You'll find the *Aristocrat* Vernier-Port Dial at all better dealers—$2 each—in the color and finish you select!

More than 200 manufacturers use and endorse Kurz-Kasch Products because of their uniform high quality, efficient design and precision. Kurz-Kasch mouldings bear this insignia—(K-K)—your guarantee of unequaled quality and unsurpassed craftsmanship. When you see the (K-K) trade mark of quality on any plastic moulding, you may be sure that quality has not been compromised in other important constructional details.

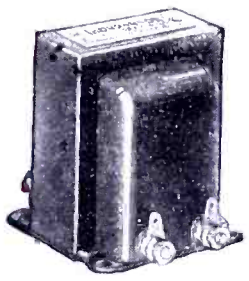
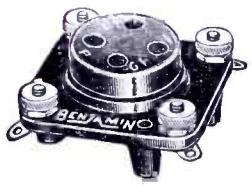
EXACTLY

the miracle receiver you have been hoping for!

Intermediate frequency transformers manufactured at St. James Laboratory, 845 Washington Blvd., Chicago, Ill.



Audio frequency transformers manufactured by Thordarson Electric & Mfg. Co., Chicago, Ill.



Sockets manufactured by Benjamin Electric Mfg. Co., 120 S. Sangamon St., Chicago, Ill.

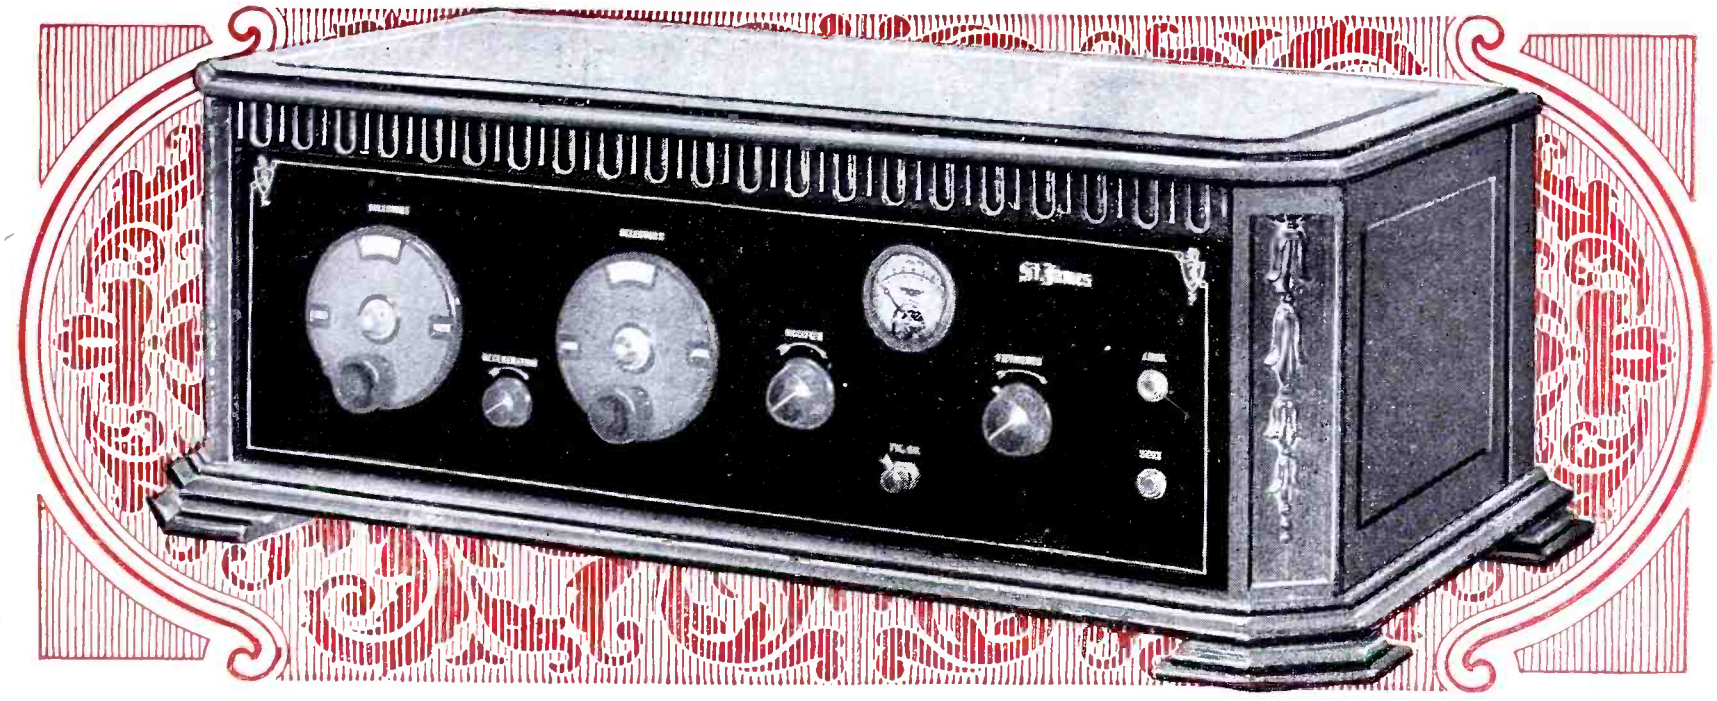
Amplification—so many kinds—radio frequency—audio frequency, the kind the golfer uses, the fisherman and neighbor with the one tube set, and the manufacturer who, "considerably off his wave," guarantees anything. Too bad that all this wasted energy cannot be utilized, but,

Suppose that you were me, and after continuous association with Radio since the time that Marconi made his first trans-Atlantic tests at Wellfleet, Mass., and you wanted the finest Receiver that could be devised, to use in your own home, and point with justifiable pride to its outstanding performance. You would have the same one that is described in this article, **exactly.**

St.

2—

And suppose that recognized authorities in the radio field subjected this set to all sorts of adverse conditions, in the tropics, competitively in the laboratory, on moving trains, U. S. Naval vessels and motor cars, and wrote in detailed reports on its exceptional performance, would this not be satisfactory evidence for you?



Add to this hundreds of letters from enthusiastic builders, some who stated that this was the first set that they ever built; but the majority those who have pursued the more expensive trail and after many changes have found their ideal rested not on promises, but an earnest endeavor on the part of responsible manufacturers to supply well engineered devices. A letter received just before this copy goes to the printer is reproduced as follows:

LAW OFFICE
ROBERT McMICHAEL
ASBURY PARK, N. J.

July 19th 1926.

St. James Laboratories, Inc.,
845 Washington Boulevard,
Chicago, Ill.

Gentlemen:-

Kindly send me at your earliest convenience one St. James Rated Condenser to use across the primary of your input transformer. Send same Parcel Post C.O.D. I do not know price.

I would like to take this opportunity to commend your transformers and your oscillator system. I have made myself a 'Super' using your products and the results are as nearly perfect as one would wish and the set has been highly praised by local engineers of the Western Electric Co.

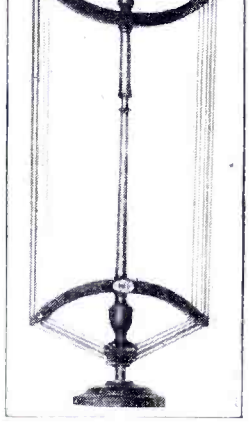
Thanking you in advance for your prompt attention to this order and for past courtesies, I am,

Very truly yours,

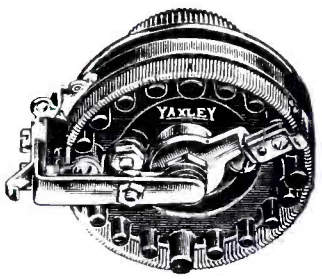
RMcM/t.

James —40

All of the manufacturers represented on this page are substantial, responsible, and anxious to be of service. Each of them have adequate and comprehensive facilities to produce the best in what they have to offer. Descriptive folder "B" will bring a prompt and courteous reply to you, giving you the information that you want, **exactly.** Just state that you are interested in the new St. James Two-Forty.



"Fiat" Loop manufactured by Radio Appliance Lab., 4884 N. Clark St., Chicago, Ill.



Rheostat manufactured by Yaxley Mfg. Co., 9 S. Clinton St., Chicago, Ill.

The St. James Super with a New Type of Dehydrated Intermediate Frequency Transformer

This receiver was designed and all illustrations prepared by the Citizens Radio Laboratory

THE super-heterodyne type of receiver is generally recognized as the most efficient of radio receiving sets. It is sensitive and selective, easy to operate and capable of bringing in distant stations with good volume and excellent reproduction.

Today a receiver must have several attributes which have been largely decided upon by the discriminating buyer, and foremost is the matter of quality. The super-heterodyne receiver, described herewith, is outstanding in this respect, due principally to the method employed in building up the signal before it enters the audio frequencies.

The principles underlying the operation of the super-heterodyne have been too exhaustively described to warrant an extended explanation here. Briefly, the circuit transforms the incoming signals to a predetermined and higher wavelength. It demands transformers which will give maximum amplification at this wavelength.

The St. James intermediate frequency transformer is very unique in design and is the only one of its kind now manufactured. Two air-core coils, wound in a special manner to reduce inter-turn capacity to a minimum, are mounted on bakelite tubing. The coil terminals are silver-soldered to terminal wires running to the transformer terminals.

The bakelite tubing carrying the coils is mounted in a high lead-content glass casing, the coils are then completely dehydrated by the repeated addition and subtraction of dehydrated air. When delicate electrical tests prove that the last possible vestige of moisture is removed, the transformers are sealed.

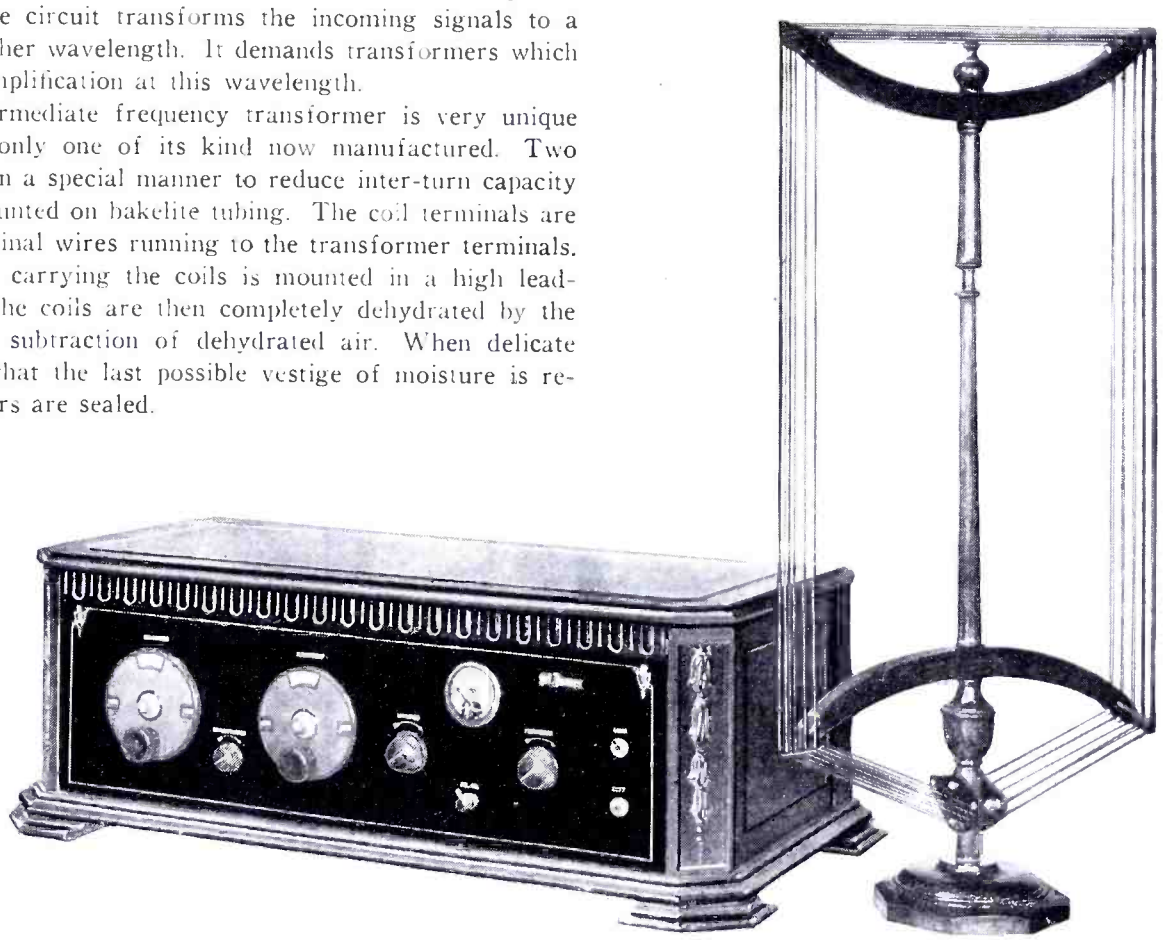


Photo A. Front view of receiver mounted in cabinet with loop

It is instantly apparent that the one outstanding handicap of the air-core transformer has been completely and permanently overcome The added efficiency due to the complete absence of moisture must be experienced to be appreciated, the satisfaction of knowing that your set is completely immune to even the most extreme humidity changes will be especially realized by those who are located on the sea coast or in the tropics.

The diameter of the largest coil used in the St. James transformers is slightly under 7/8-inch. This unusually small size, together with the effect of the vacuum treatment and the shielding effect of the high lead-content glass, combine to produce a magnetic field so concentrated that the hand may be placed directly around any of the transformers while the set is in operation, without the slightest de-tuning effect. When the fact that the complete receiver is built on a baseboard only 23 inches long, is taken into consideration, it is apparent that the fields of the transformers are extremely small. This practice of placing the parts as close together as possible is recommended as it not only permits minimum length of leads but also adds to the compactness of the set.

The manner of final checking of the intermediates insures limits of variation far below a one kilocycle limit, and the final dehydration of the coils, and their sealing off from further moisture effects precludes future changes in their electrical characteristics. With intermediates operating at 240 k.c., oscillator repeats are reduced to a minimum, and, with a total lack of inherent harmonics, the set functions smoothly without hissing or distortion even when supplying full volume to the speaker.

The circuit used in the St. James Super-Heterodyne consists of a Hartley oscillator, using a St. James Oscillector, 1st detector, four stages of intermediate radio frequency amplification, 2nd detector and two stages of transformer coupled audio amplification.

UX201A tubes or their equivalent are used throughout the receiver with the exception of the last stage of audio. Here a UX112 power tube handles the output of the audio amplifier, thereby allowing 135 volts "B" battery to be used, giving maximum volume and without sacrificing tone quality.

Thordarson Type R-200 amplifying transformers are used in the audio amplifier. With a good cone speaker music and speech are reproduced with unusual fidelity, even the slightest shading of tone,

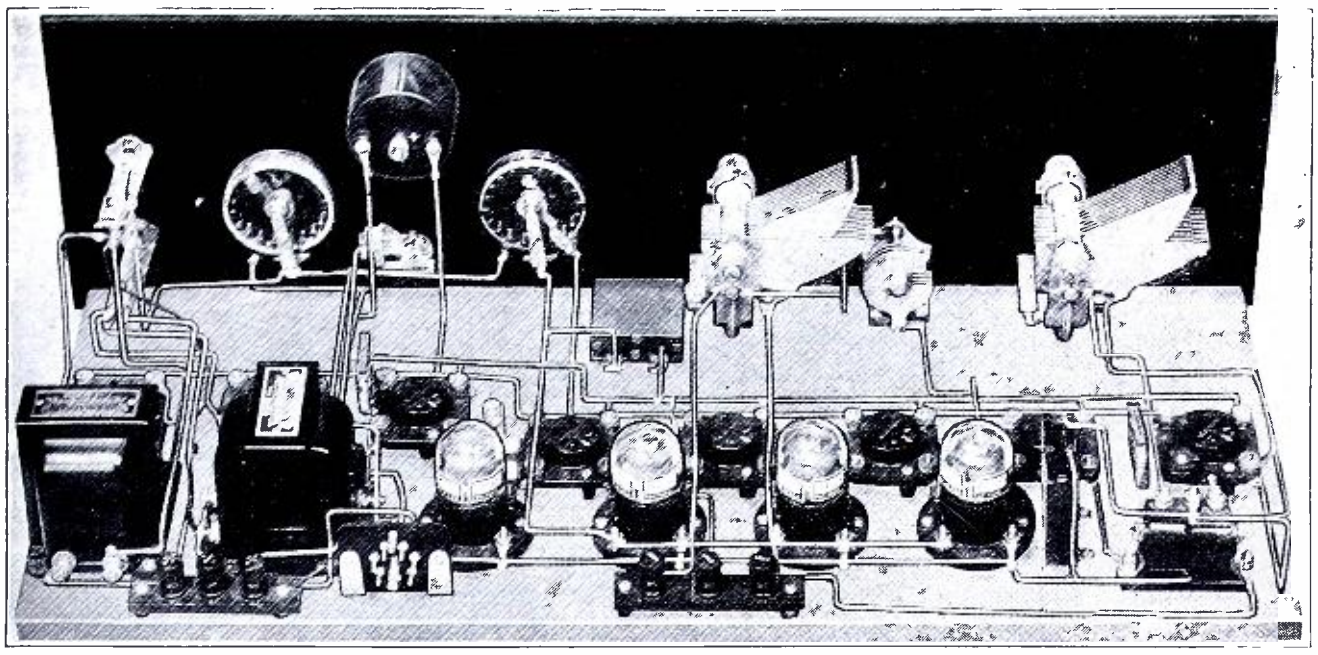

Photo B. Rear view of receiver completely wired

volume, timbre and range. They have a wide range of amplification, giving good reproduction of notes from well into the bass up past the upper limits of audible frequency.

Two major controls are used; one for tuning the loop to the desired wavelength and the other for establishing resonance between the oscillator circuit and the intercepted signal. Regeneration, so helpful in receiving distant stations, is accomplished by inserting a .000045 mfd. variable midget condenser in the plate circuit of the first detector tube. The two major controls are .0005 mfd. Hammarlund variable condensers with a straight-line frequency tuning characteristic.

The St. James Oscillector is conveniently mounted by installing it on a Electrad grid leak mounting.

Benjamin UX cushion sockets are used throughout the receiver. A minimum amount of tube or microphonic noises will be experienced with this type of socket.

A Yaxley two-ohm air-cooled rheostat controls the first six tubes. The Jewell voltmeter shows, at all times, the voltage applied to the filaments of these tubes. Fixed resistances regulate the audio tubes.

Separate binding posts are provided for the "C" battery establishing the grid bias on the audio tubes. All battery leads are connected to the receiver by means of a Yaxley cable connector.

Figure 1 is the layout of the front panel giving the location of all holes as well as the necessary engraving.

Figure 2, the baseboard layout, gives the location of all parts mounted on the baseboard. All terminals on apparatus are plainly shown and indicated so that the various pieces of apparatus bear a correct relation to each other.

In Figure 3 is shown the schematic wiring diagram of the complete receiver. A filament control jack is used in the last stage of audio. The filament circuit of the last tube is completed only when a loud speaker is plugged in.

Little or no difficulty will be had in assembling and hooking up the receiver if the layout shown in the various illustrations is followed. Parallel high frequency leads should be carefully avoided. Short grid and plate leads are automatically provided for if the apparatus is placed as shown on the baseboard layout.

Carefully check all connections against the large graphic illustration. Make corrections in hook-up where necessary and test with "A" battery with tubes in sockets. If tubes light and are controlled by the proper resistances try connecting the "A" battery across other battery terminals. When tubes only light when "A" battery is properly connected it is safe to connect the remaining batteries, hook up the loop and plug in the speaker.

With the rheostat set just under five volts on the meter, advance the potentiometer toward the negative side until the set goes into oscillation. This will be evidenced by a click or thud in the loud speaker and can be checked by touching the oscillator condenser with the finger, a double thud when the finger is touched and removed will be evidence of oscillation. Then retard the potentiometer setting until the oscillation point is just passed. The receiver is now in its most sensitive condition. Starting with both condensers at the lower end of the scale, slowly rotate the loop tuning condenser until a rushing or blowing sound is heard to which any background noise such as local motor sounds, static, etc., will be added. The receiver is now in resonance. Slowly, very slowly, rotate both condensers so as to keep this background noise present until a station is heard. A slight

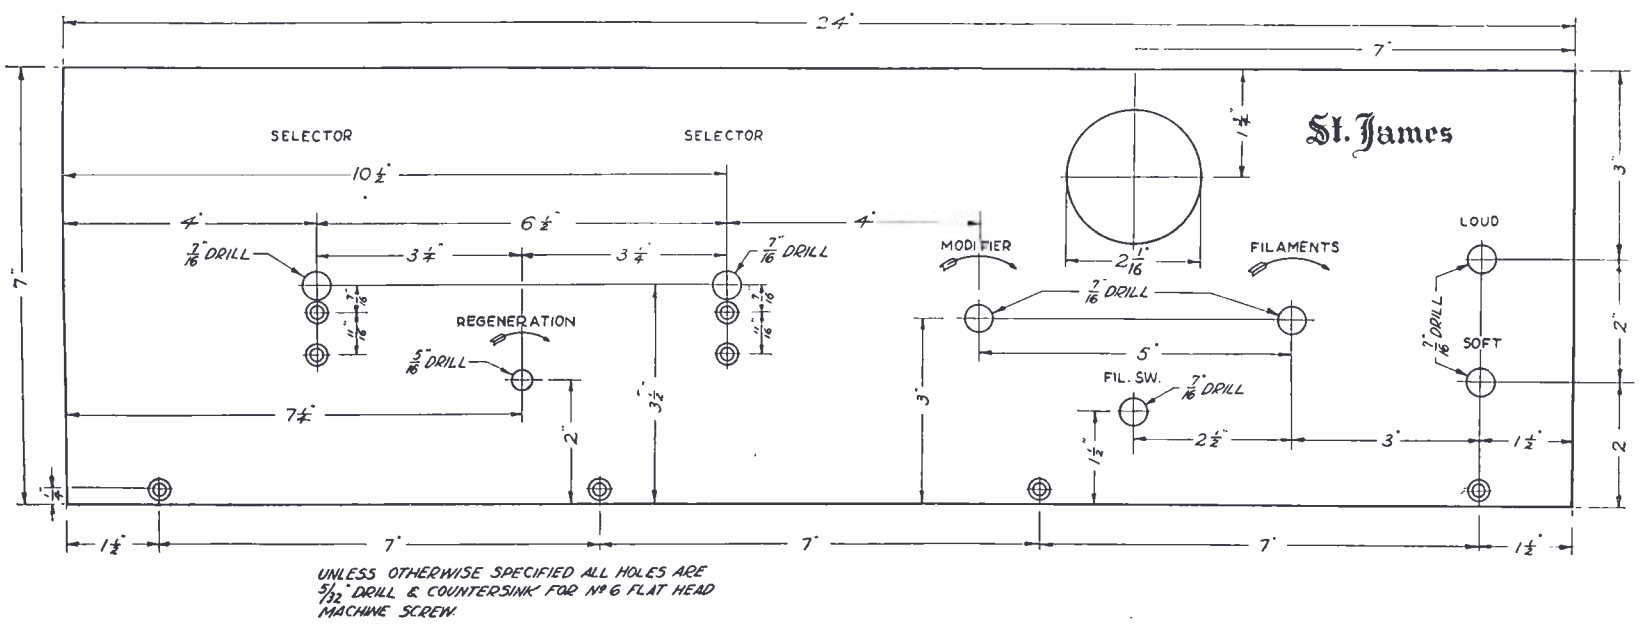

Figure 1. Front view of panel showing size of holes and engraving

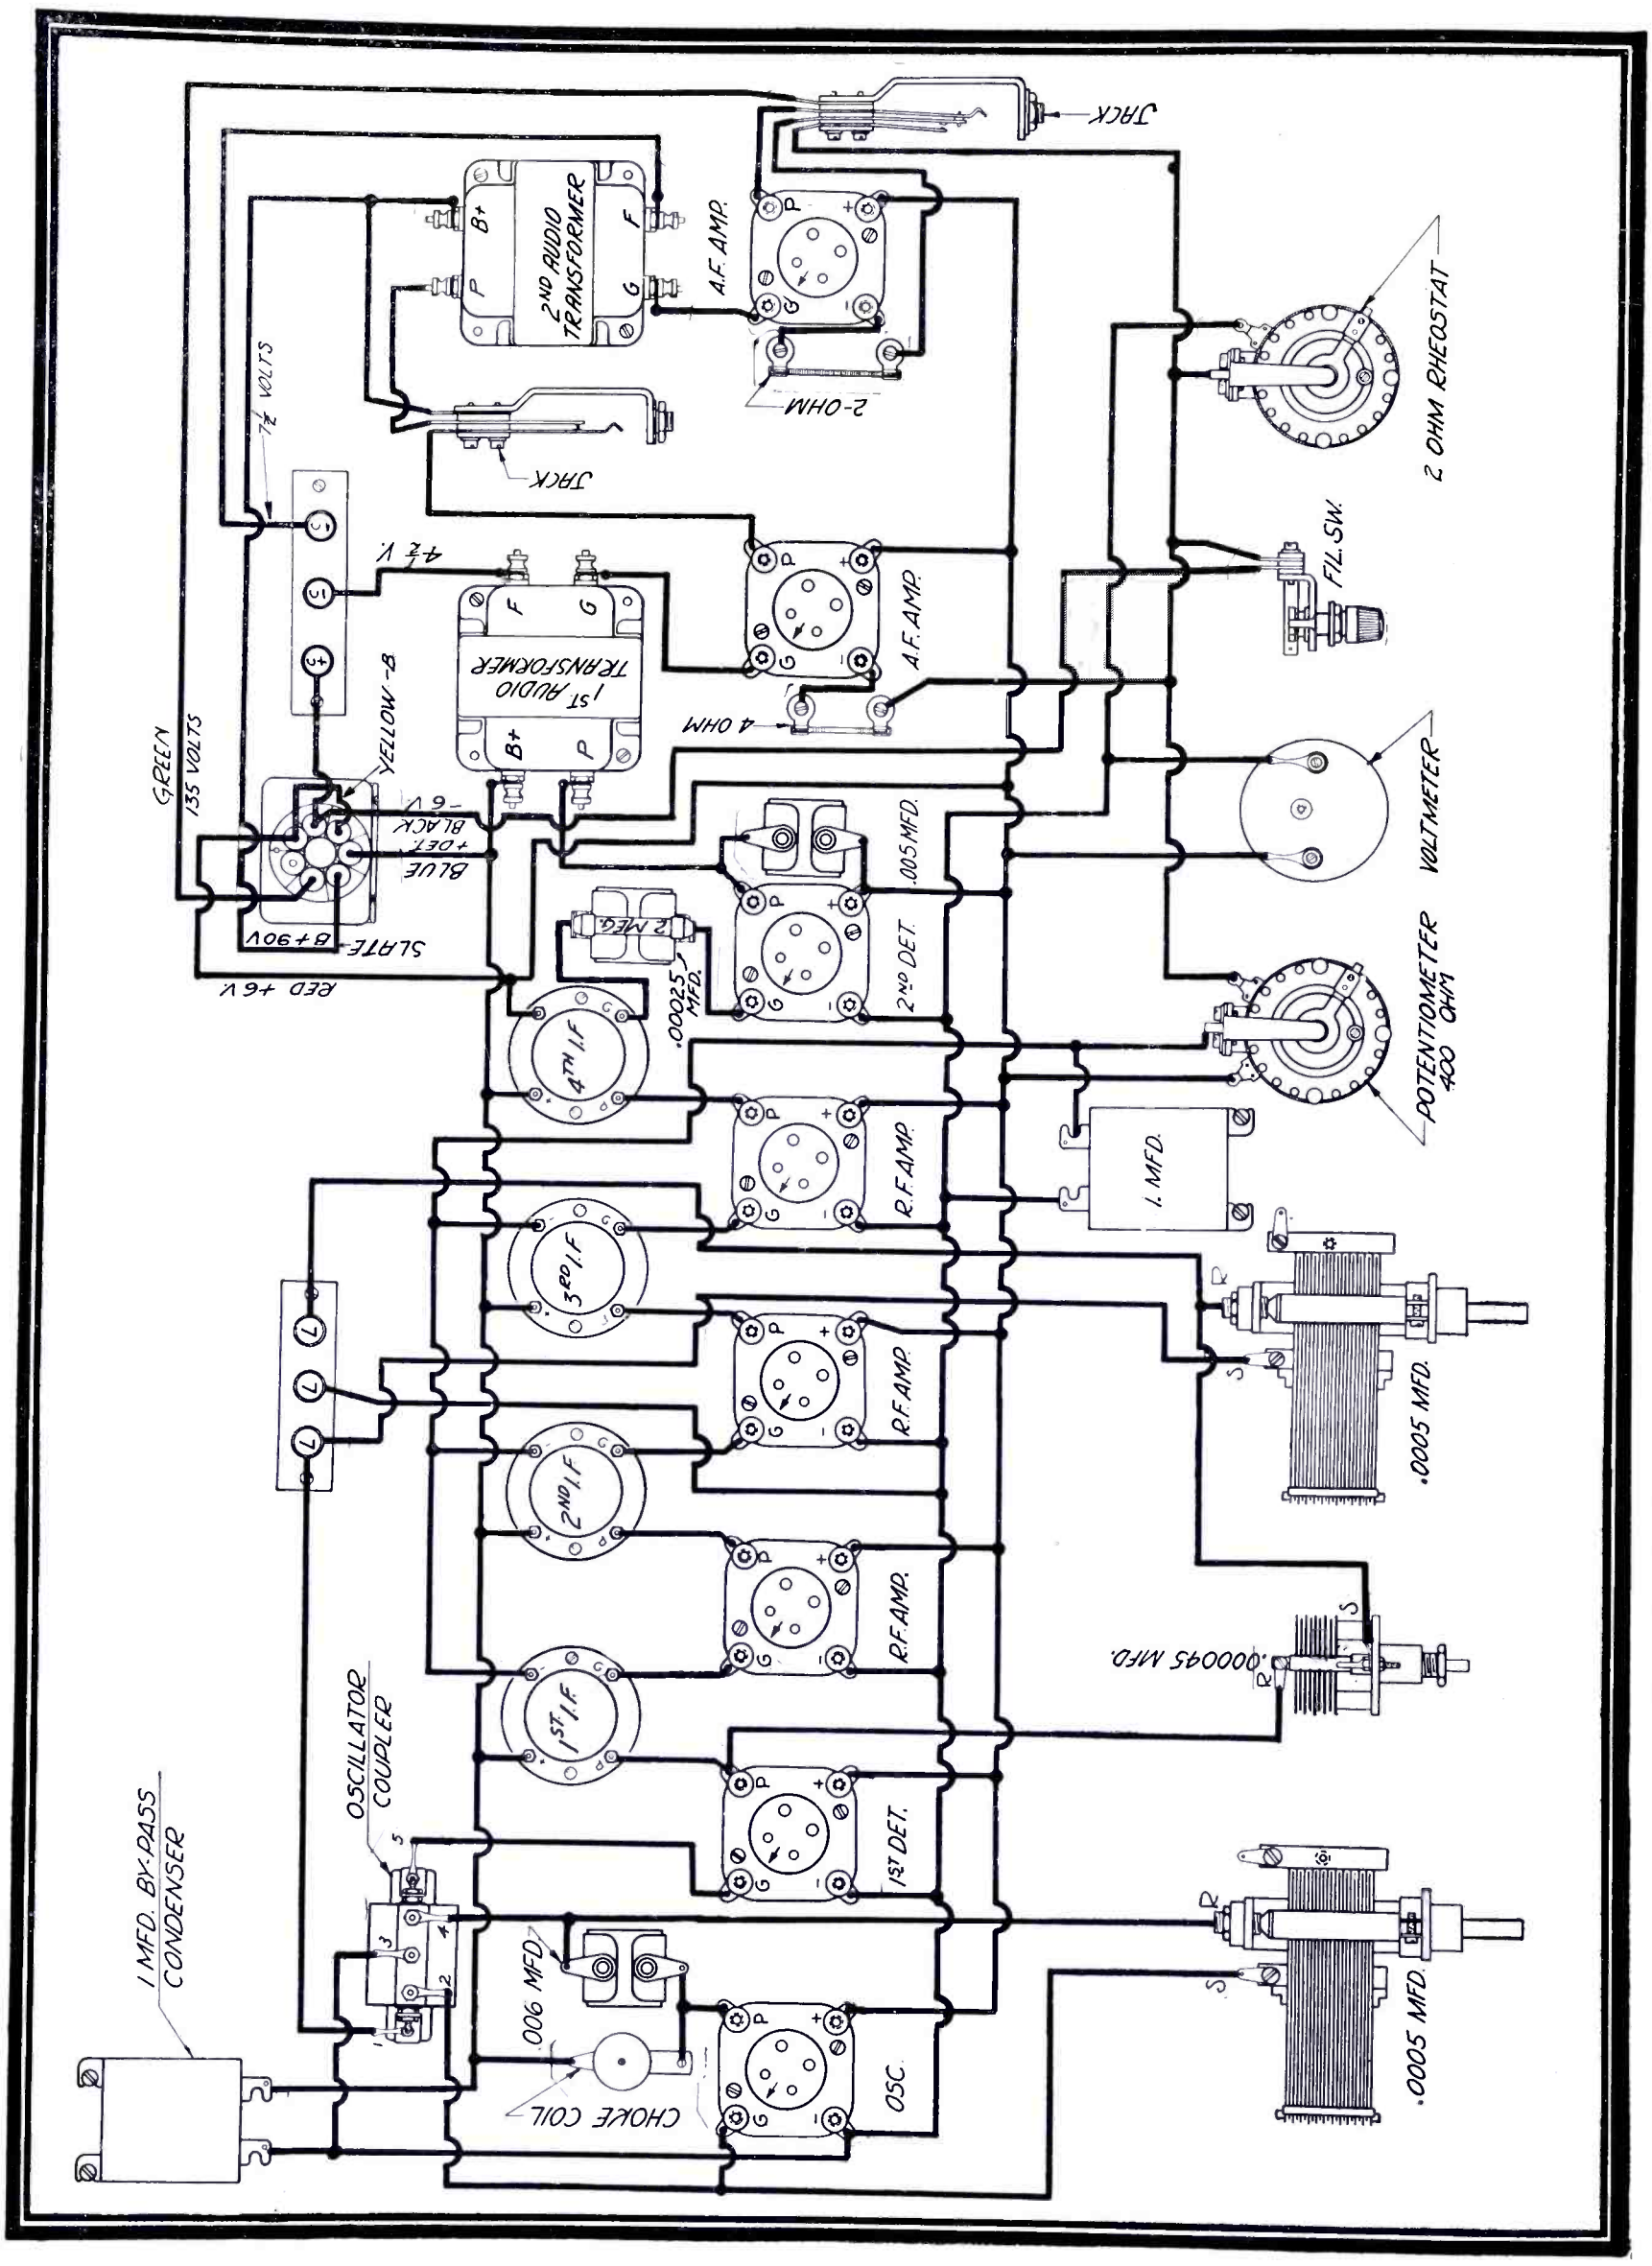

Figure 4. This diagram is a graphic illustration showing every connection in entire receiver

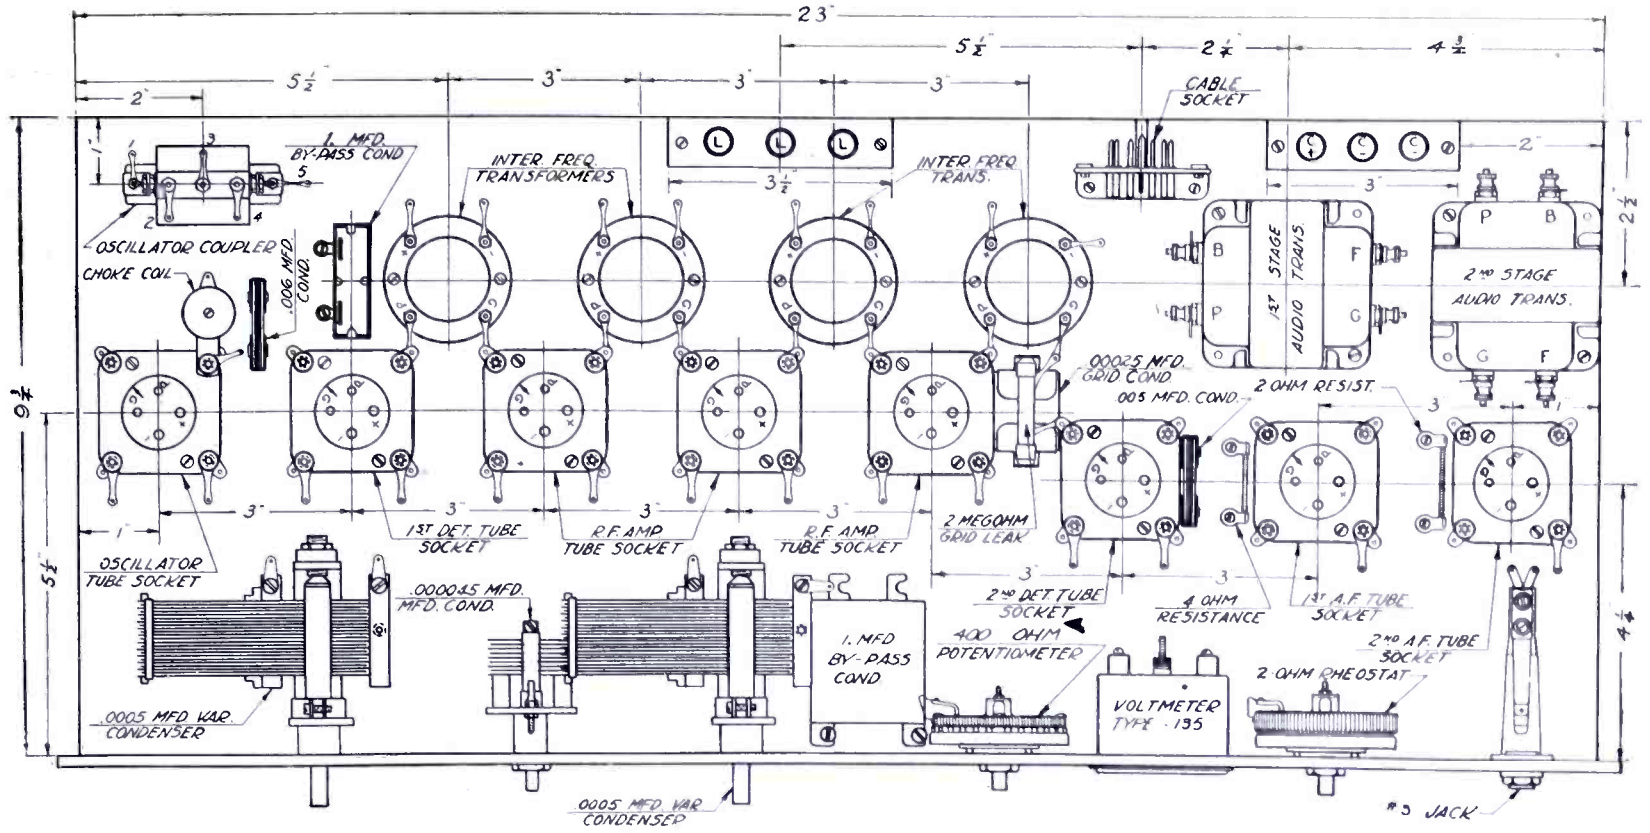

Figure 2. Baseboard layout showing arrangement of parts

readjustment of the dials and the potentiometer may be necessary to secure full volume.

The regeneration control is adjusted for maximum sensitivity while the set is in operation. This is found only by trial. It will be found that less regeneration is needed on the lower wavelengths than on the upper.

On account of the variance in tube characteristics they should be checked according to a simple method furnished by the St. James Laboratories in their instruction sheet.

List of Parts

These parts or their equivalent will give satisfactory results:

1—Formica Engraved Panel 7"x24"x3/16"
1—Jewell Pattern No. 135 0 to 8 Volts Voltmeter
1—9"x23"x½" Wood Baseboard
2—Marco Vernier Dials.
1—Hammarlund .000045 mfd. Midget Variable Condenser
2—Hammarlund .0005 mfd. Variable Condensers
1—Yaxley 2-ohm Rheostat
1—Yaxley 400-ohm Potentiometer
1—Yaxley No. 10 Battery Switch
1—Yaxley 2-ohm Fixed Resistance
1—Yaxley 4-ohm Fixed Resistance
1—Yaxley No. 3 Jack
1—Yaxley No. 2 Jack
1—Yaxley No. 660 Cable Connector and Plug
4—St. James Intermediate Frequency Transformers
1—St. James Oscillector
1—St. James Choke Coil
1—Electrad Single Grid Leak Mounting
8—Benjamin UX Cushion Sockets
2—Thordarson R-200 Audio Transformers
2—Dubilier 1 mfd. By-Pass Condensers
1—Dubilier No. 601 mfd. Grid Condenser
2—Dubilier No. 601 mfd. Condenser
1—Dubilier 2-megohm Grid Leak
2—Formica Terminal Strips 1"x3"x3/16"
6—Eby Engraved Binding Posts
1—Package Kester Radio Solder
4—Dozen Tinned Soldering Lugs
5—Dozen No. 5x½" Round Head Wood Screws
50—Feet Belden No. 12 Tinned Copper Hook-up Wire.

The St. James Super-Heterodyne Receiver is simple to operate. It is unfair to expect phenomenal results the first time the set is on the air. A little patience in tuning in conjunction with a willingness to learn the little eccentricities of the particular receiver will bear a just reward of distant stations received consistently.

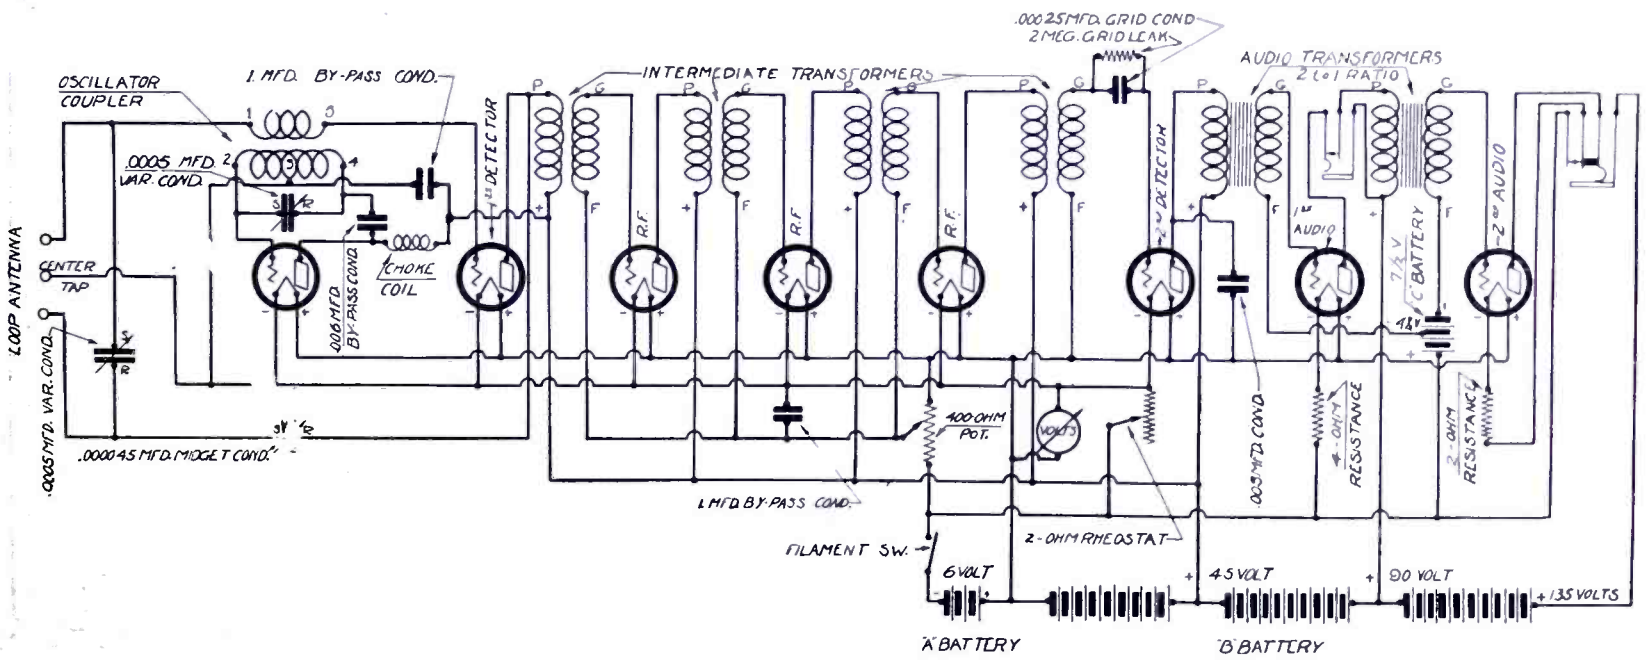

Figure 3. Schematic wiring diagram

The Qualitone Receiver

Here Is a Very Efficient Tuned Radio Frequency Set That Looks Like a Factory-Built Product, but Can Easily Be Constructed at Home by Following These Specifications

Design and All Illustrations Prepared by the Citizens Radio Laboratory

THE continued and rising popularity of the various tuned radio frequency circuits is no doubt the result of the untiring efforts on the part of the different manufacturers in their extensive experimentation, development and new design of radio frequency transformers. No field of radio has seen such a tremendous amount of energy, time and effort applied to as has the research in radio frequency transformers. Time has shown the gradual development from the original types of air core transformers, enclosed in a wooden case, which had windings on small fiber spools, to the present types of high precision air core transformers of low distributed capacity and high inductive value, which have windings of the familiar green wire, mechanically placed and entirely self-supporting with no enclosure of any kind. Recent types of radio frequency transformers have been very efficient in their way, but because of the characteristics of their respective fields it was necessary to mount them at a certain angle to prevent interstage coupling and feed-back effects. Usually the angle was one of precision and virtually impossible for the home builder to maintain.

Among the very recent developments in the design of radio frequency transformers has been that of the so-called "figure-eight" coils. The primary and secondary are mechanically interwoven over a form which insures the correct spacing of the coils. After a small amount of "dope" is applied at certain points on the winding, the form is withdrawn and a self-supporting coil is the result. A mounting is provided by which the coil may be placed securely in position and connections made to the proper terminals. The fact that the coils are wound with mechanical accuracy produces a transformer with uniform electrical characteristics and provides a uniformly high inductance, low distributed capacity and low resistance with consequent low losses. In addition to these desirable qualities, this type of transformer is very compact and does not require extreme spacing or angular mounting; it permits exact nullification for tube and stray capacity without guesswork or tedious testing; maximum coupling and high ratio of voltage increase, due to special low loss construction and concentrated field; minimum supporting insulation in the field of the coils and selectivity with maximum transfer of controlled energy to succeeding grid circuit. The peculiar construction of these coils eliminates interference usually picked up by ordinary transformers from nearby stations. It also eliminates magnetic feedback in multi-stage radio frequency circuits, thus removing one of the causes for howling.

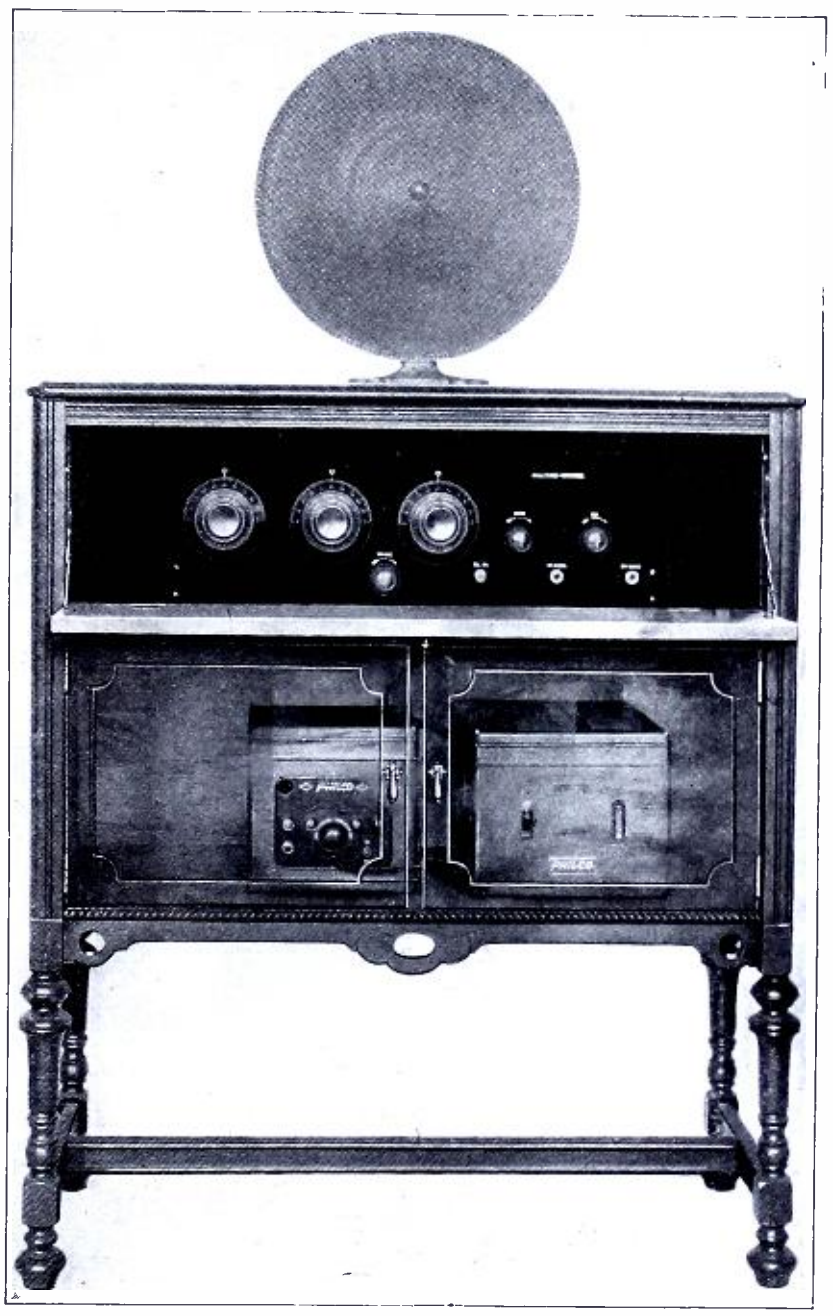

Photo A—Front view of receiver in console with suggested accessories

This particular type of transformer will operate fairly efficiently with any .00035 mf. variable condenser, but investigation shows that by combining the "Lekeless" transformer with a Benjamin .00035 mf. condenser more satisfactory reception will result because a wider tuning range with greater volume and clarity is obtainable than with other equipment. It may be interesting to note that the condenser was designed especially for the "Lekeless" transformer.

It is a well known fact that the receiver constructed in the home workshop cannot be compared with the receiver that is built in a well equipped factory. Very often the home-constructed set will perform in a manner superior to that of the factory-constructed receiver, but invariably the manufactured receiver will be chosen in preference to the home-built set. The commercial receiver has the instruments mounted upon a sub-panel, the wiring is almost wholly concealed, a well balanced panel graces the front of the cabinet and certain mechanical niceties are apparent which cannot be incorporated in the home-constructed receiver. On the other hand, the receiver as made at home is usually a conglomeration of radio parts mounted on a wooden baseboard with a poor job of wiring. It has been the view in designing this receiver to incorporate all the very desirable features usually found in a factory made set in an excellent tuned radio frequency receiver which may be constructed by the average radio fan.

The circuit used is a standard tuned radio frequency receiver using two stages of tuned radio frequency amplification, a detector and two stages of transformer coupled audio frequency amplification with a few changes made in the interest of better selectivity and reception. The primary of the antenna coupler is not grounded, and two ½ mf. by-pass condensers are placed in between the plate circuit of each of the two radio frequency tubes and their respective negative filaments. The unique arrangement

of the antenna coupler allows greater selectivity and eliminates interference and induction noises from nearby power lines to a great degree. The condensers by-pass any excess radio frequency currents which may be present in the radio frequency transformers and prevent them from causing interstage coupling and effecting the very sensitive grid circuits which are in the vicinity of the transformers. In other words, the condensers localize the high frequency currents present in the coils so that their energy is held to the correct circuit instead of straying into audio frequency circuits and causing poor quality of tone and volume. It is therefore apparent that there will be a minimum of oscillatory conditions caused by leakage of high frequency currents which in combination with the ease of operation and tuning make this a very desirable receiver.

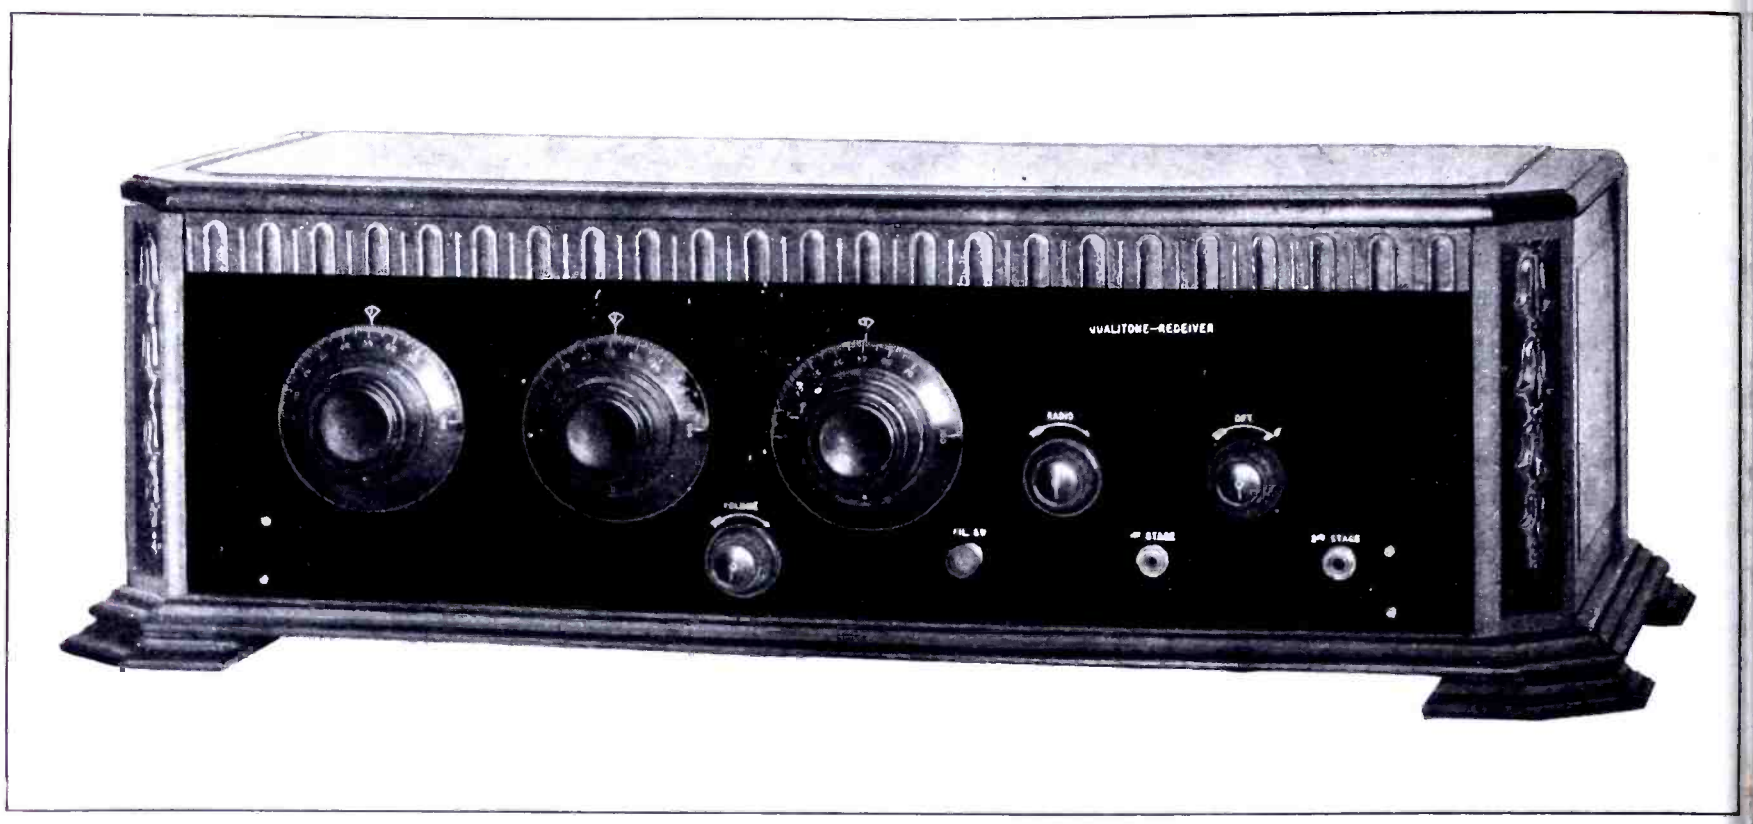

Photo B, front view of receiver mounted in cabinet

As may be gathered from the illustrations accompanying the description of this receiver, most of the parts are mounted on a sub-panel. This arrangement allows all wires with only a few exceptions to be placed under the sub-panel. The sub-panel has a complete layout of all the holes necessary for the mounting of the parts in their correct relation to each other as well as the holes through which the wires pass when making the necessary connections between the apparatus above and below the sub-panel. Two sizes of holes are used in the sub-panel; the larger hole is 5/32 inch in diameter, while the smaller hole is 3/32 inch diameter. The holes for mounting the multiplug socket, brackets, fixed resistors controlling the last two tubes, by-pass condensers and one of the holes for mounting the grid condenser are all countersunk from the top side of sub-panel for No. 6 flat head

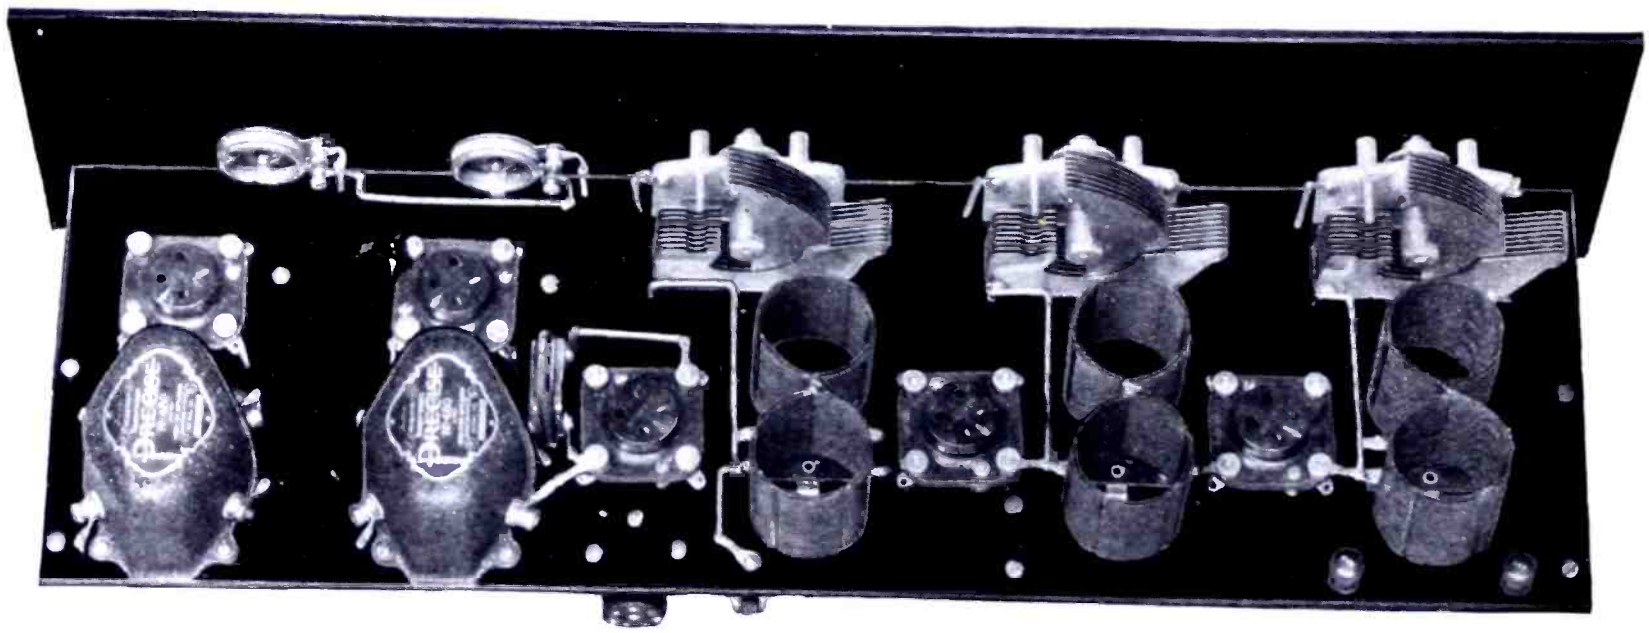

Photo C, rear view of receiver. Notice the absence of any unsightly wiring

achine screws. These holes are shown with an extra heavy ne around the actual hole. Two holes are shown which have dotted line around them instead of a solid line. These holes e countersunk from the reverse side of the sub-panel.

No difficulties will be experienced in wiring up this receiver, though the work will be expedited by mounting the apparatus

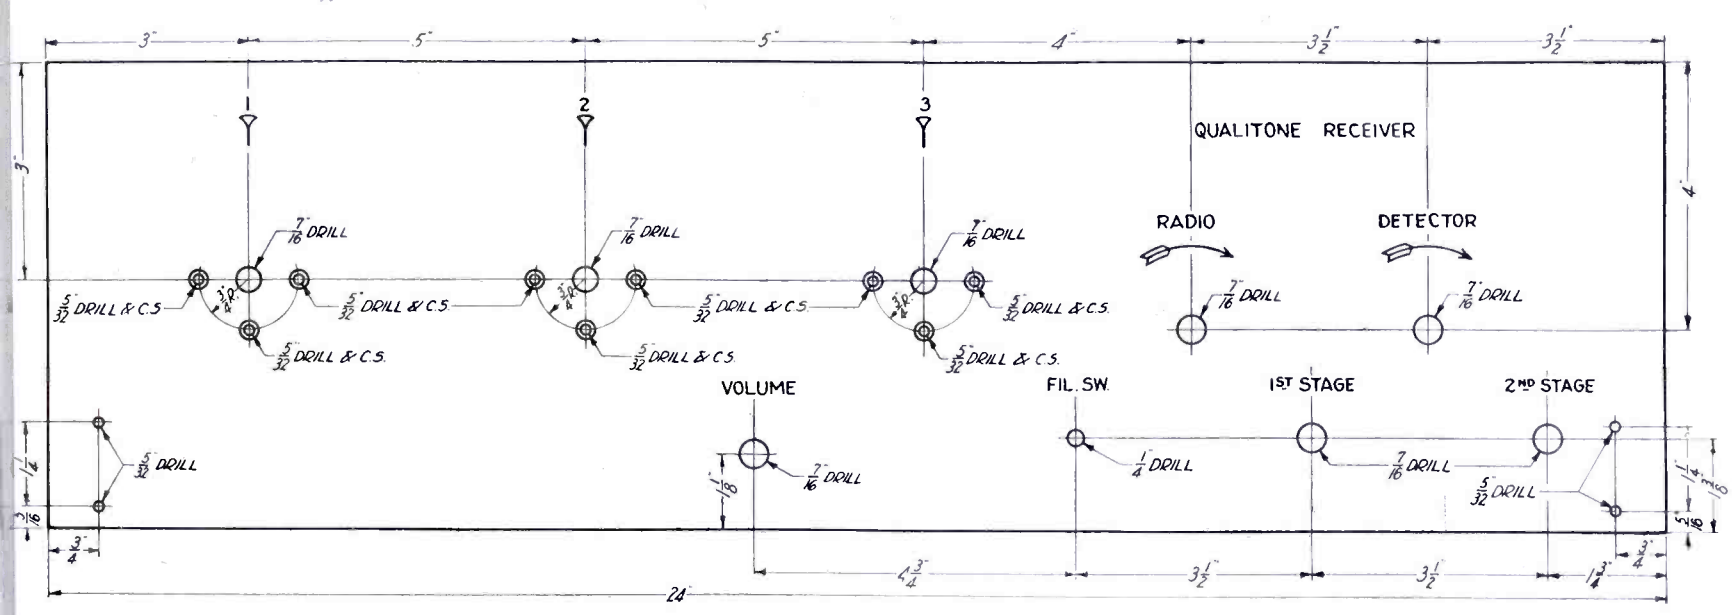

Figure 1. Panel layout showing suggested engraving

n the sub-panel only and making all connections possible and en mounting the front panel and with a few drops of solder mplete the wiring.

UX sockets are used in this receiver and are of the non-micro-onic type, which eliminates a great deal of tube noises. The dio transformers are of two different ratios; the first stage nsformer has a 5 to 1 ratio, while the second stage transformer s a 2 to 1 ratio. These transformers amplify the lower fre-encies very efficiently and should give excellent reproduction th a good cone speaker. The rheostat and variable resistance e of a very small size, allowing them to be mounted in a posi-on which does not detract from the balanced appearance of the ont panel since they do not interfere with the sub-panel.

for antenna and ground connections are cut off about eight inches from the plug proper. The back wire is connected to the positive of the "C" battery, and the brown is connected to the negative of the "C" battery.

There are no adjustments to be made after assembling, to place the receiver in proper working order. The volume may be modified by adjusting the 500,000 ohm variable resistance until the proper strength of signal is obtained. Experimentation has shown that an antenna of from 60 to 80 feet long, including lead-in, is the most efficient kind for this receiver.

The results with this five tube receiver are both gratifying and surprising as to quality and distance. The stations will always be found at the same dial settings, provided their respective wavelengths do not change.

As the tendency of construction leans towards consoles more than cabinets, we have shown the completed Qualitone receiver in both console and cabinet.

In the console model you will find a Philadelphia Storage Bat-

A 15 to 550-Meter Receiver Using a System of Interchangeable Coils

This Receiver Was Designed and All Illustrations Prepared in the Citizens Radio Laboratory

THE outstanding trend in radio research during the last two years has been towards short wave transmission and reception. Amazing distances using extremely low power have been covered by using short waves and with the uncanny reliability of this type of radio communication it bids fair to revolutionize broadcasting.

This particular receiver is different from other high frequency receivers which have been described from time to time in that an interchangeable coil system is used by which the entire range from 15 to 550 meters is covered efficiently. The interchangeable coil and associated receiving system were designed by F. J. Marco, consulting engineer, for Aero Products, Inc., Chicago. The system consists, briefly, of five interchangeable coils, each unit comprising a grid and plate inductance. A suitable base is provided, on which is mounted an adjustable primary coil, which may be fixed for best results. The design of the interchangeable coils are such has been found that the most satisfactory results are obtained when using this type of coil when the grid tuning condenser is a .00014 MF and the feedback control is a .00025 MF straight-line-frequency condenser.

The circuit is of the familiar "fixed tickler" and capacity controlled type, which has been found most suitable for short wavelengths. The controls are two, tuning and feedback, and since the feedback is quite constant over a fairly wide band, operation is very simple. Two variable condensers are used. It

Photo A—Front view of receiver

The coils will cover, when used with 201A tubes and the above

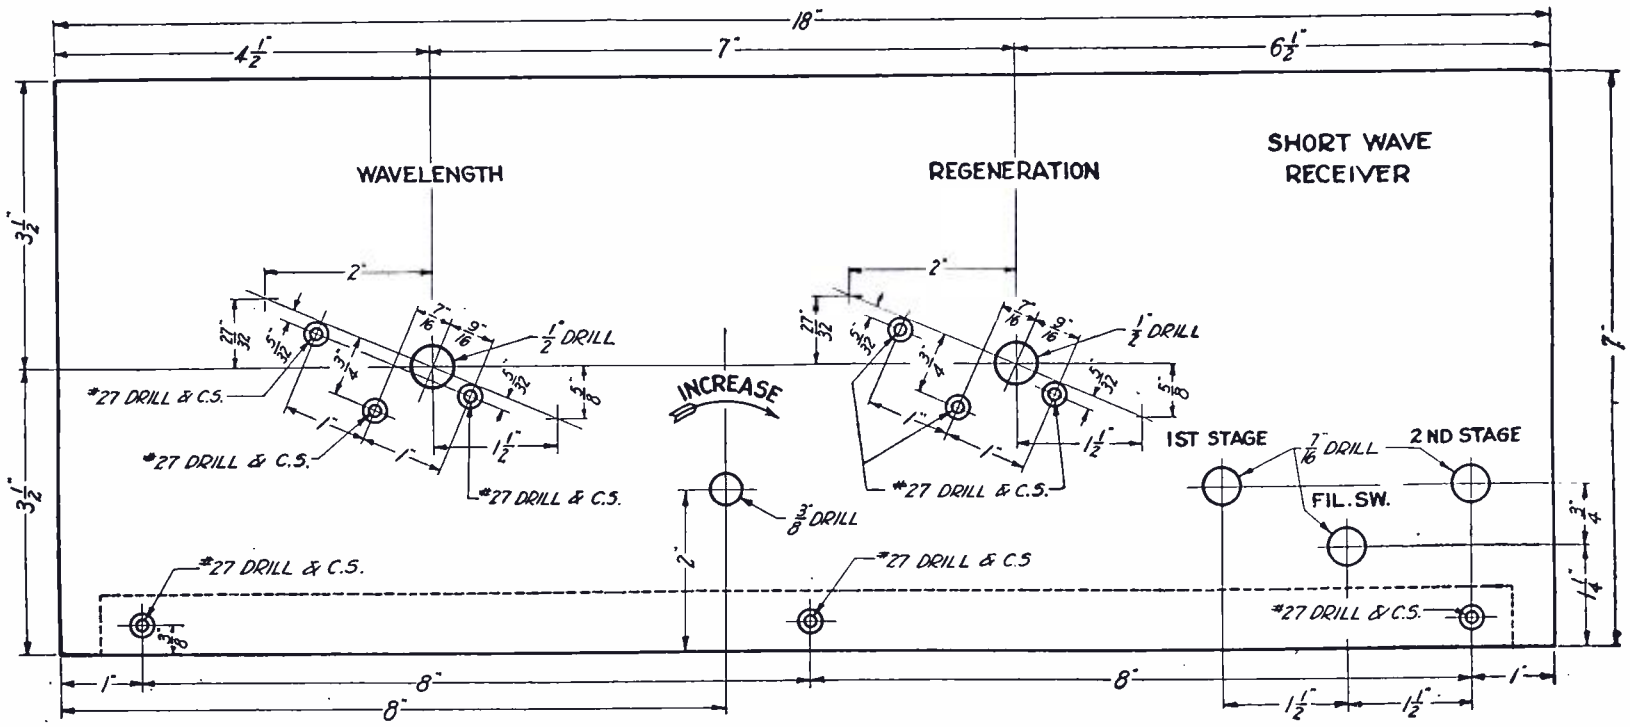

Fig. 1—Panel Layout

mentioned capacities in tuning and feedback condensers, 15 to 33.5 meters, 31.5 to 68 meters, 57 to 133 meters, 125 to 250 meters, and 235 to 550 meters respectively. This may vary slightly, due to the length of leads and tube capacities, but should allow the operator to find a particular wave-band easily.

As may be seen from the illustrations accompanying this article, two stages of audio frequency amplification are used in this receiver which allows a loud speaker to be used on all signals. This is obviously advantageous as being preferable to using headphones.

In view of the fact that a short wave receiver is subject to microphonic noises from the tubes, cushion sockets have been specified to prevent this very undesirable condition. The sockets are of the new UX type which are now considered as standard.

A No. 51 Daven Mounting is provided by which various grid leak and condenser combinations may be tried until the best signals are found. Experimentation has shown that a grid leak of 8 megohms and a grid condenser of about .0001 mfd. is the best combination in this particular type of receiver. If good results are not obtained from these values the combination must

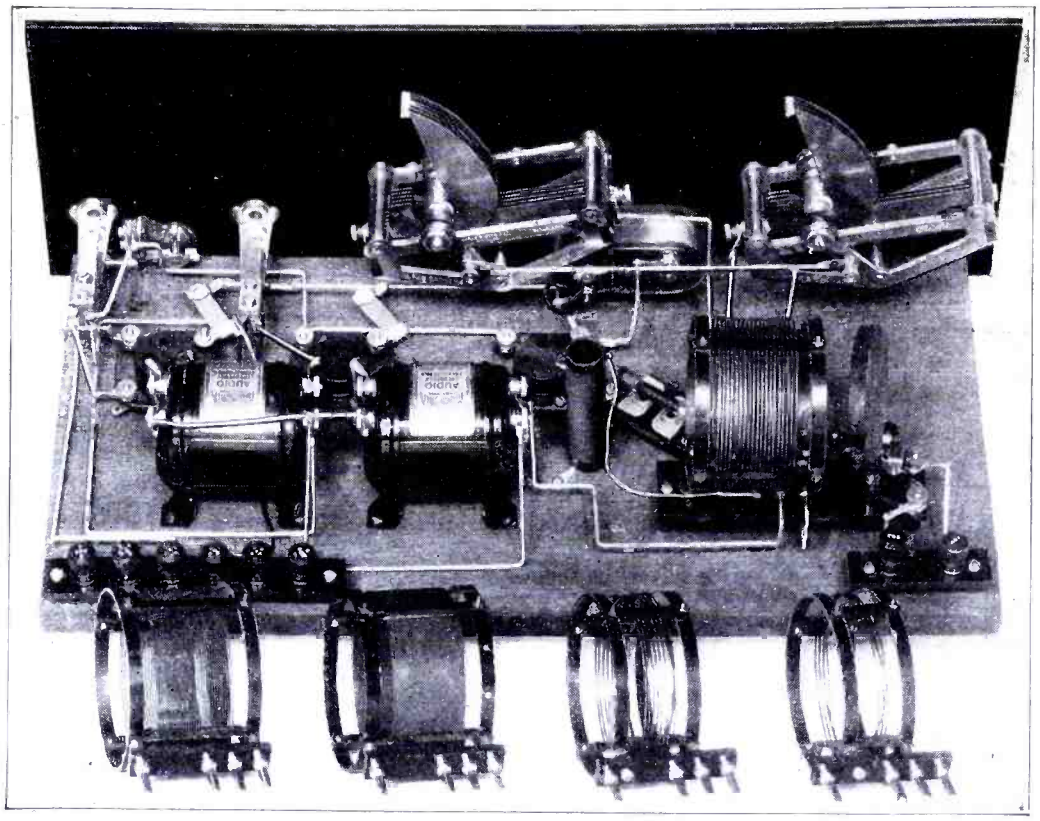

Photo B—Rear view of completed receiver, showing complete set of Aero interchangeable coils

of this receiver to wind one himself. Procure a piece of Bakelite tubing ¾" outside diameter, 3½" long. Drill two holes in each end of the tube wall about ¼" apart, about 1/32" in diameter. Fasten end of No. 28 DCC wire through two holes and allow about six inches to project, wind 200 turns around tube and anchor other end through remaining two holes, again allowing six inches to project. A spool of No. 28 wire, ¼ pound in weight is sufficient.

It will be found that by making the grid return on the detector interchangeable from positive to negative better signals will result when proper polarity is established. The filament circuit may or may not be grounded. This lead is shown in the diagrams as a dotted line, as conditions vary. In some installations a good deal of AC hum is found when filaments are grounded. Other times again, heavy interference may be encountered which may be eliminated to a great degree by allowing the filaments to remain ungrounded. In either case of grounding, or not grounding, body capacity will be absent.

No difficulty should be experienced in assembling and wiring this receiver, although care should be taken that all leads be as

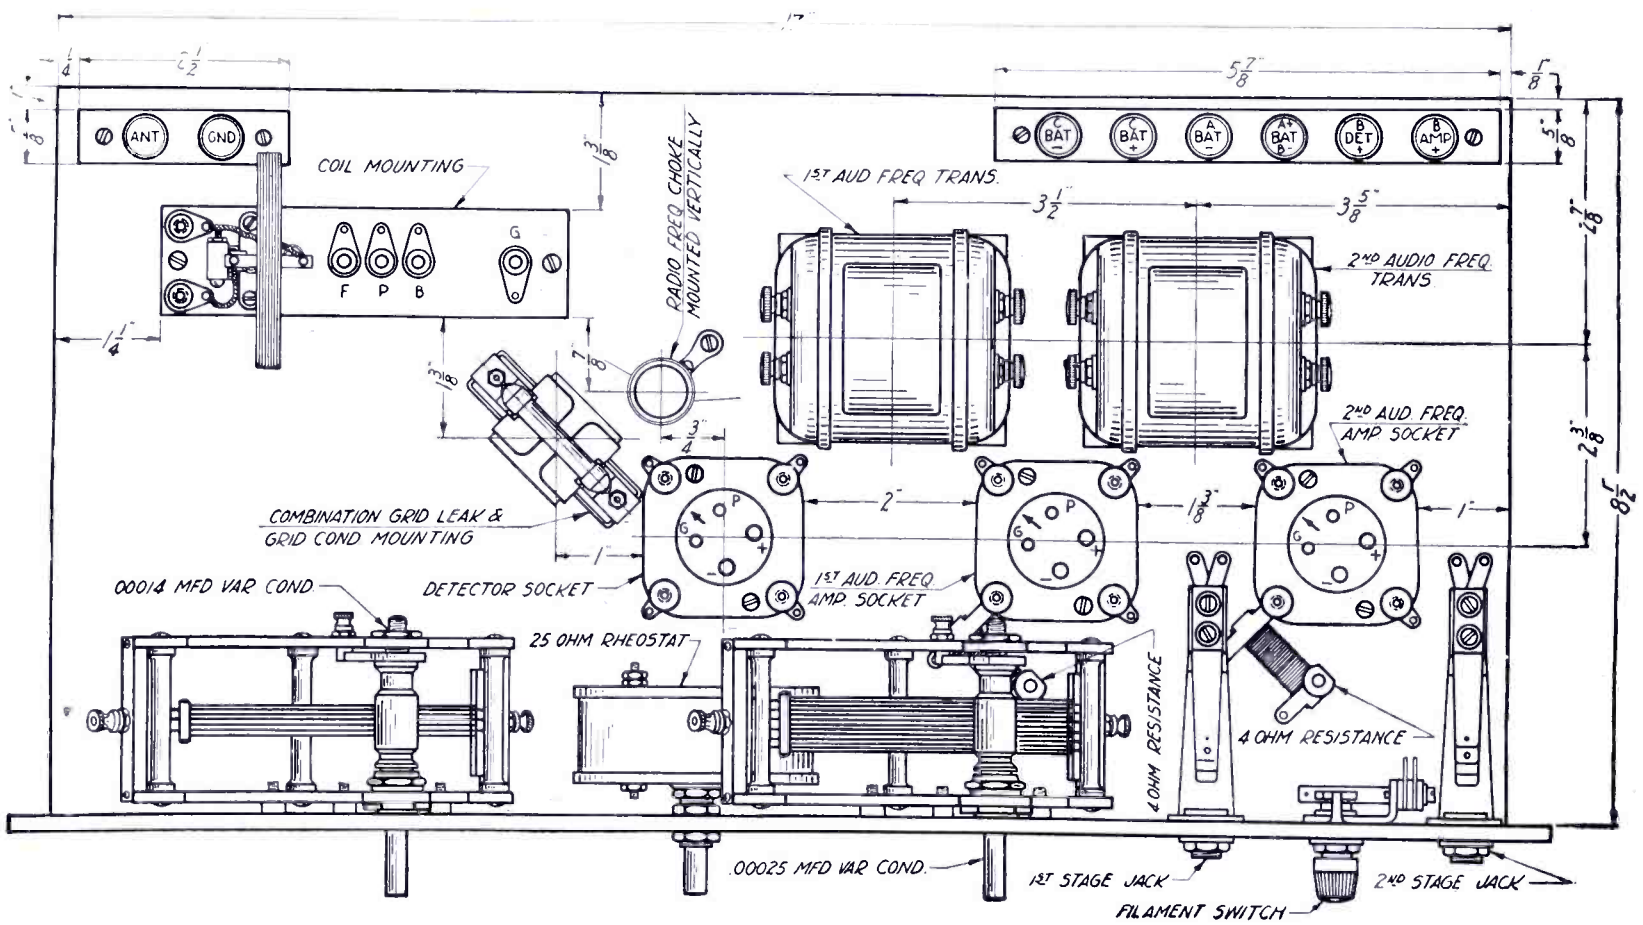

Fig. 2—Baseboard Layout

be altered until best results are obtained.

It has been found that a radio frequency choke is necessary before the first audio transformer. This choke is not manufactured at the present time and it is necessary for the constructor short as possible. Insulation on any of the wires is not necessary and is not advised since research has shown that poor results in reception will follow if insulated leads are used. Very high ratio vernier dials have been selected for the tuning controls in this

ceiver in view of the fact that a very minute adjustment is eded in tuning in the short wave transmitters.

It will be noticed that the Karas Condensers are provided with th a large mounting nut fitting around the condenser shaft d a series of three screw holes in the frame. The large nut not used in mounting the condensers, and care should be used that no part of the threaded portion surrounding the condenser aft projects beyond the face of the panel. Using the flat head achine screws supplied with the condensers and inserting the all spacers, also supplied between the condenser frame and the nel the variable condensers may be easily mounted in place. will be found that it is advisable that the mounting holes for

on all wavelengths with the antenna and ground connected. For the best results the antenna should have a maximum length of not more than 50 feet including the lead-in. If dead spots are encountered on any short wavelengths, loosen antenna coupling. If this does not eliminate the dead spot remove from 5 to 10 turns from the radio frequency choke.

In operating the receiver, always keep it oscillating gently for CW reception and just below the point of oscillation for phone reception. It is altogether proper that a word of caution be placed here in reference to the fact that this type of receiver re-radiates when oscillating too freely and great care should be taken that the operator does not enter the ranks of the "Bloopers"

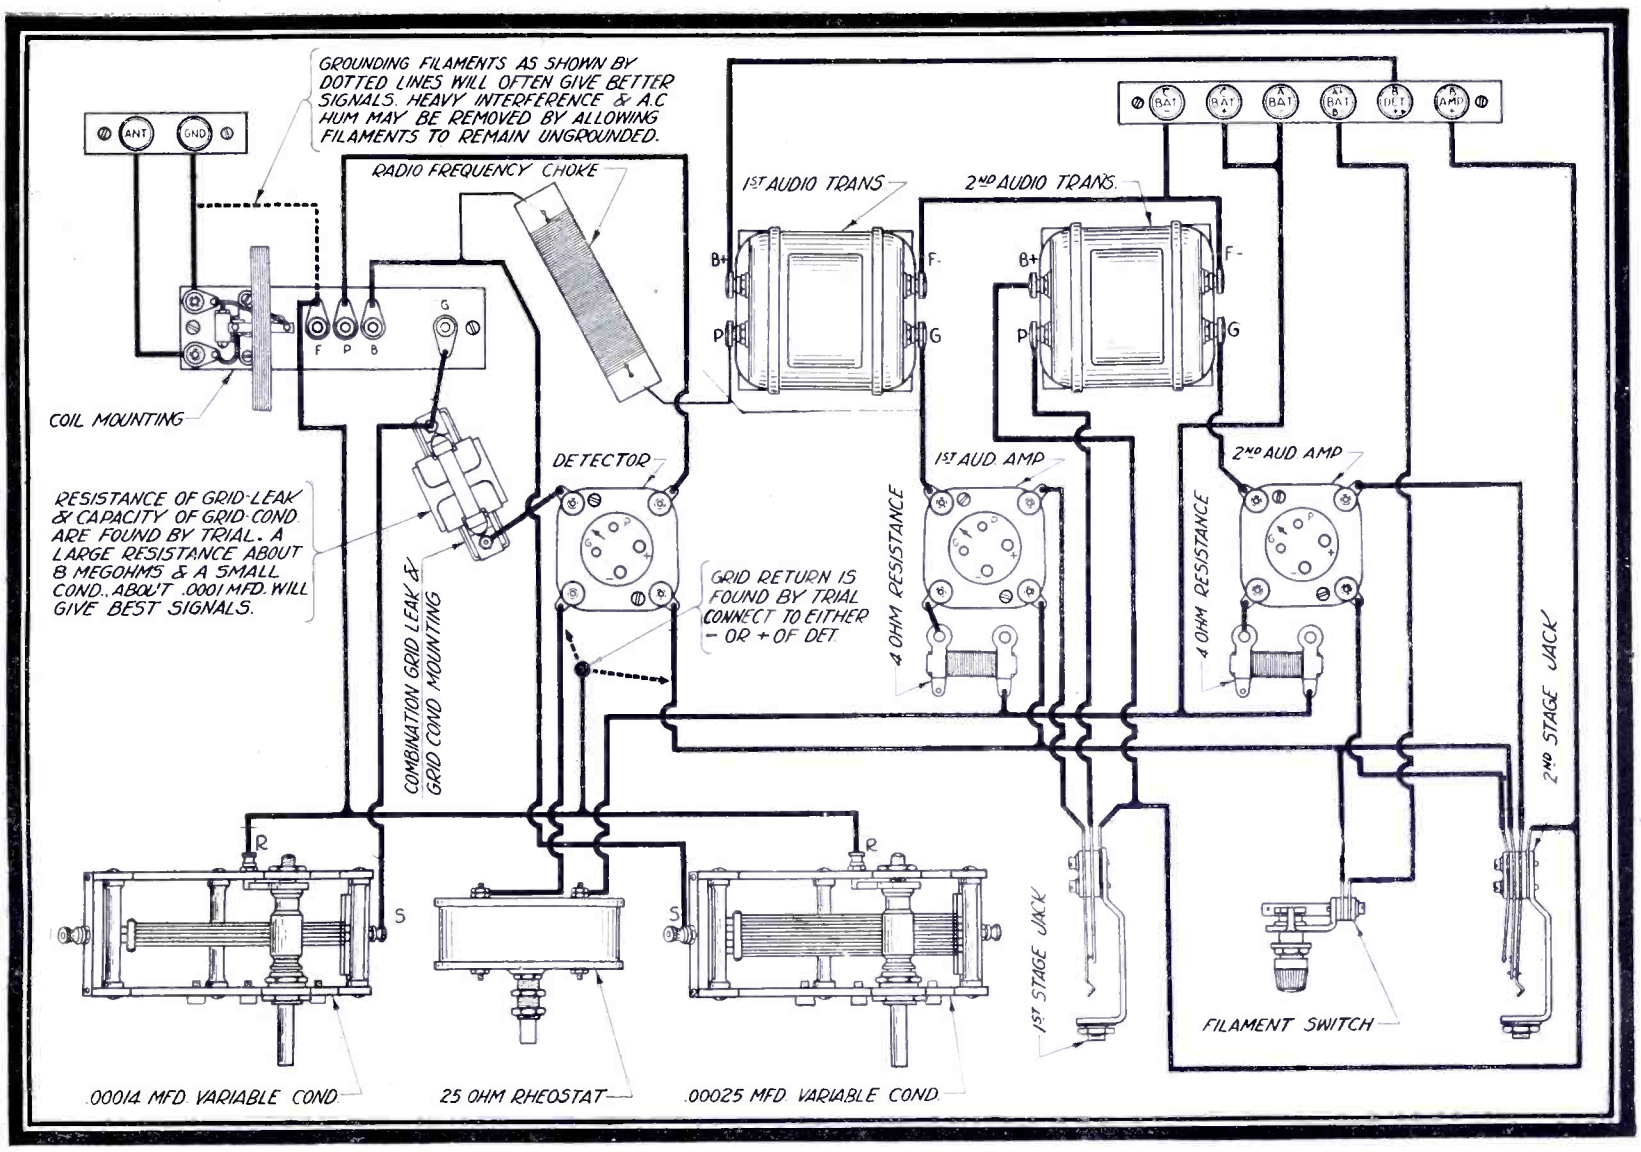

Fig. 3—Graphic illustration showing each connection

e condensers be liberally countersunk so that the heads of the ounting screws will be below the surface of the panel. The rnier dials are actuated by a felt disk which must bear directly ainst the panel, and it is therefore obvious that any mechanism ojecting beyond the panel face will seriously interfere with the eration of the vernier controls, if not altogether rendering em ineffective.

After assembling the receiver, carefully check over the wiring, rrect mistakes if any have been made, and then connect the tteries to the receiver. Insert the third largest coil, disconnect e antenna and with a flexible lead make grid return of detector e positive or negative and try various combinations of grid ks and grid condensers. This procedure is almost absolutely cessary as tubes vary and short wave receivers are prone to into oscillation with a bang or howl instead of the conventional ss. About .0001 mfd., and 8 megohms will probably be found be the best. However, if howling is encountered, the capacity ust be raised and the grid leak lowered. Sometimes changing e detector grid return will clear the trouble.

When the best grid return, grid condenser, and grid leak have en found, check all of the coils and make certain the receiver n be made to oscillate smoothly from maximum to minimum especially when he is listening in on the 200 to 550 meter wave-band. Using both hands for tuning will give best results. A swinging signal may be followed by adjusting the feedback condenser as it detunes very slightly when moved. This detuning is convenient for this purpose, but is not sufficient to disturb logging.

LIST OF PARTS

These parts or their equivalent will give satisfactory results.

1 7"x18"x3/16" Drilled and Engraved Formica Panel
1 5/8"x2½" Formica Terminal Strip
1 5/8"x5" Formica Terminal Strip
1 8½"x17" Wooden Baseboard
2 Karas Harmonik Audio Transformers
1 Karas .00014 mfd. SLF Variable Condenser
1 Karas .00025 mfd. SLF Variable Condenser
3 Benjamin Type 9040 Cleartone Sockets

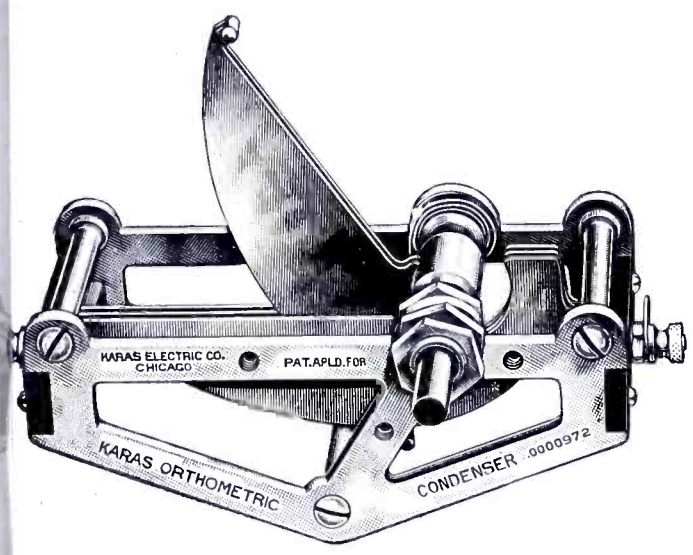
KARAS—Choice of the Experts

IN the construction of a *short wave* receiver the choice of parts used is most important. Frequencies are so great that every detail of materials and assembly must be perfect for satisfactory results. Karas apparatus has been the choice in practically every short wave receiver yet presented to set builders by radio publications. Sleeper in *Radio Engineering*—Schnell in *Q. S. T.*—Marco in *Radio*—Hill in *Radio Age*—Ryan in *Radio Digest*—ALL specified Karas.

In this issue of Citizen's Radio Call Book is the description of a long range short wave receiver requiring Karas 7 and 11-plate Orthometric condensers and two Karas Harmonik audio frequency transformers. The Victoreen super-heterodyne, also described in this issue, requires two Karas 23-plate condensers. In the oscillator circuit of a "super," a high quality condenser is absolutely essential. The experts *know*—they have testing apparatus and get the laboratory reports. Wise set builders will follow the experts' choice.



Karas Orthometric Condenser

With the Karas Orthometric condenser, stations are spaced equally over the dial by kilocycles, which is the basis on which the government assigns stations their wave lengths. No crowding on the shorter waves, no useless spreading on the longer ones.

The solid brass plates, soldered at points of support, have the lowest losses known. The pig-tail assures a continuous electrical path to the weak currents; pig-tail on the 5-plate is insulated to prevent contact noises. Skeletonized brass end plates place the least possible metal in the effective field; the dialectric of hard rubber is placed well without the field and neither leaks nor absorbs energy. Karas bearings allow the rotor to turn evenly and smoothly.

Orthometric 5-plate .0001 mfd., $6.50; 7-plate .00014 mfd., $6.50; 11-plate .00025 mfd., $6.50; 17-plate .00037 mfd., $6.75; 23-plate .0005 mfd., $7.00; special 17-plate with extended shaft for Equamatic System, $7.00.

Karas Micrometric Dial

Karas Micrometric Vernier Dial is a precision instrument that tunes accurately to the thousandth (1/1000th) part of an inch and has a ratio of 63 to 1. It turns easily with a liquid-like smoothness. The gear arrangement by which this extremely fine adjustment is accomplished is a recent achievement of Karas engineers. There is no possibility of even the slightest "back-lash." Micrometric turns ***instantly*** in either direction, at any point, by the lightest touch on the vernier knob. Rough tuning is done with the larger knob.

It is a genuine pleasure to tune with such a dial. The large diameters of the knobs to be grasped prevent cramping of the fingers when going after DX several hours at a stretch. It is unnecessary to drill an extra hole for mounting. Dial markings and numerals are gold inlay; 200 divisions on the 180 degree type—400 on the 360 degree rotation models. Outside diameter is 4½ ins. Price $3.50 each.

Karas Harmonic Transformer

By amplifying ALL frequencies nearly equally—low tones—middle tones—high tones—and the many harmonics and overtones of all audible sounds—Karas Harmonik audio frequency transformer delivers pure, natural, undistorted musical reception to which it is delightful to listen. At the same time, in the Harmonik, Karas presented the set building public with a transformer of higher efficiency—one that gives a far greater voltage amplification per stage. Price $7.00 each.

Karas Equamatic System

The circuit sensation of the 1926-27 season is the Equamatic System. Using Equamatic apparatus as made by Karas you get maximum and equal sensitivity and amplification on ***all*** wavelengths—high, low and medium. You get greater selectivity without distortion or loss of the harmonics of musical selections. These long-sought features are actually obtained since no "losser" methods whatever are employed.

The essential parts for the building of an Equamatic Receiver are made by Karas. Complete instructions for assembly and wiring, including drilling layouts, are available. The Equamatic booklet, fully explaining the Equamatic System and what it does, will be sent on receipt of 10c in stamps or coin.

Karas Condensers in the 23, 17 and 11 plate sizes are sold by good Radio Parts Dealers in most cities. The 7 and 5 plate sizes are not so widely stocked by dealers. Orders for any parts mentioned above will be filled direct, or may be placed through your dealer and his jobber. Send no money. Just pay the postman the price plus a few cents postage.

Tell 'Em You Saw It in the Citizens Radio Call Book

The Nine in Line Super

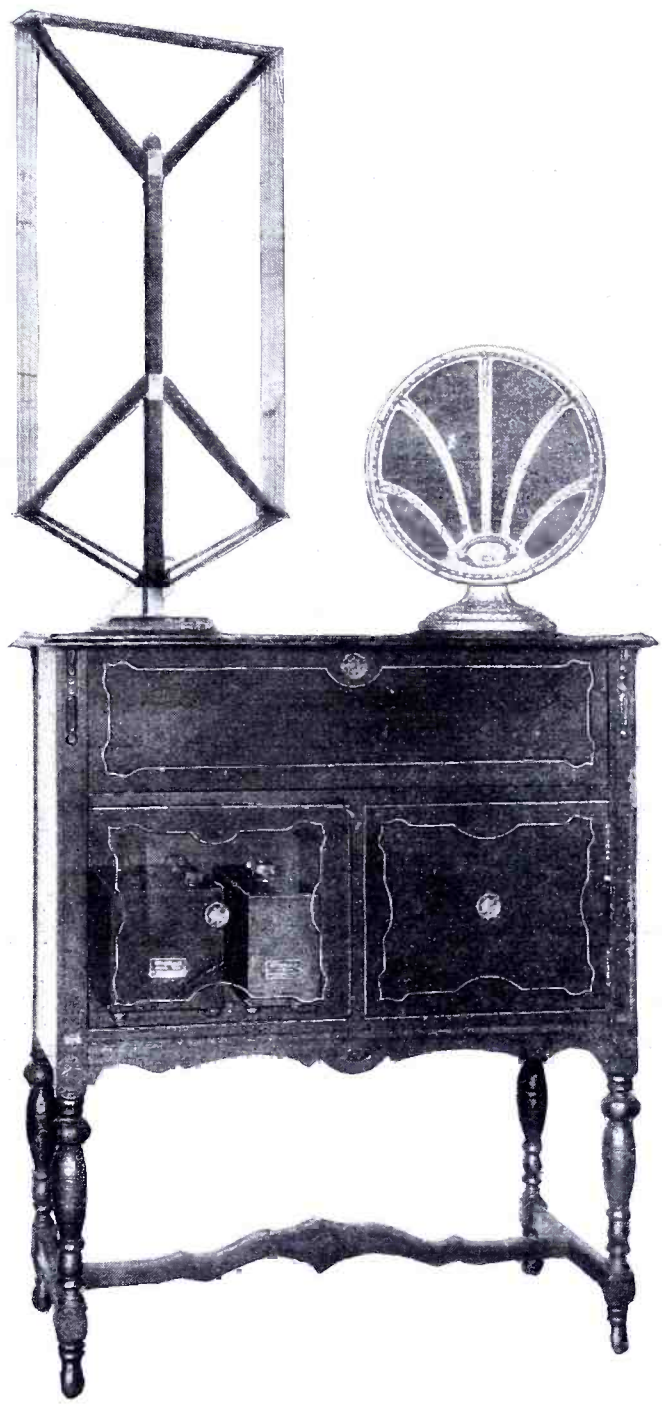
This receiver was constructed and designed in the Citizens Radio Laboratory. Its performance was more than satisfactory under the most severe conditions

THE 1926-27 radio season finds itself confronted with new problems in building receivers. Decisions in cases of "pirating" of the air have created a confusion in broadcast conditions without precedence, and congested cities will ve ten to twenty stations broadcasting simultaneously, the latter t even being forced to keep to their assigned wave length. We arn of increase of power in the output of most of the stations, us being unable to separate them on the erage receiver, and many radio enthusits will lose courage and leave their reivers untouched for weeks.

However, the developments in receiver nstruction have foreseen the conditions cing the radio public. Quality and effiency have always been the requirements receiving instruments, and this article ill deal with a set which will satisfy the uilder even under the new broadcast contions. The receiver, designed in the labotory of the Citizen's Radio Call Book, us proven that it is possible to overcome l present difficulties. Hair-sharp selecvity, tremendous power and highest qualy of tone are combined with simplicity tuning and economical cost of operaon.

One important item should be emphazed for receivers constructed for the nateur set builder. This is appearance. oday the amateur will be eager to demonrate the set, not only for efficiency, but so for simple symmetrical layout, and e receiver to be described is a proof at it is possible to construct a highest ade receiving instrument at home.

The startling efficiency of the set was early demonstrated in Chicago. While local, mostly super-power, stations were oadcasting, it was the simplest matter to ne in on a score of long distance staons on an average midsummer night, and was even possible to reach 600 miles ith full loud speaker volume during the ytime. The fully balanced system asres an extremely quiet operation and ere are no regenerative howls or oscilations. It is acknowledged that the superterodyne circuit is the only receiving stem where extreme selectivity can be tained. However, it was comparatively fficult to combine selectivity with tone, d our laboratory has been experimenting r many months to construct this receiver, hich will be superior in efficiency under e most favorable conditions.



View showing how receiver can be mounted in a console with suggested accessories

We have selected the H. F. L. Transformer units, originally signed for long wave receivers, and have succeeded in incorporating stages of intermediate frequency, with 2 tuned stages—an periment which was never carried out successfully in previous ceivers.

Figure 2 shows the assembly of the apparatus on a bakelite se panel, the latter being drilled according to the dimensions ven in this drawing. After the set is assembled in the manner advised, small holes should be drilled through the filament terminals of the sockets in the base panel, as the entire wiring is made underneath, and the necessity will arise to reach the socket terminals from there. The grid and plate terminals of the transformer are directly bridged to the respective terminals of the sockets, except the grid of the 6th and 7th transformers. The latter are bent up and 4/32x5/8-inch screws are placed through the eyelet holes of these units and connected under the base panel to the respective leads. The same is done on the battery and filament terminals of all transformers.

The radio frequency choke unit has but three connections, the terminal F not being made use of. The L-430 Radio Frequency Transformer, used as oscillator, is mounted on the lower part of the base panel. The entire wiring is done, as mentioned, under the base panel, and all connections are made as short as possible. The "B" battery leads of the transformers are run closely together into the prongs of the cable bracket, and they should be connected according to the colors shown in Figure 3. This figure gives a clear view of the entire wiring system, and the schematic diagram of Figure 4 will be an aid in checking the connections.

Two by-pass condensers, 3 mica condensers, a filament ballast for the audio tubes and the midget condenser are also placed under the base panel. The photograph shown in Photo C will give a clearer explanation of the assembling and wiring system under the sub-panel.

It is emphatically advised to select the very best material for this receiver and to use extreme care in connecting the various parts. Perfect solder joints will assure least resistance and hence better reception.

A common "C" battery is used for all grid returns, and a voltage of 4½ to 6 volts recommended. It will be noted that this "C" battery will provide the necessary bias also for the second detector tube, so that rectification will be accomplished on the negative side of the static characteristic curve of this tube.

The oscillator and the two detector tubes are operated with a common rheostat, mounted on the left end of the front panel. This arrangement creates an additional helpful tuning control for lower wave signals where the oscillator dial might tune too sharp. The 4 WX12 intermediate frequency tubes are connected in series and controlled by a 25-ohm rheostat placed in the center of the front panel. This rheostat acts as a volume control. The right-end knob operates a 200,000-ohm centralab radiohm, connected across the secondary of the first audio transformer, and will serve as an audio frequency modulator.

The arrangement of the tubes from left to right are as follows:

1st Detector 201A

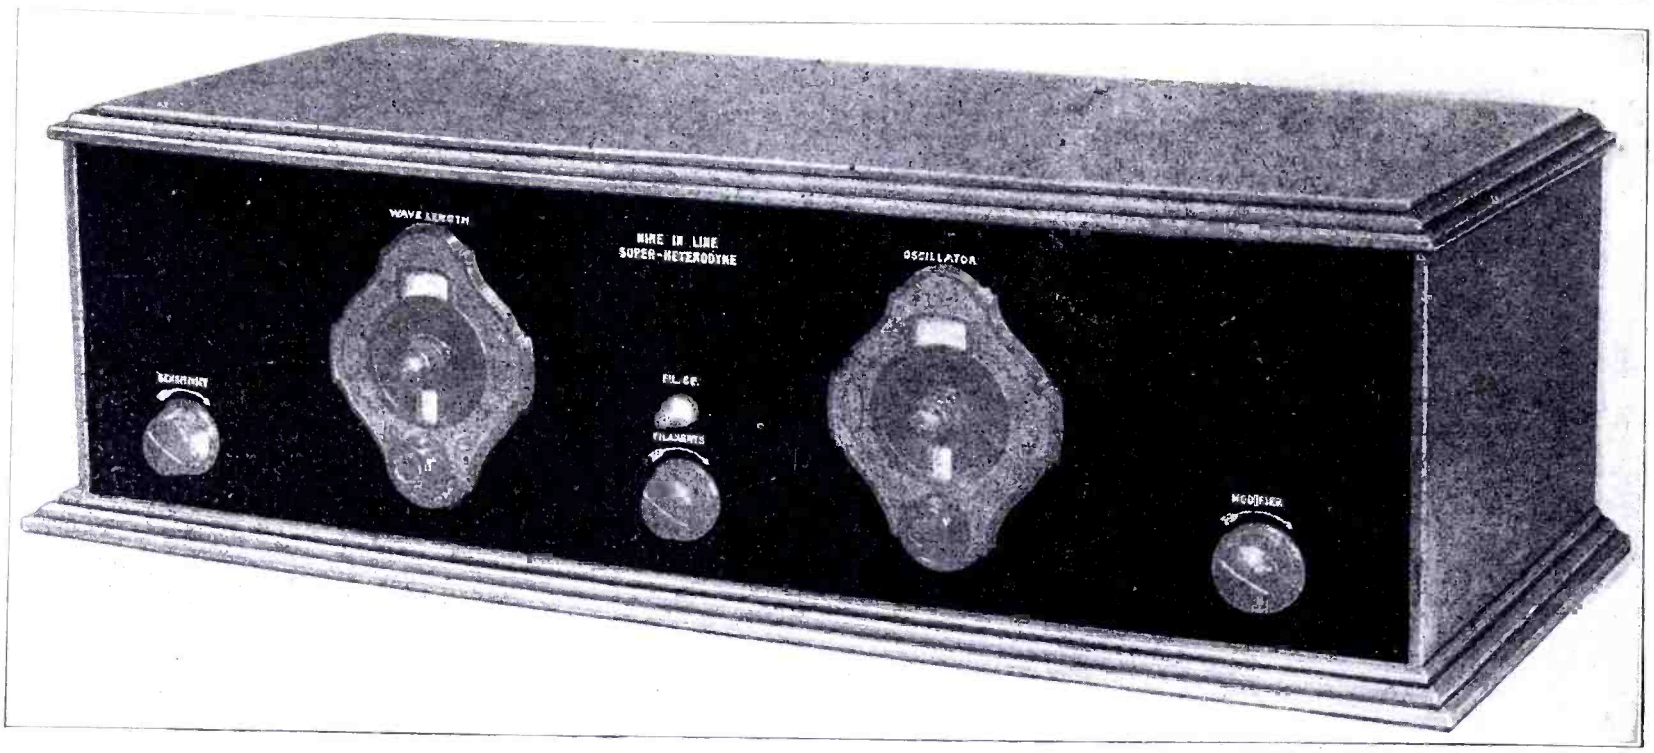


Photo A. Front view of receiver mounted in cabinet

4	Intermediate frequency	WX12
2nd	Detector	201A
1	Oscillator	201A

It will be useful to give a brief explanation of the reasons why this receiver has given results never achieved yet with other radio sets.

Experimenters familiar with the super-heterodyne circuit have probably experienced that the use of more than 3 stages of intermediate frequency will meet great difficulties and therefore they have never been successful with inserting more intermediate frequency transformers. The average super-heterodyne combines 1 filter and 3 untuned stage transformers. However, passing the highly amplified I. F. signals through a second tuned stage will permit a considerable increase of selectivity, and this can be accomplished if the 2 tuned stages are very closely peaked, possibly within 1 per cent. The untuned stages in this case should have a very flat resonance curve. They act merely as intermediate frequency amplifiers. This can be accomplished by a coil of high capacity (paper section coil) and a heavy, closed iron core with a large surface, that is, a great number of very fine high silicon steel laminations. An intermediate frequency untuned transformer of this design will have a fairly uniform amplification factor within a range of 6 to 8 kilocycles and thus create less tendency to I. F. oscillations and distortion. The signal carried through 2 transformers of this type will enter the first tuned stage on a very broad band, and this band tightened

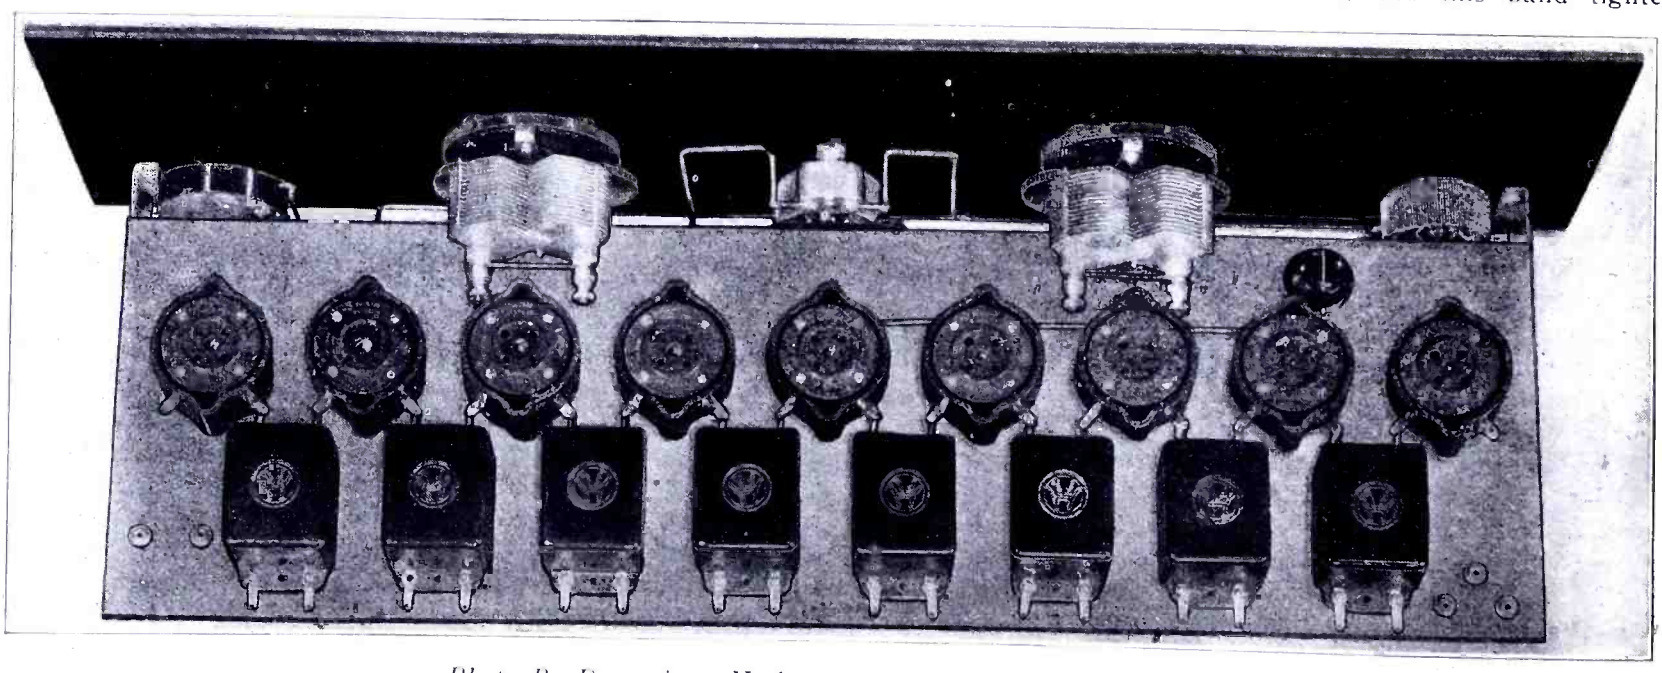

Photo B. Rear view. Notice the neat arrangement of parts

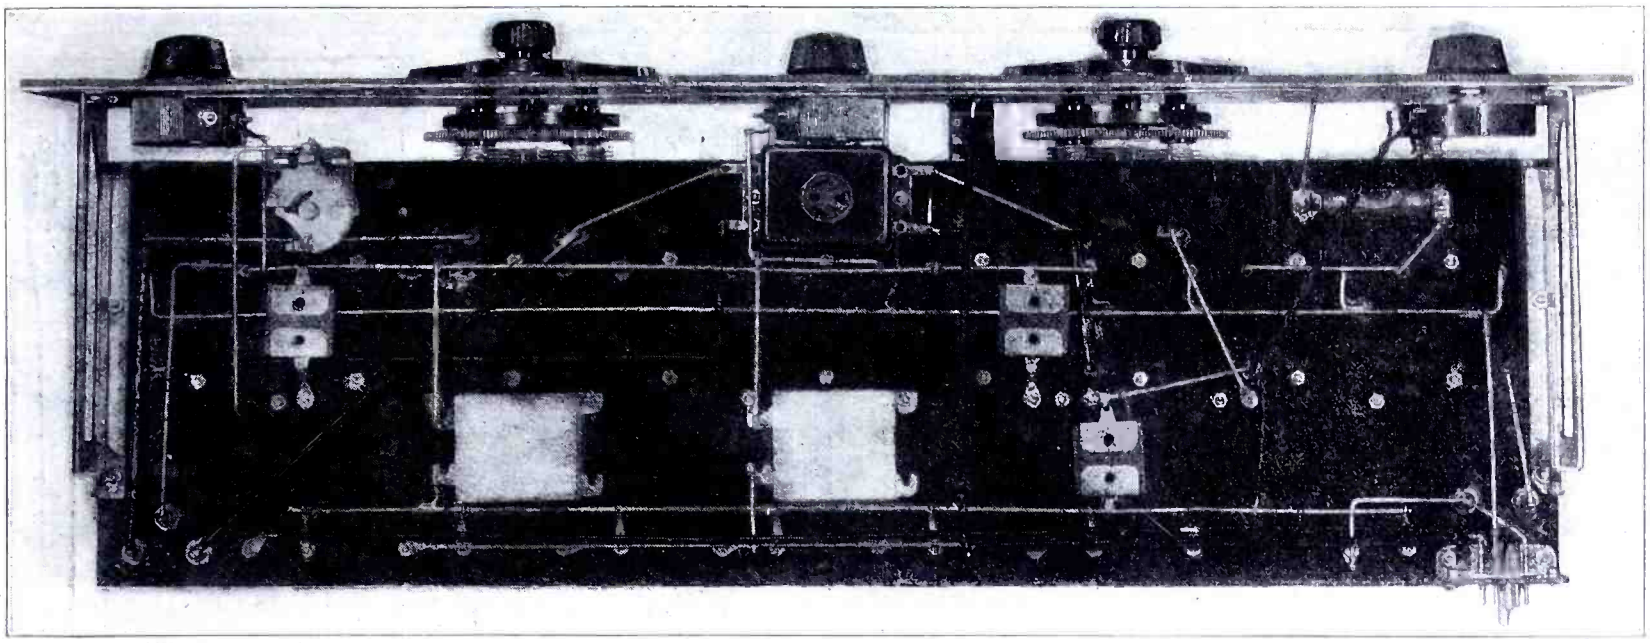

Photo C. Bottom view showing arrangement of parts under subpanel

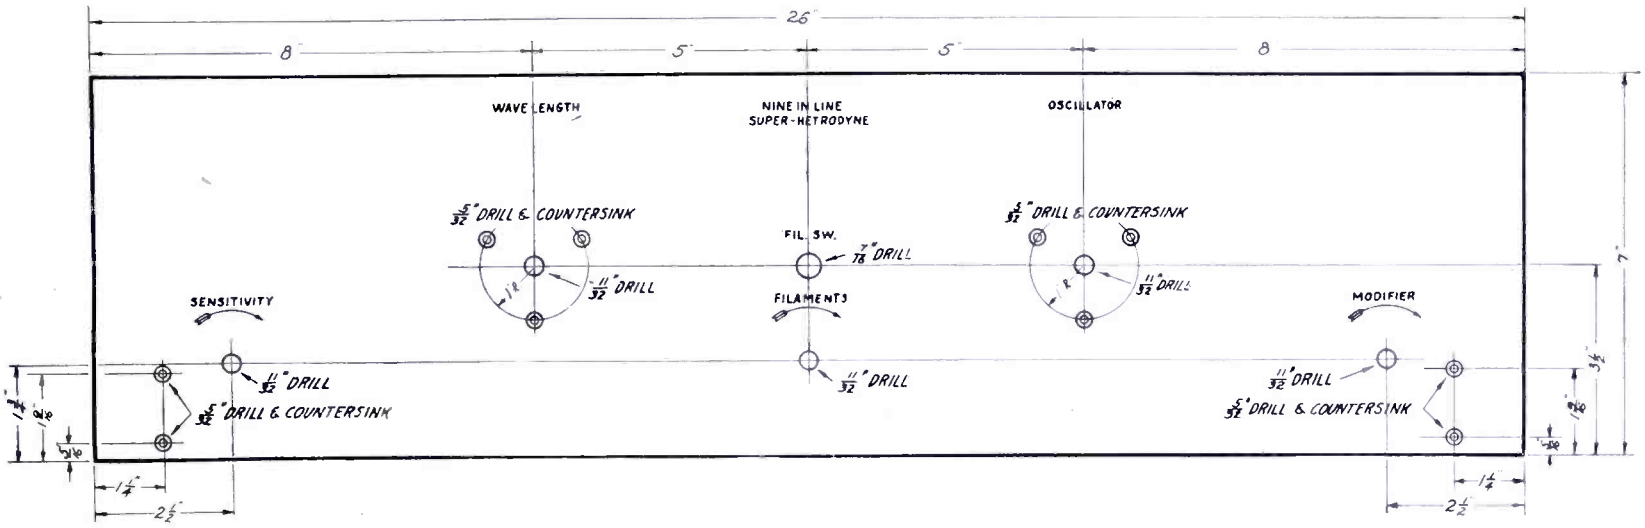

Fig. 1. Panel layout

through a filter stage will go through another amplification stage before it passes through the second filter into the detector.

Nevertheless, a so highly amplified intermediate frequency signal will have the tendency to feed into the audio frequency amplifying stages. It has proven that for high power, long wave input to the audio stages, transformer coupled amplification will perform best, and therefore all super-heterodyne constructions have decided for this type of amplifiers instead of resistance or impedance coupling. Therefore care has to be taken to prevent feed of the intermediate frequency signals into the audio, as a sensitive human ear will still detect oscillations up to 20,000 cycles. The audio transformers of this receiver is of the very smallest dimensions, wound with the smallest gauge wire available for winding purposes, and has a specially shaped core of very thin laminations. The high impedance secondary of this construction with its comparatively high capacity effect will create a sharp decline of the amplification curve over 10,000 cycles and thus not amplify the entering intermediate frequencies to the volume of audibility. In this way one of the greatest disadvantages of super-heterodyne receivers is eliminated.

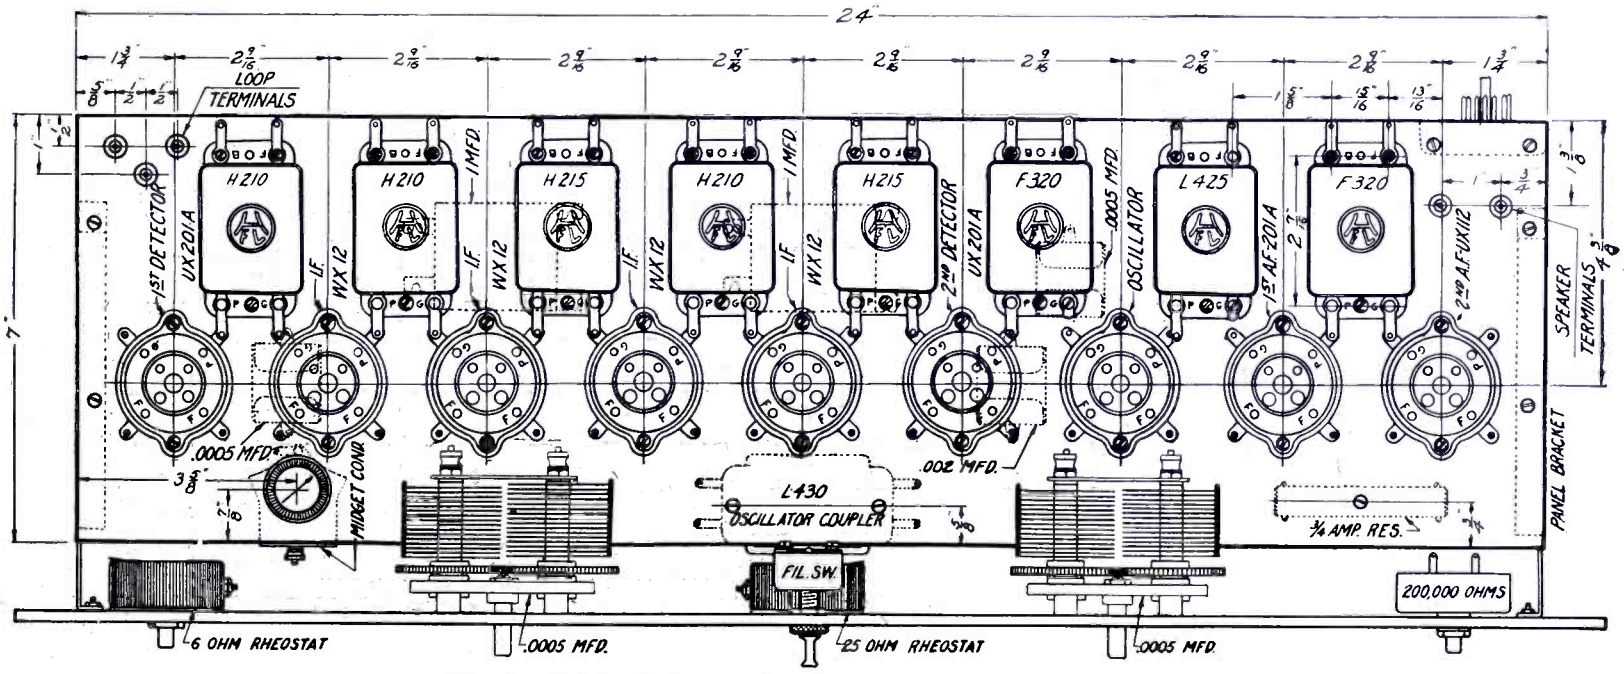

Fig. 2. Subpanel layout showing arrangement of apparatus

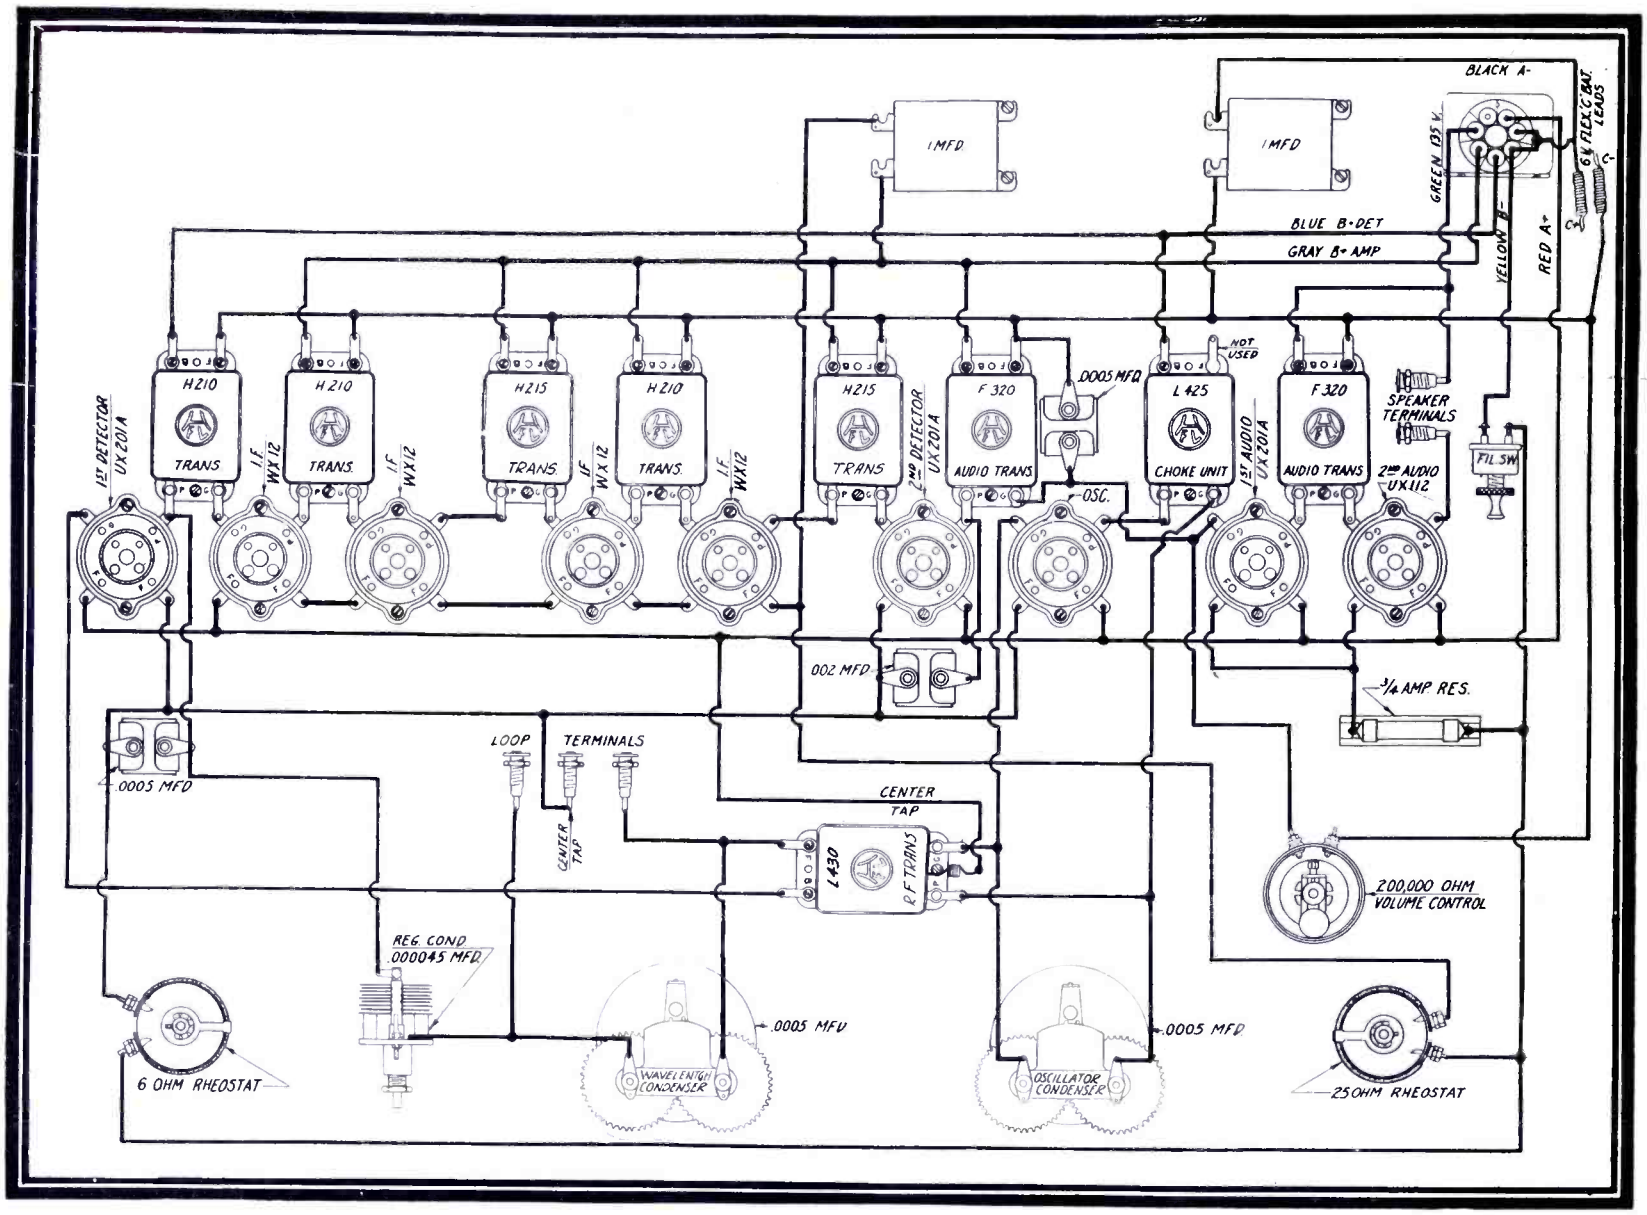

Fig. 3. Graphic illustration showing every lead in entire receiver

Another important factor in balancing super-heterodyne circuits is the oscillator energy. The so widely emphasized "low loss" expression is not of great importance in this case. The oscillator has to range within the broadcast wave band and its output energy has to match that of the loop circuit, in order to prevent overloading of the first detector grid with one of the two power sources. The input circuit will be more efficient if a complete balance is created.

The accessories shown consist of:

A complete "A" and "B" Power Plant. The "A" delivers 6 volts and "B" all necessary voltages, which are variable, to operate detector and amplifier circuits. Connects into any convenient a.c. light socket. Manufactured by Storad Manufacturing Co., Cleveland, Ohio.

The Speaker is the new Thorola cone type, dual diaphragm. Manufactured by Reichman Co., Chicago.

The Loop is the new Qualitone, made by the Duro Metal Products Co., Chicago.

The Console is one of the many types made by the Chillicothe Furniture Co., Chillicothe, Mo.

(If any information is desired regarding any of the accessories listed, please write manufacturer direct.)

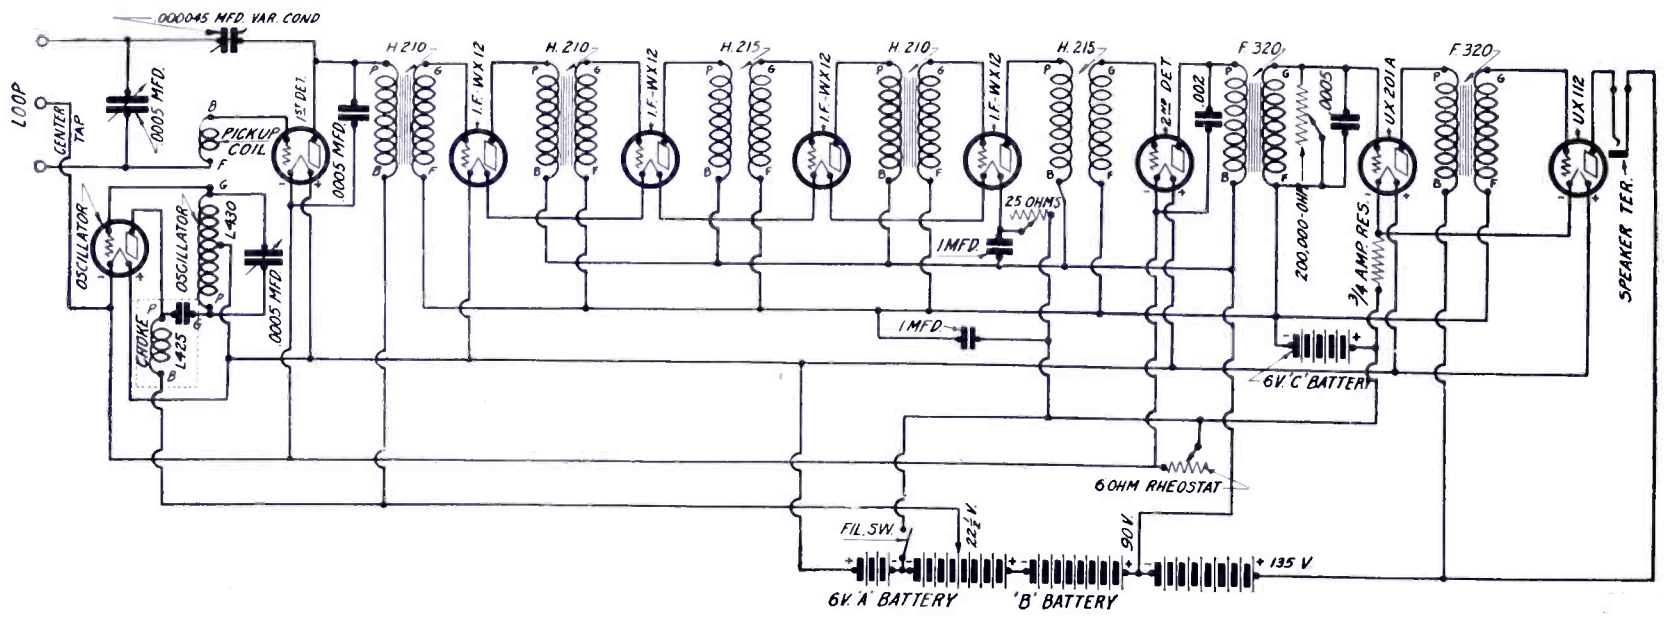

Fig. 4. Schematic wiring diagram

Quali-Tone

SPEAKERS LOOPS UNITS

for the finest Radio Reception

Quali-Tone No. 4

Quali-Tone Speakers FOUR MODELS

Quali-Tone Speakers represent at the one time the utmost in quality and performance at low cost and extraordinary beauty of appearance and design. THE JUNIOR QUALI-TONE is ideal for portable receivers and for use wherever space is limited. It is finished in black crystal, equipped with the popular Quali-Tone adjustable unit . . . height 13 in. Bell 8½ in. Price $7.50. . . .

QUALI-TONE Model No. 2 is most artistically designed, finished in a semi-dull black leather pattern that is exceedingly attractive. It is slightly larger than the Junior, being 15 in. high with a 10 in. Bell. Price $10.00. . . .

Quali-Tone No. 3 has an 11½ in. Bell of Bakelite polished to a deep black lustre that delights the eye. Sound chamber and base have a dull black Morocco leather finish that harmonizes with any surroundings. It is 19½ in. high and is equipped with the justly famous QUALI-TONE DeLuxe Unit. Price $15.00. . . .

QUALI-TONE Model No. 4—the Speaker Supreme—has a polished Bakelite Bell while the sound chamber and base have a dull black Morocco finish. Like No. 3, this marvelous Speaker is also equipped with the QUALI-TONE De Luxe Unit that assures a quality of tonal reproduction altogether beyond expectations. Height, 22½ in. Bell, 14 in. **Price $25.00.**

Quali-Tone De Luxe Unit

Extremely powerful concert type. Finished in black crystal enamel with nickel trimming. Constructed to handle extra heavy volume. Adaptable to any standard make of phonograph or console set. **Price $7.50.**

Quali-Tone Phonograph Radio Unit

With adapter will transform any standard phonograph into a loud speaker. Sturdy construction and fine adjustment reproduce light and heavy tones with equal exactness. Adaptable to consoles with built-in speakers. **Price $6.00.**

Quali-Tone Loop

Holds 2 world's records. Brought in stations 8,000 miles distant.

Collapsible Aerial With the Exclusive Thumbscrew Adjustment

Quali-Tone Loop

The Quali-Tone's new thumbscrew adjustment keeps the loop wires taut always—an improvement that contributes largely to the startling performance of this remarkable loop. Then, too, the long vertical strands of the Quali-Tone result in a greatly increased efficiency that adds appreciably to the distance range obtainable. The Quali-Tone will outperform any loop on the market and will invariably produce a decided improvement in the operation of any receiver.

Guaranteed

The Quali-Tone is thoroughly guaranteed in every respect against defective workmanship. Construction is of the very highest quality throughout. The loop woodwork is walnut finish. All the metal fittings are heavily nickel-plated. The wire spacers are made of the highest quality insulating material, eliminating the losses that are commonly found in loop aerials. Only the best grade of stranded wire, well insulated and covered with silk braiding, is used.

A heavy, substantial walnut base is provided, felt-padded at the four corners to prevent scratching. Three long, flexible leads with phone tips facilitate quick connection of the loop to the receiver. Size, open, 16 in. x 34 in. Size, folded, 14 in. x 6½ in. x 3 in. All loops have the center tap terminal for .0005 variable condenser. **Price, $10.00.**

Recommended

Radio Editors, Engineers and Fans alike proclaim the Quali-Tone superior to all others. Mr. E. H. Scott, designer of the World's Record Super Nine, attributes the record-breaking performance of his renowned receiver in great part to the Quali-Tone Loop he always used.

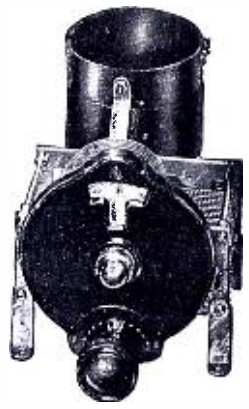
NATIONAL RADIO PRODUCTS

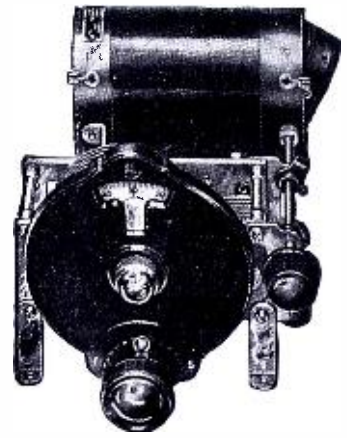


B D-1B With "B" Dial

NATIONAL Tuning Unit B D-1B consists of a Browning-Drake spacewound inductance coil, mounted on a .0005 NATIONAL "EQUICYCLE" (SLF) condenser and covering the broadcast range. The inductance has the lowest R. F. resistance recorded for a coil of this type. The condenser uses three-quarters instead of one-half turn, thus still further spacing out the stations. A NATIONAL VELVET-VERNIER 4-inch dial is included.

Price **$10.25**
With illuminated Type C Dial.. **10.75**

Also furnished with NATIONAL Equimeter (SLW) Condenser at $1.00 less than above list.



B D-2B With "B" Dial

The B D-2B NATIONAL Tuning Unit combines a Browning-Drake Spacewound Transformer with a .00025 NATIONAL "EQUICYCLE" Condenser. This condenser gives clean-cut separation of stations on all wavelengths. The NATIONAL VELVET-VERNIER, Type B Dial included with the unit is known to every Radio enthusiast from coast to coast for its perfection and constancy of action. It is now made as Type C, with an illuminated dial.

Price—B D-2B, with Type B Dial **$13.75**
With Type C Dial..... **14.25**

Also furnished with NATIONAL Equimeter (SLW) Condenser at $1.00 less than above list.

E M-500 With "A" Dial

The NATIONAL "EQUIMETER" Condensers (straight-line wavelength) are as popular as ever among broadcast listeners and Radio amateurs. Made in all capacities from 50 to 1,000 MMF.

Type A NATIONAL VELVET-VERNIER Dials,—the original and matchless dials for operation of variable condensers,—are supplied with these condensers.

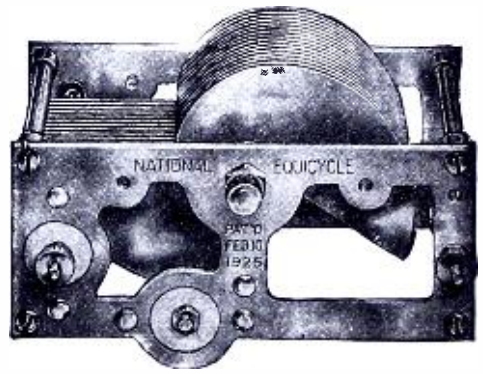
Price— 50 MMF..... **$5.00**
250 MMF..... **6.00**
500 MMF..... **6.50**

The NATIONAL VELVET-VERNIER Dial, Type C, is essentially the same as Type B Dial as far as perfection of construction and operation, beauty of appearance and ease of attachment are concerned. It has the same variable ratio of from 6-1 to 20-1.

But it is designed with a tiny invisible 6-volt lamp which illuminates the dial directly. This lamp can either be separately switched or placed in the filament circuit to act as a tell-tale for the tubes. Extra 6-volt lamps, **$0.20**. 4½-volt lamps, **$0.35** each.

Made in either clockwise or counter-clockwise and with 360° divisions (0-200) or in Dual Range—180° (0-100-0).

Price—In nickel finish..... **$3.00**
In gold finish..... **3.50**



The NATIONAL "EQUICYCLE" Condenser is a true straight-line frequency Condenser, with three-quarters of a turn instead of one-half. The construction is patented. The entire condenser is built of aluminum, with brass working parts and Isolantite insulation. Volney D. Hurd, Radio Editor, THE CHRISTIAN SCIENCE MONITOR, has said of this condenser: "It changes a mob into an orderly procession and lengthens the line of march." This quality of great separation of stations is not to be disregarded in these days of shifting wavelengths and overcrowded frequency bands. Prices include either Type A or Type B NATIONAL VELVET-VERNIER DIAL. Add 50c for Type C illuminated dial.

Price—250 MMF..... **$7.00**
350 MMF..... **7.25**
500 MMF..... **7.50**

No matter how sensitive or selective a Radio set may be, it gives little real satisfaction if the quality of its audio amplification falls below modern standards.

The NATIONAL IMPEDAFORMERS have been designed for quality audio amplification. Each of the three units contains a .1 Mfd. TOBE Condenser and a LYNCH Resistor. The first unit has also an R. F. Choke, which is a real necessity for perfection of reproduction. Three Impedaformers, three tube sockets and a rheostat are all that is necessary for an audio amplifier which is the last word in power and faithfulness of reproduction.

Price—NATIONAL IMPEDAFORMERS,
Type B, each..... **$5.50**

The NATIONAL Radio set essentials listed above, may be easily built by you into a modern receiving set, capable of distance, able to separate stations sharply, of fine appearance, easy to operate and easy to listen to. Send for Bulletin 116-CB. Be sure you get the genuine NATIONAL products.

A Browning-Drake Receiver with Impedance Coupled Amplification

This Is a Very Popular Circuit for Home Construction and if the Following Construction Data Is Carefully Followed Will Give Very Satisfactory Results

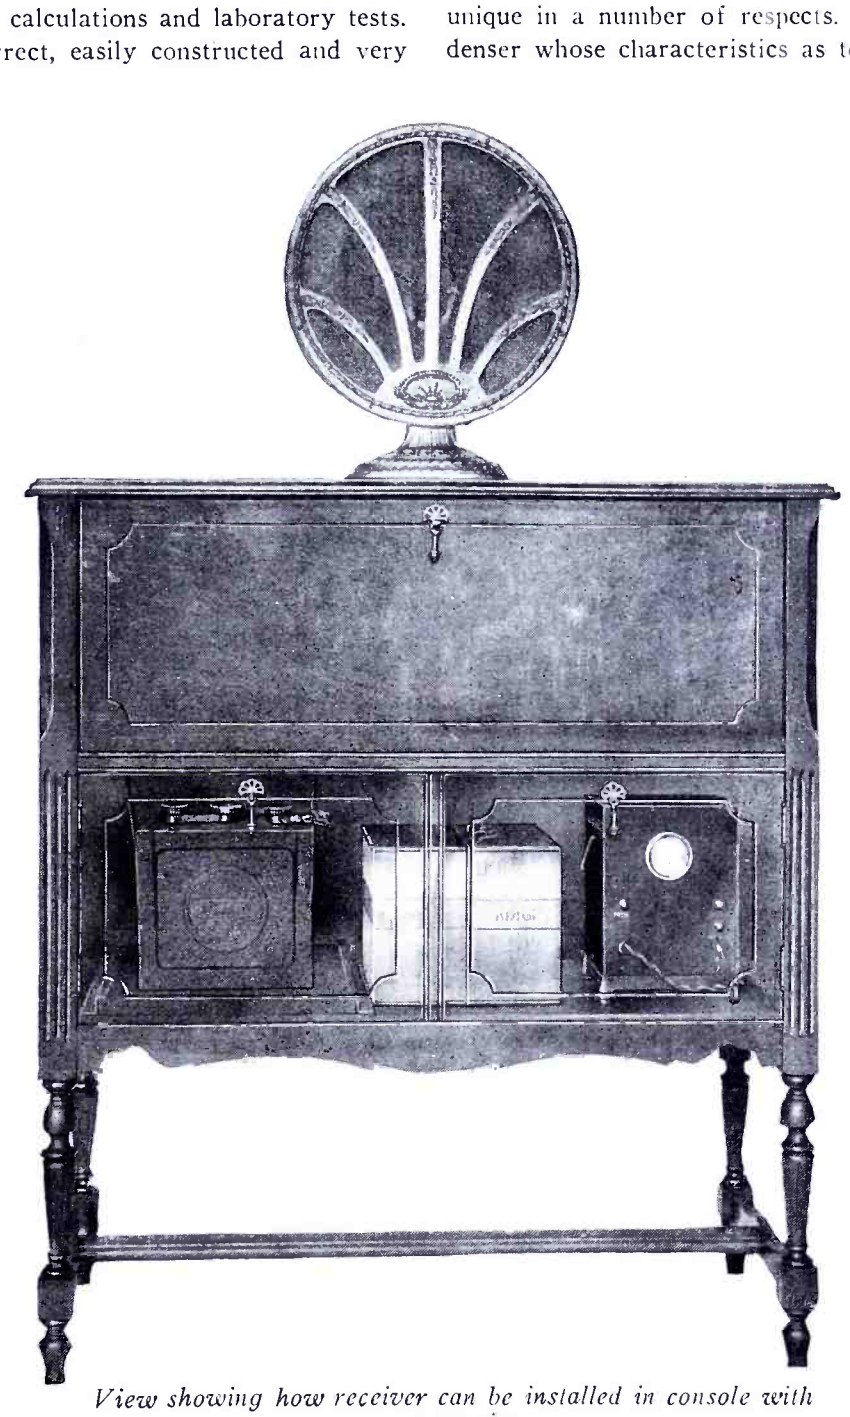
This Receiver and All Illustrations Prepared in the Citizens Radio Laboratory

NE of the few circuits which have been the most prominent in their popularity with the home constructor is the Browning-Drake. This remarkable receiver was designed by G. H. Browning and F. H. Drake of Harvard University, and he result of careful mathematical calculations and laboratory tests. e fact that it is scientifically correct, easily constructed and very cient accounts for its popularity.

Continued experimentation on part of the manufacturers of Browning-Drake tuning units, h the improvement of the same view, has developed a new type unit which, while different from original, incorporates new de- n and methods which combine to ke the performance of the new paratus superior to that of the .

The primary of the new type of nsformer is wound on a short gth of Bakelite tubing which has ontinuous groove across its out- e surface in a manner similar a screw thread. The wire con- uting the primary rests in this oove. The short length of tub- bearing the primary is inserted hin a larger tube upon which is und the secondary, also in a oove. The winding on the an- na coupler is identical in me- anical construction to the sec- dary of the transformer. The essary connections are made thin the units and the tap and ds of the windings are soldered the combination eyelets and sol- ing lugs which in the case of transformer hold the two tubes the correct position so that their oper inductive relation is main- ned at all times.

The advantages of winding the ils by this method are obvious. hard drawn copper wire is used ich has a flexible enamel baked on its surface. Unlike the for- r wire, using a dyed vegetable re insulation, the enameled wire s an extremely low skin resistance to radio frequency currents. In dition the wire is mechanically spaced upon the tube and rests in a oove which prevents slipping and establishes a snug job of wiring thout the use of an adhesive. Vegetable fibre insulated wire is bject to absorption and drying out of water vapor as well as being excellent collector of dust. In as much as the enameled wire can- t be affected by water vapor and since the dust gathering upon the coil may be easily wiped off, the superiority of an enameled wire over an insulated wire is self-evident.



View showing how receiver can be installed in console with accessories

Another improvement in the units is the replacing of the tuning condenser by an Equicycle variable condenser. This new condenser is unique in a number of respects. It is a straight line frequency condenser whose characteristics as to capacity, when used in conjunction with the correct inductive value, are such that the waveband between 200 and 600 meters, or 1500 kilocycles, is within its tuning range. The shape of the plates of the condenser are such that the stations as "tuned in" will be evenly spaced according to the numbers appearing on the dial face. This feature in itself is not new but in this new design the total rotation of the rotary plates is 270 degrees instead of the customary 180 degrees which has been the practice in condenser construction. The added ninety degrees allows a wider spacing of the high frequency stations. The high efficiency of this new type of condenser is no doubt the result of insulating the stator from the rotor by using a newly discovered dielectric material, known as "Isolantite." This substance was only developed after long research and is now recognized as one of the best insulators of radio frequency currents.

The circuit used in the new Browning-Drake receiver is identical to the original circuit. The tuner consists of one stage of balanced tuned radio frequency amplification and a regenerative detector. Sufficient signal strength is obtained by amplifying the detector output by passing it through three stages of impedance coupled audio frequency amplification. This receiver is ideal for any locality due to its selectivity and the wonderful tone quality.

Most types of amplifiers and loud speakers at present reproduce most efficiently sounds about two octaves above middle "C." Above and below this pitch the response is much less. At 200 and 5,000 cycles practically no sound will be heard. This difference between the efficiency at about 1,000 cycles and other points above and below is responsible for the harsh and "tinny" quality so frequently experienced in the average receiver.

The impedance coupled amplifier is so nearly uniform in efficiency

throughout the audible range of frequencies that all the notes from the lowest qualities of human voice and of musical instruments are preserved. The impedance units used in this receiver permit perfect reproduction of tones as low as 25 cycles per second. Thus the mellow harmonious background of the contra basses and cellos is not lost, and the full effect of an orchestra or organ made available. Impedance coupled amplification will become more popular with the constructors of receivers, as its superiority in tonal color and musical range is better appreciated. In all tests with this circuit a cone speaker gave the best reproduction.

The Impedaformers used in the Browning-Drake receiver, described herewith, have the correct value of stopping condenser and resistance supplied with the unit and connected to the proper terminals inside of the container. One unit is marked "1st Stage" and can only be used for that purpose. A .001 mfd. fixed condenser is shunted across the "B Positive" and "P" terminals of the first Impedaformer.

Amperites are used to control all tubes with the exception of the detector tube. The radio frequency tube has a rheostat in addition to the Amperite to modify its filament current, while the detector has only a rheostat controlling it. This arrangement allows either UX 201A or UX 199 tubes to be used. The only change necessary to modify the receiver so that 199 tubes may be used is to replace the Amperites with those rated for 199 tubes operated from a 4-volt battery. The rheostat controlling the detector tube and the radio frequency tube rheostat are not changed. A power tube is used in the last stage of audio in both cases. With the 201A tubes a UX 112 tube is used, while a UX120 tube is used with the 199 tubes. The correct "C" battery bias for either of the power tubes will be found on the circular supplied with the tube.

The radio frequency amplifier is a UX 199 tube regardless of whether 4- or 6-volt tubes are used. This is necessary for best results with this receiver, as it is easier to balance and neutralize this type of tube.

If you want this circuit to work properly, be very careful when you neutralize the radio frequency tube. Insert the phone plug in the speaker jack, thereby connecting the speaker to the output of the amplifier, with the radio frequency tube in its socket. Tune in a strong signal placing the tickler coil just below the point of oscillation. Remove the Amperite controlling the R. F. tube and with a long-handled screw driver or piece of formica sharpened at one end, turn the set screw on the Variodenser counter-clockwise as far as it will go. Now, turn the screw clockwise until a "pluck" is heard in the speaker. At this point the signal that you previously tuned in should be at a minimum. Replace the Amperite. If the receiver howls, turn the screw on the Variodenser clockwise slightly until the howling disappears.

Photo A shows a front view of the completed receiver. It will be noticed that there are two major controls for wavelength and one control for regeneration. Of course, the best results and the greatest sensitivity are obtained when the tickler coil is kept just below the point of oscillation. A tap is provided on the antenna coil for short or long antenna. This is controlled by a jack switch shown in the lower left hand corner of the panel. For all practical purposes the position of the switch can best be determined by experiment. A filament switch is provided to turn on all the tubes at once. Figure 1 shows the drilling and engraving necessary on the panel.

Photo B is a rear view of the completed receiver. It will serve as a guide for the constructor so that he will not experience any trouble in connecting up the instruments. Figure 2 shows the baseboard layout

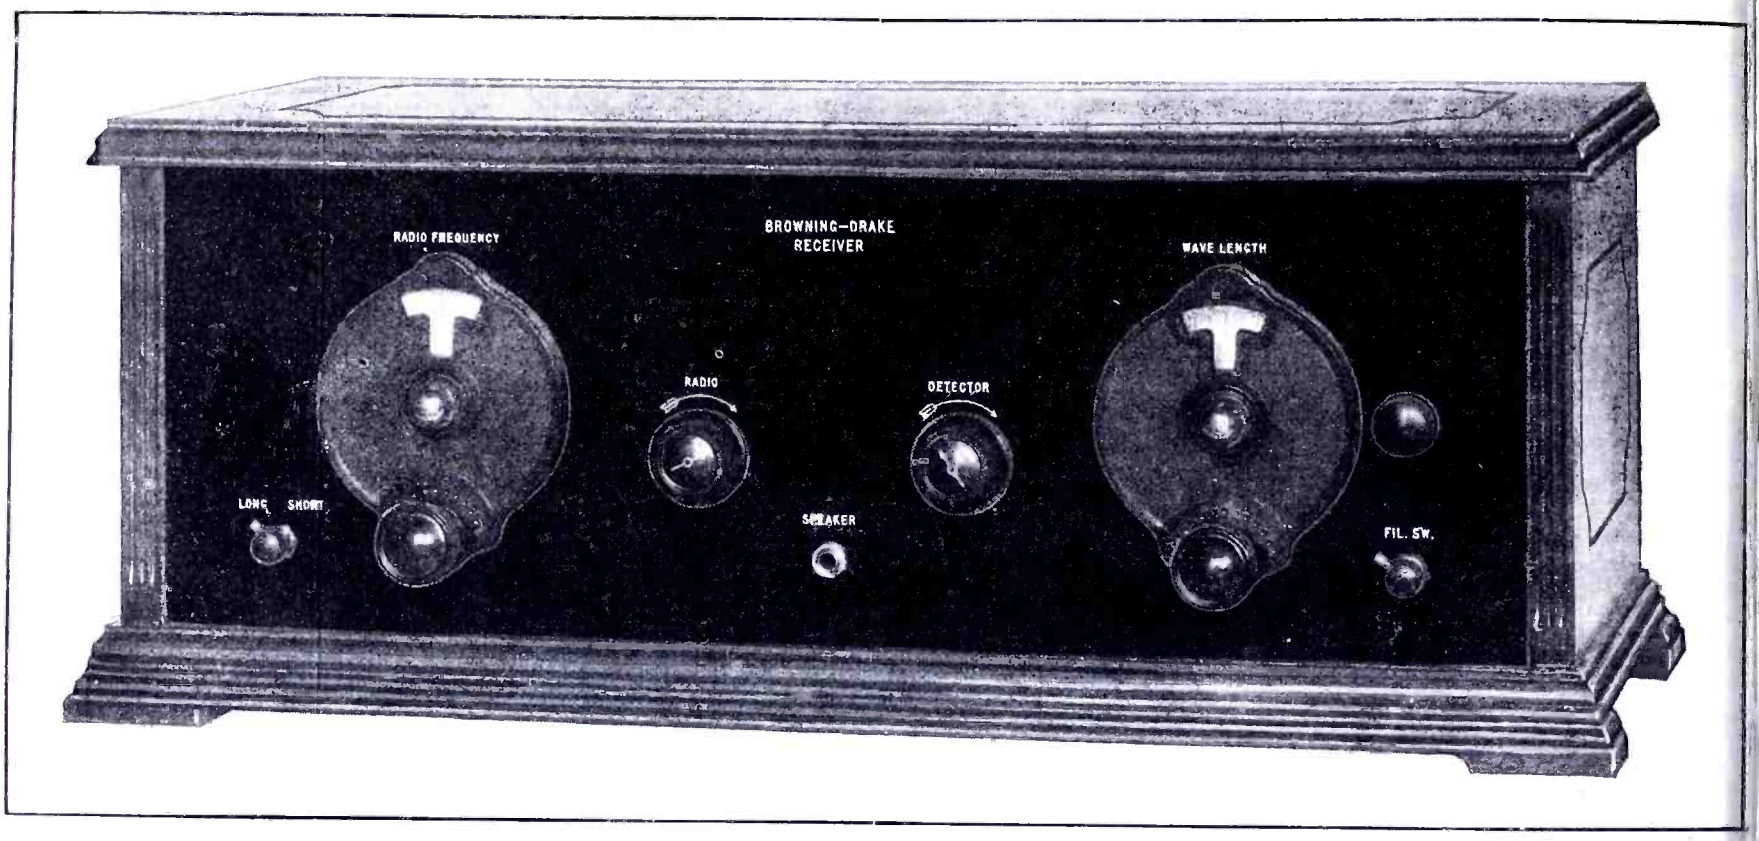


Photo A. Front view of receiver in cabinet

giving all dimensions. We suggest that you follow this arrangement of apparatus to insure a neat job of wiring. No difficulty should be encountered by the builder if he mounts all the baseboard apparatus first and makes all the connections possible. Next the panel assembly should be completed and all connections made that are possible. Then by mounting the panel on the baseboard a few drops of solder will complete the job.

Figure 3 is a graphic illustration showing every connection in the entire circuit. It is advisable to check back against this diagram when the wiring is complete and make sure that every connection is made as specified. For the fans who are more experienced, the diagram in Figure 4 will carry an especial appeal.

A Central Laboratory Modulator plug is used to vary the volume of the speaker. The different stages do not employ separate jacks, as the modulator plug can be varied to eliminate the strongest signal without detuning the receiver.

The new Browning-Drake receiver has been designed with the utmost care, and it is only fair then, that the constructor use care in his workmanship when he assembles the set. It is not possible to make any design proof against carelessness. No set can be made successful unless the instructions are followed accurately, the correct parts used, and real thought and care put into the work.

The original model as constructed in our laboratory has been wonderfully successful in its operation, and these results can be duplicated by anyone who will follow instructions. If, however, the parts are

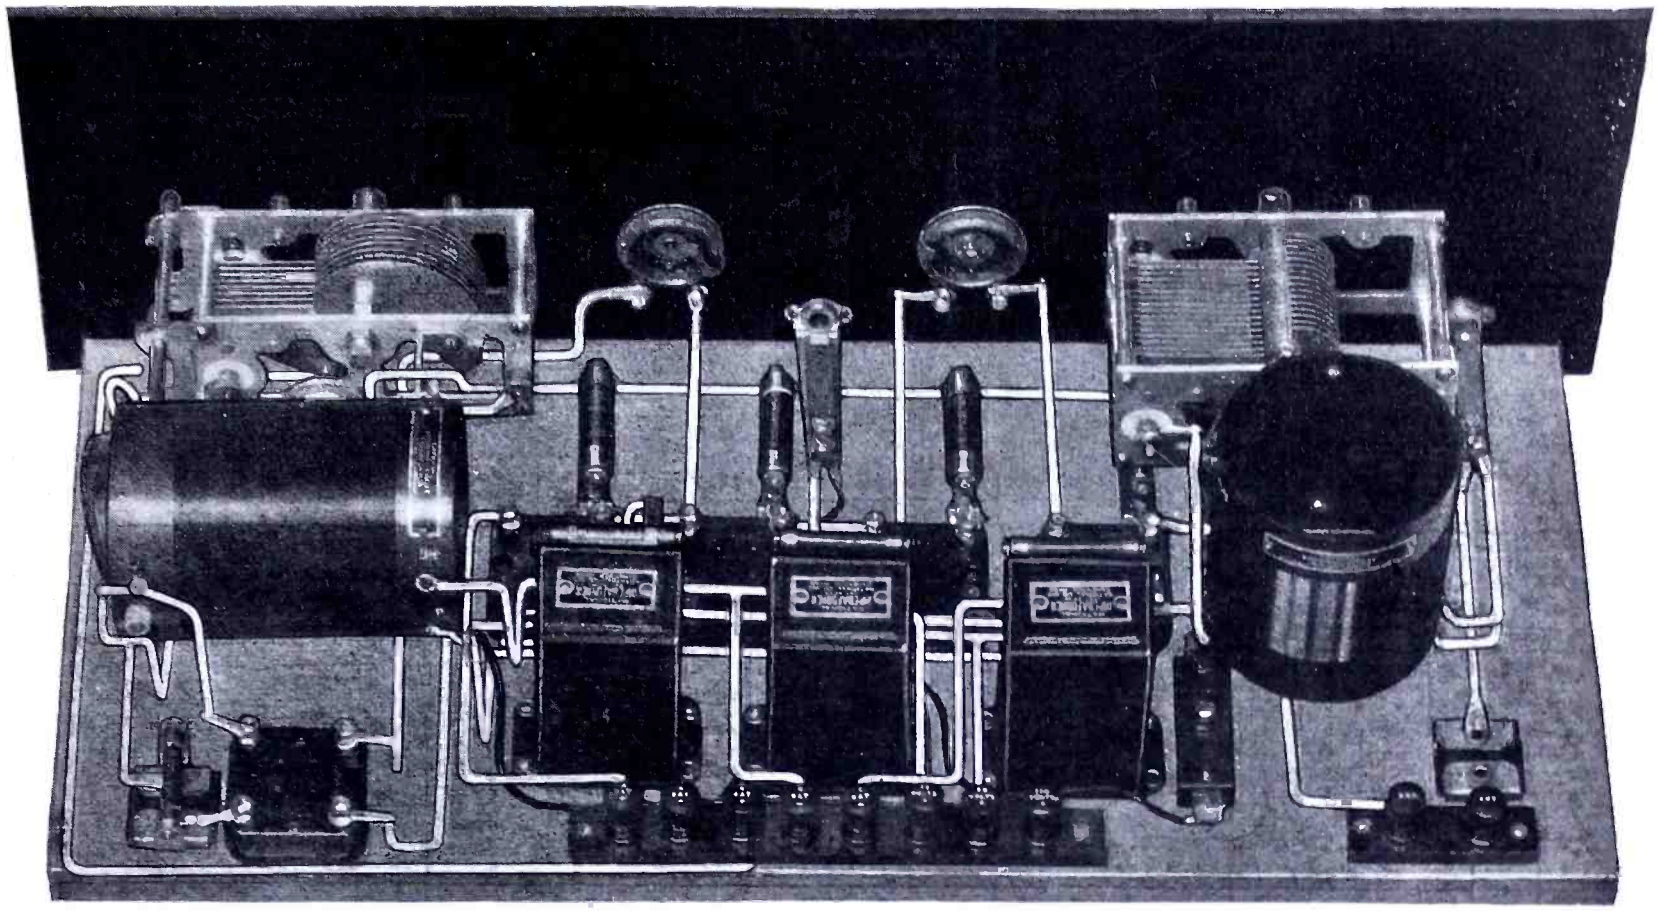

Photo B. Rear view of completed receiver

nnected together in an experimental form, it is not fair to complain you are disappointed in the results.

LIST OF PARTS

These parts or their equivalent will give satisfactory results:

—Drilled and Engraved Micarta Panel.
—6¾"x¾" Micarta Terminal Strip.
—2½"x¾" Micarta Terminal Strip.
—Frost No. 530 UX Sockets.
1—Carter Imp Filament Switch.
2—Carter 25 Ohm Imp Rheostats.
1—Carter No. 3 Jack Switch.
1—National Tuning Unit B-D1B complete with National Vernier Dials and Equicycle Condensers.
1—National Unit B-D-2B.
1—Dubilier No. 601 .0001 mfd. Condenser.
1—Dubilier No. 601 .00025 mfd. Grid Condenser.
1—Dubilier No. 601 .001 mfd. Condenser.

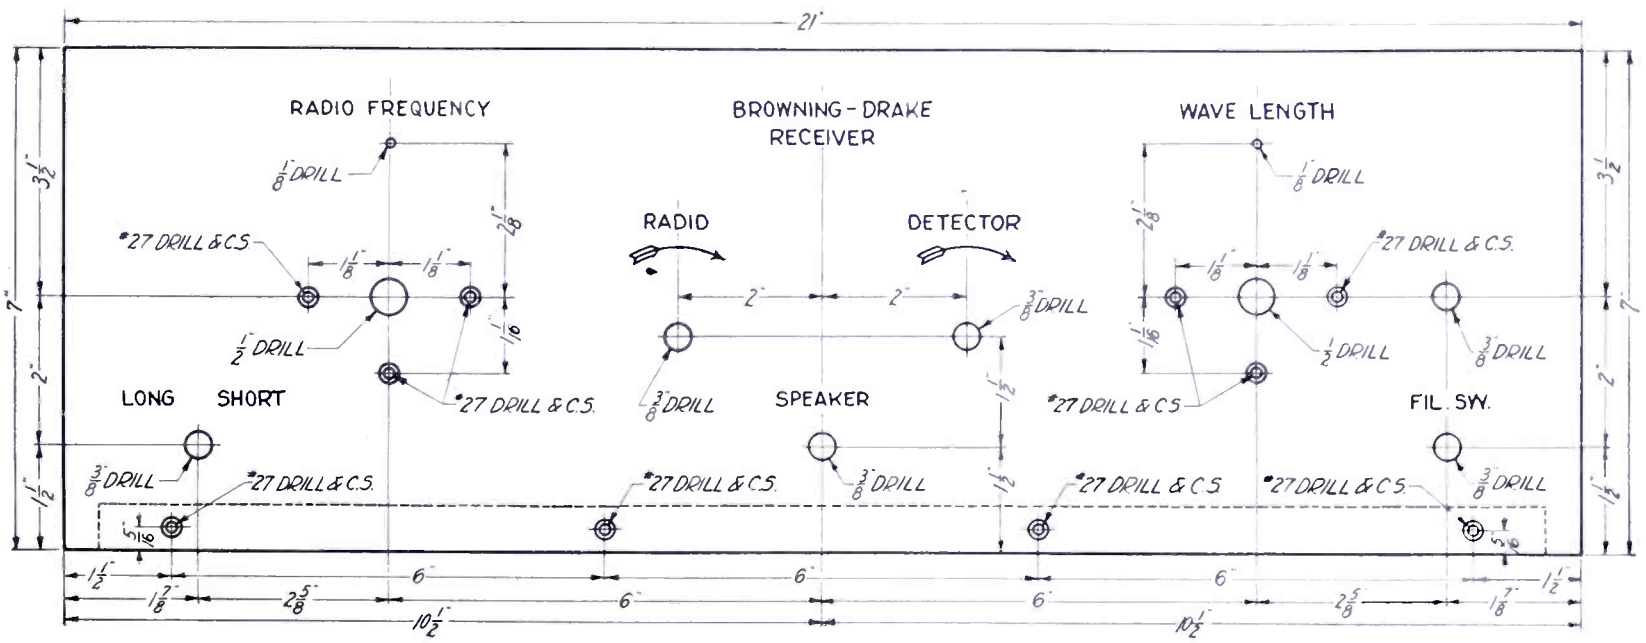

Fig. 1. Panel layout giving size of holes

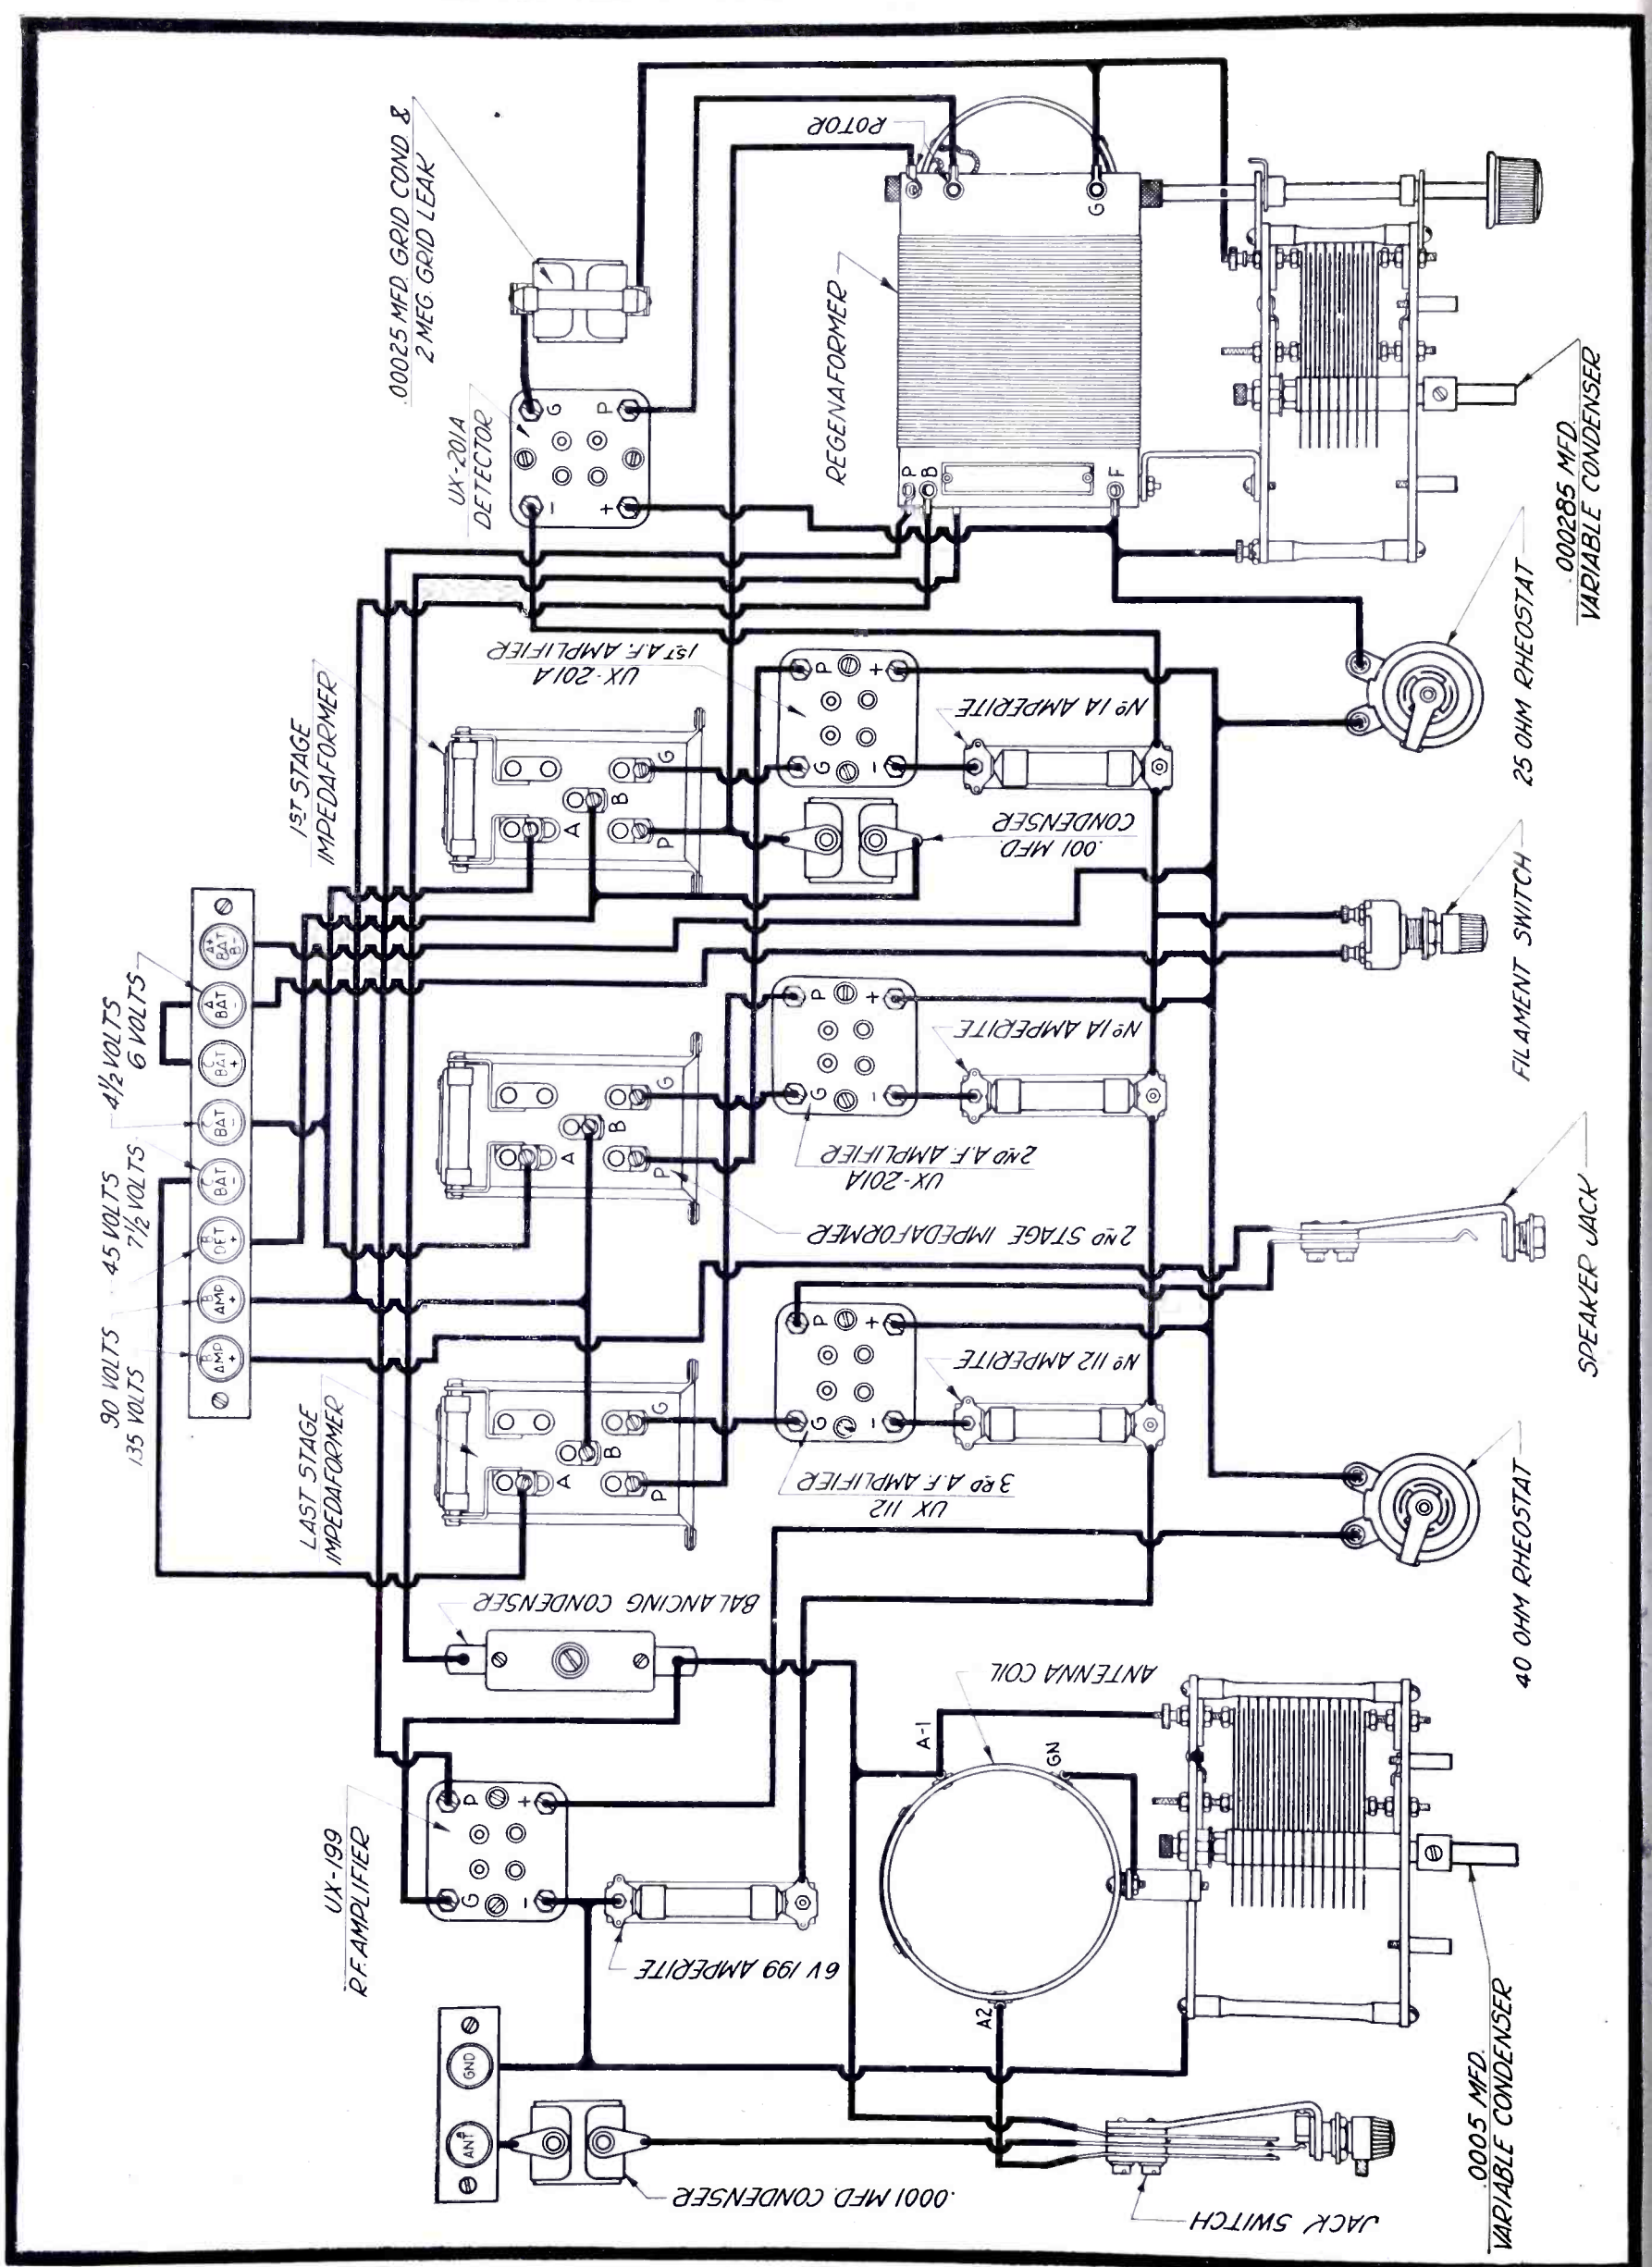
—No. 112 Amperite.
—No. 6V 199 Amperite.
—No. 1A Amperites.
—Carter Type 101 Radio Jack.
10—Eby Engraved Binding Posts.
1—X1 Model "N" Variodenser.
3—National Type "B" Impedaformers, including one "input stage."
3—1/10 Megohm Lynch Grid Leaks.



1—2 Megohm Grid Leak.
1—Central Laboratory Midulator Plug.
1—20"x9" Wooden Baseboard.
4—doz. large Kellog Soldering Lugs.

One 6-volt 120 ampere hour Willard storage battery, manufactured by Willard Storage Battery Company, Cleveland, Ohio.

One Interstate A battery charger, for re-charging 6V battery from house current, manufactured by Interstate Electric Company, St.

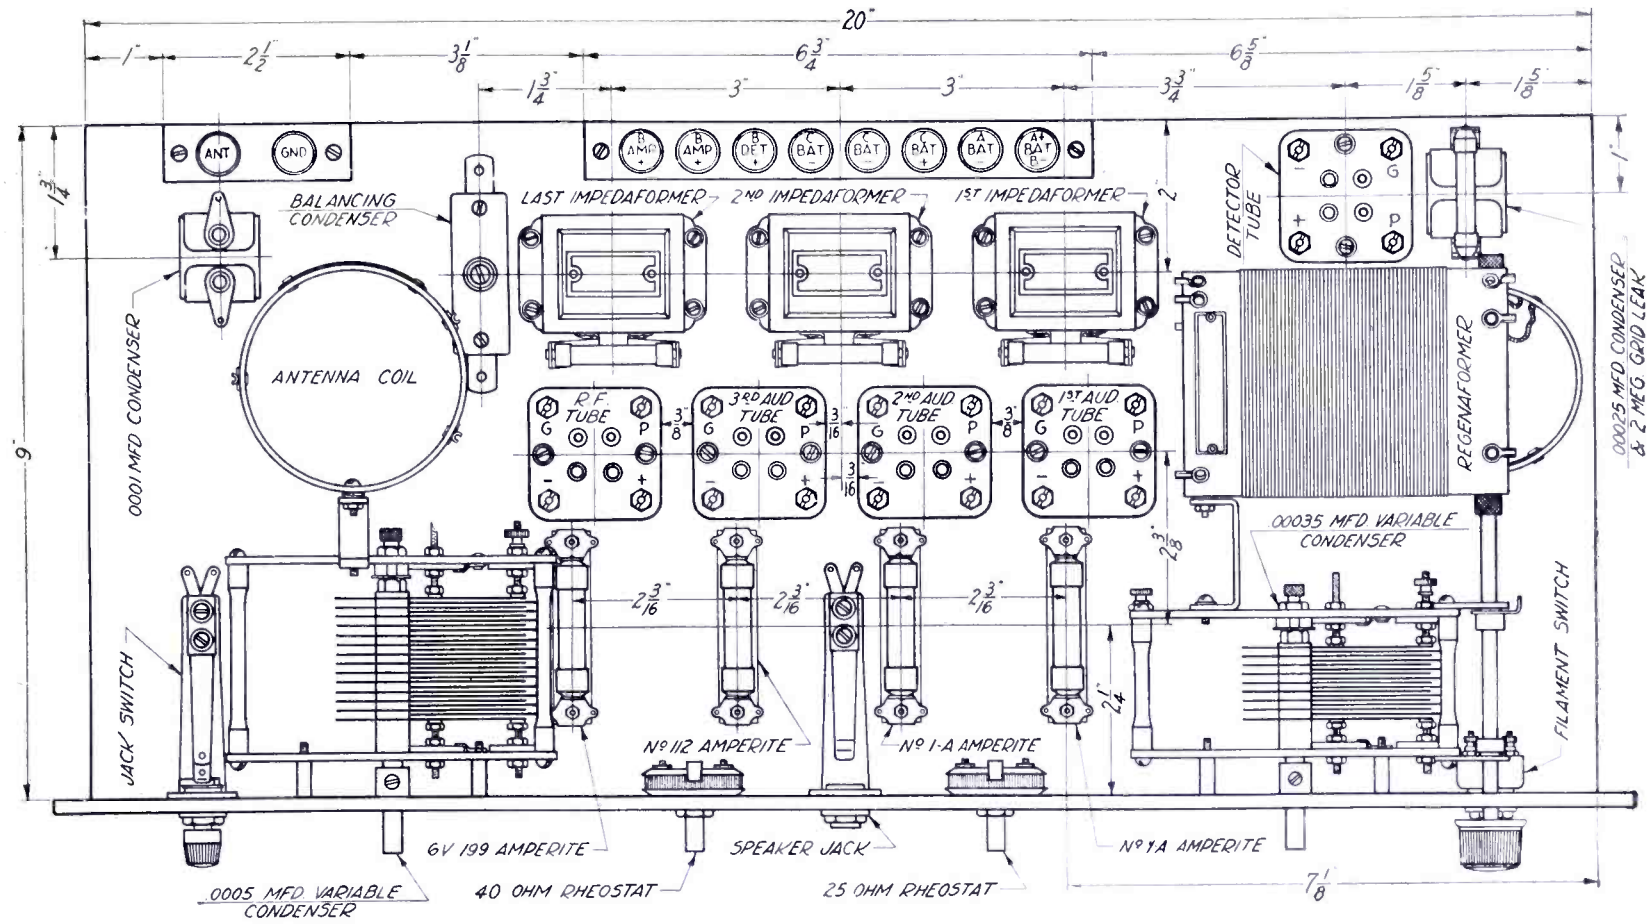


Fig. 2. Baseboard layout showing correct arrangement of apparatus

3—doz. No. 5x5/8" Round Head Nickel Plated Wood Screws.
0—Feet No. 12 Tinned Belden Wire.
4—No. 6x1" Flat Head Wood Screws.
1—Blackburn Ground Clamp.
1—Package Kester Radio Solder.

The accessories shown in this article consist of:

Two 45-volt heavy duty Ever-Ready B batteries, manufactured by he National Carbon Company.

Louis, Mo.

The loud speaker shown is the new Model 9 Thorola cone type with dual diaphram, manufactured by Reichman Company, Chicago.

The console is by the Chillicothe Furniture Co., Chillicothe, Mo.

(*Any of the manufacturers of the above accessories will be glad to supply you with literature further describing these products. Write them direct.*)

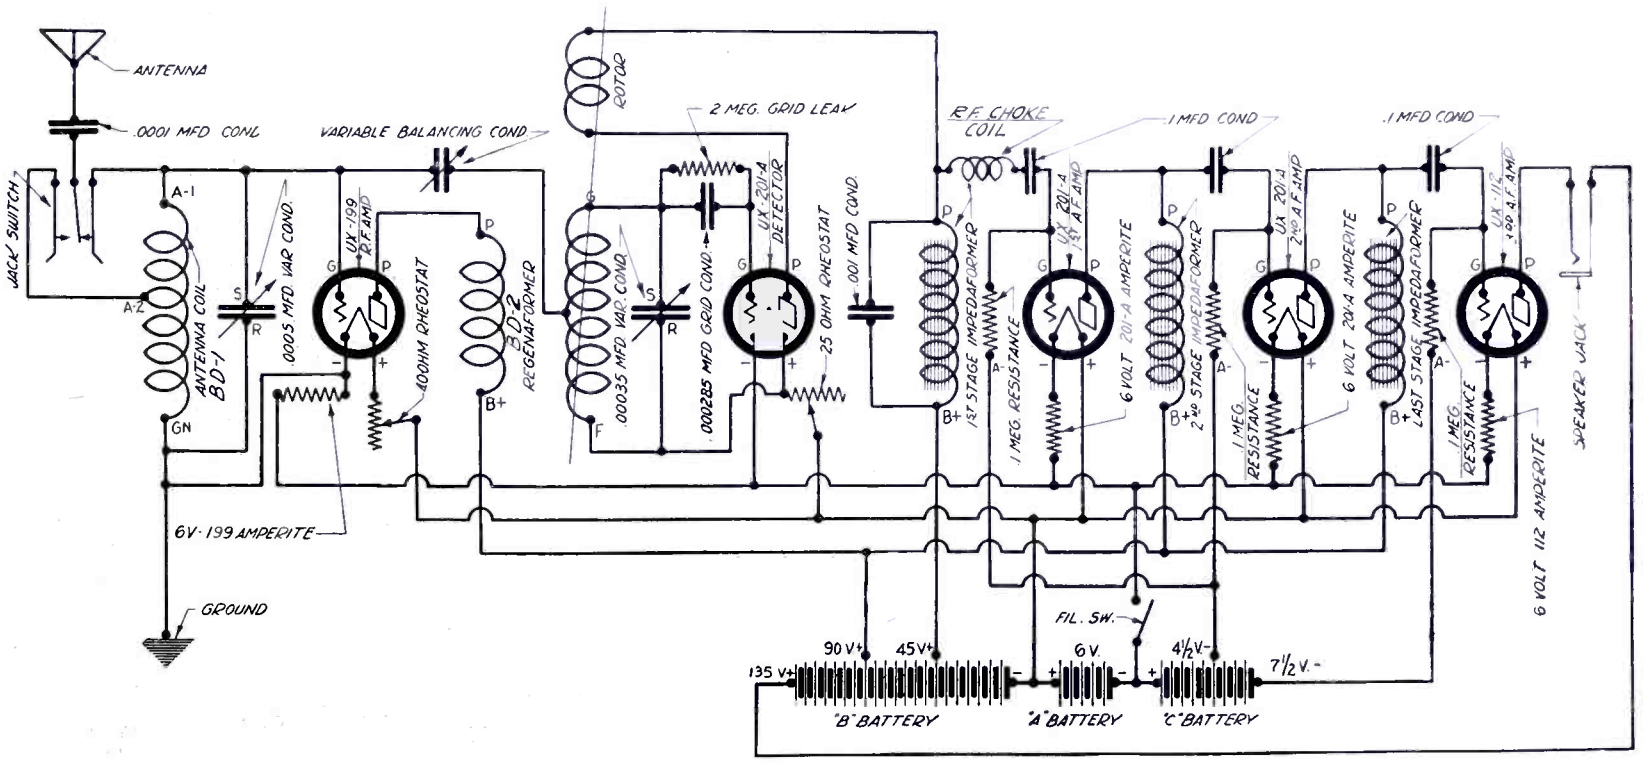

Fig. 4. Schematic wiring diagram

How to Build the Shielded Six

THE receiver pictured in the accompanying photographs is probably the first type of thoroughly shielded tuned radio frequency receiver ever made available to the fan public that might be satisfactorily constructed in the kitchen workshop. The design itself in its more general aspects is certainly not new; for any of the leading receivers as produced by the country's finest set manufacturers incorporate the major points evident in the construction of this particular outfit, which is known as the Silver Shielded Six.

The Shielded Six receiver contains six tubes, three functioning as radio frequency amplifiers, one as a detector, and two as audio frequency amplifiers. In this respect the receiver is unique; for up until this year it has been considered impossible by engineers to construct a receiver containing three stages of tuned radio frequency amplification which could be made to operate stably and efficiently. This the Six does by virtue of certain unusual features in its design which will be described in succeeding paragraphs, and thus it permits of the realization of an ideal in an entirely different direction at the same time, for but two controls are used to operate the entire receiver.

The receiver is mounted upon a seven by twenty-one inch walnut finished brass panel most artistically yet simply decorated. This panel carries practically no equipment and is used merely to conceal the "works" of the receiver behind it. At the left appears one of the major tuning dials which controls the antenna circuit of the receiver, while at the right is a similar dial marked "Station Selector II," which controls the tuning of the second and third radio frequency stages and the detector circuit. Below and to the center is a volume control which also serves to regulate the sensitivity of the receiver. At the right is a small switch turning the entire outfit on and off, while at the left a similar switch allows the use of either a long or short antenna at will, or it may be used to coarsely regulate the degree of selectivity of the receiver.

Behind this panel and fastened to it is a heavy steel sub-base. The sub-base and panel are fastened together by means of the volume control resistance and the on-off and antenna switches, which pierce both the panel and the front edge of the sub-base. This sub-base carries at the left a terminal strip to which the loud speaker cords, the antenna and ground wires and all battery wiring are connected. Thus no wires whatsoever appear upon the front of the panel, even the loud speaker connections being taken from the rear.

At the front of this sub-base are four aluminum stage shields, each containing one of the four radio frequency circuits of the receiver. This type of shielding is particularly advantageous, for not only does it prevent entirely coupling of the various circuits housed in the separate shields as well as eliminate entirely the pick-up of outside disturbances, but it does this in a much more effective way than ordinary shielding. This is because, where two circuits are isolated only by a single thickness of metal, circulating currents are frequently set up in the metal shielding by

Photo A. Front view of completed receiver

one circuit and transmitted to the second circuit. In the case of the Shielded Six, due to the use of two separated walls between each circuit, the possibilities of circulating currents in one shield being communicated through another shield to the other circuits is very effectively obviated.

In each one of these stage shields is contained a specially constructed type of condenser which gives practically straight line frequency tuning over the upper range of the dial or on the lower wavelengths and gradually verges into straight line wavelength tuning on the lower dial readings, or the higher wavelengths. This type of tuning allows of maximum ease of adjustment both in the hands of experienced and inexperienced users. The particularly interesting feature about these condensers is their extreme uniformity, which is absolutely necessary if effective gang control of three circuits is to be accomplished. These condensers are very solidly fastened to the steel sub-base as well as to the bottom section of the stage shields in such a manner that their positions cannot alter and that their capacities may not change appreciably over long periods of time.

The inductance coils used in the receiver are also built for extreme uniformity and, in fact, their inductance will vary in stock production less than one-quarter of one per cent, which is a far greater accuracy than is required for the successful construction of the Shielded Six. These coils are interchangeable

and are plugged into six-contact sockets located in the respective stage shields. Thus if a coil is damaged or in any way injured, it may easily be removed and a new one substituted. Further, the possibility for seasoned experimenters of constructing special coils, say, for the European wavelength ranges, is thus left open.

In each of the three left-hand or RF amplifier shield compartments there are located in addition to the tuning condensers and inductance coils a tube socket, a by-pass condenser and a stabilizing resistance. The function of the stabilizing resistance will be considered in connection with the discussion of the circuit and its operation. In the right-hand compartment practically the same equipment is located except that instead of the stabilizing resistance there is a small choke coil which aids in isolating the radio frequency and audio frequency portions of the circuit.

The audio frequency amplifier is of the transformer coupled type and consists of two stages and an output transformer. Because of the characteristics of this amplifier, it is safe to say that the quality obtained from the entire receiver will more than equal

using one or the other of the two positions of the antenna switch in operation. The secondary winding of this antenna coupling coil marked with the numbers 3 and 1 is exactly similar to the secondaries of all the RF transformers and consists of a winding of enameled wire upon six supporting ridges upon a bakelite coil form. These ridges are threaded and the turns of the winding are thus spaced. The shape of the coil is such that practically maximum advantage is taken of every possible factor contributing to efficiency. One very interesting features is the location of this coil directly upon the bottom of the stage shield separated and from it only by the thickness of the coil socket. This spacing has been very carefully worked out and results in effective oscillation control at the lower end of the wavelength range and a pronounced increase in efficiency toward the higher end of the wavelength range; for the radio frequency resistance of the grid circuit actually is lower at 500 meters with the coils shielded than it is with the coils unshielded.

Two methods of securing uniform amplification over the entire

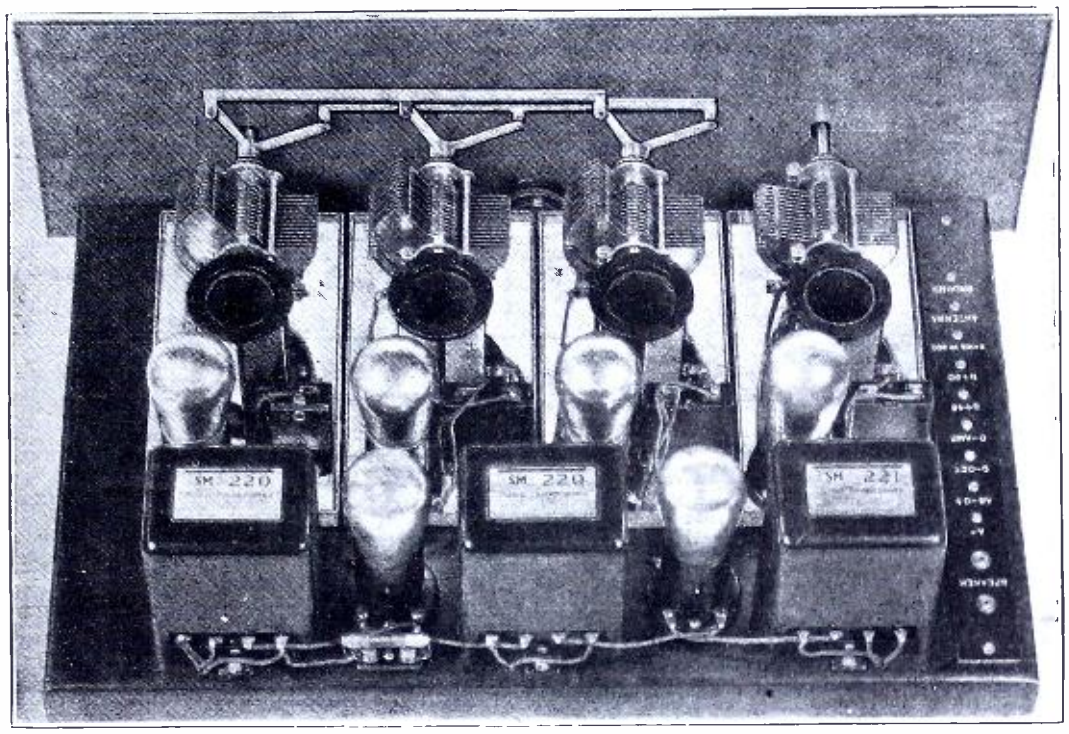

Photo B. Rear view with shields removed

that of any manufactured receiver upon the American market during the 1926-27 season.

The circuit diagram for the receiver is shown schematically and pictorially. For the present, however, only the schematic diagram will be considered in explaining the operation of the circuit and the functions of the various parts. It will be noted in this diagram that there are four dotted line sections marked "631 Shields." Inside each one of these shields appears a certain amount of wiring and certain parts such as coils, condensers, tubes, etc. Beginning at the left of the diagram appears the antenna stage, while next to it is the second radio frequency stage. To the right successively appear the third radio frequency stage and the detector stage, while in the unshielded portion of the diagram to the extreme right appear the first and second audio stages.

An examination of the radio frequency portion of the cricuit will indicate that each stage circuit is completely shielded. Thus in the first or left-hand compartment we find that the shield itself (as are all other shields and metal work in the receiver) is grounded. The antenna lead feeds in through the small antenna control switch at the left of the front panel to the primary of the antenna coupling coil No. 116A. By means of a tap on this coil, adjustment can be made for either long or short antenna. This also means that if only one size of antenna is used, the selectivity of the receiver can be altered at will within certain limits by

wavelength range of the receiver are employed together with a variable control, the purpose of which will be considered later. The first of these methods is by means of a resistance which is included in the grid circuit of each RF amplifier tube. This resistance combines two effects—one inductive and the other resistive. The theory of the operation is that in any tuned RF receiver as the wavelength at which it is operated decreases, the tendency to oscillate increases. This is obviously an undesirable condition inasmuch as maximum amplification will be obtained only with a uniform amount of regeneration at all wavelengths, which is impossible without some means of compensation. The first means employed in the Six is the grid resistance, the radio frequency resistance of which increases fairly rapidly as the wavelength at which the receiver is operated decreases. Thus these resistances serve to even up the amplification over the entire wavelength range and to allow the receiver to be operated in an extremely sensitive condition both at the high and low ends of its range.

The resistances alone are not depended upon for adequate oscillation control, however. A small tickler winding "2" and "6" is used in each stage which serves to control regeneration in the stage since each stage is individually so designed that without the resistance considered it would be in an oscillating condition. With, however, a very careful balance worked out through months of laboratory work, the combination of the grid resistance and

small tickler coil results in a receiver which is not only stable over its entire wavelength range but operates at practically peak efficiency at all wavelengths.

Inasmuch, however, as there are a large number of set users who desire the absolute limit of sensitivity from a receiver, an adjustable regeneration control has been incorporated in the receiver which terminates in the small knob appearing in the lower center of the panel. This resistance controls the sensitivity of the first RF amplifier stage without appreciably reacting upon the adjustments of the second, third and detector stages. The method by which this is accomplished is very interesting and would in itself deserve a lengthy discussion, which would be impossible here. Suffice it to say that as the sensitivity of the first stage is increased, its effective load upon the balance of the receiver decreases and the tendency to oscillate becomes very pronounced. By means of this volume control which cuts resistance into one circuit sumultaneously as it cuts it out of another, the sensitivity and stability of all circuits except the first is maintained constant, while the sensitivity of the first circuit can easily be moved up gradually toward critical regeneration. The value of this adjustment is evident to anyone who has ever operated a radio set.

Each RF circuit is very definitely localized within its shield excepting only the leads carrying energy from one shield to another. By-pass condensers are located in each stage compartment effectually preventing undesirable coupling through B battery or filament wiring. In the detector stage a small choke coil is employed together with a .002 by-pass condenser, which prevents any of the radio frequency component of the detector circuit leaking through into the audio frequency amplifier.

Inasmuch as the antenna characteristics to be encountered under a variety of operating conditions cannot be pre-determined, and as they react upon the tuning of the circuit with which they are associated, the antenna stage of the receiver is controlled directly and without respect to the other circuits. However, the second, third and detector stages have their condensers varied together by a positive link motion, which enables all three circuits to be simultaneously tuned by a single dial. Thus the receiver has but two major operating controls and the finding of a station becomes a surprisingly simple matter, for both of these dials will have practically the same readings for a given wavelength.

The audio frequency amplifier incorporates a pair of extremely heavy audio transformers designed with a rising low frequency characteristic. This means that they will provide maximum amplification and maximum power handling capacity at low frequencies in the neighborhood of 30 cycles and that the amplification will fall off gradually as the frequency increases. The reason for this is that in modern broadcasting equipment an exactly opposite tendency is evident which results in distortion with amplifiers which will give practically perfect amplification of themselves (and of which practically none exist). With the transformers used, these variations in broadcasting and further discrepancies in loud speaker design are compensated for with the result that surprisingly faithful reproduction is obtained from the receiver, as judged by the human ear. The use of an output transformer allows a power tube to be employed with practically any plate voltage that the builder may desire. This output transformer prevents the overloading of loud speakers, preserves and improves their efficiency and further compensates for their very poor performance at low frequencies—the average loud speaker will hardly produce a sound with quite a strong signal applied at 30 cycles.

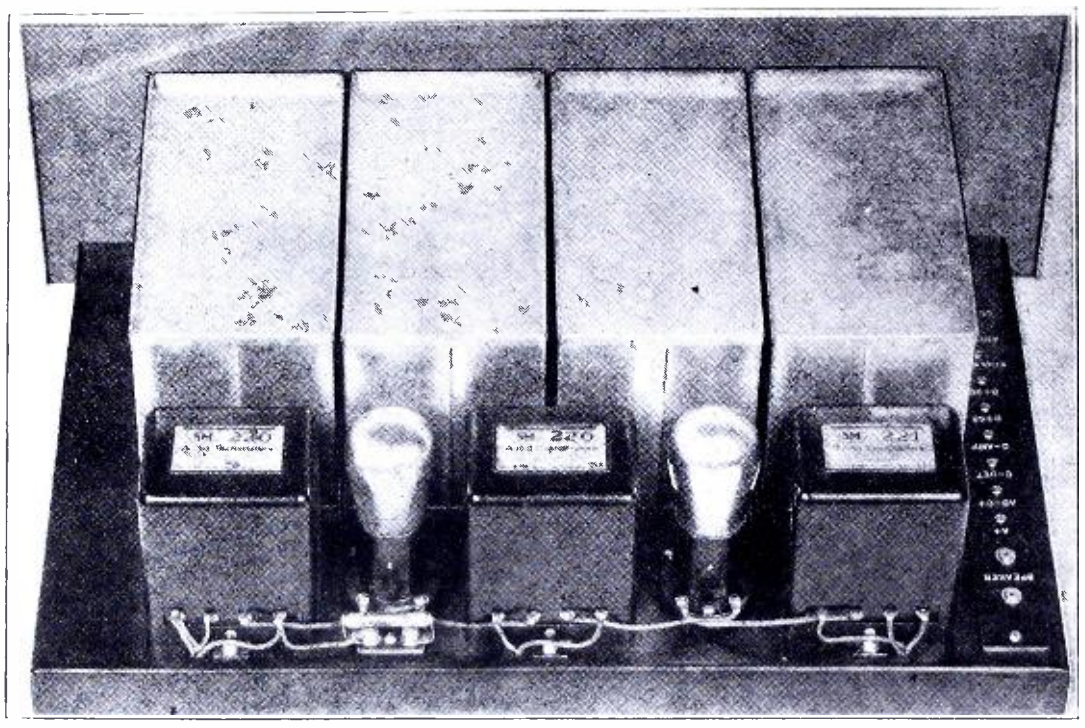

Photo C. Rear view of receiver completely wired with shields in place

The output transformer, by virtue of its design, does much to correct this condition.

In all of the circuits UX201A tubes are used except in the first or second audio amplifier. In the first audio amplifier either a UX201A or UX112 tube is used, whereas in the second audio amplifier a UX171 or UX210 tube should be used with the highest available plate voltage in order that maximum quality of reproduction may be obtained. No provision is made for adjusting the volume of the received signal in the audio amplifier, this being taken care of by the small volume control knob at the center of the panel.

The parts needed for constructing the Shielded Six are listed below and may be procured in complete kit form.

It is essential in any event that the coils, coil sockets, stage shields, tuning condensers and link motion be procured in kit form, as unless this is done they will not be carefully measured for operation together and will not operate satisfactorily. When the parts are purchased in kit form, they have all been laboratory tested and will operate together without any trouble.

Parts List

4—SM 631 Stage Shields
2—SM 316A Condensers
2—SM 316B Condensers—Long Shaft

4—SM 515 Coil Sockets
2—SM 411 RR Dials
3—SM 115A Coils
1—SM 116A Coil
6—SM 511 Tube Sockets
1—SM 275 Choke
2—SM 220 Transformers
1—SM 221 Transformer
1—Polymet .002 Condenser
5—Polymet 1 mf. Condensers
1—632 Link Motion
2—Carter Tip Jacks
1—Terminal Strip with Terminals
1—Crowe Metal Panel, Pierced

tionary plates in a central position and that there is no tendency on the part of the rotor plates to come close to or scrape on the sides of the stationary plates.

The various parts may be mounted upon the steel sub-base as indicated in the different photographs. All parts should be placed on the sub-base in the positions as indicated from the different photographs and the panel should not be fastened to the sub-base except as one of the last operations.

There is only one caution that need be observed, particularly in mounting the parts—that is with respect to the variable condensers. It is barely possible that after they have been mounted a strain may have occurred which will pull the plates slightly out of alignment, although they are constructed to prevent just this. If it is noticed that as the rotary plates are adjusted there is a tendency for them to come closer to one side of the stationary plates than the other, it will be necessary to adjust the positions

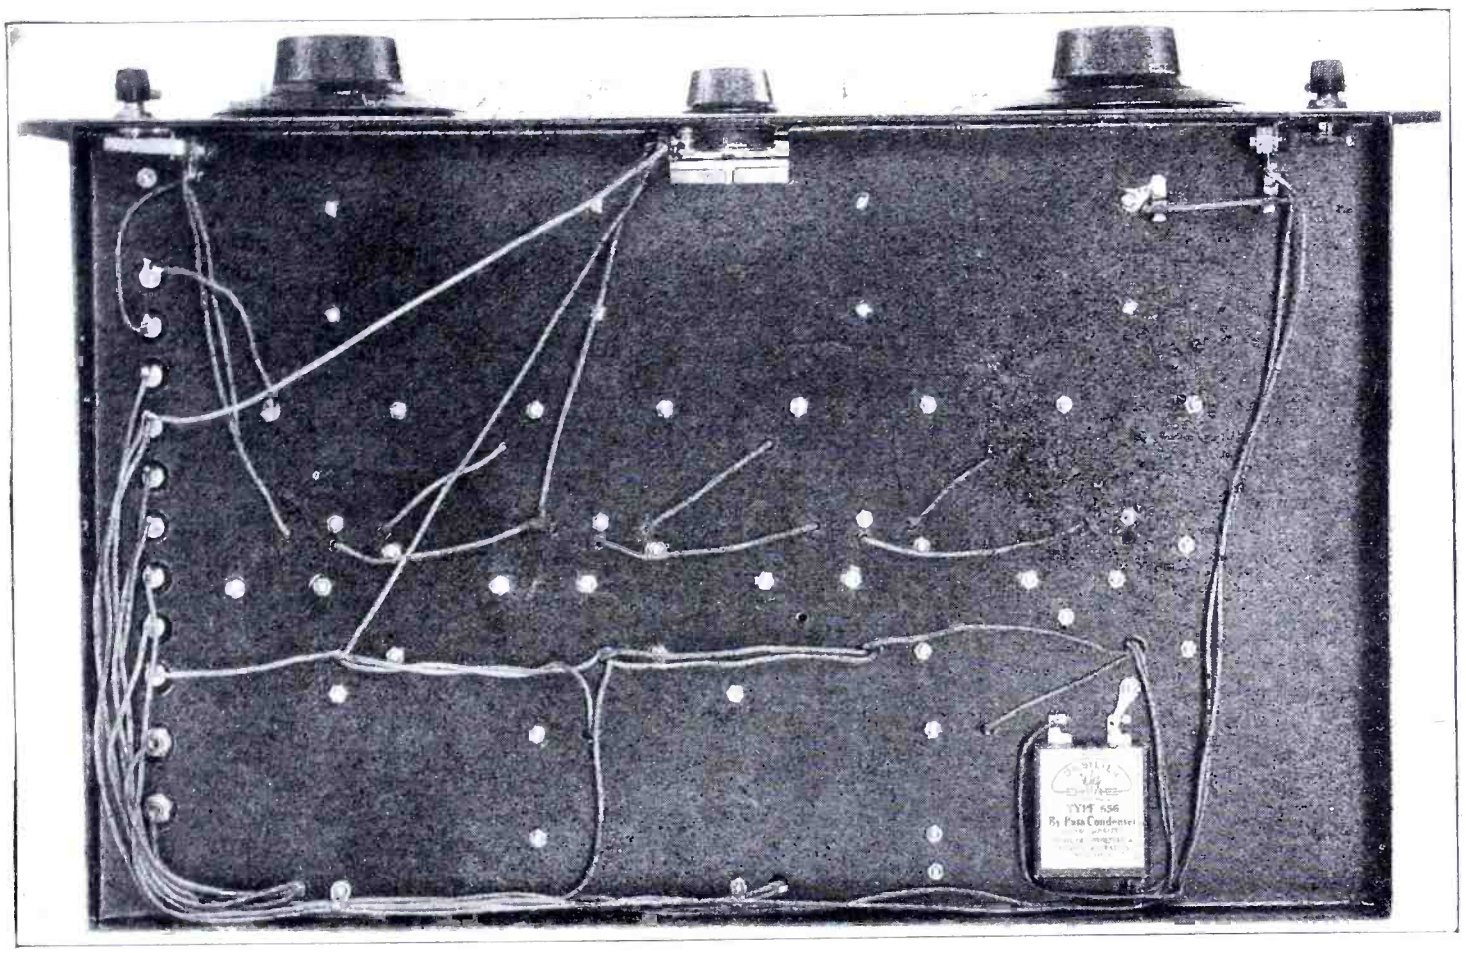

Photo E. Bottom view of metal sub-panel showing arrangement of leads

1—Steel Base, Pierced
1—Yaxley No. 10 Switch
1—Yaxley Special Antenna Switch
1—Carter 25,000 Hiohm
1—Carter .5 Ohm Resistor
3—Carter 200 Ohm Resistors
1—Coil Hook-up Wire
1—Assortment Misc. Parts
1—Polymet 2/10 Meg. Resistance
1—Polymet Grid Leak Mounting

After these parts have been procured, they should be carefully xamined for minor troubles which may have developed in transit nd handling. The jacks and switches should be examined for ood contact as should the tube sockets and coil sockets. The oils should be examined to make sure that the windings have ot been damaged or crushed in any way. The variable conensers should be most carefully inspected to make sure that as he rotary plates are adjusted they interleave between the stator plate sections so that each rotor plate will center up between its two adjacent stator plates when viewed from above. The necessary adjustment of the position of the stator plate sections may be made by loosening the nuts to be found on either side of the bakelite supporting strips, these nuts being actually on the tie-bars of the stator plates. This will allow of shifting the entire stator plate sections to any desired position where they may be locked by means of these same nuts.

The parts having been mounted on the sub-base, the wiring may be put in place using a soldering iron and Belden flexible rubber-covered hook-up wire. No difficulty will be encountered in wiring, as the numbers on the schematic diagram correspond exactly with those on the various instruments. It is advisable either that the wire have its insulation scraped and the ends fastened beneath the terminal screws of the parts or that they be soldered to lugs in turn fastened beneath the terminal screws.

One precaution must be observed in wiring. It will be noticed that two leads run from the left-hand stage shield under the sub-base to the one next to it and from this to the next shield to the right, and, in turn, from this shield to the extreme right shield. These two wires must be kept free and away from all other

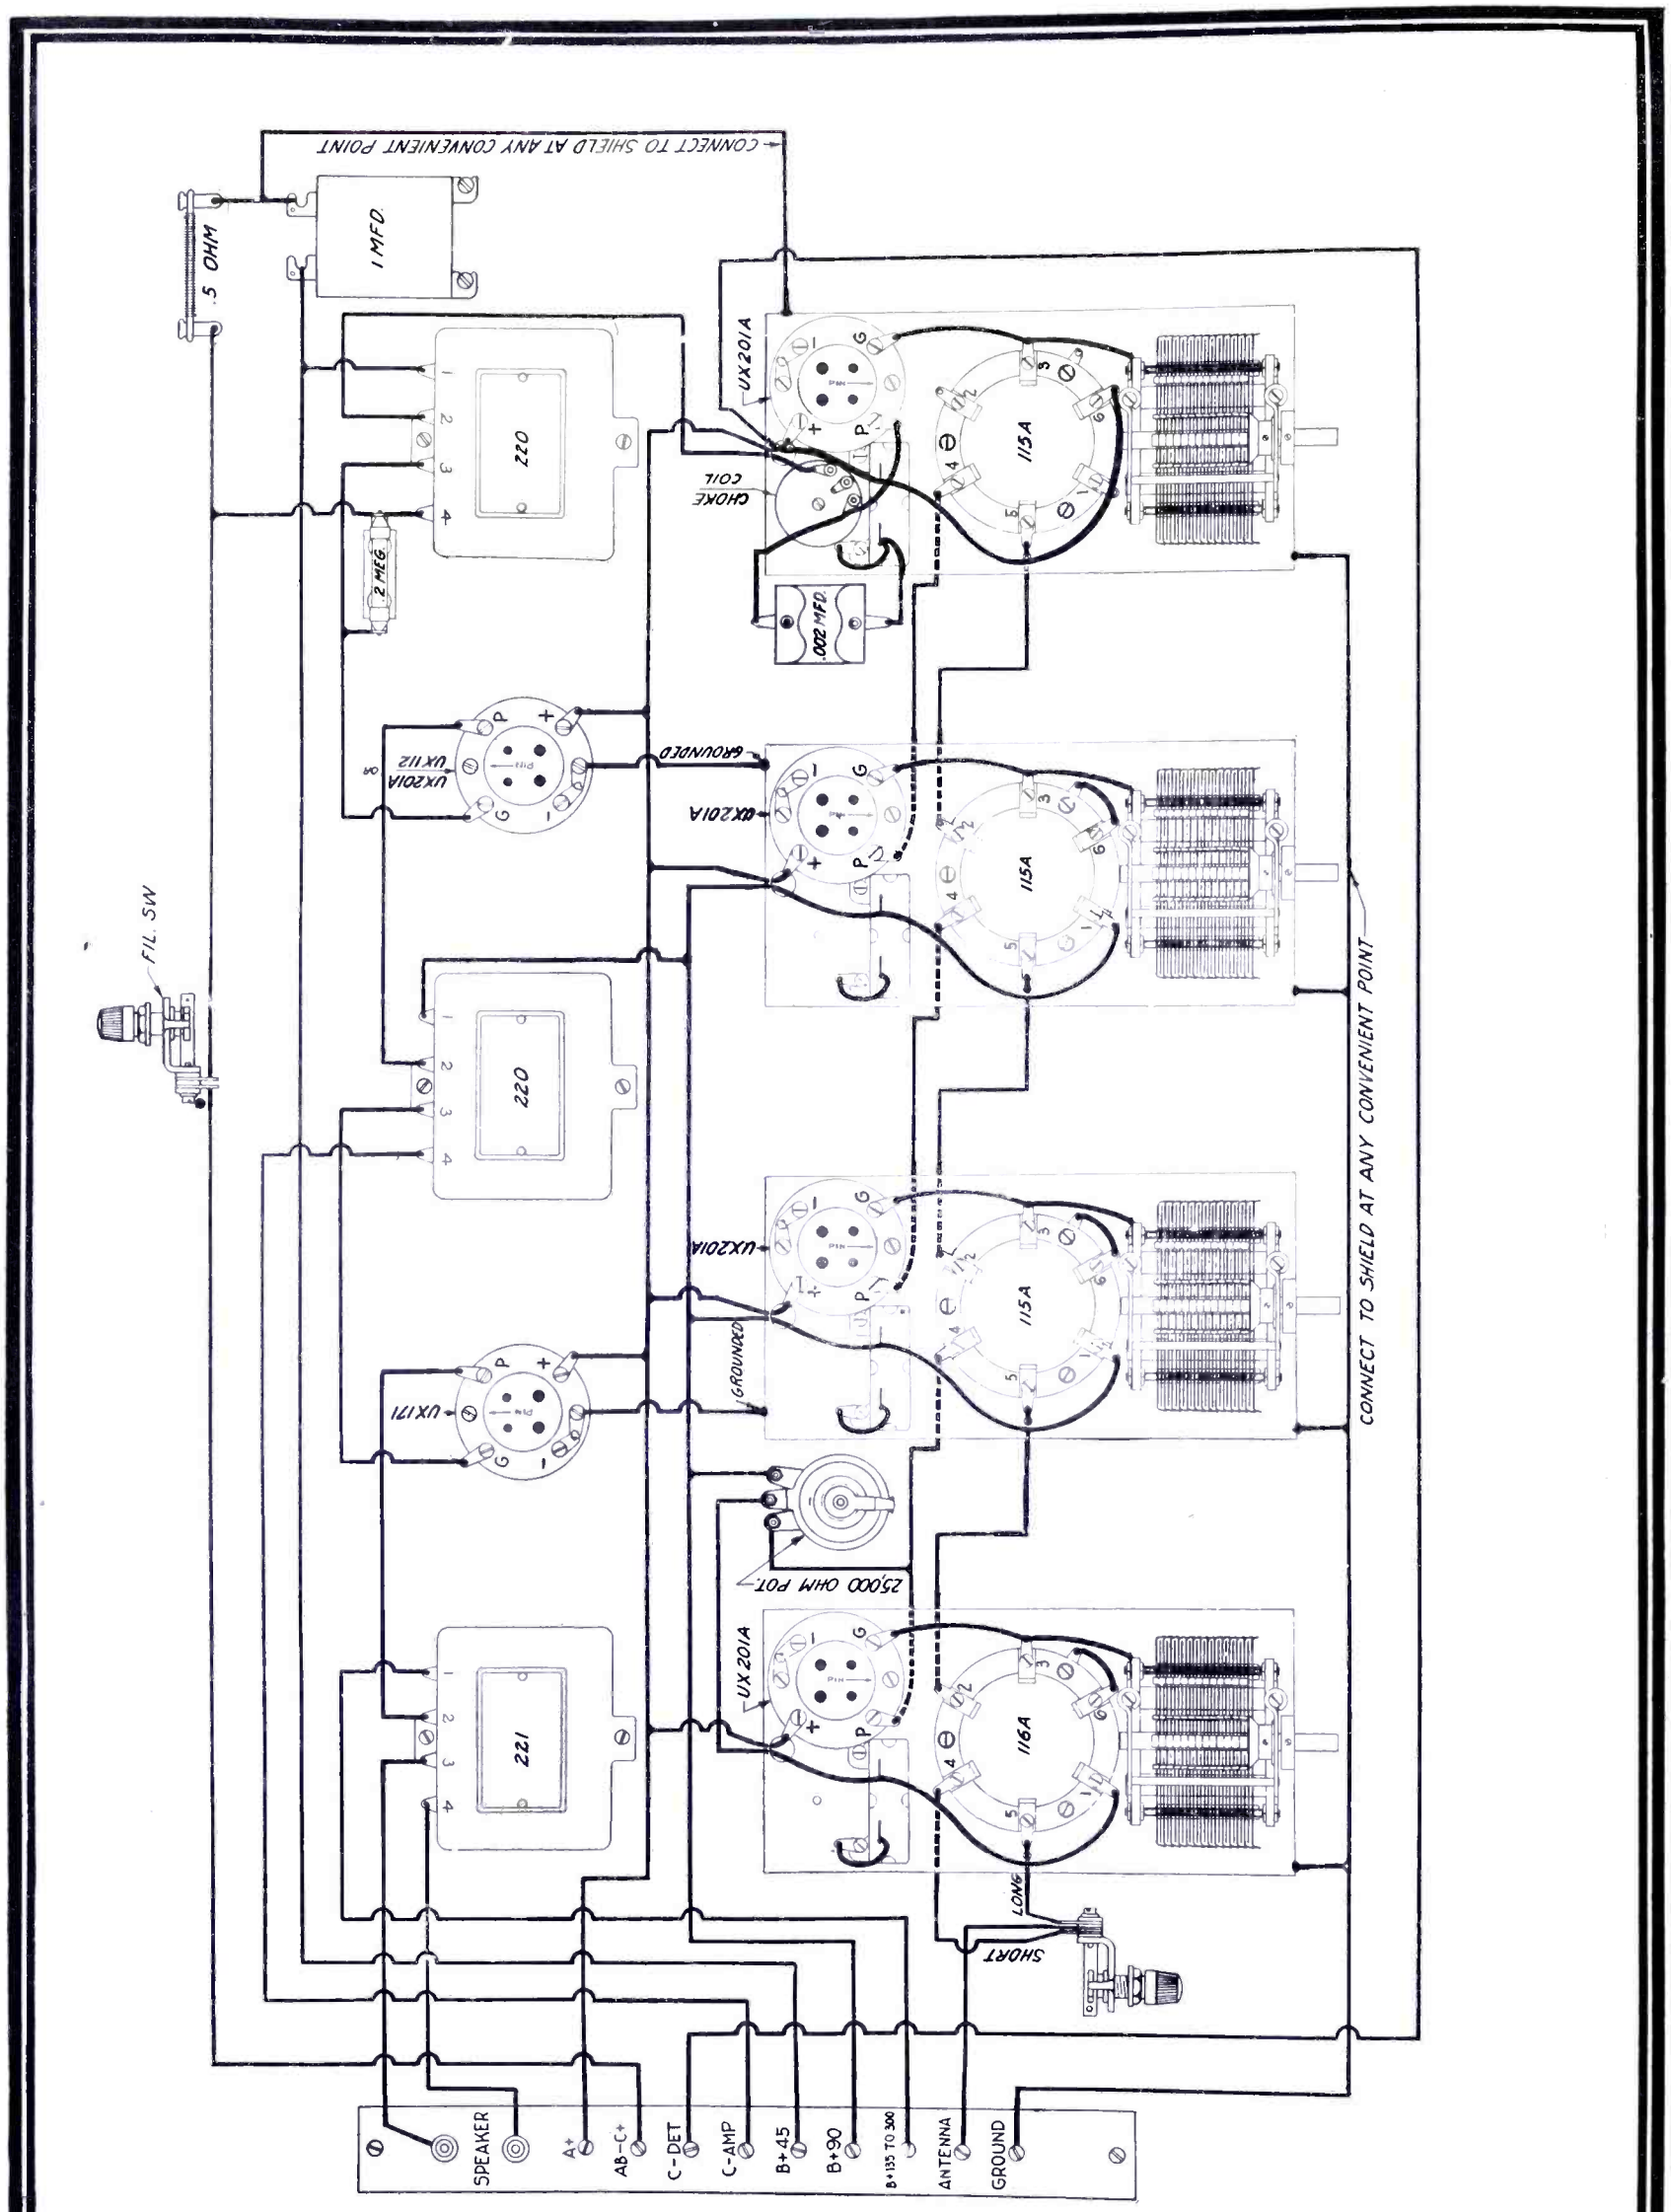

Figure 1. Graphic illustration showing each connection in entire receiver. In the three left shields, the 200 ohm resistors take the place of the connecting wire from "G" to "3"

wiring of the set. This can easily be arranged by carrying all wiring along the back of the sub-base, then around and down along the terminal strip toward the front. This precaution applies to the wiring which is located beneath the sub-panel. The wiring in each stage shield should be made as short as possible, the placement of the individual connections being evident from the photographs. In every case the negative filament connection and the negative B battery connection is made through the shield and metal sub-base. It may be found in assembly that a poor contact will be made and one or more of the tubes may not light due to the lacquering of the sub-base. If this condition is encountered, it may be corrected by removing the lacquer from the bottom of the sub-base at the points where the screws used both for holding down the tube sockets and making the negative filament connections run through the shields and sub-base into their fastening nuts.

After all wiring has been done on the sub-base, the front panel may be attached after the three right-hand condensers have first been ganged. The method of ganging them is to push the link motion over their shafts as illustrated in the photographs. The condensers should then be set so that their rotor plates are just about to interleave with the stator plates, but so that to the eye

135 Volts of B Batteries
C Batteries as Required by Tubes
5—UX201A Tubes
1—UX171 Tube

The batteries should be connected to the terminals marked for them and a 4½ volt C battery used on the detector tubes, though it may be found that 3 volts will give somewhat better results. With the UX171 tube a 22½ volt C battery will be required for the audio amplifier in addition.

The tubes should be placed in their sockets and the coils in their respective sockets. The type 116A coil goes in the antenna or extreme left-hand socket, the 115A coils in the other sockets, while the UX171 tube goes in the socket between the 221 and 220 transformer at the left of the set.

In operating the receiver the filaments of the tubes should be turned on by means of a switch at the right-hand end of the panel, the loud speaker cord tips inserted in the jacks marked for them, and an antenna, either indoor or outdoor and from 30 to 60 feet long, connected to the receiver, as well as a wire termining in a ground clamp on a water, gas or steam pipe. With

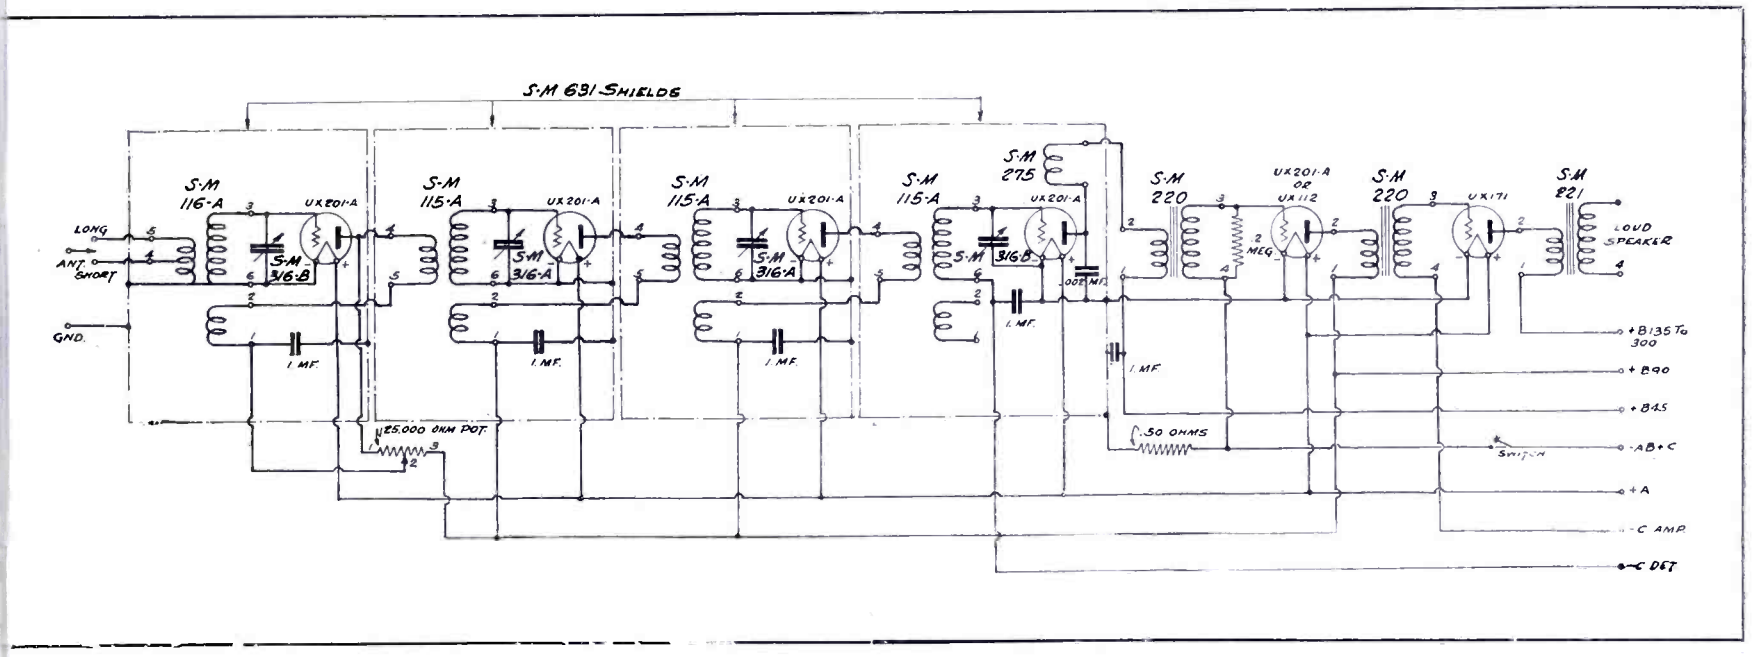

Figure 2. Schematic wiring diagram. In the three left shields the 200 ohm resistors act as the connections from "S" to the tube's grid

there is a tiny gap between them. This gap should be set so that it is uniform on all three condensers and the monkey motion then locked in position in such a fashion that the condensers can be turned only about 1/16 of an inch further out in each case, but so that if the shaft of one is rotated the other three will be carried to the full interleaved position due to the link connection. This having been done, the panel may be attached by means of the two switches at either end and the volume control at the center. The volume control should have been put in previously, before the stage shields went into place. Two washers will be found with the volume control, made of fibre. One of these should be placed on the inside of the sub-base and one on the outside of the sub-base so that no metallic contact will exist between the volume control and the metallic panel. It will be necessary to center the shaft of the volume control resistance in the over-sized holes in both panel and sub-base in order that there will be no connection between the shaft bushing and the panels.

The receiver having been completely wired, it is ready to be put in operation and will require the following accessories:

Accessories

1—Loud Speaker with Plug
1—Antenna and Ground System
1—6-Volt Storage Battery

the antenna switch set in the "long" position the two dials should be varied slowly throughout their range, keeping them in approximately the same relation. Once a station has been found by this method—and it is ridiculously simple—the dial readings should be written down and saved for future reference.

If the selectivity of the receiver is insufficient for congested local conditions, this may be easily corrected by throwing the antenna switch to the short position. No filament rheostat is used on the tubes, a fixed resistor keeping them at a satisfactory operating voltage throughout the normal charge life of the storage battery. No provision is made for adjusting the volume of the receiver by cutting in or out tubes, but rather by the small volume control knob at the center of the panel.

In operating the receiver, if the volume control knob is turned all the way to the right, squeals will probably be heard and the receiver may possibly howl as a signal is being received. It will be found that with this knob set so in the middle of its range, no squealing will be experienced and the receiver may be operated using only the two large dials. If, however, this control knob is set so that the receiver is just ready to squeal, maximum sensitivity for distant stations will be obtained. This is practically always unnecessary where reception from stations with a one hundred mile radius is required under average conditions.

Thus the control for normal operation lies in but two adjustments—the two major tuning dials.

The Madison-Moore Super-Heterodyne Receiver Using 199 Tubes

This "Super" was designed in the Citizens Radio Laboratory and its performance has been quite satisfactory

THERE have been many requests from the readers during the last few months for information and hookups of a Madison-Moore Super-Heterodyne using 199 tubes instead of the 201A type. These requests have paralleled experimental work in our laboratory that has developed and now offers a Super-Heterodyne Receiver operating from UX199 tubes and a UX120 power tube, using the new Type "MM" Madison-Moore transformers designed especially for the small tube. It is in every way a satisfactory set in so far as distance, selectivity, volume and tone quality are concerned, and has the advantage of being built in a much smaller cabinet and due to the frequency used (92,500 kc.) has a much lower noise level than the transformers operating at lower frequencies.

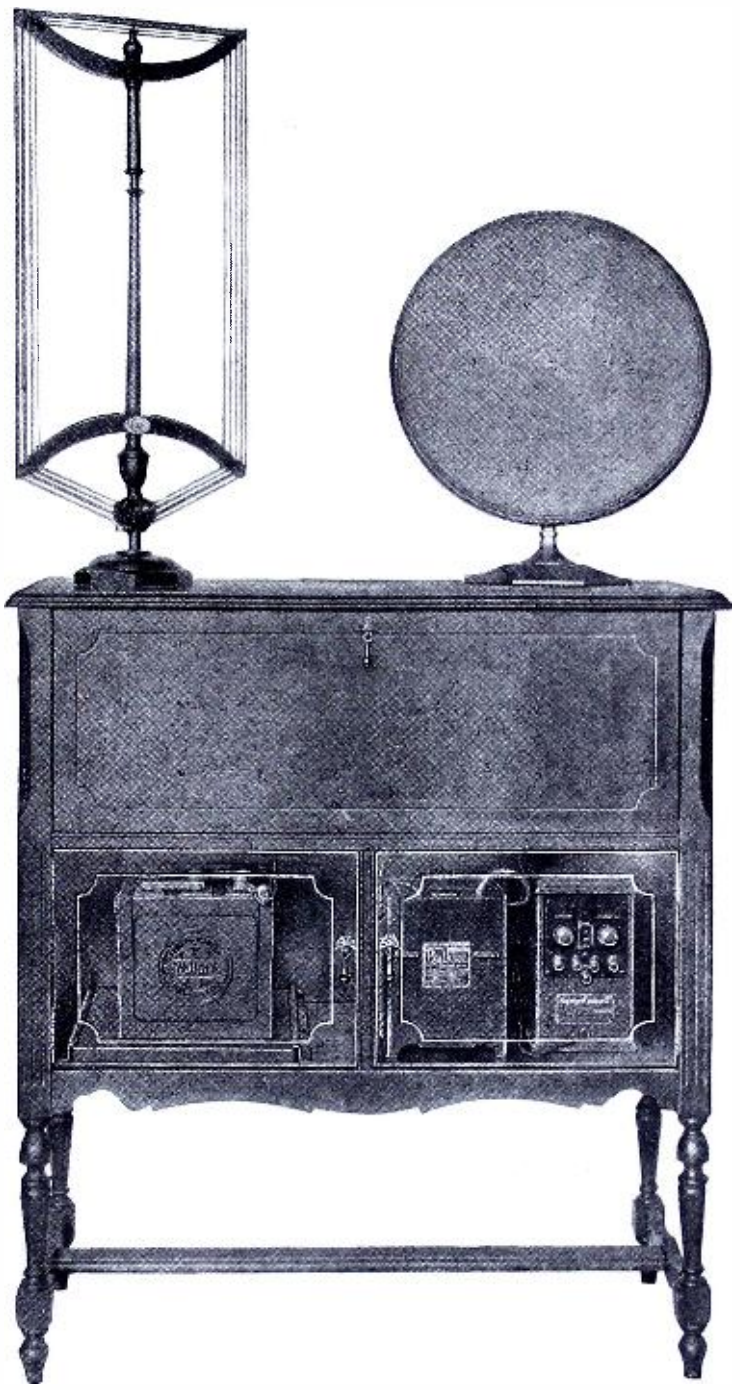

Photo A. Front view showing how receiver can be placed in a console, with suggested accessories

In this receiver, as in the one previously described in the last issue of the "Call Book," using 201A tubes, the first tube is made to act as a partial detector by the 6-volt "C" battery in its grid return circuit. This tube amplifies the signal several times, depending on the character of the tube used and its filament temperature. The No. 1 unit is used as an oscillator, and when tuned with a .0005 mfd. variable straight frequency condenser, it will cover all wave lengths from 200 to 600 meters, and delivers an even output throughout its entire range. The output of this No. 1 unit is not mixed with the signal in the grid circuit of the first tube as is the customary practice. This is a step forward and an original and decided improvement over the old method. The continuous wave current generated by the oscillator is mixed with the partially rectified and amplified signal in the correct amount to replace that taken out by the first tube. This amount is regulated by the position of the rheostat in the filament circuit of the second or oscillator tube. The position of the rheostat for the first and second tube can be determined and left in that position for best reception and quality of tone unless another tube is substituted.

The signal is passed from Unit No. 1 to the primary of Unit No. 2, which is a coupling unit and transfers the energy to tubes and Units Nos. 3, 4 and 5. These units act as intermediate frequency amplifiers and have a peak frequency of 92,500 cycles or a wave length of approximately 3240 meters.

Figure 5 shows the schematic wiring diagram of the receiver. Both the loop and oscillator circuit are turned by .0005 mfd. straight frequency variable condensers. These condensers, the Cardwell Taper Plate Type "E," are a new departure in condenser design, and a short description of them will be interesting. Unlike the average variable condenser of straight frequency characteristics, the rotating plates are concentric in shape and have their weight concentrated close to the rotor shaft, where it exerts but a short leverage. Instead of the usual metal punching, the plates are die cast and machined into a taper which, when the condenser is assembled, allows the rotor to dovetail into the stator in such a manner that the spacing varies as the condenser is rotated. As the rotor is turned out from the stator, the spacing increases, and with this increase there is a decrease in capacity, since the capacity is at all times inversely proportional to the amount of dielectric. The taper is so calculated that the tuning characteristic approximates Straight Frequency over the lower part of the dial but the curve falls off sufficiently to give a slightly greater separation on the longer wave lengths than absolute Straight Frequency would secure.

The filament temperature of the oscillator tube is controlled by a 40-ohm rheostat. While the voltage applied to the oscillator tube is not very critical, a slight excess will cause undesirable oscillations. The first detector tube is regulated by a 40-ohm rheostat. A 20-ohm rheostat controls the three intermediates whose filaments are connected together in parallel. The voltage applied to the radio frequency tube is indicated by the Weston Voltmeter mounted on the front panel. The normal operating voltage of the intermediates is from 2¼ to 2¾ volts. Poor tubes may require a slightly higher operating voltage. A 25-ohm Yaxley variable resistance is used to control the second detector tube. It is adjusted once for best results while the receiver is in operation and then allowed to remain set. Each of the audio tubes is regulated by a fixed resistance, the first audio tube by a 15-ohm and the second by a 10-ohm. It will also be noticed that the cases of the two audio transformers and the last Madison-Moore unit (No. 5) are connected to the negative of the "A" battery. The other Madison-Moore units are automatically connected to the negative "A" when they are inserted into the circuit.

UX 199 tubes are used throughout the receiver with the excep-

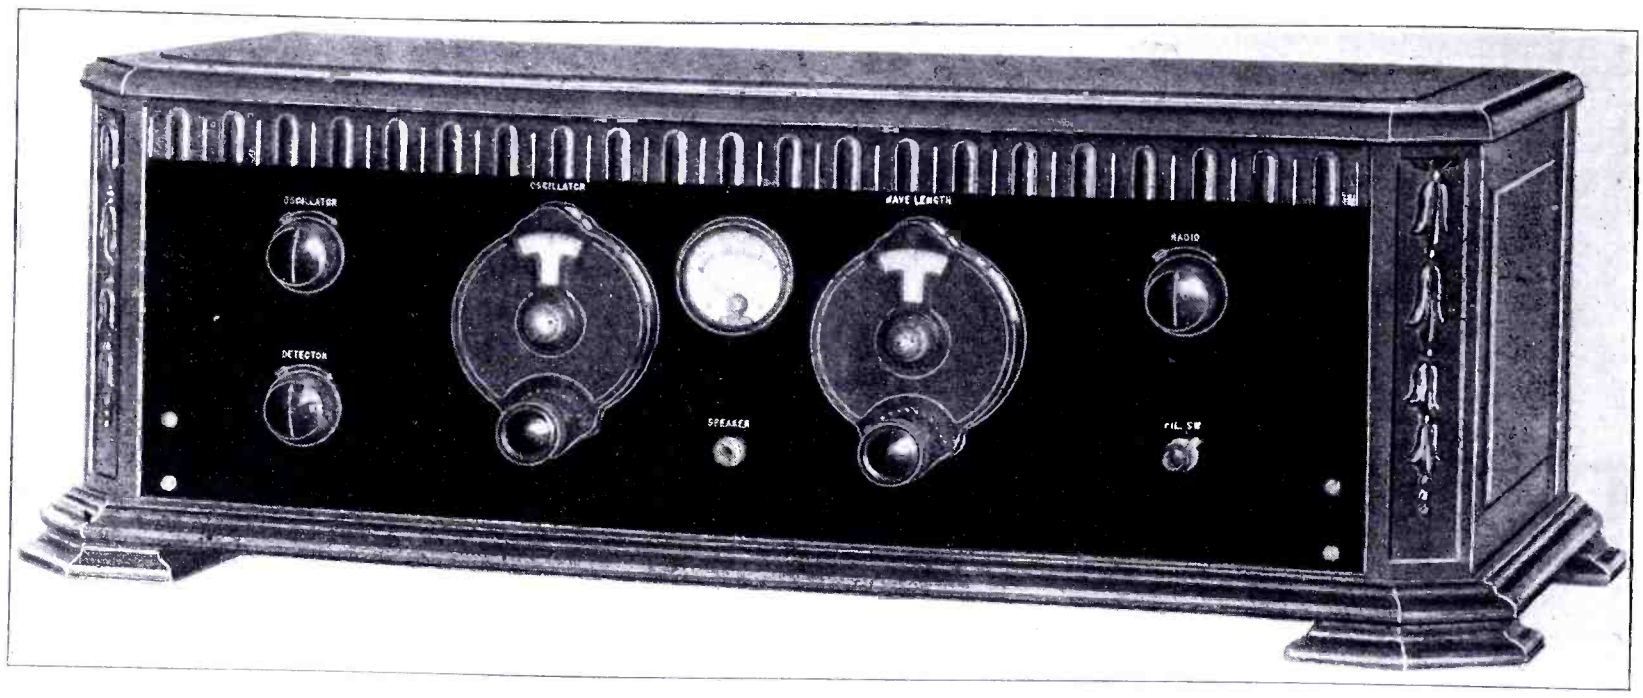

Photo B. Front view of receiver mounted in a cabinet

tion of the last stage of audio; that tube is a UX 120 power tube. The necessary "C" battery voltage is clearly shown on the schematic wiring diagram and the large graphic illustration. The first stage of audio has a negative bias of 4½ volts. Using "C" battery bias allows greater voltage to be used without distortion and brings about a considerable saving in "B" battery current.

All batteries with the exception of the two "C" batteries are connected to the receiver by means of a Jones Multiplug and Cable. The regular color code supplied with the cable is utilized with the exception that the brown is disregarded, and the black, which is usually used for the ground, supplies the receiver with 135 volts "B" potential. The two "C" batteries are connected to the receiver by separate binding posts along the rear edge of the sub-panel.

Figure 1 is a layout of the front panel of the receiver. The correct location of all of the holes is shown, as well as the necessary engraving. In the lower corner at each end of the panel is a pair of holes provided for the correct mounting of the Benjamin brackets which support the sub-panel.

In Figure 2 is shown a layout of the sub-panel. Two sizes of holes are shown. Those holes by which the apparatus is mounted into position are all 5/32-inch drill. Ten holes have an extra circle around them. They are countersunk for No. 6 flat head machine screws and are for mounting the Jones Type BM plug, the supporting brackets, the 1 mfd. by-pass condenser, under the sub-panel, and the Frost jack, which while mounted on the front panel is fastened to the sub-panel with a screw and helps support it. Two more holes are shown with a dotted circle around them. These holes are also countersunk for No. 6 screws, but from the under side of the sub-panel. They are used for mounting the Madison-Moore Unit No. 3 into place. The remaining smaller holes, which appear black, are the holes through which the wires pass from one side of the panel to the other. If the constructor does not wish to lay-out the wire holes he can just drill the apparatus mounting holes and then fasten the various parts to the sub-panel, after which the necessary wire holes may be drilled with a small hand drill as they are required.

It is a comparatively simple matter to assemble and completely wire the Madison-Moore Super-Heterodyne Receiver. By referring to Figure 3, the Baseboard Layout, the correct placing of the parts may be easily accomplished. Care should be taken that the apparatus be mounted in such a manner that the terminals bear a correct relation to the other parts. The apparatus shown mounted on the sub-panel is clearly marked for this purpose. The Madison-Moore units are fastened into place first. Then the Jones Plug, the three by-pass condensers, the supporting brackets, the grid leak and condenser and the two fixed resistances should be mounted under the sub-panel. The remaining parts which mount on the top surface of the sub-panel are then screwed down. The front panel is also assembled, but is not fastened to the brackets.

It is advisable that soldering lugs be placed under all terminals to facilitate soldering and assure a positive contact. Insulated wire may be used in hooking-up the receiver, although it is not

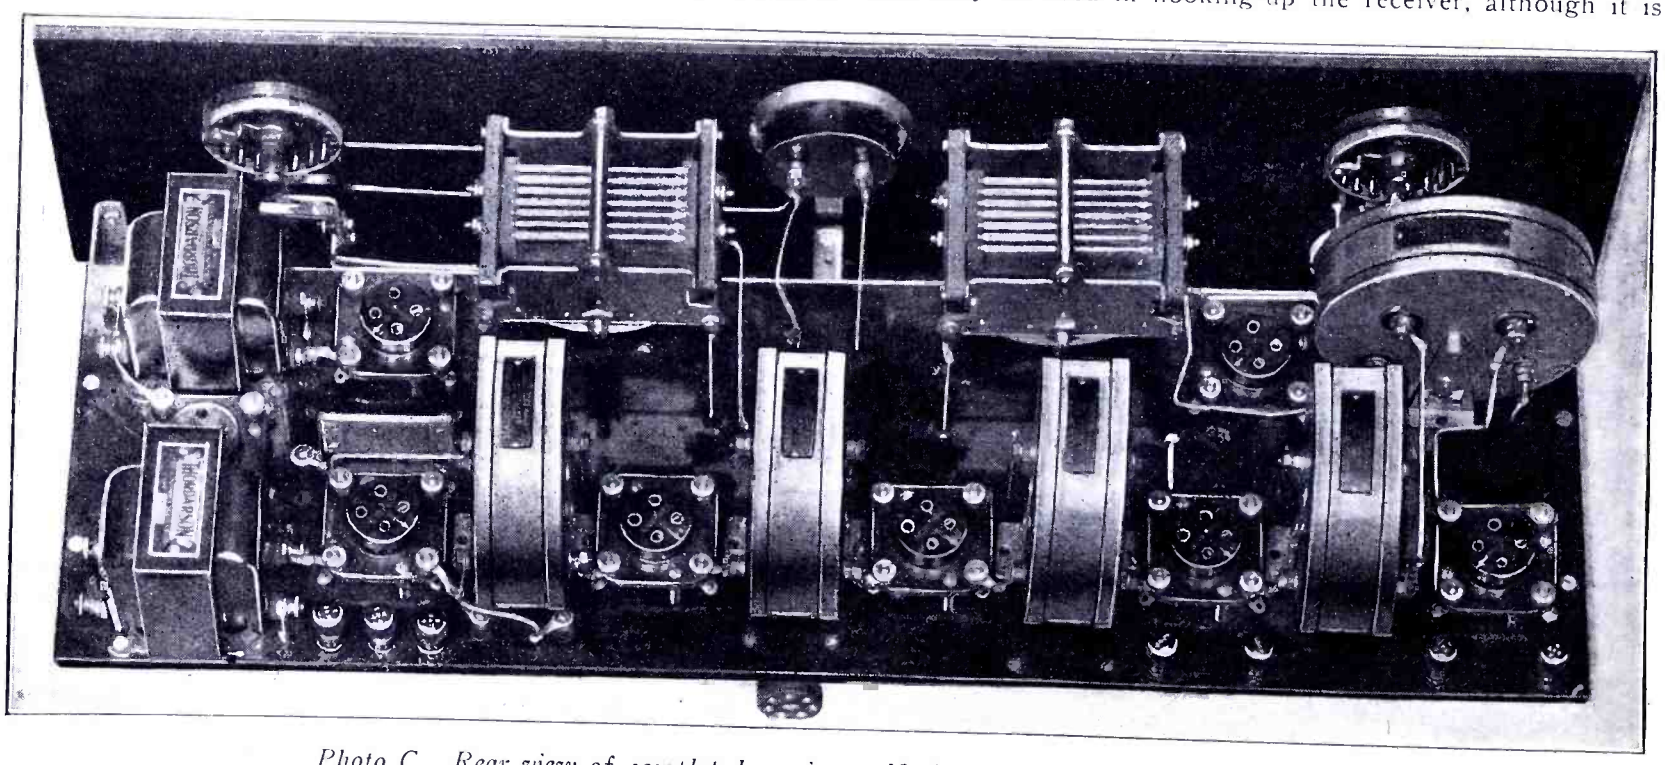

Photo C. Rear view of completed receiver. Notice the neat arrangement of parts

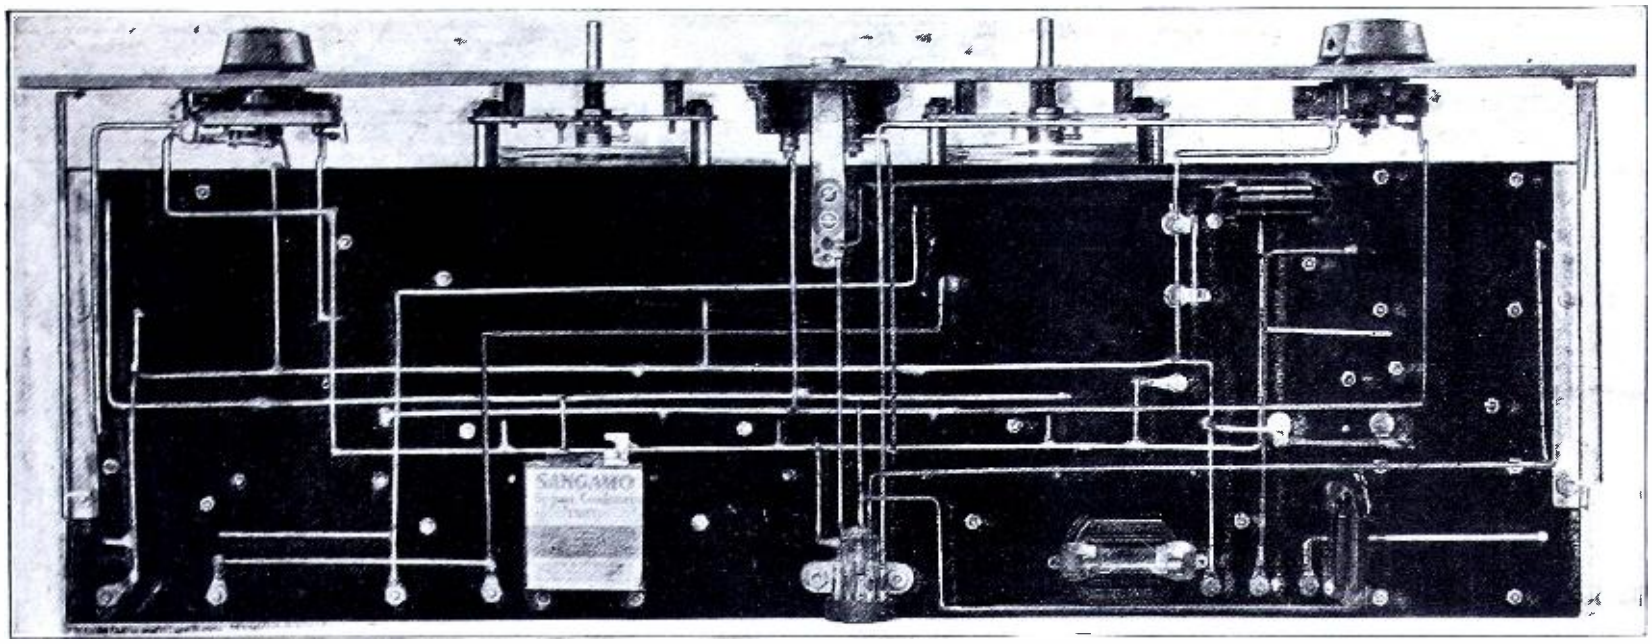

Photo D. Bottom view of sub-panel showing how all leads can be neatly arranged

necessary. Practically all connecting wires are below the sub-panel. Those plate and grid leads which must be short are above the panel. The wiring under the sub-panel is kept against it as much as possible. The constructor will have no difficulty in hooking up the receiver and making a neat job of it, if he follows the various photographs and illustrations accompanying the article. After all possible connections have been made on the sub-panel assembly, the front-panel is fastened into place and the wiring finished.

After all wiring has been completed, carefully check all connections by referring to Figure 4. Make those corrections which are necessary and then connect a 4-volt "A" battery to the proper terminals and insert the tubes in their sockets. Test all tubes as to operation; observe whether they are controlled by the proper rheostat or resistance. Touch the "A" positive battery wire to each of the other terminals on the Jones Plug. If the tubes do not light up except when the "A" battery is applied to the proper terminals, it is safe to connect the "B" and "C" batteries. However, if any of the tubes light up it is an indication that something is wrong and a mistake has been made in the wiring. Carefully recheck all connections until the mistake is found. Repeat the "A" battery test and connect the other batteries, the loop and the speaker to the receiver.

If a station is on the air the receiver should respond at once.

The New ELKAY Receiver

TRADE MARK REG.

WITH DONLE TRUPHONIC AUDIO AMPLIFICATION

for the man who has heard the best in reception and still says, "I guess I'll wait till they get it right; then I'll buy!"

In beauty of tone—in uniform volume on all waves—and in "needlepoint" selectivity in congested areas, the new ELKAY represents the very utmost in radio—totally regardless of price!

—it embodies the new DONLE TRUPHONIC SYSTEM OF AUDIO AMPLIFICATION, plus the Elkay Synauto R. F., which give it a pure tone and a very high amplification from 200 to 580 meters, *uniformly*.

—it has the Elkay Tube Equalizor System of interchangeable, automatic rheostats; any combination of tubes can be used. In addition to the splendid new tubes now to be had, before this radio season is over there will be special R. F., Detector, Audio and Output tubes on the market. Elkay owners will be able to use these tubes without alteration of hook-up.

—both the R. F. stages and the Detector are entirely shielded.

—a new Uni-Control has the flexibility of three dials; very simple to tune, no sub-controls.

—"floating" sockets mounted on Bakelite sub-panel; all important insulated and wearing parts, genuine Bakelite.

—all connections from a common cable, plainly tabbed.

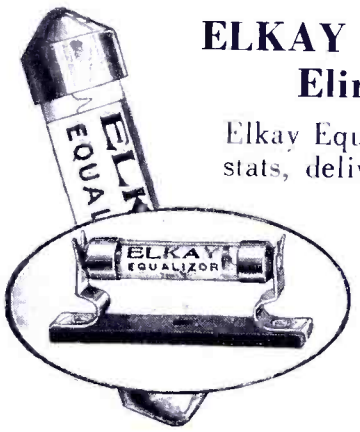
—in a beautiful sloping-front cabinet of brown, antique Duco finished natural grain mahogany.

—$125 list.

The Elkay 5-Tube Set

Compares favorably in appearance, selectivity, volume, distance and tone with sets at twice its price. Has one stage R. F., detector, one stage of transformer coupled amplification and two resistance coupled amplifiers. A radio frequency choke permits the same smooth operation on low or high wave lengths. Has the Elkay Equalizor System, which permits the use of any combination of tubes, and a device for controlling selectivity which is an Elkay patent. Retail, $80.

Exclusive Elkay Franchises to the Trade



ELKAY TUBE EQUALIZORS
Eliminate Rheostats

Elkay Equalizors replace variable rheostats, delivering correct voltage to any type of tube *automatically*. To use any combination of tubes in the same set, merely insert an Equalizor of the correct value; there is one for every tube made. 50c list; 75c mounted.

Elkay Suppressors, made in the same form as Elkay Equalizors, are non-inductive, noiseless resistances for the grid circuit of R. F. tubes. They suppress regeneration in the grid circuit at just the right point to insure greatest sensitiveness. 75c list; $1.00 mounted.

Elkay Locatrol Condensers are double or triple condensers of variable type, ganged together to be operated from the new vertical, Unicontrol dials, identical with those in the new Elkay 6-tube set. Prices on application.

Quantity Prices to Manufacturers

The Langbein-Kaufman Radio Co., Dept. C, 62 Franklin St., New Haven, Conn.

A Synchronized Tuned Radio Frequency Receiver Employing Donle Truphonic System of Amplification

IN designing this new six tube receiver there has been kept in mind the following important needs:

1. Absolute faithful reproduction.
2. Good and uniform sensitivity from 200-550 meters.
3. A machine that will never be obsolete through the advent of better tubes, either audio, radio or detector.
4. Economical use of batteries.
5. Simple tuning arrangement with every flexible possibility, relative to ease in tuning.
6. Freedom from extraneous noises and good selectivity at control (shielding).
7. High grade parts and a neat, pleasing appearance.

This year the most cardinal demand will be quality. Every radio periodical, every manufacturer, every engineer has quality on his tongue tip. Many claim to have true reproduction and attempt to prove their claim by frequency output curves.

Unfortunately, frequency-output curves show very little of the true value of audio amplification, as distortion can be easily introduced at a single fundamental frequency. The truth is that for true, faithful reproduction not only a constant amplification for varied frequency is necessary, but a straight line increase in amplification must be obtained for increase in load. In other words, the load-amplification curve must be constant at given frequencies.

Donle has combined transformer and total impedance in a single stage, resulting in a division of load and absolute reproduction without loss of amplification.

Distortion may also arise in output tubes, and it is equally essential to use an output tube in the last stage. For ordinary use the UX 171 and UX 112 are ideal.

Up to the present there has been very little change in radio frequency amplification; namely, fixed induction between grid and plate with methods of neutralization and suppression of regeneration.

Fans have long realized that in designing primaries for R. F. transformers they were much impressed with the fact that a few turns worked best for low waves and a large number of turns for long waves. When they used large coupling, the receiver was a knockout for 450 up, but below that it squealed like a pig. Or if a few turns were used, it was found that results from 400 up were poor.

This receiver utilizes a split primary mechanically connected to the condensers, in order to give uniform amplification over the broadcast range from 200 to 550 meters. The maximum amplification over the complete range of a receiver is obtained if the set is designed to operate just below the point of oscillation. The regeneration should change with the increase in capacity and wavelength, and in order to keep these two factors uniform the coupling should be varied in proportion.

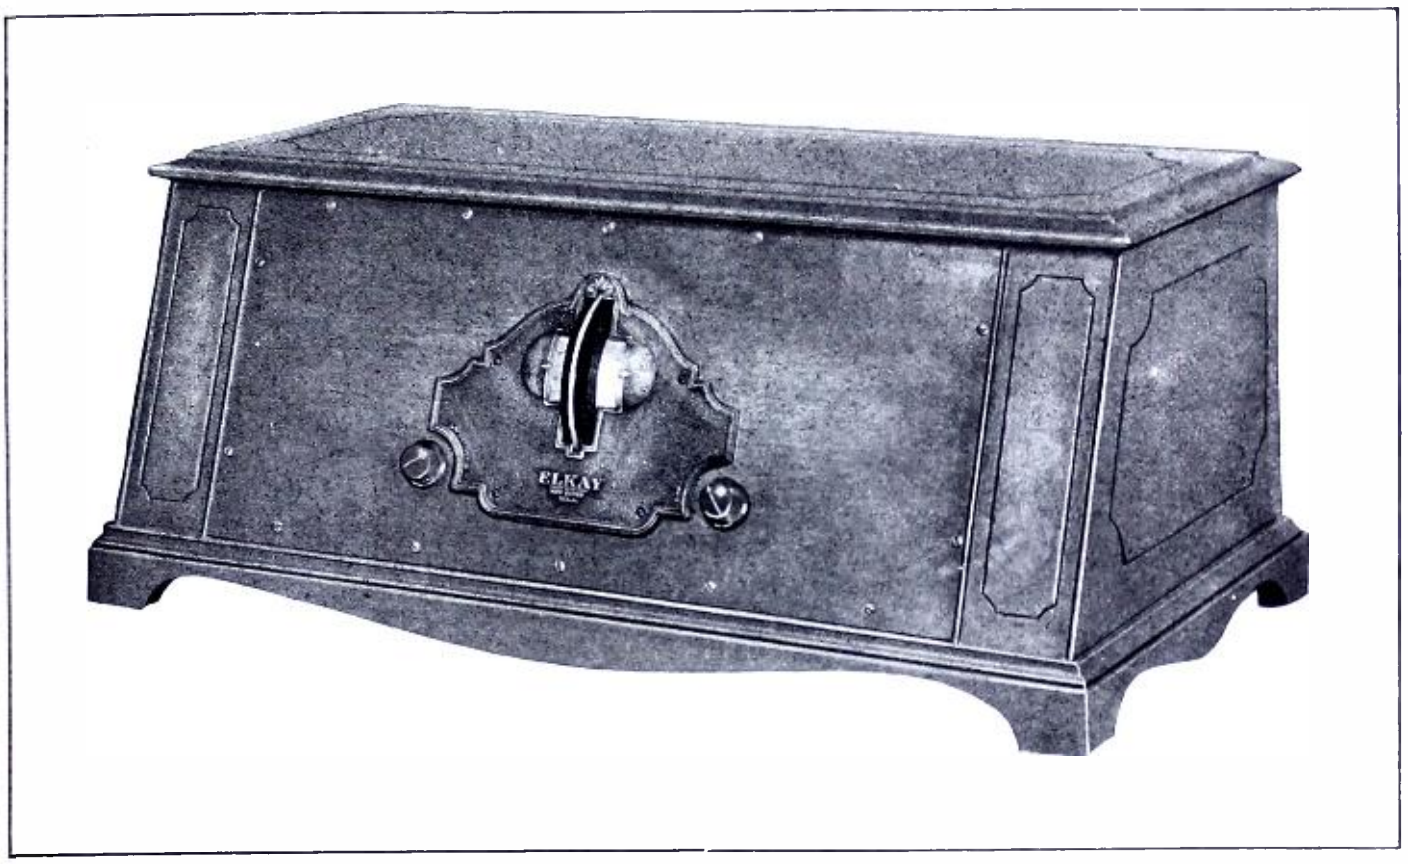


Photo A. Front view of completed receiver showing tuning controls

The tendency to burst into oscillation is critical and the engineers have further smoothed out the circuit by using a non-inductive resistance, which chokes the regeneration in the grid circuit. Suppressors are in cartridge form so that varied degrees of sensitivity may be obtained by increasing or decreasing their value.

Shielding is also employed to prevent interstage coupling or outside electro-static or electro-magnetic pickup.

In spite of the perfection of B battery eliminators, it is essential to keep the plate currents as low as possible, as in this manner only can real quality and results be obtained. Proper C bat-

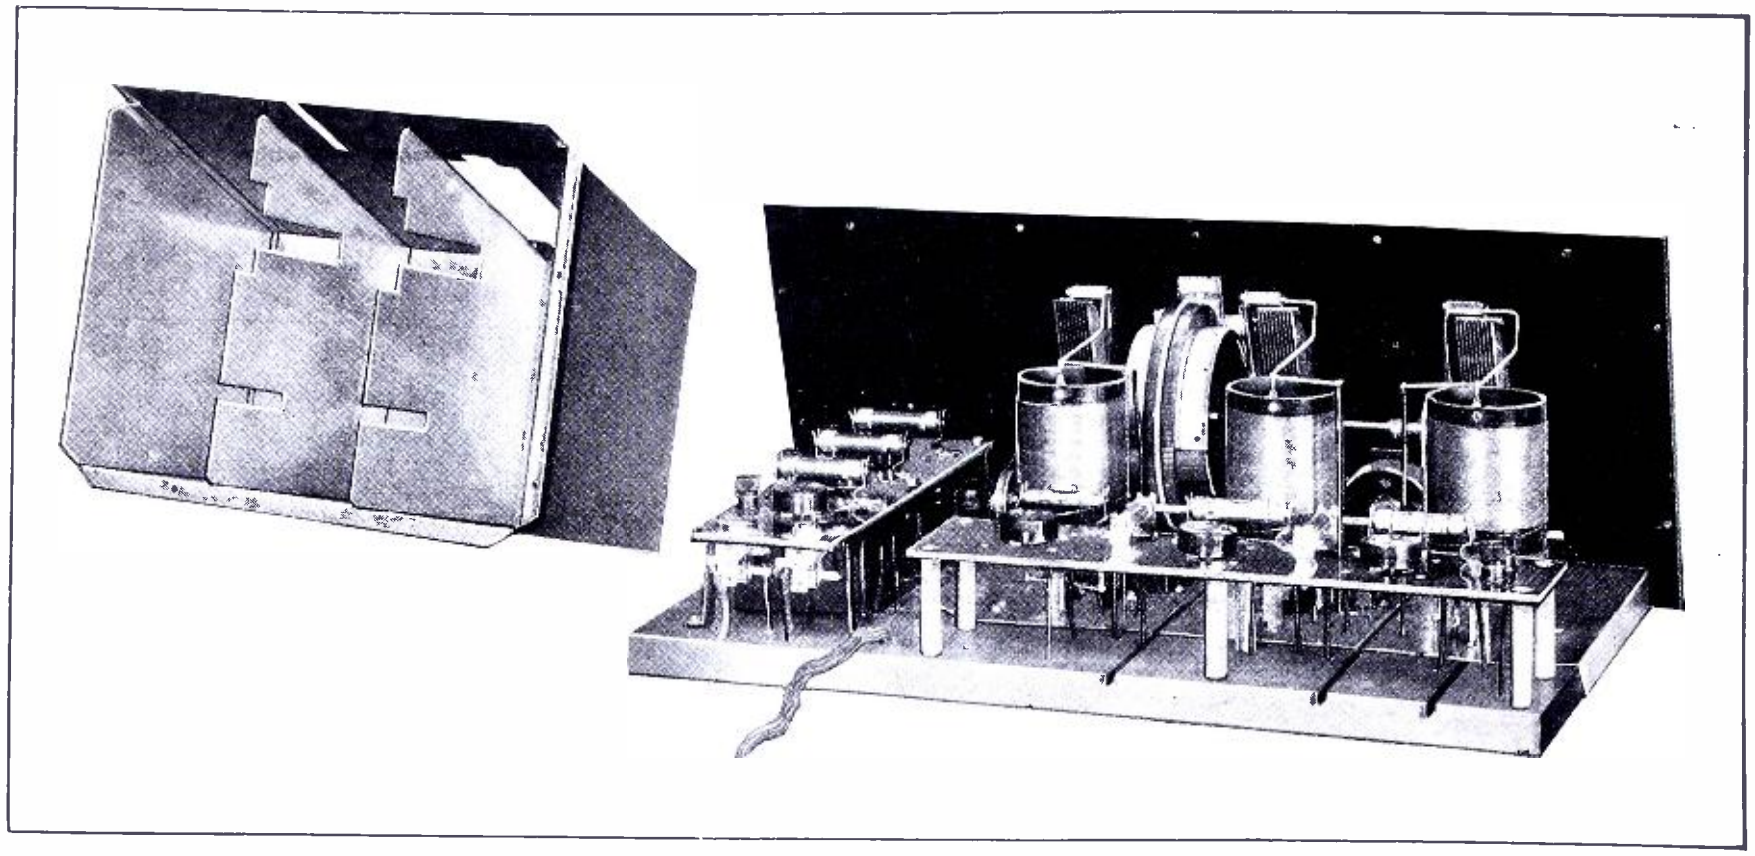

Photo B. Rear view of receiver with shield removed

tery provision and the impossibility of increasing filament emission over normal values does this for the receiver.

The modern receiver must have ease of tuning, the ability to swing from one station to another without delicate adjustments. Yet the reliable receiver must have sufficient controls to have everything at the thumbs' tips. A simple ingenuous tuning arrangement is employed permitting the operator to tune as a one, two or three dial set actually at your thumbs' tips. It permits tuning or detuning at will.

Shielding is no longer a fancy, but an actual necessity in real radio receivers. Proper shielding prevents inter-stage coupling, allowing each radio stage to operate at maximum efficiency. Electro-magnetic and electro-static coupling is reduced to practically zero, with the result that the removal of the aerial kills reception immediately. The result is that in congested regions small antennas may be employed with great selectivity. Even in rural territories it is possible with the sensitivity obtained with the UX 200-A and Donle S-7 to receive on indoor and spring aerials, even over long distances. Shielding, too, cuts down local noises and permits easy adaption to A, B and C eliminators.

In localities where there is an abundance of large powerful broadcasting stations the 201-A tube will not be able to handle the output of this receiver. It is advisable to use a power output tube in the last stage. At the time of publication of these instructions, types R. C. A. 112, 171, and Daven MU 6 tubes have been tested and found satisfactory for output tubes. In inserting these tubes into the machine be sure the proper Equalizor is inserted. Information on this will be found in the instruction book. It is to be remembered that increased C battery will be necessary with these tubes and with a higher voltage.

In rural territories, or in fact wherever long distance reception is desired where the locals are off, a very sensitive detector tube may be employed. The R. C. A. UX 200-A may be ideally employed in the six tube machine, resulting in simplified tuning and increased distance. A slight hiss accompanies the increased amplification, which is not serious.

The ideal arrangement of tubes for a receiving set near large broadcasting stations would be five 201-A tubes and one 112 tube in the output. In rural territories where distance is a prime necessity it is recommended that 201-A tubes be used in the R. F., a 200-A in the detector, a 201-A in the first two audios and a 112 in the last audio.

There are available various types of R. F. and intermediate tubes which may be employed in the six tube Elkay, provided the proper Equalizor is inserted and the proper voltages adjusted. Experimenters should only use these at their own risk and with

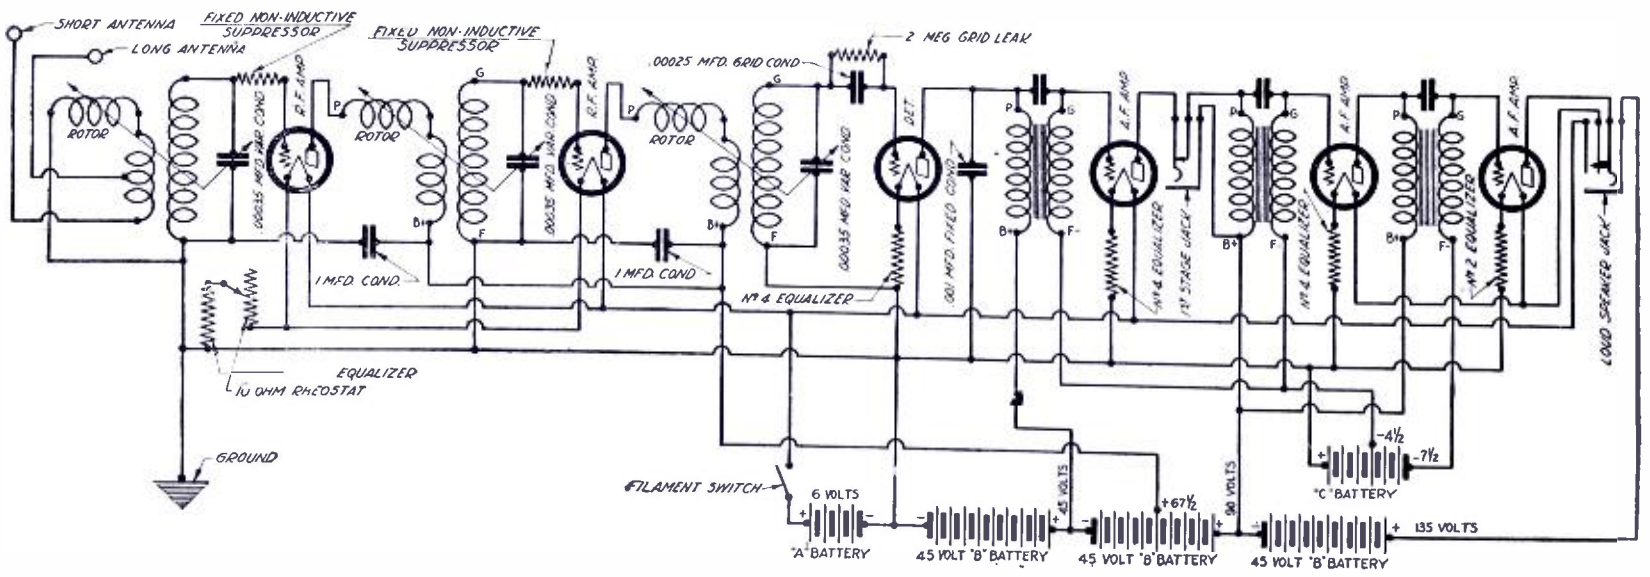

Figure 1. Schematic wiring diagram of receiver

results depending upon their ability to adjust tubes to their local condition.

Long aerials may be employed in the Super-Selector and lengths up to 150 feet may be used with increased results, provided it does not materially affect selectivity. Bear in mind that a large aerial always tends to decrease the selectivity or the ability to separate stations, but at the same time increase the volume and the ease of reception.

The machine is provided with two aerials, one marked "Short Antenna" and the other "Long Antenna." When first installing always connect the short antenna unless it is found that selectivity is lacking. Then a long antenna should be used.

In localities like New York, Chicago, Philadelphia and Boston, where there are quite a number of powerful broadcasting stations, it is desirable to keep the length of the antenna down. One of 80 feet is desirable in such congested territories.

In dealing with the aerial and ground due consideration must be given and it should be realized that the success of the six tube receiver, or in fact any receiver, rests in the proper erection of these two necessities.

The aerial and ground constitute the energy pickup system delivering the weak signals to your receiver. Unless they are carefully erected, doubtful results will always be obtained.

The standard aerial is one of 100 feet long, excluding the lead-in. It should be as high and as clear from surrounding objects as is possible to erect it. The lead-in should be brought as direct to the receiver as is possible. Always tap the aerial away from conducting or interfering objects. Lead it direct through the wall or window to the machine. Bear in mind that all connections should be soldered, for unless a good connection can be made by slipping them into clips, eventually the joint will become corroded and useless.

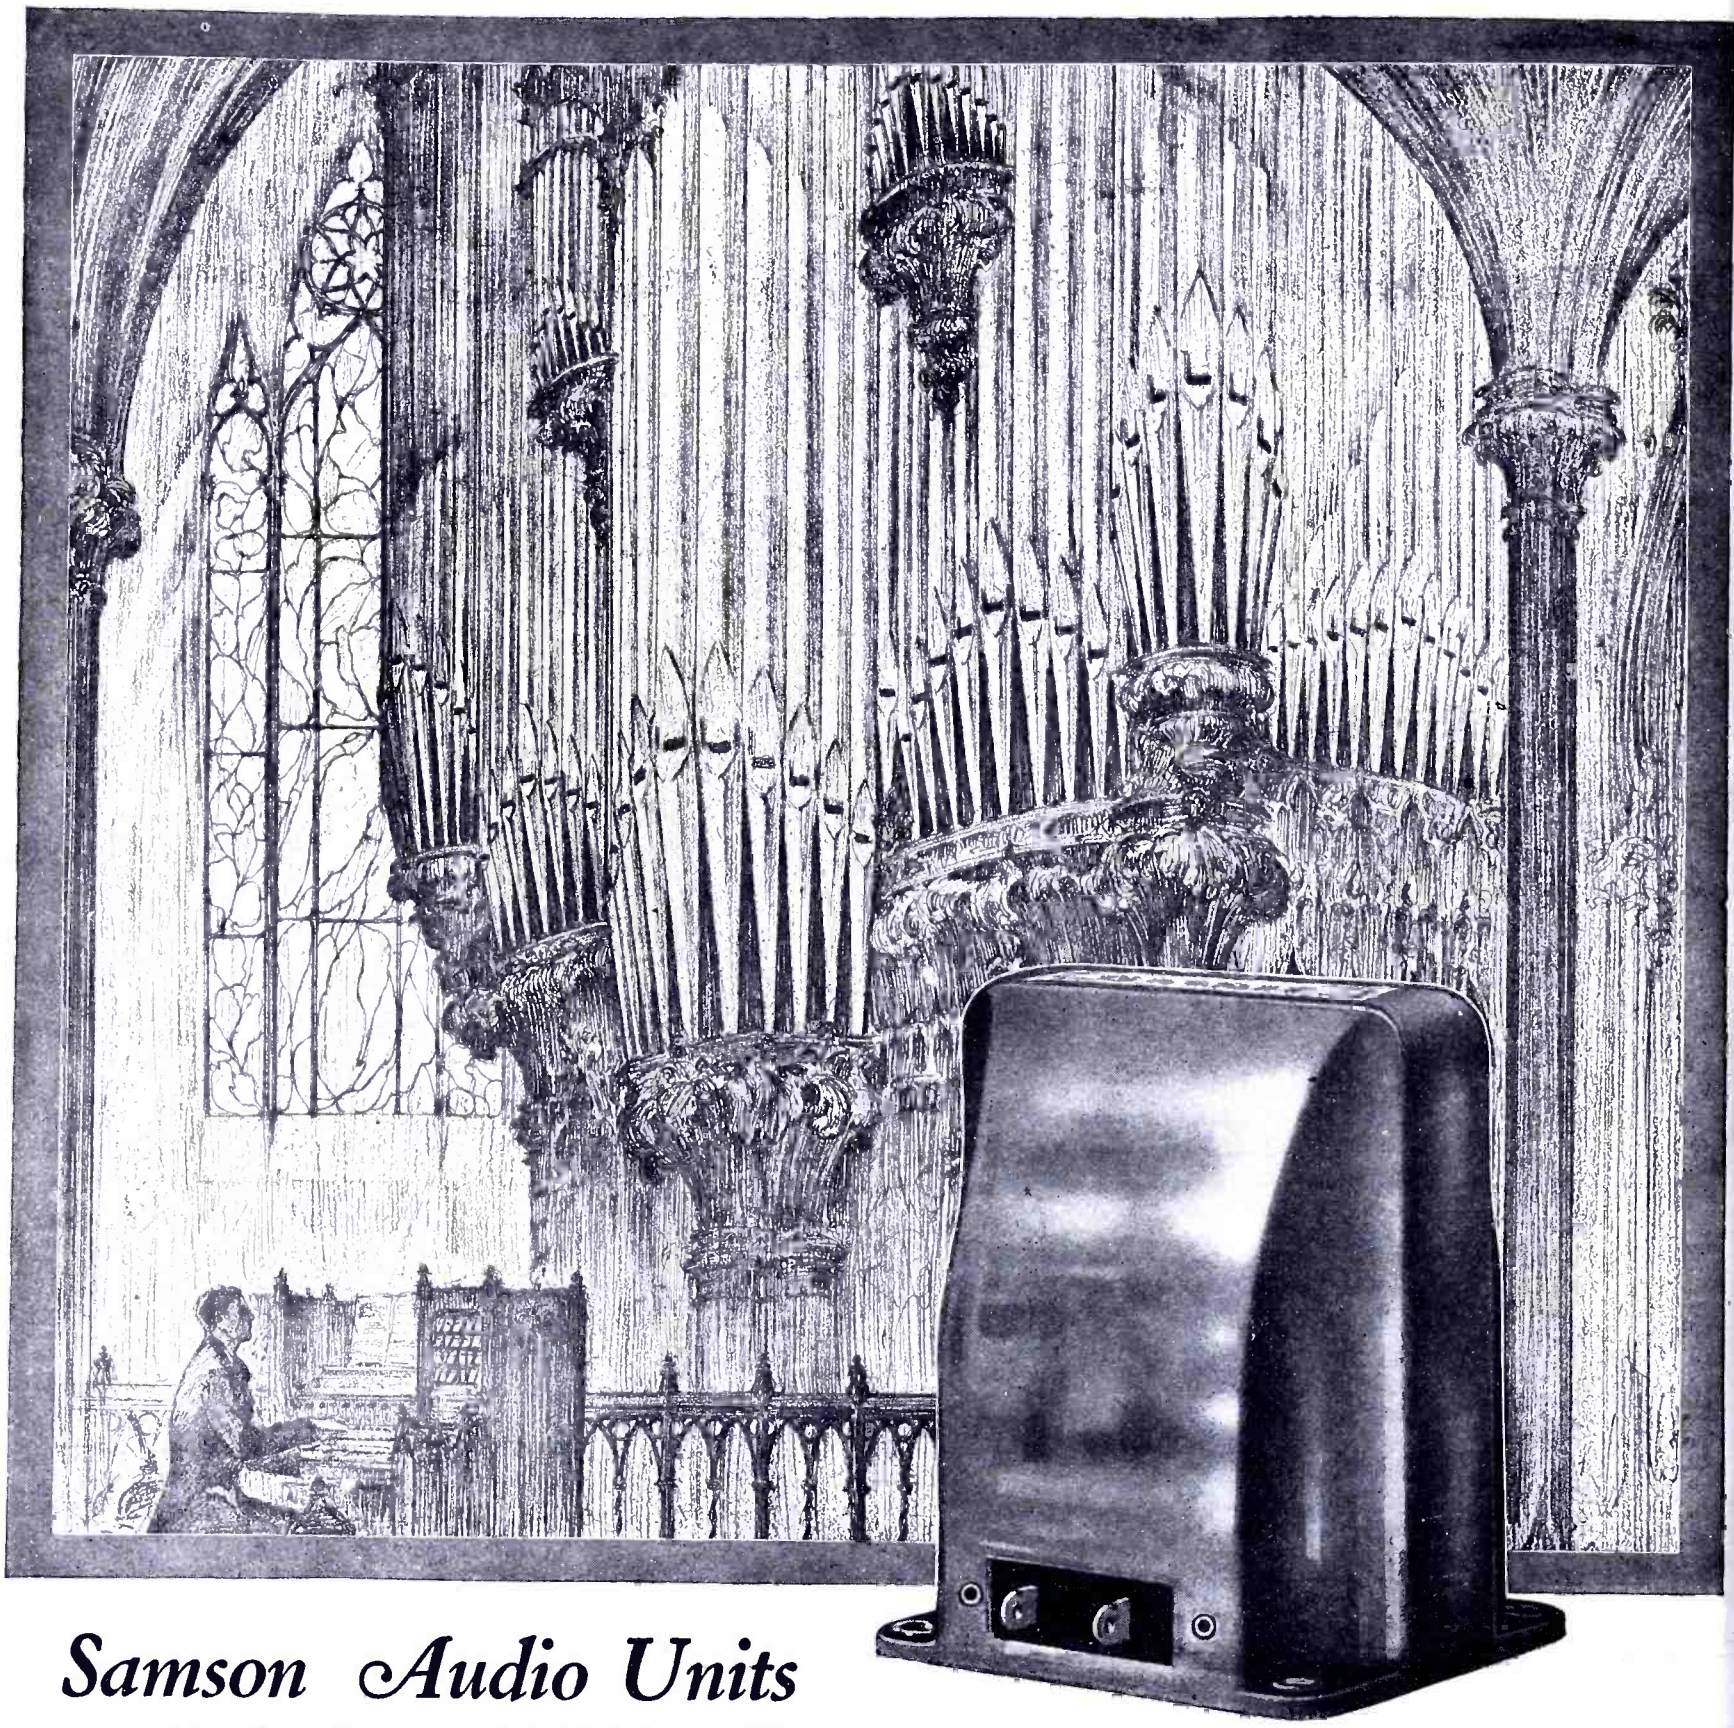
A good ground is as valuable as a good aerial. Ordinarily a water pipe or radiator which leads directly to the water system is recommended. Be sure a good ground clamp is used and that the pipe is carefully scraped before application. A good outside ground may be also used by driving a good clean pipe into moist ground. This is to be used as a second resort.

Short ground and aerial lead-ins are advocated, as these particular parts actually add resistance to the signal without material pickup.

List of Parts

These parts or their equivalent will give satisfactory results:

1—Elkay baseboard—drilled and slotted.
1—Elkay special 3-compartment copper interstage shield—two pieces.
1—Elkay three gange condenser and dial unit—fingertip control—complete.
1—Set Elkay Syn-Auto coils (three) with shafts and pulleys.
2—½ mfd. 1000 volt by-pass condensers—Dubilier.
1—Elkay radio frequency unit with three spring sockets. Equalizer, suppressor and grid leak clips—mounted.
1—Micamold .00025 grid condenser.
1—Three stage Tru-Phonic Audio amplifier unit enbloc—Alden.
1—Audio amplifier panel with three spring sockets; Equalizor clips.
1—.002 by-pass mica condenser.
1—No. 955 Frost gem jack—filament control.
1—No. 954 Frost gem jack—closed circuit.
1—Pacent rheostat, 6 ohm.
1—Elkay Resistance.
1—Six wire six-foot Battery cable—American Braid.
5—Eby binding posts.
5—Elkay Equalizers.
2—Elkay Suppressors No. 700.
1—Lynch three meg. grid leak—Gastor.
1—Yaxley No. 20 switch.
2—K. K. No. 17¼ knobs.
1—Elkay panel and cabinet (optional).



Samson Audio Units

are capable of uniform and faithful amplification well in excess of the most exacting broadcast requirements.

Their range extends from the lower fundamentals through the higher harmonics enabling them to reproduce, with equal clarity, the dull rumble of the tom-tom or the thin shrill of the flute.

This ability to reproduce the harmonics or higher multiple frequencies is what gives tone-color or background to sound—is what permits the listener to distinguish notes of the same pitch but from different instruments—results not possible with audio units which cut off at comparatively low frequencies.

In a word—with a loud speaker of corresponding range—

Samson Audio Units

insure the sort of radio you've hoped to hear—the quality of radio that will make you think you've been translated from a broadcast listener to one of an audience which is listening, firsthand, to a speech or to music.

For 1926-27 the Samson Electric Company offers eleven different audio units:

Symphonic Transformers		**$9.00**
Push-Pull Input Transformer	**Type X**	**5.50**
Standard Transformers	**Type IIW-A3 Ratio 2-1, 3-1, 6-1**	**5.00**
Dual Impedance	**Type D (Donle Design)**	**5.00**
Output Impedance	**Type O**	**5.00**
Push-Pull Output Impedance	**Type Z**	**5.00**
Plate Impedance	**Type P**	**4.50**
Grid Impedance	**Type G**	**4.50**
Audio Frequency Choke	**Type No. 3**	**3.00**

Our book—"Audio Amplification"—already accepted as a manual of audio design by many radio engineers—contains much original information of greatest practical value to those interested in bettering the quality of their reproduction. Sent upon receipt of 25c

A De Luxe Five Tube Tuned Radio Frequency Receiver

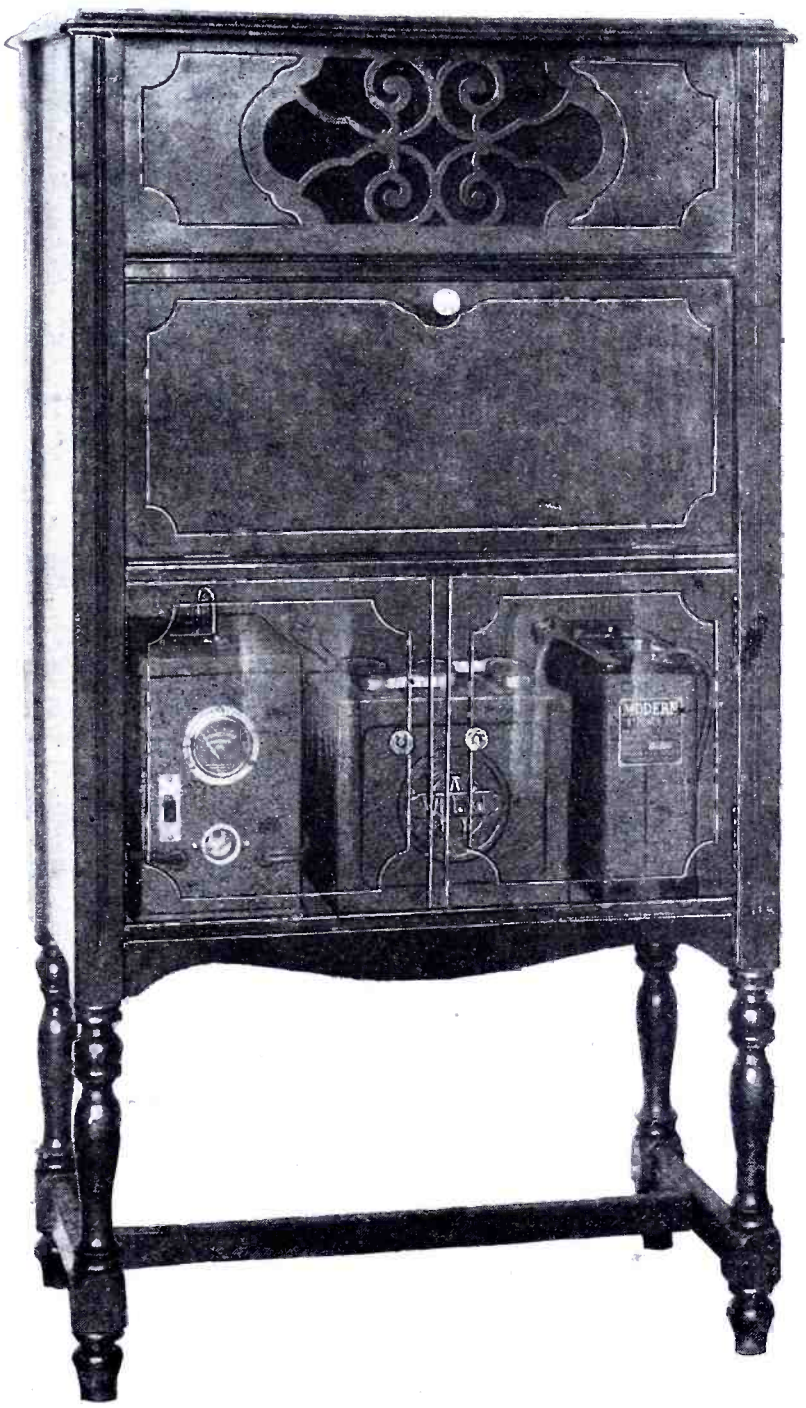
This Receiver Was Designed and Tested in the Citizens Radio Laboratory

THE difference in this receiver as compared to other tuned radio frequency receivers is largely in the neutralization of the radio frequency tube. This is accomplished by a method somewhat different from that ordinarily employed. new design of neutralized condenser having a very precise adtment, varied by a small knob on top of the condenser case, is ced between the grid return and the plate of the radio frency tube. Between the grid urn and the negative filament of radio frequency tube is inted an 85 millihenry radio frency choke coil with a .0001 d. fixed condenser across it.

The question naturally arises as why a condenser, which allows io frequency currents to pass, shunted across the choke coil, igned especially to stop the lio frequency currents. With the jority of radio frequency chokes w sold on the market, the disbuted capacity is quite high and ows a great deal of the radio quency to pass. The choke coil d in this circuit has an exmely low distributed capacity l therefore does not pass suffint current to permit the proper eration of the circuit. The conser acts as a gate or valve and mits the necessary amount of lio frequency to pass through. The combination of the choke l its associated condenser bale the radio frequency circuit such a manner that the only ustment necessary to place the eiver in proper working order the setting of the neutralizing ndenser. Evidence that the rever is properly neutralized will found in the absence of a resonce check in the speaker when two tuning controls are operd together. Proper neutralizan of the receiver absolutely events any reradiation and conquent annoyance to neighbors.

Unlike the ordinary tuned radio quency receiver using regenerain, this set makes use of a double or coupler. One rotor is the ckler" or regeneration control; other the primary of the radio quency transformer, and is used as a selectivity control.

In fact, the receiver is ideal in any locality. In metropolitan as, where the air congestion is severe, its selectivity may be reased so that interference is reduced to a minimum. On the er hand, in suburban districts, where interference is negligible, receiver may be tuned broadly without sacrificing volume or tance. With the primary rotor in a vertical position, maximum ectivity is obtained, and vice versa. The selectivity control ed not be varied after it has once been set according to the gree of selectivity desired by the operator.



View of receiver mounted in console with suggested accessories

Figure 2 is a schematic wiring diagram of the complete receiver. It will be noticed that all tubes are controlled by Elkay Equalizers. This method allows the maximum efficiency to be realized from each tube without manual control. Loud speaker volume is controlled by the "tickler." If the operator desires a more sensitive control, a Centralab 500,000-ohm variable resistance may be shunted across the secondary of the first dual impedance, or a Centralab Modu-Plug used for the loud speaker.

A new system of audio amplification is used in this receiver. It combines the advantages of all types of coupling with the exclusion of the disadvantages. Being more efficient than either impedance or resistance coupling, it permits a quality of reproduction equal to the very best of either under the most favorable conditions, as well as affording a greater amount of amplification. The disagreeable characteristic of transformer coupling, amplifying only weak signals excessively, is not found in this new system, nor is there the slightest tendency toward audio regeneration or howling. The amplifying units appear similar to audio transformers. However, their electrical characteristics and construction are entirely different. Two windings are placed upon a single iron core. A by-pass condenser is shunted across the plate and grid ends of the windings and sealed into the case at the factory.

In operation the unit functions in a manner similar to a resistance unit. Instead of a leak of high resistance, one of impedance is used. By this method a high impedance is presented to the alternating signal coming from the plate of the preceding tube, but a very low resistance to the charge leaking off from the grid of the following tube. Tests have shown that this system of amplification has a very high efficiency for all signal intensities.

In Figure 1 is shown a layout of the front panel of the receiver. The correct location of all mounting holes is accurately shown, as well as the necessary engraving. The two holes for mounting the antenna coupling are not shown. They are located 5¼ inches from the bottom of the panel at the left end. One hole is ½ inch and the other is 3¾ inches from the left end of the panel. The holes are each ⅛ inch in diameter and are drilled only ⅛ inch deep. Using a No. 6-32x⅛-inch round head machine screw as a tap, the hole may be easily tapped. The antenna coupler may then be easily mounted into position.

Figure 3, the baseboard layout, shows the location of all parts mounted on the baseboard and panel. The parts are properly

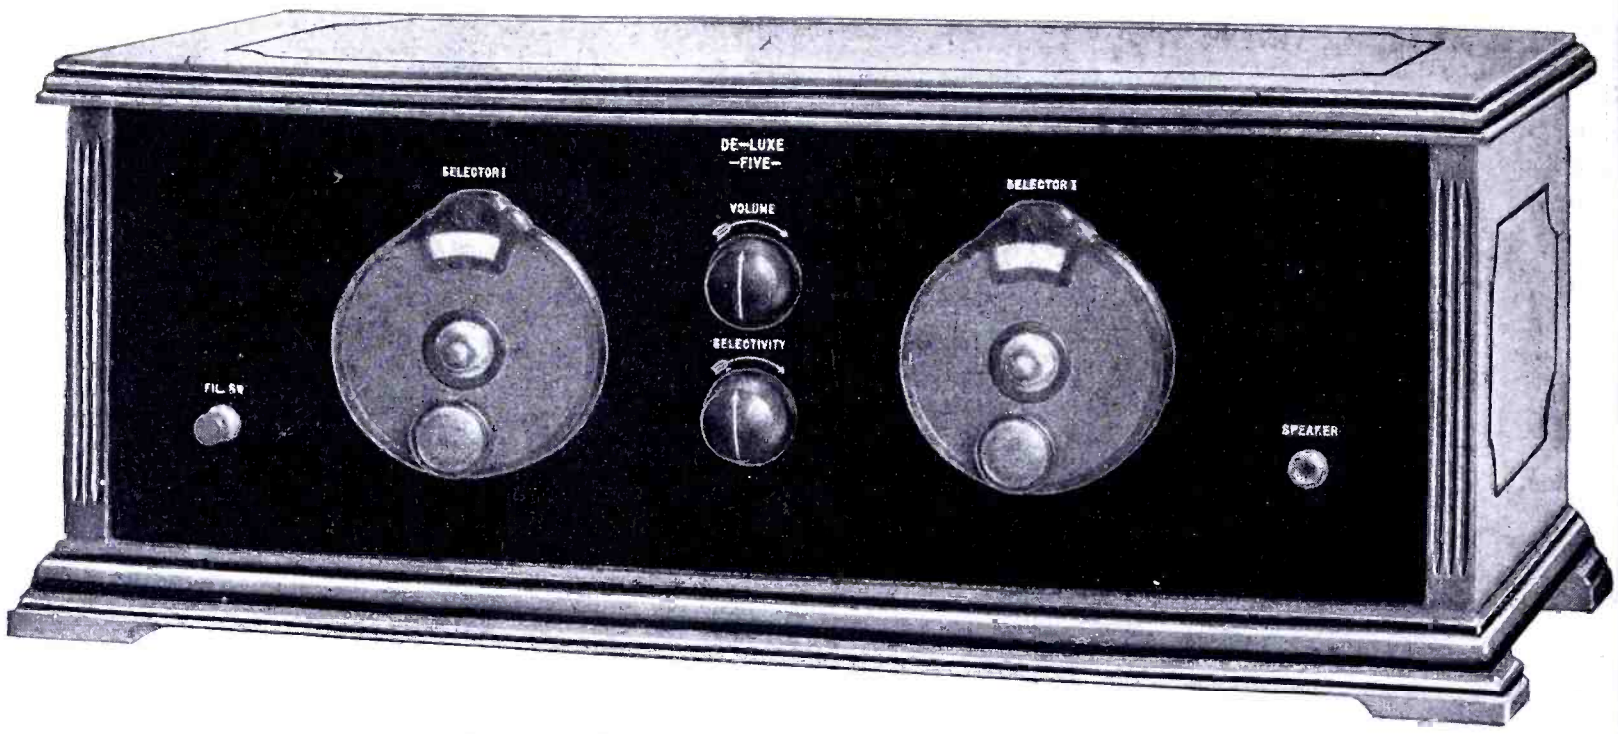


Photo A. Front view of receiver mounted in a cabinet

located, with all terminals plainly marked so that the apparatus may be mounted in the correct position with their respective terminals bearing a correct relation to other apparatus. Photo "B" will help materially in properly locating those parts on the baseboard which are not shown in Figure 3, due to other apparatus hiding them.

The accessories shown consist of a Modern "B" battery eliminator, which will deliver all necessary voltages to operate the detector and amplifying tubes and is manufactured by the Modern Electric Co., Toledo, Ohio. A Willard standard six-volt radio battery is shown as the "A" supply. The Sterling charger shown will keep the "A" battery charged and may be connected to any electric socket having 60 cycle alternating current. The console contains a built-in Utah loud speaker. This is manufactured by the Radio Products Corporation, Chicago, Ill. *(If any information is desired regarding these accessories, please write the manufacturers direct.)*

LIST OF PARTS. :These parts or their equivalent will give satisfactory results:

Samson Radio Products

Samson Radio Products show the results of nearly half a century manufacturing experience. They are built to a standard and not to a price.

Samson Radio Products, when used with other high-grade standard parts, produce results that are unequalled for tone quality, selectivity and sensitivity.

What's Behind Samson Radio Products?

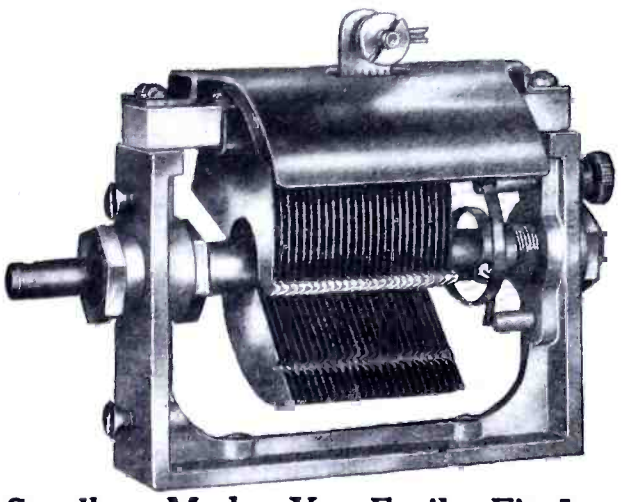
When doorbells were first rung, Samson Batteries rung them—dependably.

When fishermen first sought waterproof ignition systems, Samson supplied ignition—dependably.

When the U. S. Government enlisted fire alarm systems for the world war, Samson Systems proved—dependable.

When radio set manufacturers standardize on Samson Radio Parts they gain quality and—dependability.

Samson Radio Products carry no wild claims in their advertising but they are—dependable.



Smallest Made, Yet Easily Fit Into Present Sets

Samson Uniform Frequency Condensers

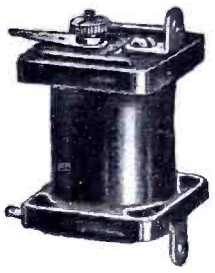
With them you can easily do away with the crowding of stations on your present receiver having ordinary condensers—where 85 out of 100 come in below 50 on the dial.

Mathematically proportioned plates assure uniform station spacing at both low and high ends of the scale as well as in the middle.

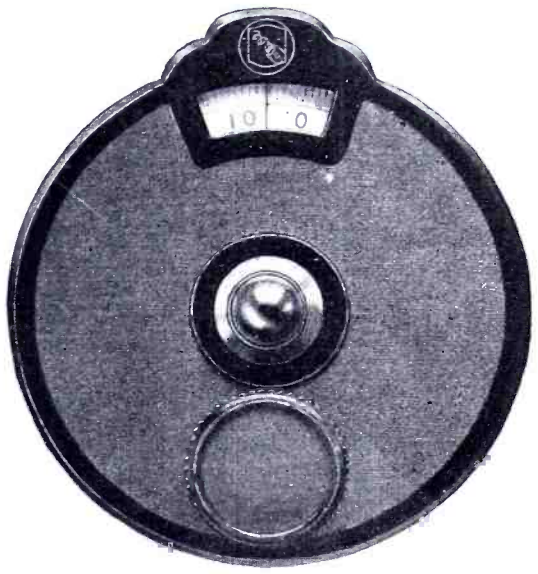
Samson Uniform Frequency Condensers are built to a tolerance of 1/1000 inch.

These grounded rotor type instruments have losses lower than the average laboratory standards.

This condenser, due to its design, does not have the defects caused by either solid metal or dielectric end plates. Samson Uniform Frequency Condensers have a one-hole mounting. They can be mounted vertically or horizontally, and are guaranteed accurate within plus or minus 1% of their rated capacitances. 500 mmf, $7.50; 350 mmf, $7.25; 250 mmf, $7.00; 125 mmf, $7.00; 75 mmf, $7.00.



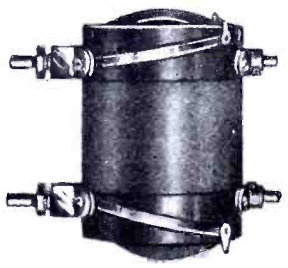
Samson Radio Frequency Choke Coils keep high radio frequency currents out of—or in—a particular portion of a circuit, preventing overloading of tubes with consequent distortion. They are also used where a high radio frequency impedance is desired. Their helical winding gives inimitable operation as a choke over an unusually wide band of frequencies. Write for Bulletin No. 27. Price of coils, No. 85, $1.50, and No. 125, $2.00.



Samson Vernier Dial

Samson Vernier Dial is universal—suitable for right or left hand rotation—and non-microphonic. It has an adjustable tension and a hair line close to split degree dial. This permits engineering instrument accuracy in readings. The dials are easily assembled without "play" or "shake" and will wear indefinitely without loosening. Price $2.50.

Samson Neutralizing Condenser is variable by fine gradations and stays permanently where adjusted. Minimum capacity .00002 mfd. Maximum capacity .0003 mfd. Price $1.75.



Samson Double Rotor Coupler gives a selectivity instantly adjustable from broad to "razor edge" and can be used as a coupler and R. F. transformer in many circuits. Price $7.50.

Samson Audio Frequency Choke No. 3 stabilizes and suppresses distortion in audio frequency amplifiers. Its patented helical winding gives an extremely low self capacitance for its size. Properly used, it prevents "motor boating" or "putting" due to "B" Eliminators, and makes "B" batteries last much longer. Send for Bulletin No. 28. Price of choke $3.00.

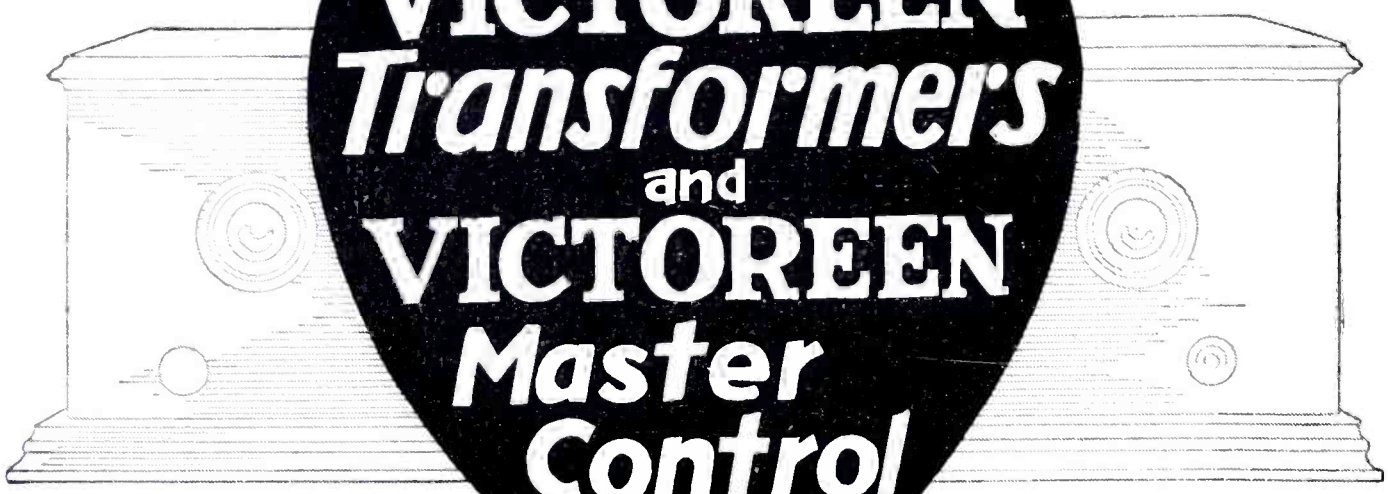
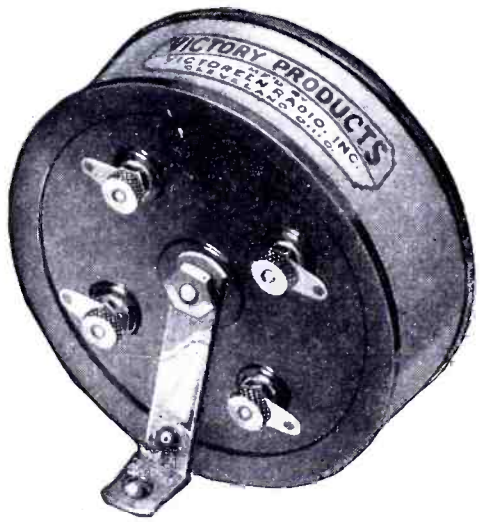
The Heart of the Circuit

VICTOREEN Transformers and VICTOREEN Master Control Unit





Victoreen No. 170 R. F. Transformer—neat and compact—3 in. in diameter, 1 in. thick.

Victoreen R. F. Transformers

are made with air core construction. They are not merely "matched," but are actually tuned to a guaranteed precision of 1/3 of 1%.

Victoreen Super sets are free from oscillations, howls or squeals—no matching of tubes is necessary.

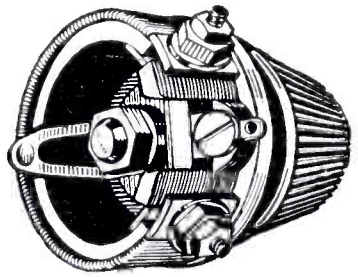
The "B" battery consumption is exceptionally low—8 to 10 milliamps with potentiometer at negative side—less than some 3 tube sets.

For range, clarity, volume, selectivity and ease of operation, a Victoreen Super cannot be excelled.

The Heart of the Circuit

4 Victoreen No. 170 R. F. Transformers, each (No. 171 Transformers when dry cells are used)	$7.00
1 Victoreen No. 150 Coupling Unit, each	5.50
Should the use of aerial be preferred to loop, Victoreen No. 160 Antenna coupler is required, each	3.50
1—400 ohm Victoreen Potentiometer	1.50
2—6 ohm Victoreen Rheostats, each	1.20
2—30 ohm Victoreen Rheostats, each	1.20
1—Type V. S. Master Control Unit	19.50

Get a complete list of necessary parts from your dealer or write us direct. Your dealer will be able to supply all parts. The free Victoreen folder and hook-up answers all questions about the Victoreen circuit.



Victoreen Manganin Rheostats

The only Rheostat with zero temperature coefficient—no matter how warm the unit becomes the resistance remains absolutely constant.

Victoreen Rheostats have double the number of turns of wire used on ordinary Rheostats—that means twice as fine adjustment.

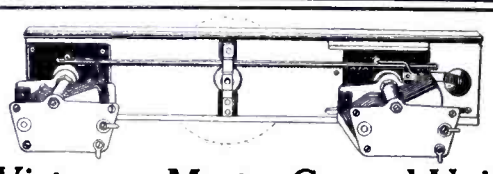
Genuine Manganin wire used in all Victoreen Rheostats.

This three terminal Rheostat simplifies wiring.

Made with 5 resistances—2, 6, 10, 20, 30 ohms—$1.20 each.

Victoreen Potentiometers

200 and 400 ohm resistances, $1.50 each.



Victoreen Master Control Unit

A completely assembled convenient single control unit for use in any circuit employing 2, 3 or 4 condensers.

Easy to mount and can be used on any lay-out without changing the wiring. Standard unit has 2 condensers. One or two more can be added, or it can be rearranged by the fan to suit his requirements.

Simplifies tuning—stations can be logged to one dial setting, whether loop or aerial is used.

Unit as shown:

For Victoreen Super or any 2—.0005 MF condenser set	$19.50
Extra condenser ready to mount	4.50

The Victoreen Super-Heterodyne Receiver

The super-heterodyne circuit is generally considered by most radio engineers as well as the radio public as the most efficient, sensitive and selective radio set of today. A superior receiver will appear only when an extremely radical achievement is made in the science of radio

THE distinguishing feature of the super-heterodyne receiver, which sets it apart in the classification of receiving circuits, is the use of intermediate frequency amplification. More than usual care must be exercised in the selection of proper intermediate frequency transformers, since the success or failure of the receiver is primarily dependent upon them. It is sometimes necessary for the builder to match the intermediate frequency transformers and resort to various devices for suppressing undesirable oscillations as well as selecting a set of tubes with approximately the same characteristics before the set will function properly. However, in the Victoreen Super-Heterodyne Receiver, described herewith, the tedious and expensive matching processes and the oscillation suppressing methods are eliminated, due to the excellent design of the intermediate frequency transformers.

These transformers are very unique in design, and a short description will be interesting. Due to the fact that there is no iron used in the core, the amplification constant curve is sharply peaked at 3400 meters, 88,000 cycles. This wave length or frequency was selected because it offers the least trouble from harmonics, which will be experienced in any receiving set of this nature. The aircore is two inches in diameter, thereby allowing a minimum amount of wire to be used to establish the proper inductance and at the same time keeping the field in close proximity to the coils, thereby eliminating feed-back and enabling the transformers to be placed in close relation to each other. The secondary is tuned by a small fixed condenser of approximately .00025 mfd. capacity which reduces the radio frequency resistance of the circuit. The condenser is adjusted at the factory by means of an oscillator and two radio frequency tubes and sealed to prevent any change or detuning which may occur through handling. Since the condenser is shunted across the secondary winding of each transformer, the grid-filament capacity of the tube is small in comparison, and has a negligible detuning effect. Any good tubes available may therefore be used without bothering to match them to the transformers.

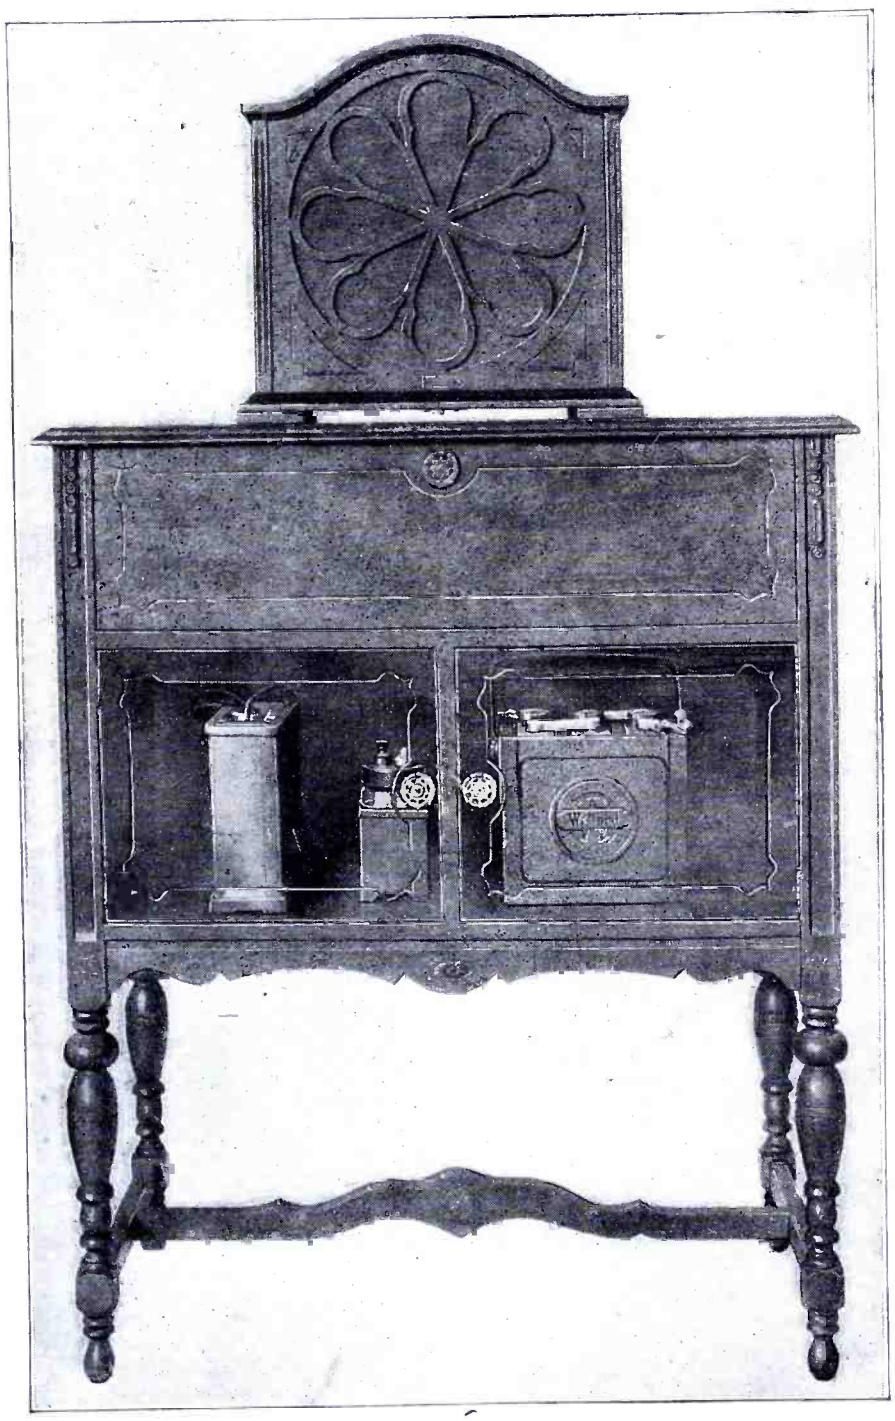

Photo A. View showing how receiver can be placed in a console with suggested accessories

A second adjustment is made at the factory which gives each transformer exactly the same amplification constant. This prevents interstage coupling with attendant oscillations which materially reduce the sensitivity of the receiver and destroy the clarity of signals. This extreme care in "peaking" the transformers allows a precision of ⅓ of 1% to be maintained at all times in the production of the coils, and speaks well for the rigid specifications under which the transformers are manufactured.

The circuit used in the Victoreen Super-Heterodyne Receiver is a well established hookup consisting of an oscillator, first and second detectors, intermediate frequency amplifiers and two stages of audio frequency amplification arranged for the use of a power tube in the last stage.

As may be observed from the illustrations, a switch is provided by which either a tapped loop or antenna and ground may be used. When the switch is thrown to the right, to operate the receiver on the loop, the wavelength condenser is automatically connected to the outside terminal of the loop and the tap to one end of the primary of the oscillator coupler, which places a positive bias on the first detector tube. At the same time the .000045 mfd. midget condenser is inserted in the plate circuit of the first detector tube and allows regeneration to be used when operating the receiver with a loop. The midget condenser is a very precise control over regeneration and serves as an excellent regulator over both sensitivity and selectivity. However, when the switch is thrown to the left, to operate the receiver with antenna and ground, the wavelength condenser is connected to the secondary of the antenna coupler which it tunes, and the outside terminals of the loop are automatically disconnected from the wavelength condenser. The midget condenser is also removed

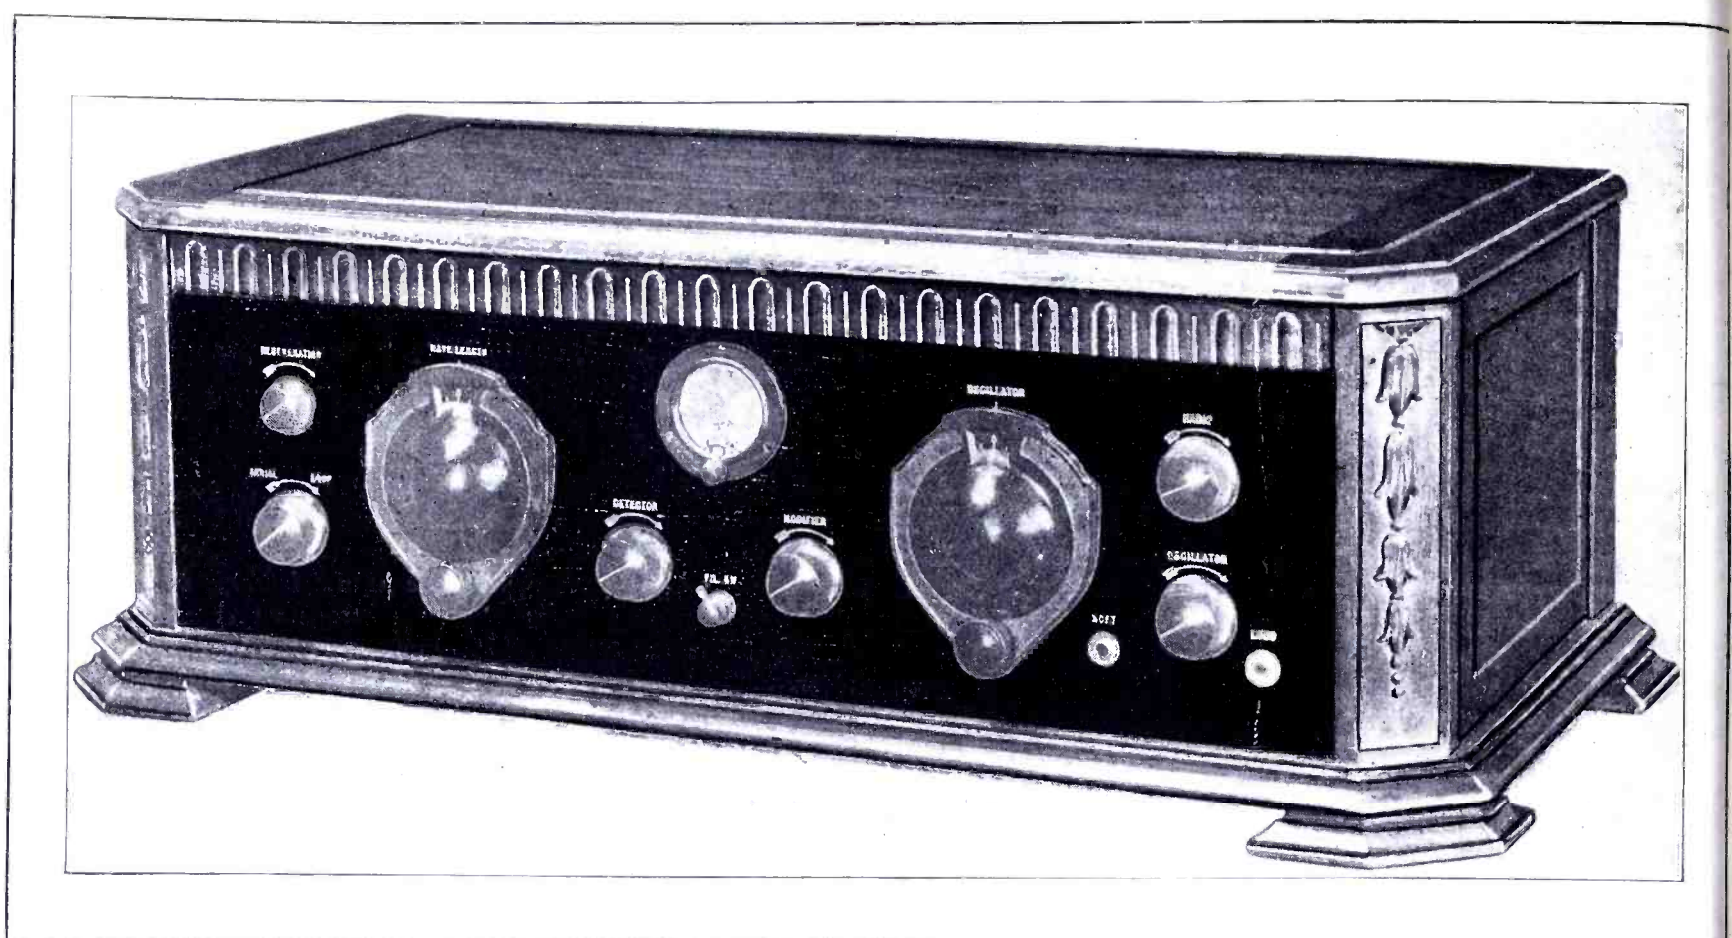

Photo B. Front view of receiver mounted in cabinet

from the circuit, since regeneration is not used while the set is operating from an antenna and ground system. A common "A" positive lead is used for both the tap on the loop and one end of the secondary of the antenna coupler.

When the loop is being used it is advisable to disconnect both antenna and ground, and vice versa. Push-type binding posts are provided to facilitate a quick change. Slight regeneration may be observed when using the antenna. This is caused by the small capacity in the change-over switch, but does not affect the operation of the receiver.

While a potentiometer is used in the circuit, its purpose is not that of an oscillation control, but serves as a useful and desirable control over the grid voltage of the radio frequency tubes and is used as a volume control. Under no circumstances will the receiver oscillate, regardless of the position of the arm on the potentiometer.

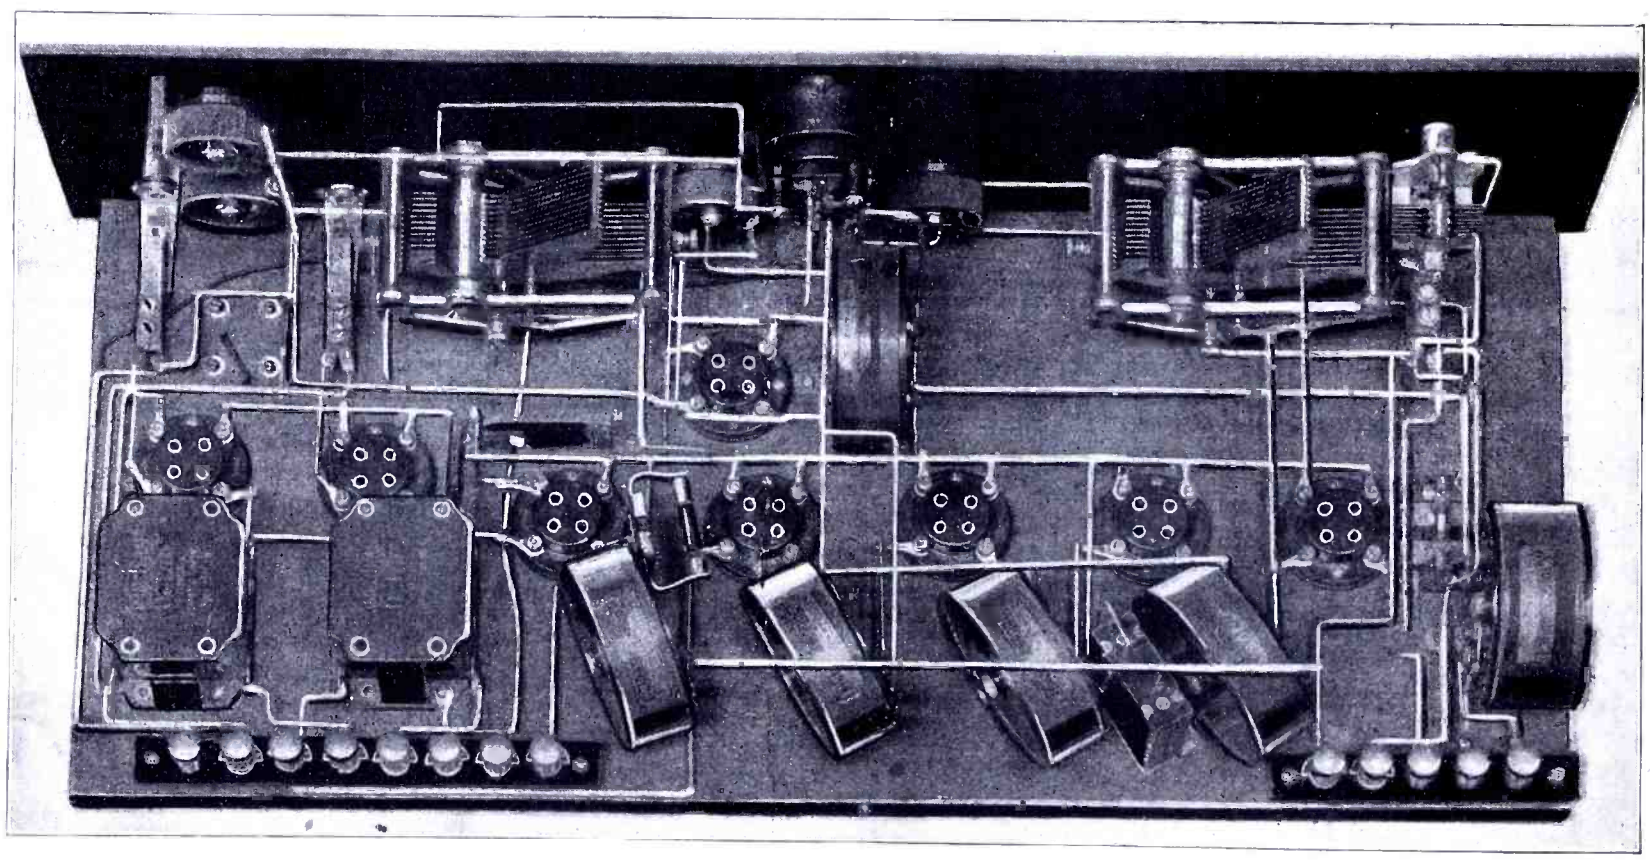

Photo C. Rear view of receiver after wiring has been completed

Greater clarity and much less tube noises are also obtained, d together with the fact that the grid voltage can be controlled nveniently to that point on the negative side, which gives best ults, a greater reduction in "B" battery consumption is tained.

first detector tube. A 6-ohm rheostat regulates the filament temperature of the three intermediate frequency tubes. The second detector tube has a 25-ohm variable resistance in the negative filament lead which is adjusted until the best results are obtained and then allowed to remain set. Each of the audio tubes have

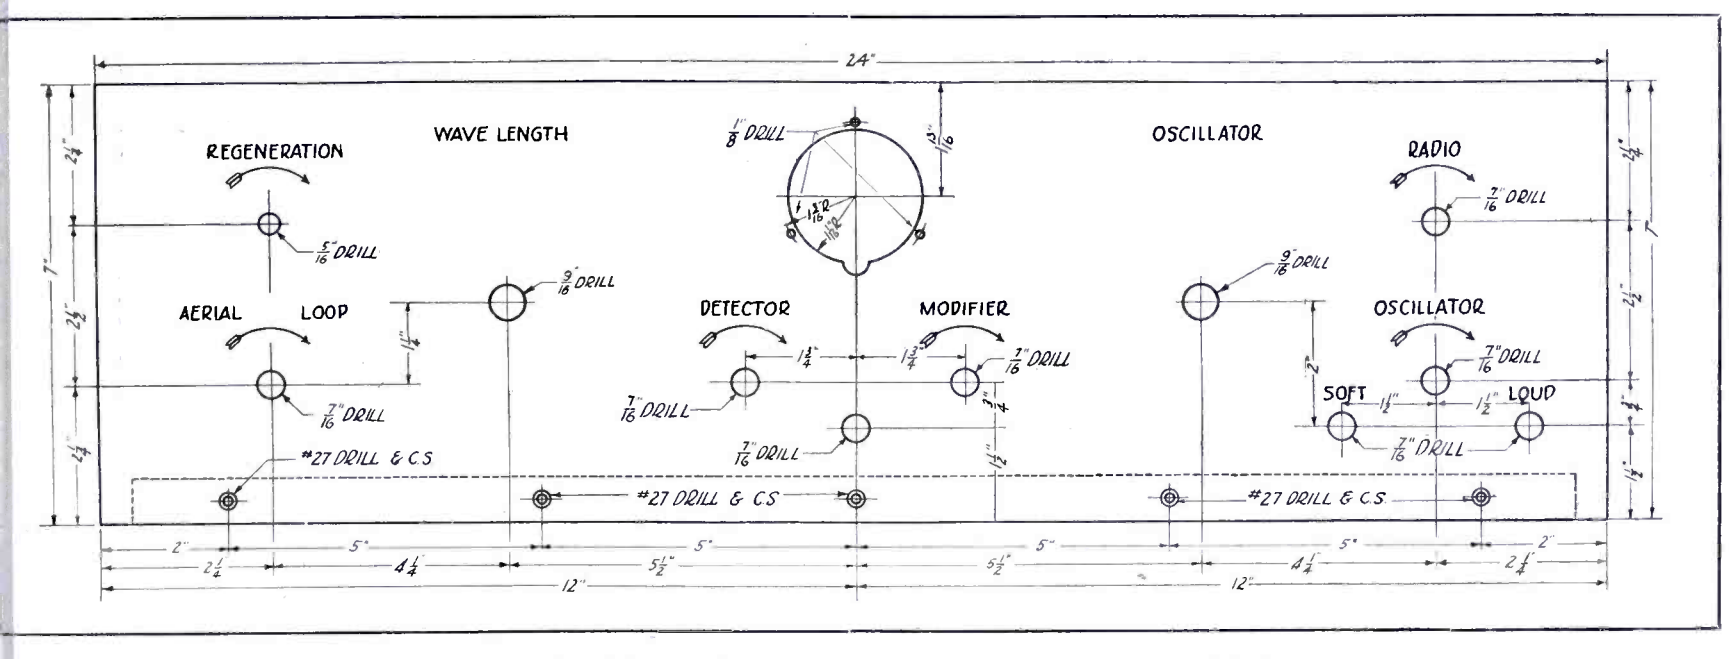

Figure 1. Panel layout showing suggested engraving and size of holes

UX 201 A tubes or their equivalent are used throughout the ceiver with the exception of the last stage of audio, where a X 112 power tube is used. If it is desired to use UX 199 tubes in nection with 171 Victoreen transformers it will be necessary to ert a 1½ volt "C" battery in series with the "F" terminals of intermediate frequency transformers and the arm of the potentioter. The negative lead of the "C" battery goes to the "F" terminals and the positive lead to the arm of the potentiometer. Also

fixed resistances in their negative filament leads, the 4-ohm unit controls the first audio tube, while the 2-ohm resistance controls the UX 112 power tube. A filament control jack is used in the output of the last stage of audio. This jack automatically lights the power tube when a plug is inserted into it.

Karas Orthometric Condensers have been selected in this receiver to assure an even spacing of stations over the entire dial range. The new Kurz Kasch Bakelite disc Aristocrat Vernier

he right. The potentiometer arm should be about three- ters of the way toward the negative side.

he Victoreen Super-Heterodyne differs little in operation from r super-heterodyne receivers. Careful tuning is a prime requi- since it is an extremely selective receiver and the operator "skip" over the stations if care is not used. To tune the iver proceed as follows: With all tubes burning turn the lator dial slowly one degree at a time. For each setting of dial, turn the wavelength dial slowly in either direction. If tation is heard, advance the oscillator dial up one or two ees and repeat the movement of the wavelength dial. Con- this procedure until signals are heard. Then carefully rotate oscillator dial until the maximum strength of signal is obtained, which time the wavelength condenser is also adjusted for imum signal strength. Sometimes the strength of the signal be improved by changing the tubes around until the best lts are obtained. Like any other receiver, this one has its little peculiarities which must be understood before the very results can be expected. For antenna operation a single 40 feet long, including lead-in, will give excellent reception. use of an antenna somewhat broadens tuning, and the shorter antenna, the better.

Jewell double scale voltmeter is provided to ascertain the and "B" voltages at all times.

50 Feet Belden Tinned Copper Hookup Wire

The Acme "B" eliminator shown in the Console has a switch for high or low voltage and a variable resistance for obtaining the correct voltage on the intermediate frequency tubes and detectors.

A Kodel trickle charger, manufactured by the Kodel Radio Corp., Cincinnati, Ohio, is shown connected to a standard 6-volt radio battery made by the Willard Storage Battery Co., Cleveland, Ohio.

The new Acme Double Disc, Type K-2, cone speaker, is shown. This is shown in a finished walnut cabinet also manufactured by Acme Apparatus Co., Cambridge, Mass.

The Console shown is manufactured by the Chillicothe Furniture Co., Chillocothe, Mo.

The Super Cabinet shown in Photo B is made by D. H. Fritts & Co., Hearst Square, Chicago.

(Any information regarding these suggested accessories can be obtained by writing direct to the manufacturers.)

The Universal Receiver

This Is a New Design of a Very Popular Circuit. By Following These Specifications Excellent Results Will Be Obtained

OUR READERS are continually requesting information and details of a receiver which is easy to construct, economical in price and operation, and contains a minimum number of tubes consistent with loud speaker reproduction of good quality over long distances. In addition to this, many desire a receiver in which either dry cell or storage battery tubes may be used.

Many receivers have appeared from time to time and were reputed to possess all of these desirable features. A careful test of the performance of the completed receiver would usually show that those features which were claimed to be present were very conspicuous by their absence.

In our search for a receiver which would fulfill the requirements, our attention was attracted by many excellent circuits. Each was carefully experimented with and a selection made. We now offer our readers a receiver which we consider to be the ultimate in four tube possibilities. The Universal Receiver, as it is known, is comparatively new and while it has been described before in other publications, various changes and modifications have been made in the interest of increased sensitivity and selectivity as well as appearance and ease of wiring.

A combination of one stage of balanced tuned radio frequency amplification, a regenerative detector with a tickled tickler and two stages of first grade transformer coupled audio amplification with a power tube in the last stage make up the circuit in this unique receiver. Figure 5 shows a schematic wiring diagram of the complete receiver. It will be observed that a .0001 mfd. variable condenser is in series with the antenna. This small condenser in the antenna system, when used in conjunction with the type 277-C coil, allows extreme selectivity with maximum sensitivity. If local broadcast interference is experienced, tuning may be sharpened by adjusting the capacity of the condenser toward minimum. For all-round reception the capacity of the condenser should be set at maximum. The type 277-C coil is the antenna coil, tapped to establish a bias on the radio frequency tube, and tuned by a .00035 mfd. variable condenser. The remaining major control is also a .00035 mfd. variable condenser tuning the type 277-D coil, which is a radio frequencly transformer of the auto-transformer type, with a fixed tickler. A 500- to 50,000-ohm variable non-inductive resistance is in series with the tickler and adjusts it electrically. A pilot light operated from the "A" battery and controlled by the filament switch indicates at all times whether or not the tubes are burning. In the first stage of audio a 6-1 ratio audio transformer is used, the second stage using a 2-1 ratio audio transformer. These transformers when used with a good cone type of loud speaker will reproduce the audio frequencies as broadcast today as well as the highest, with a very excellent tone quality. A first stage jack is not necessary, since the variable resistance in the tickler circuit acts as a very efficient volume control.

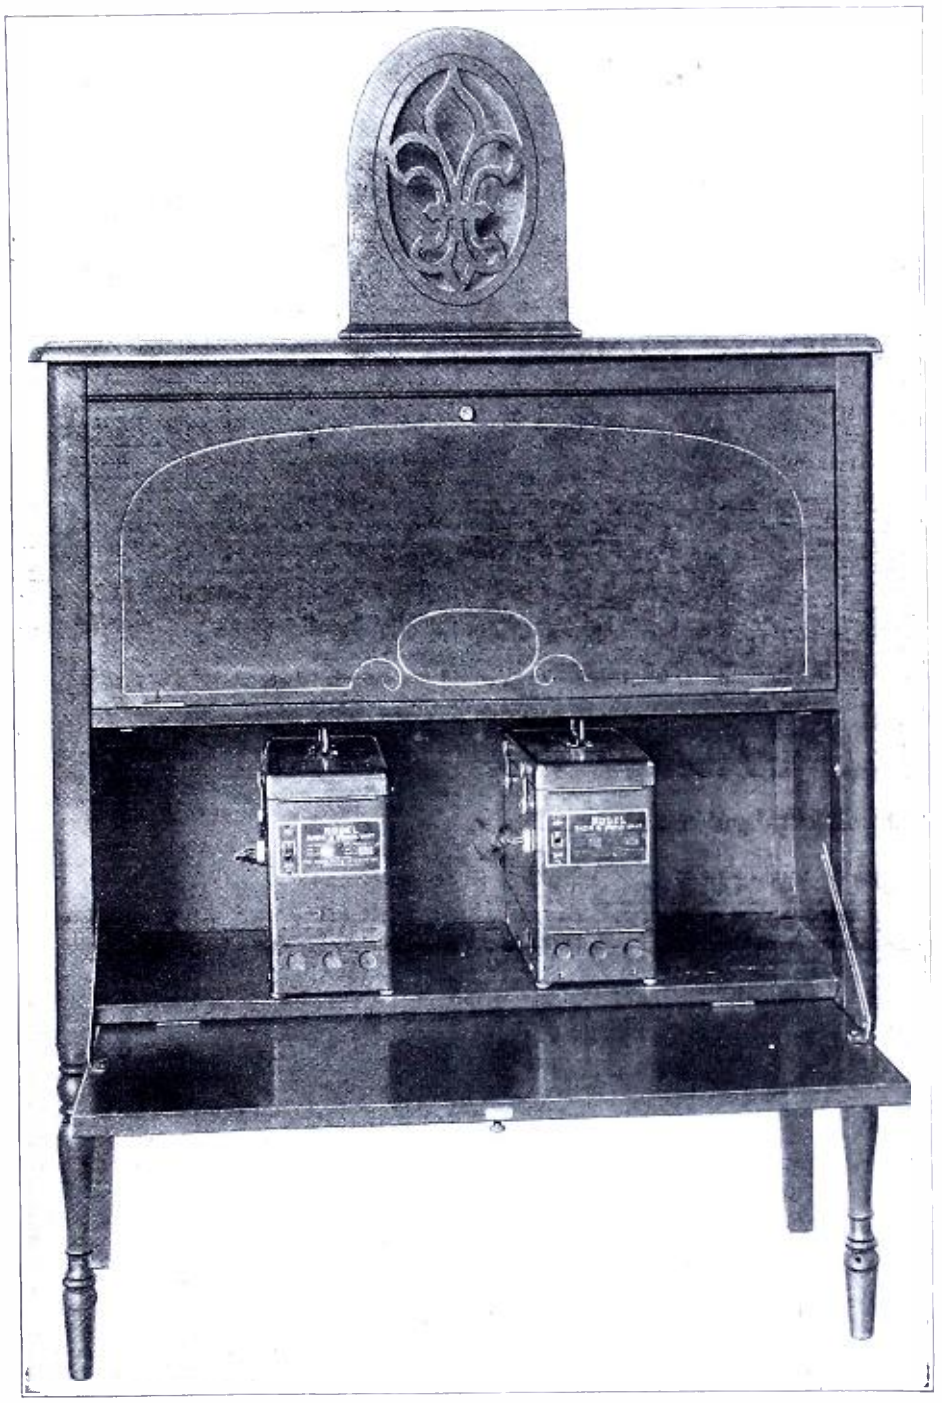

Photo A. View showing how receiver can be placed in a console with suggested accessories

The Universal Receiver as described herewith is designed to operate from a 6-volt storage "A" battery, using three UX 201-A tubes and one UX 112 power tube in the last stage of audio. To convert the receiver into one which operates on 4½ volts, substitute the UX 201-A tubes with UX 199 tubes and the UX 112 with a UX 120 power tube. Also remove the No. 112 and No. 1-A Amperite units and replace them with a No. 120 and 4V 199 Amperite unit respectively. Circulars are supplied with the various tubes explaining their correct working voltage.

In the event that a UX 200-A detector tube is used instead of the 201-A, it will be necessary to change the grid return on the detector tube from positive to negative. This may be easily done by soldering that wire, normally connecting the grid leak to the positive filament terminal of the detector socket to the negative filament terminal of the detector socket.

List of Parts

These parts or their equivalent will give satisfactory results:

1—7x21x3/16" Drilled and Engraved Formica Panel
1—7x20x3/16" Drilled Formica Sub-Panel
1—Pair type M-V Pan-Brackets
2—General Radio Type 247-H .00035 mfd. Variable Condensers
2—General Radio Type 310 Dials
1—General Radio Type 285 6-1 Ratio Audio Transformer
1—General Radio Type 285-L 2-1 Ratio Audio Transformer
4—General Radio Type 349 Sockets
1—General Radio Type 277-C Coil
1—General Radio Type 277-D Coil
1—General Radio Type 301 12-ohm Rheostat
1—General Radio Type 301 25-ohm Rheostat
1—General Radio Type 368 Midget Condenser
1—General Radio Type 236 .5 mfd. Paper By-Pass Condenser

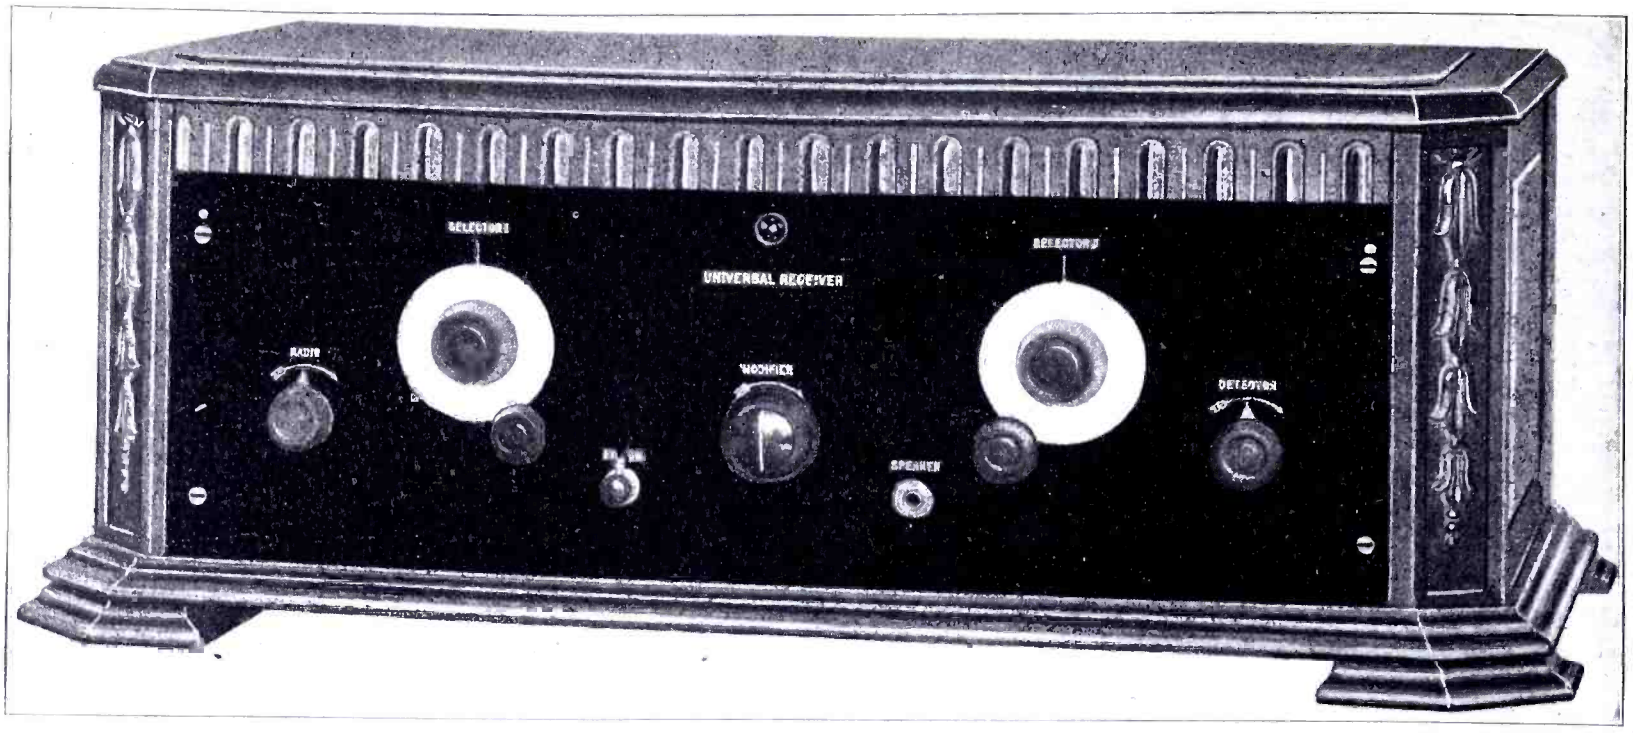

Photo B. Front view of receiver in cabinet

1—Yaxley Type 310 Pilot Light Bracket
1—Yaxley Type 701 Open Circuit Midget Jack
1—Yaxley Type 10 Filament Switch
1—CRL 50,000-ohm Variable Non-Inductive Resistance
1—Precise Type 940 .0001 mfd. Variable Condenser
13—Eby Marked Binding Posts
1—Lynch Single Resistor Mounting
1—Lynch 3-megohm Grid Leak
1—Amperite Type No. 112
1—Amperite Type No. 1-A
1—Micamold .0001 mfd. Fixed Condenser
1—Micamold .00025 mfd. Grid Condensor (without leak mounting)
3 Dozen No. 6x32x½" Round Head Brass Machine Screws
1 Dozen No. 6x32x1½" Flat Head Brass Machine Screws
3 Dozen Kellogg Tinned Soldering Lugs
1—Blackburn Ground Clamp
1 Package Kester Radio Solder
50 Feet Belden No. 12-gauge Tinned Copper Hookup Wire
1 Foot Flexible Insulated Wire

1 Brach De Luxe Senior Aerial Outfit

Figure 1 is a panel layout and shows all of the apparatus location and size of all holes. Necessary engraving is also shown in its correct position. Templates are supplied with the variable condensers to aid in locating the mounting holes properly. When other brackets than those specified are used, care should be taken that all mounting holes are correctly located, as well as to observe whether the apparatus mounted on the front panel has sufficient clearance to be operated properly.

Figure 2 is a baseboard layout and shows all of the apparatus mounted into place upon the sub-panel and front panel. It is best that each panel be assembled separately and all possible wiring completed before fastening the panels together with the brackets. The antenna coil is mounted into place, about ¼ inch above the sub-panel, by a small brass bracket. The bracket is made of 1/16-inch material, ½ inch wide and 2 inches long. A ¾-inch bend is formed on one end and a 5/32-inch hole drilled in its center. Two more holes, also 5/32-inch drill, are made 5/8 inch apart in the long arm with the bottom hole 5/8 inch from the outside of the bend. Holes for mounting purposes are pro-

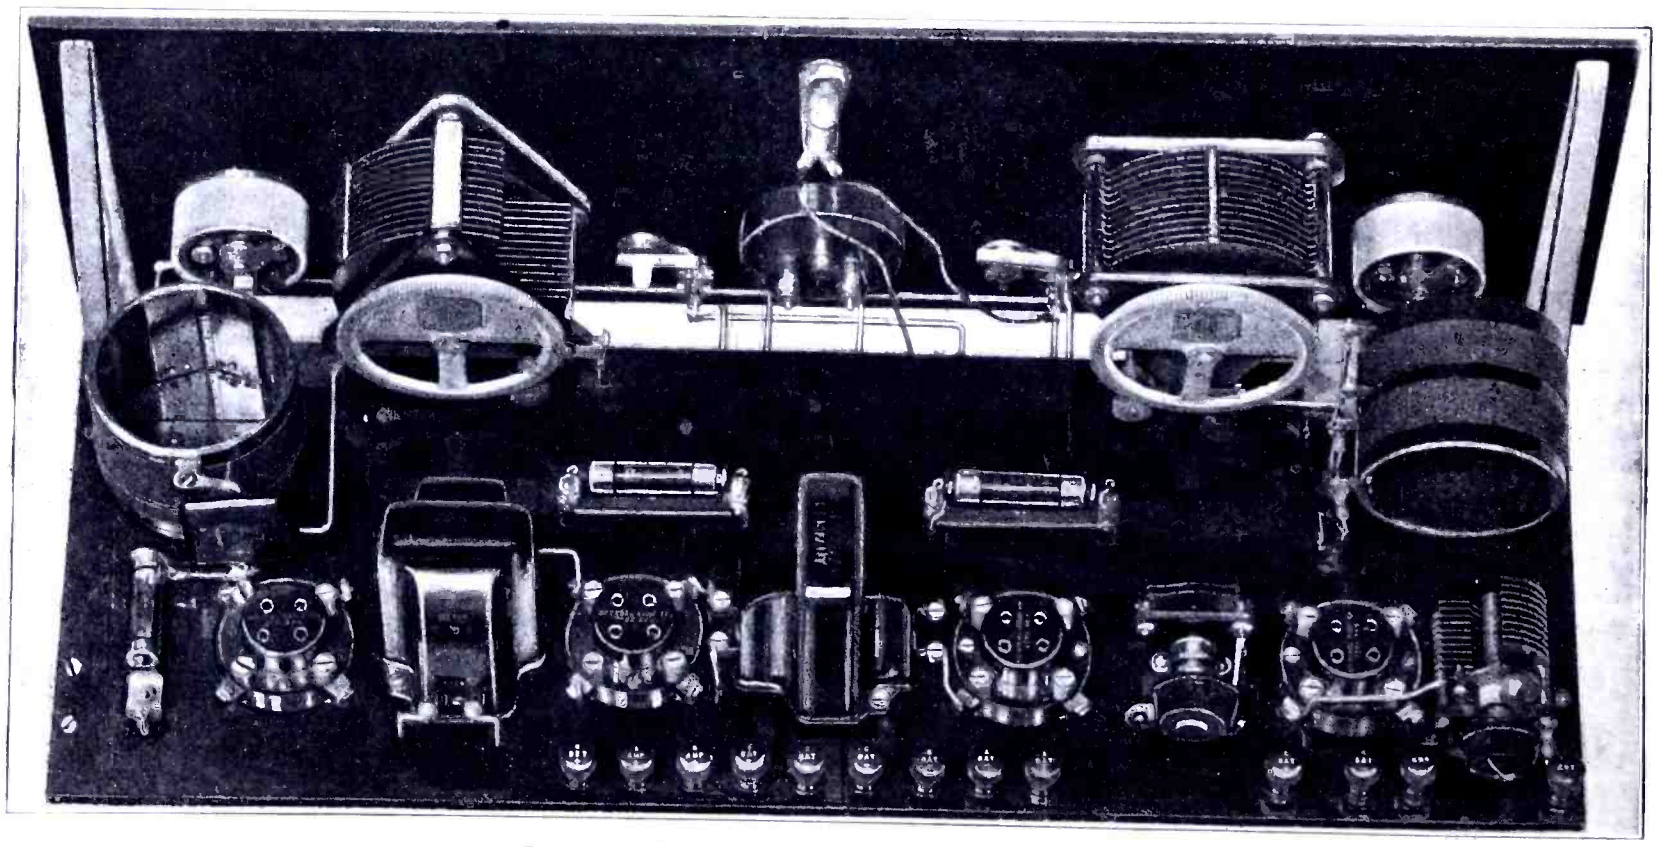

Photo C. Rear view of receiver completely wired

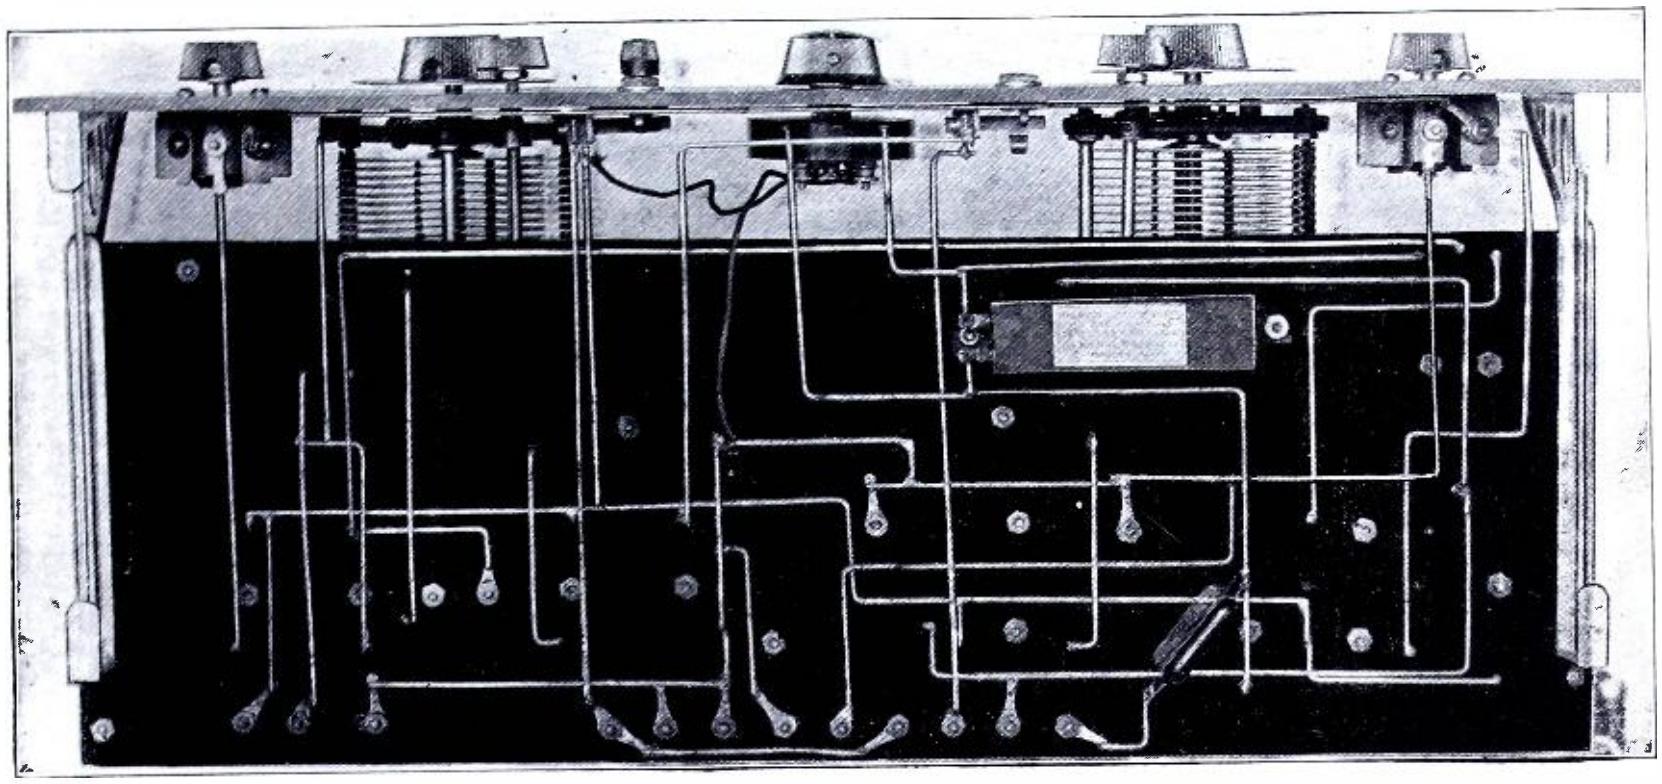

Photo D. Bottom view of sub-panel. Note the neat arrangement of wiring

vided in the coil frame. The .0001 mfd. condenser in series with the antenna is held in place by a soldering lug, clamped upon the upper surface of the sub-panel by the antenna binding post, and the wire running to the plate terminal of the radio frequency tube. A 21-inch front panel is used to permit plenty of room to remain between apparatus and assist the builder to make a neat job of wiring. The constructor is strongly advised against making any change in the layout of parts in the receiver. The circuit used is quite critical and it is obvious that if changes are made the highest degree of efficiency and satisfaction cannot be expected. No difficulty should be experienced in hooking up the circuit if the wiring as shown in the photographs is carefully followed. The .0001 mfd. fixed condenser across the primary of the first audio transformer is placed under the sub-panel directly below the transformer and soldered into position.

A feature of the receiver as built is that separate binding posts are brought out for the "C" battery connections necessary to establish the bias in the radio frequency tube. In addition to this, separate terminals are provided so that plate and grid bias voltages of the audio amplifiers may be varied for the best results as well as allowing any type of audio tube to be used.

After assembling the receiver and completely wiring it, carefully check all connections against Figure 3, the graphic illustration. Correct mistakes in wiring, if any, and connect the "A" battery alone to the receiver. Using only one tube, try each socket and observe whether the tube lights and is controlled by the proper resistance. Then connect the "B" and "C" batteries, if tubes light properly, and again try a single tube at a time and note whether each tube operates normally. When each tube functions properly it is safe to insert all tubes in their respective sockets and connect the antenna and ground as well as plug in the loud speaker in the output jack.

The batteries used in the operation of this receiver must be fully charged and up to their rated voltage. Squealing and distorted reception will result if batteries are used which have their current exhausted to any degree.

If the wiring is correct the Universal Receiver will respond as soon as it is placed into operation, if there is any broadcasting going on. A single wire antenna approximately 50 feet long will give excellent results in metropolitan areas. The use of a longer antenna is advised only when the nearest broadcasting is 25 miles away.

The only adjustment necessary to place the receiver in proper working order is the neutralization of the radio frequency circuit. This is accomplished as follows: With the detector oscillating, tune in some broadcast signal of moderate strength whose fre-

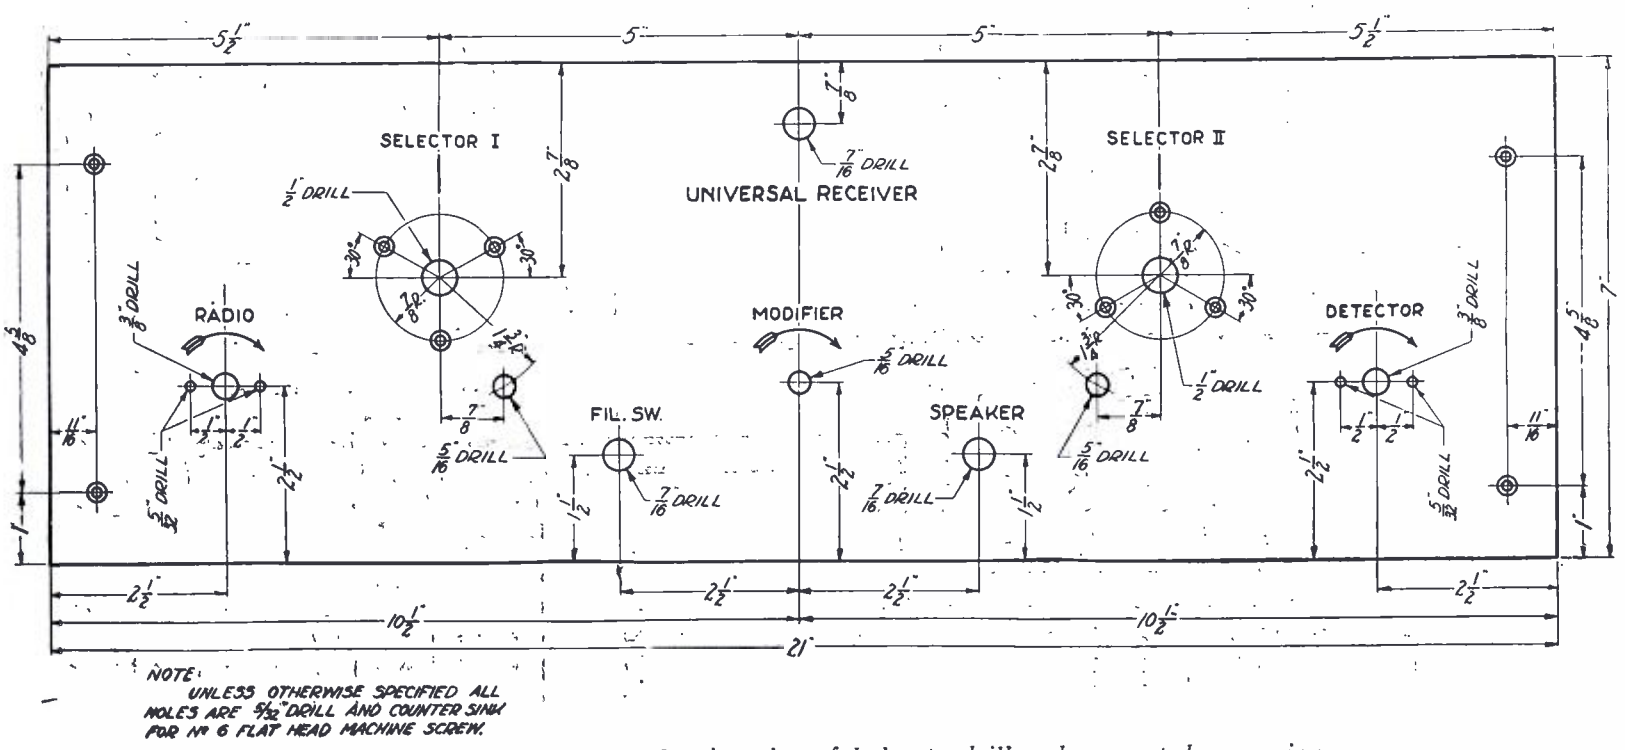

Figure 1. Panel template showing size of holes to drill and suggested engraving

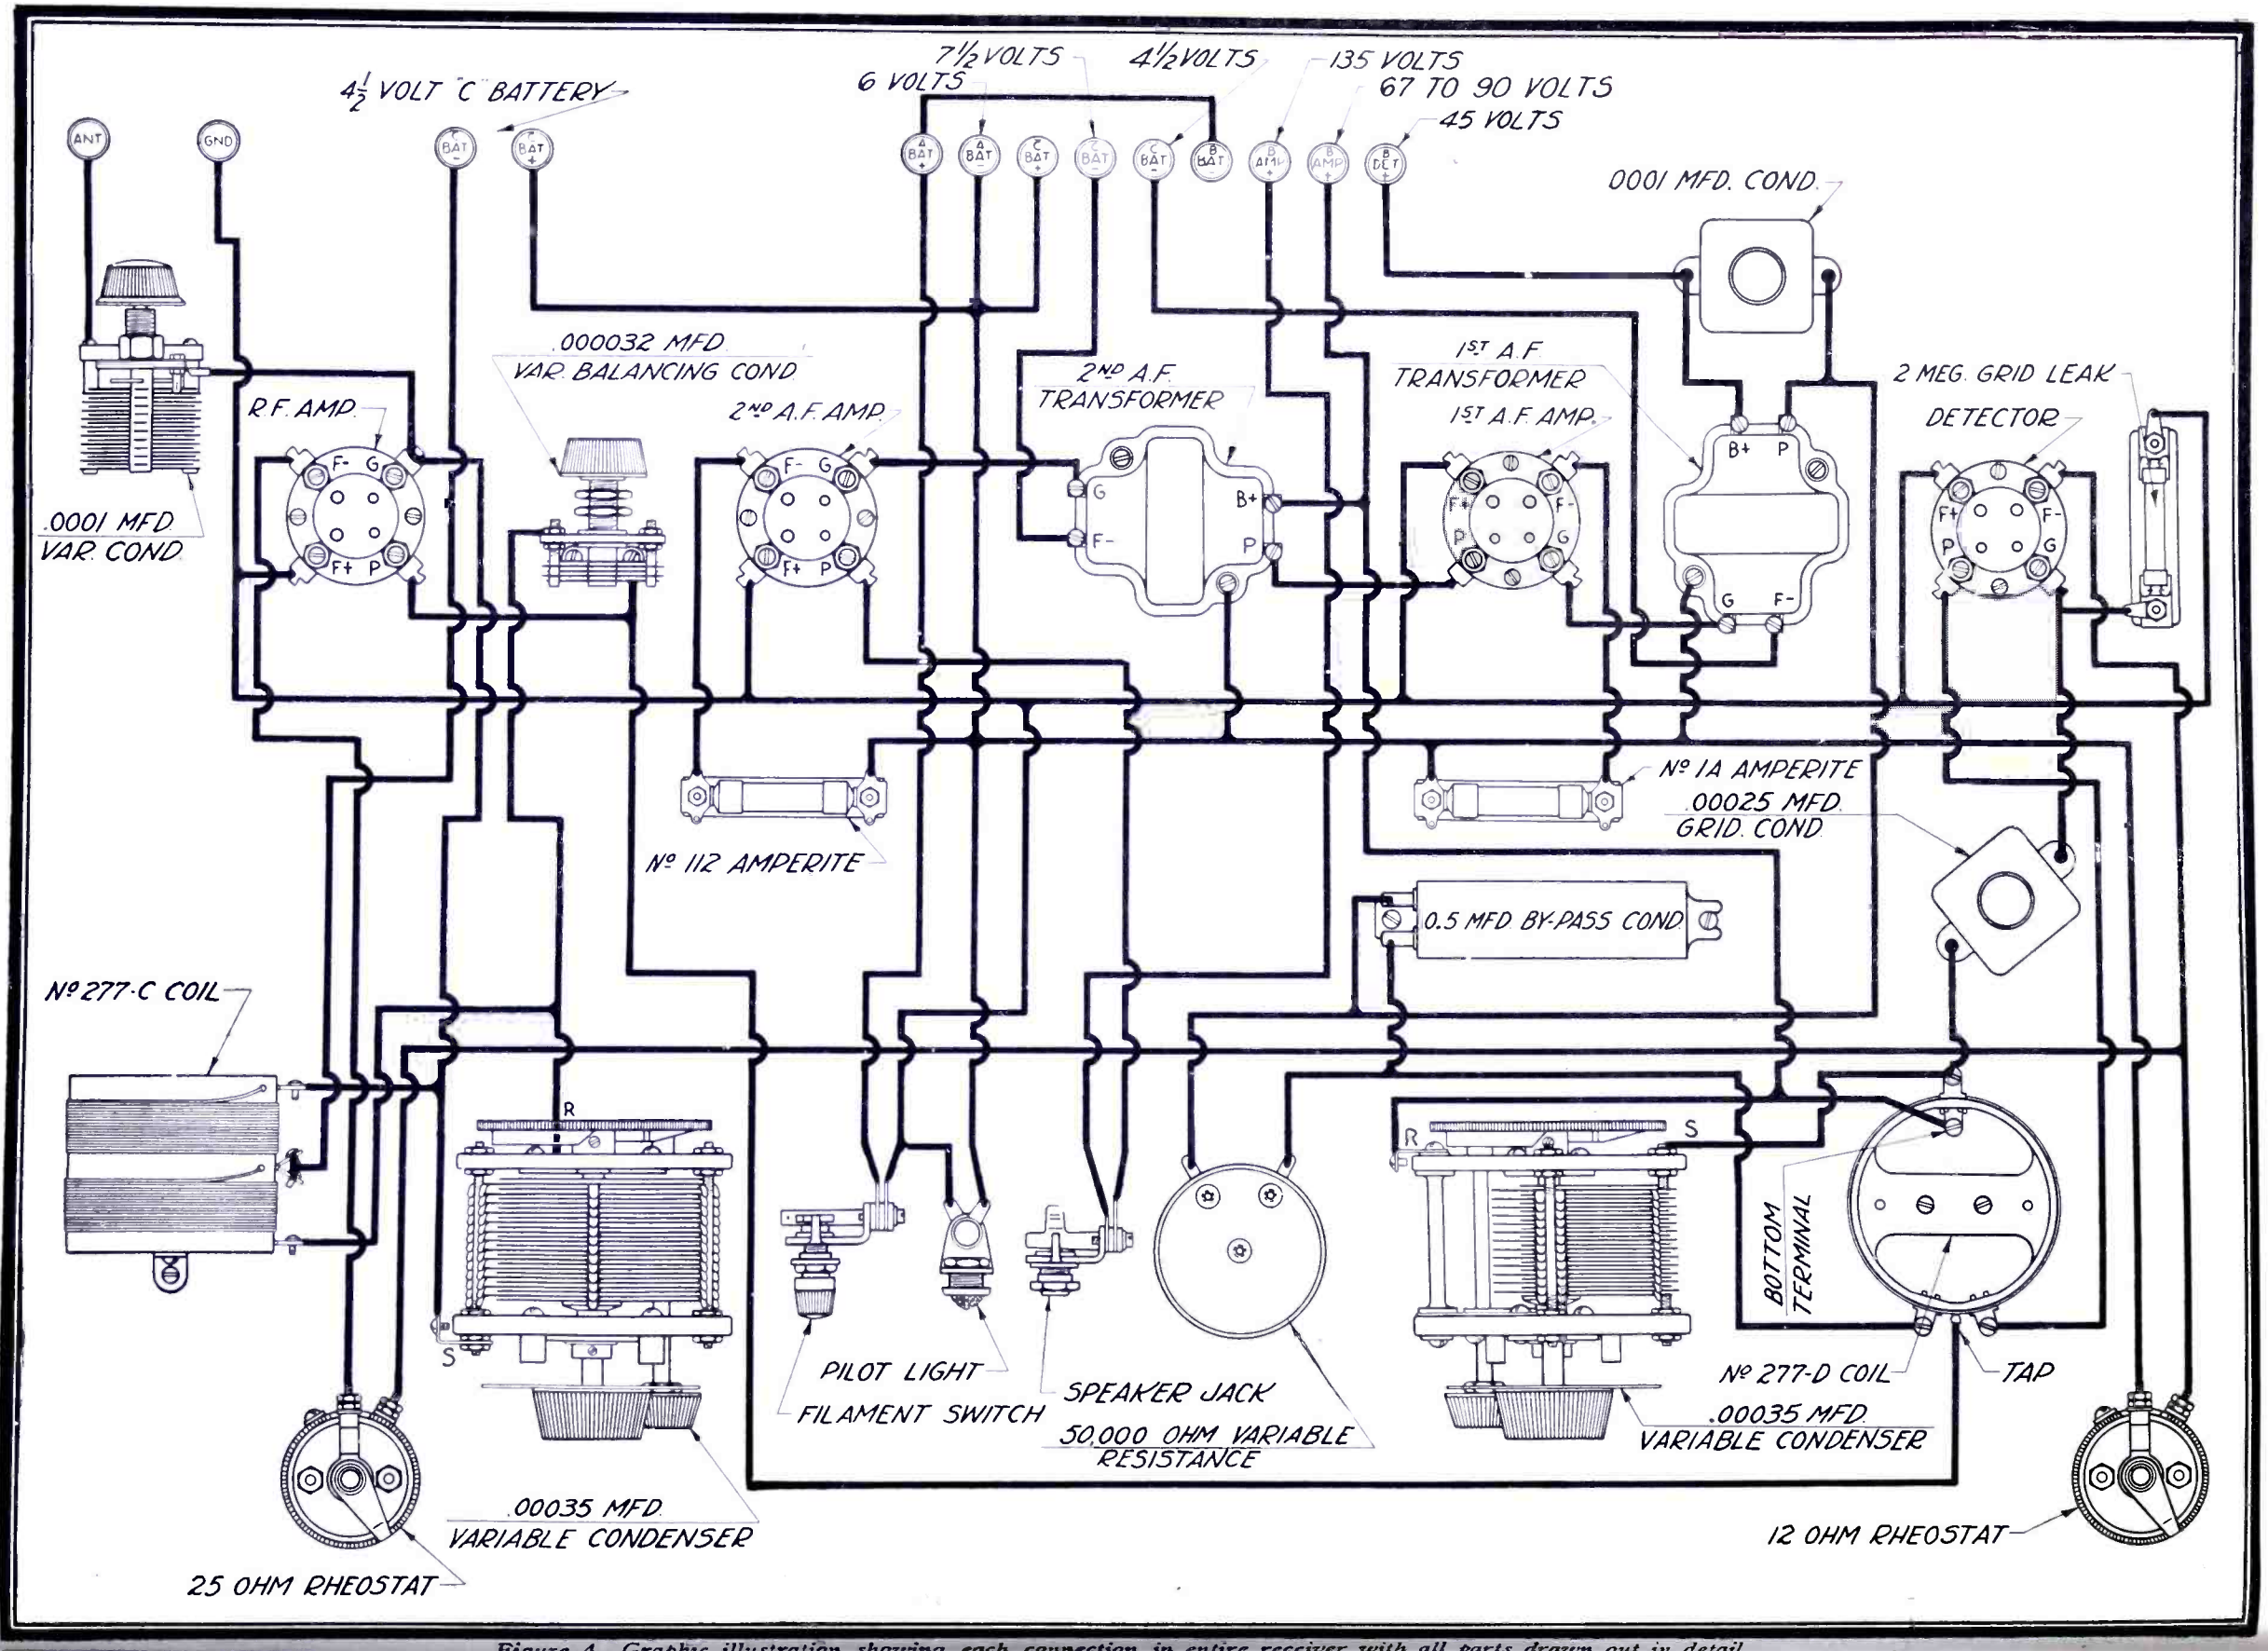

Figure A. Graphic illustration showing each connection in entire receiver with all parts drawn out in detail

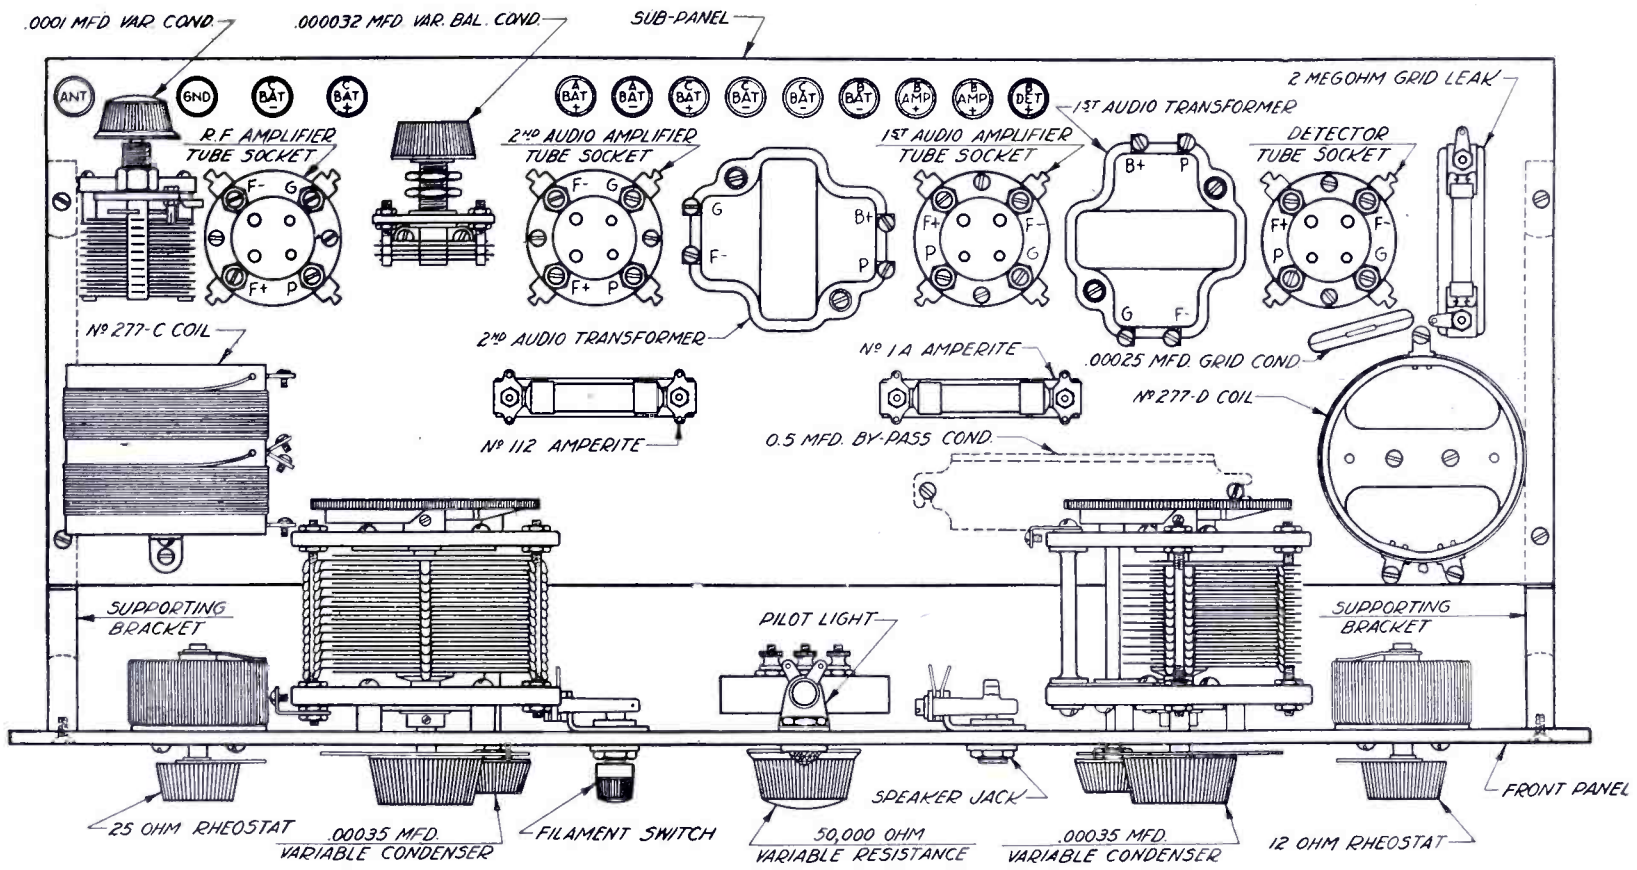

Figure 2. Drawing showing top view of receiver with arrangement of parts

uency is about 1000 kc. (300 meters). The detector condenser Selector II) should be turned until the whistle is quite loud. f the antenna condenser (Selector I) is varied, a change in the itch of the whistle will be observed. To properly neutralize the eceiver it is necessary to adjust the balancing condenser until uch a condition exists where the whistle does not change in pitch. Moving the neutralizing condenser a little at a time, the antenna ondenser is varied and the pitch of the whistle noted. The pitch ill lower in frequency when below the neutralization point and ise in frequency when above. The listener can therefore easily nd the correct point of neutralization by noting at which point he whistle does not change.

The two major controls will tune approximately alike over the ntire dial range if properly adjusted when attached to the con- enser shafts. The adjustment of the rheostats when the set is in operation is not critical, although every effort should be made to burn the tubes at the lowest filament operating temperature.

Reception results with this four tube receiver will be both gratifying and satisfactory.

Photo A shows a Kodel "A" power unit and "B" eliminator when connected in any convenient 110-volt A. C. socket will supply all necessary voltages for operating all tubes. These units are manufactured by the Kodel Radio Corp., Cincinnati, Ohio.

The speaker is a Brandes, new model cone type, made by Brandes, New York City.

The super cabinet shown in Photo B is made by D. H. Fritts Co., Hearst Square, Chicago.

(Any inquiries regarding these accessories should be directed to the manufacturers.)

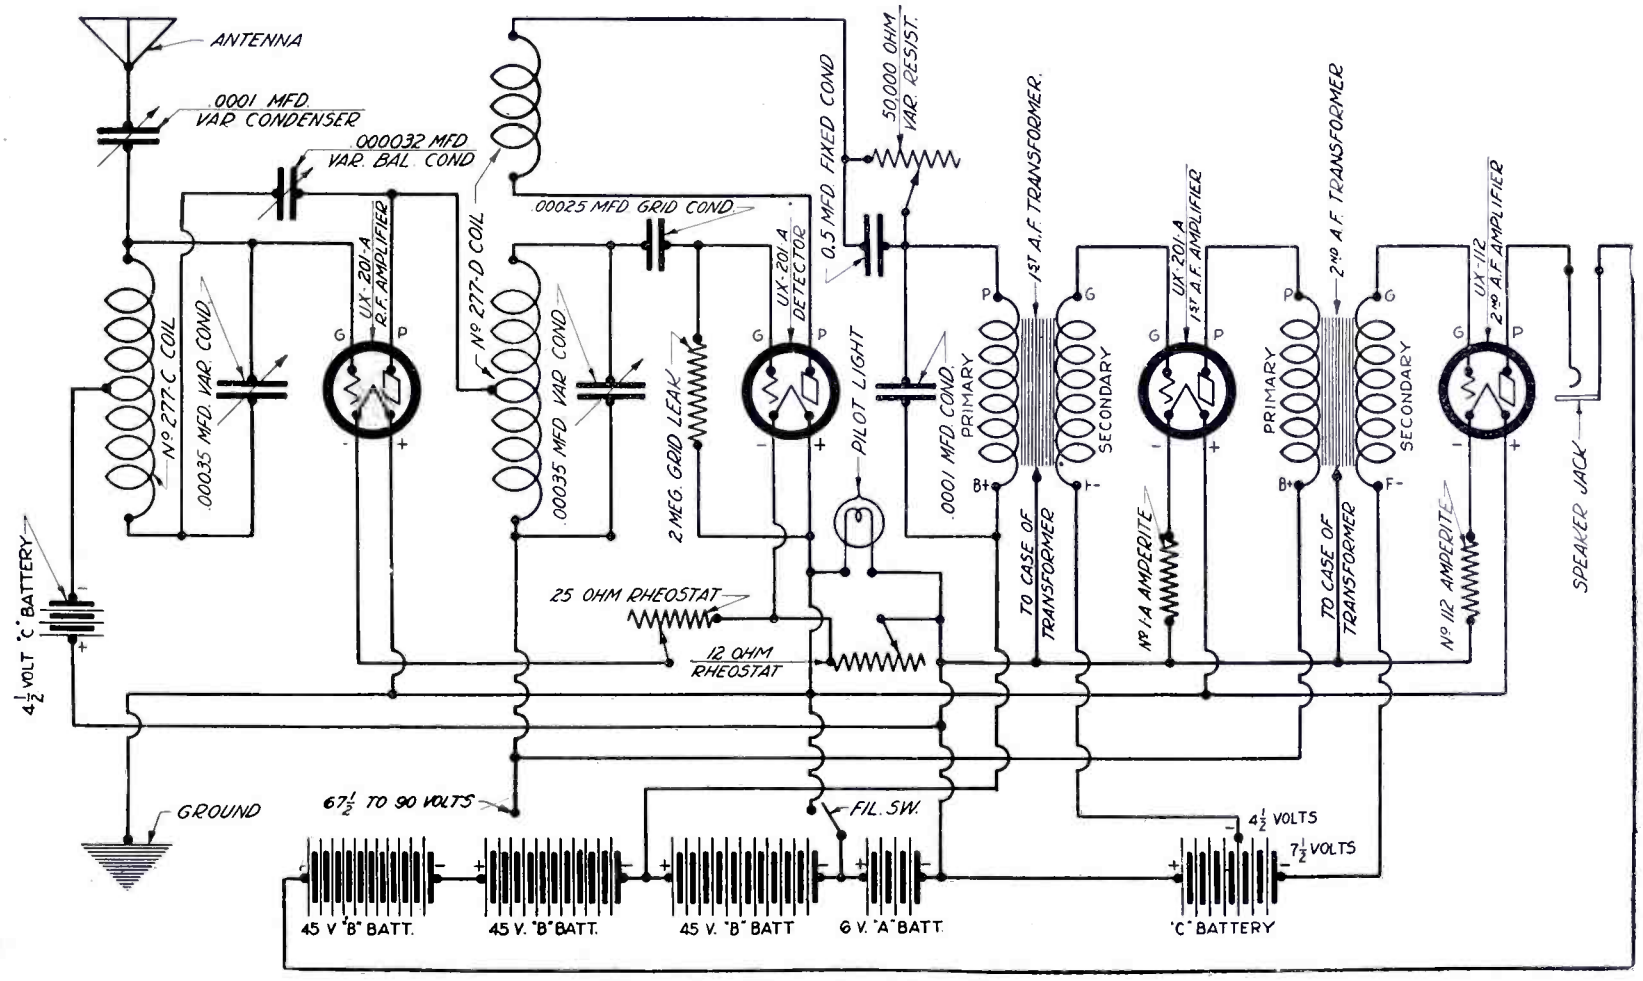

Figure 4. Schematic wiring diagram

Building the "Aero-Dyne"

Here Is a Receiver Whose Parts Are of the Highest Quality and Whose Engineering Design Has Been Carefully Planned

THE "five tube set" has become so popular with the home builder during the past two radio seasons that there are few who have not attempted the construction of one of this variety. Some have given satisfaction, others have not, all according to the merit of the manufacturers product and the skill with which they were put together by the builder himself.

The "Aero-Dyne" is a receiver employing five tubes, two stages of radio frequency, a detector and two of audio, but there its similarity to the average receiver stops. The inductances, the heart of any radio set, are designed in an original and unique style, giving several points of superiority. These are straight solenoids, wound with heavy, white cotton covered wire on a skeleton framework which is built up of thin strips of bakelite, giving a strong, low resistant and consequently sharp-tuning coil. The primary of each inductance is placed inside, at the filament end, and is slightly spaced to give a high co-efficient of coupling to the secondary with a minimum number of turns; a desirable feature in this class of circuit. The antenna circuit is coupled to the first grid coil by means of a variable primary which may be adjusted for tight or loose coupling, adopting it to long and short aerials or local interference conditions.

The tuning controls are three, one for each inductance, and the oscillation and volume of reception are controlled by means of a variable high resistance in the plate circuit of the radio-frequency tubes. This gives just the right B-battery voltage for each wavelength and allows the set to be pushed to the limit of distance and selectivity by virtue of regenerative action. Thus is combined tuned radio frequency and regeneration, another desirable feature.

The builder of the receiver should refer to the front and rear photos of the set and the schematic diagram shown here. Any good make of .00035 variable condensers of straight-line-frequency or wavelength pattern may be used, but those shown in the list of parts are to be recommended. All other parts should be of the highest quality to carry out the effectiveness of the receiver.

A completely engraved panel especially for this set is on the market and a detailed set of colored, step-by-step diagrams wit necessary blue-prints, is included with the kit of coils.

List of Parts

These parts or their equivalent will give satisfactory results:

9—XL Marked Binding Posts
1—Sangamo .00025 MF Grid Condenser with Clip
1—Sangamo 1 MF By-Pass Condenser
1—Sangamo .001 MF Fixed Condenser
1—Lynch 2 to 5 Megohm Grid Leak

Photo A. Front view of completed receiver

1—Yaxley Open Circuit Jack

1—Formica 7x28 Sub-Panel
1—Formica 7x28 Aero-Dyne Panel
5—Benjamin Sockets
3—Kurz Kasch Dials
1—CRL 200,000 Ohm Variable Resistance
2—Thordarson 3½ to 1 Audio Transformers
1—No. 112 Amperite
3—Karas .00035 MF Variable Condensers
1 Package Kester Solder
50 Feet No. 12 Belden Tinned Copper Wire

After drilling the panel and sub-panel for the larger parts, the should be connected together with the panel brackets and th parts mounted. Now the filament wiring is run, from the batter binding post through all sockets and rheostats (the audio on th fixed resisfance) back to the other battery post. The switch an rheostats should control the filaments of the tubes. The coil should now be connected to the condensers and tube element and the B battery wiring run, the RF line through the high re

tance on the front panel. Be careful to connect the by-pass ndensers exactly as shown, as much trouble may be eliminated observing this fact.

In order to put the set in operation five standard UX 201A pes are required, although somewhat superior results may be d by using the new 200A in the detector socket. In order to

When first tuning up, set the three dials at approximately the same position in about the middle of the scale, light the tubes to average brilliancy and adjust the volume control. If everything has been correctly done, the set will go into oscillation, as evidenced by a slight click or roar, as the knob is turned clockwise. Just under this point of oscillation is the best place to operate

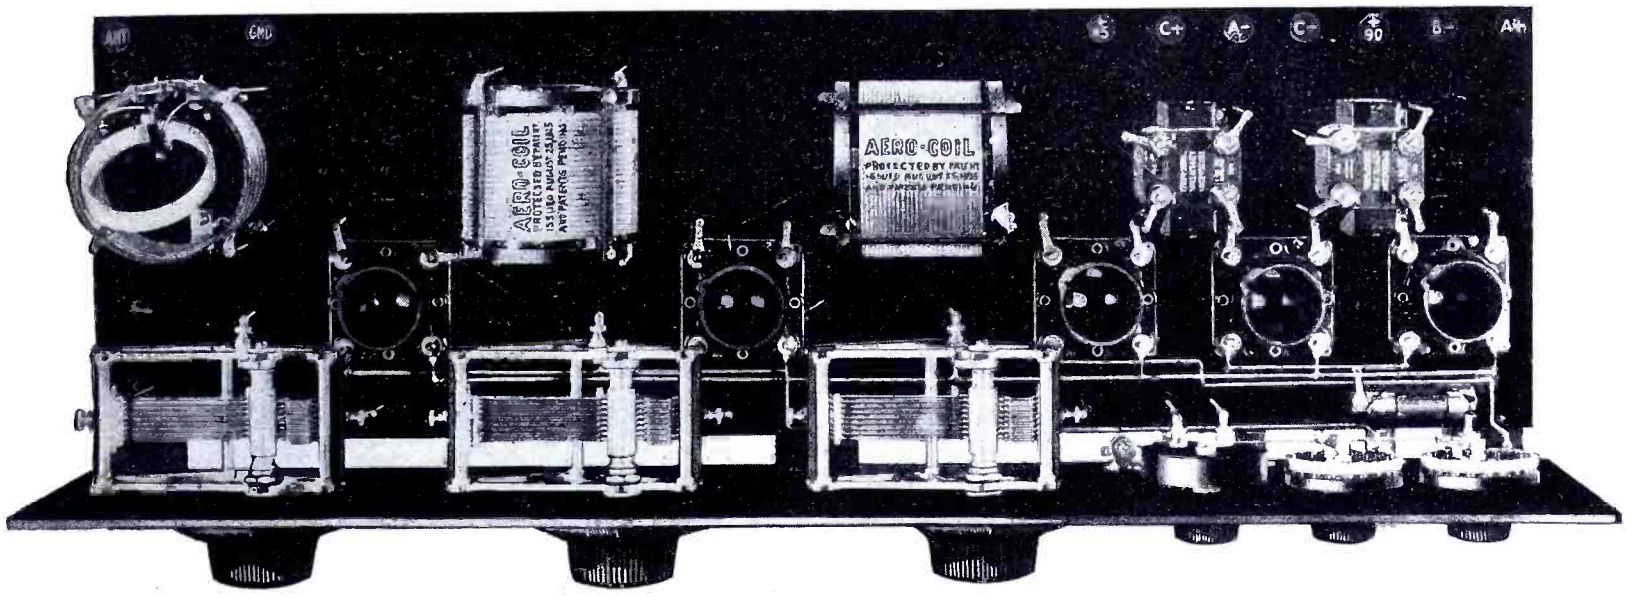

Photo B. Top view of receiver showing arrangement of parts

e this tube as a detector the grid return should be made nega- e rather than positive, as shown in the figures. This stops the jectionable hiss when a gas tube of the 200A type is desired. little experimenting with grid leaks is always productive of tter results. The length of the aerial may be anything from

for distance, although locals will be found of ample volume with far less adjustment of the control. Now sweep the scale, keeping all three dials about the same reading and thereby all three circuits in resonance. Even if you do not hear a station at every dial adjustment, you will soon learn to recognize the resonant

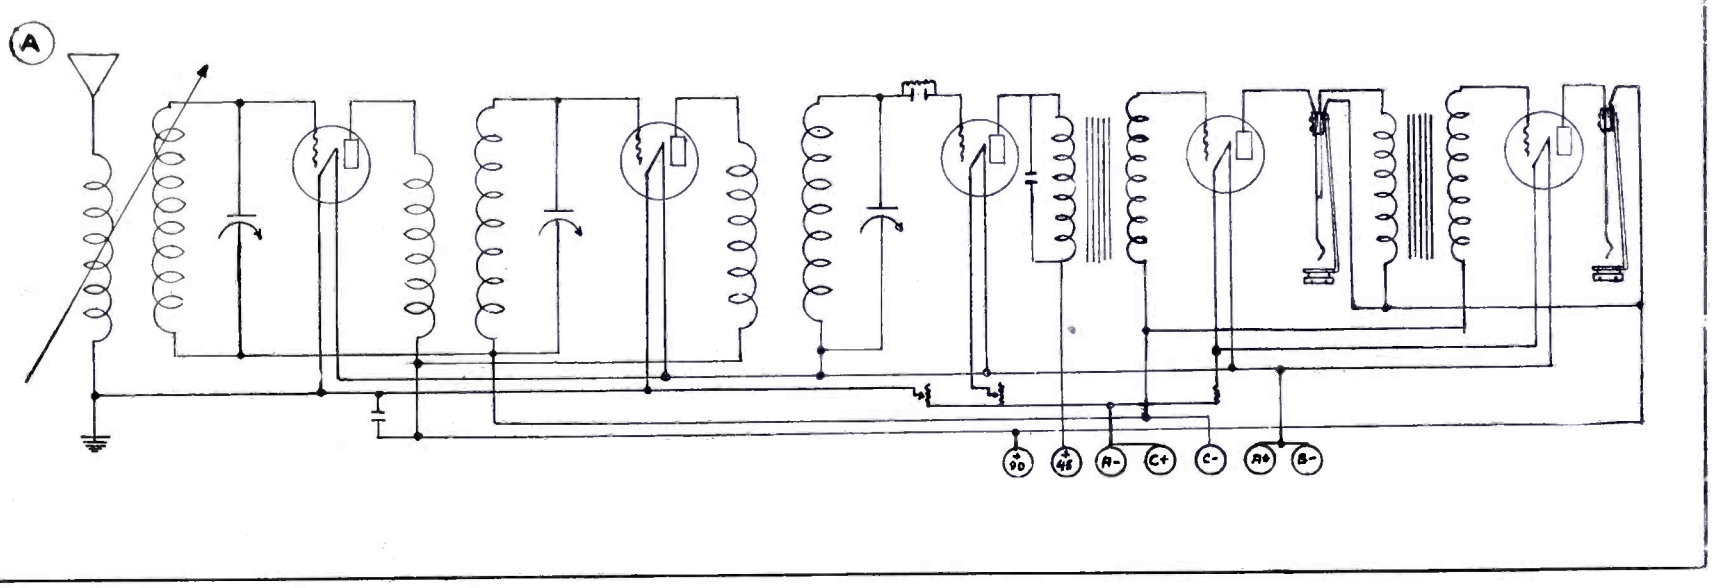

Figure 1. Schematic wiring diagram

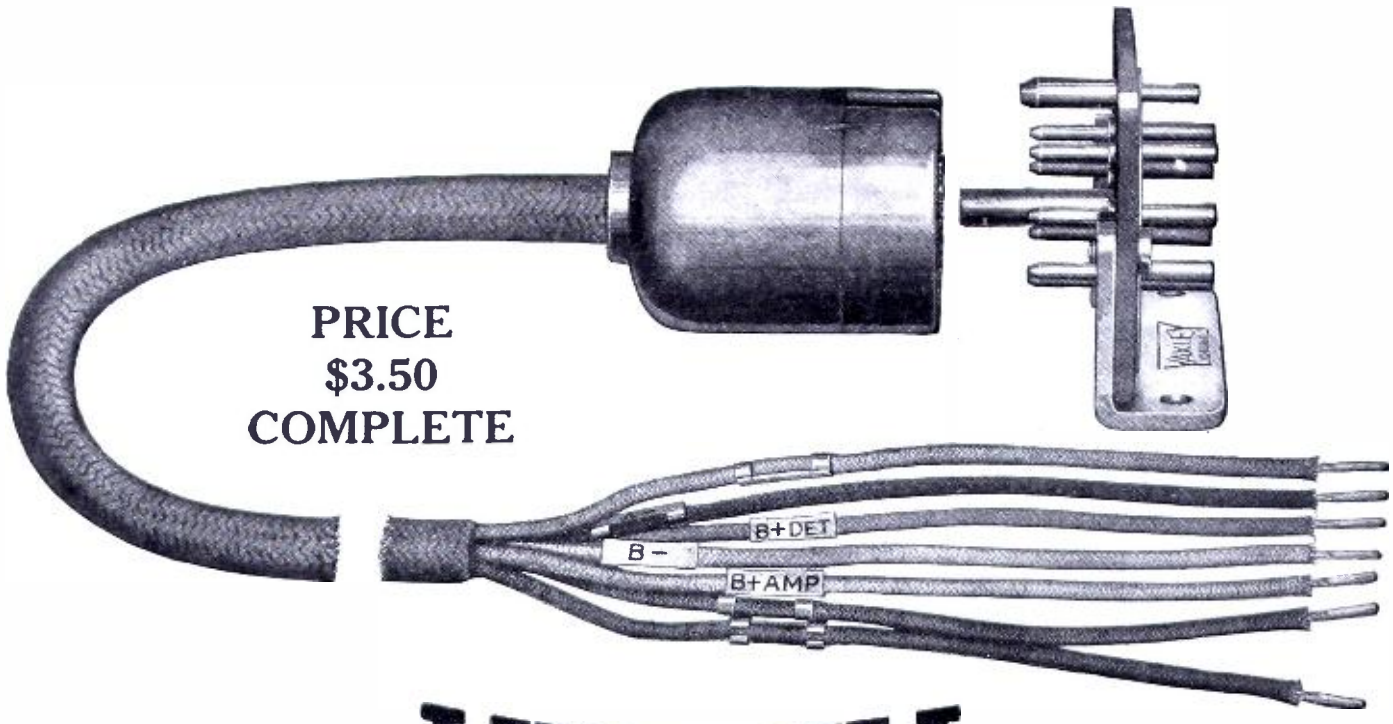
) to 100 feet, although the longer is preferable because of louder gnals on distance, although it will not tune as sharply. A good round is an asset. You will note that a C battery is used on oth RF and audio stages; this greatly increases the selectivity nd cuts down the B battery drain. It also makes the set operate ore smoothly and allows better oscillation control.

condition, as there is always a slight amount of atmospheric noise which will only be heard when the set is in an operating condition. A little practice on locals will soon equip you to hunt for distance and some slight adjustment of the variable primary on the antenna coil will allow more volume or better selectivity, as local conditions warrant.

Connect Your Set This Modern Way



YAXLEY
APPROVED RADIO PRODUCTS

Cable Connector Plug

Here is the new Yaxley Cable Connector Plug with the Bakelite construction for connecting your set to battery leads quickly, easily and **correctly.** You cannot go wrong. These features tell you why you should buy this plug:

THE PLUG

Phosphor bronze double contact springs, seated in Bakelite—assure perfect contact always. Cannot work loose. Shorting impossible. Plug cannot be used incorrectly.

THE CONNECTOR PLATE

Contact pins are seated in Bakelite—not affected by heat of soldering iron. Pins are brass, tinned for soldering. The Connector Plate mounts by means of convenient bracket which is reversible or bracket may be removed entirely for sub-panel mounting—an exclusive feature. Color Code (Standard RMA Colors) also plainly marked with battery designations, permanently attached for proper connections.

THE CABLE

Extra quality, seven strand, 5 foot cable (RMA Colors) furnished, A and B strands marked with Yaxley Metal Cable Markers that snugly hug wires. Six extra markers packed with each plug. Wire ends tinned for soldering.

Buy one of these Cable Connector Plugs today and get a new enjoyment out of your radio set. If your dealer cannot supply you, send the coupon now.

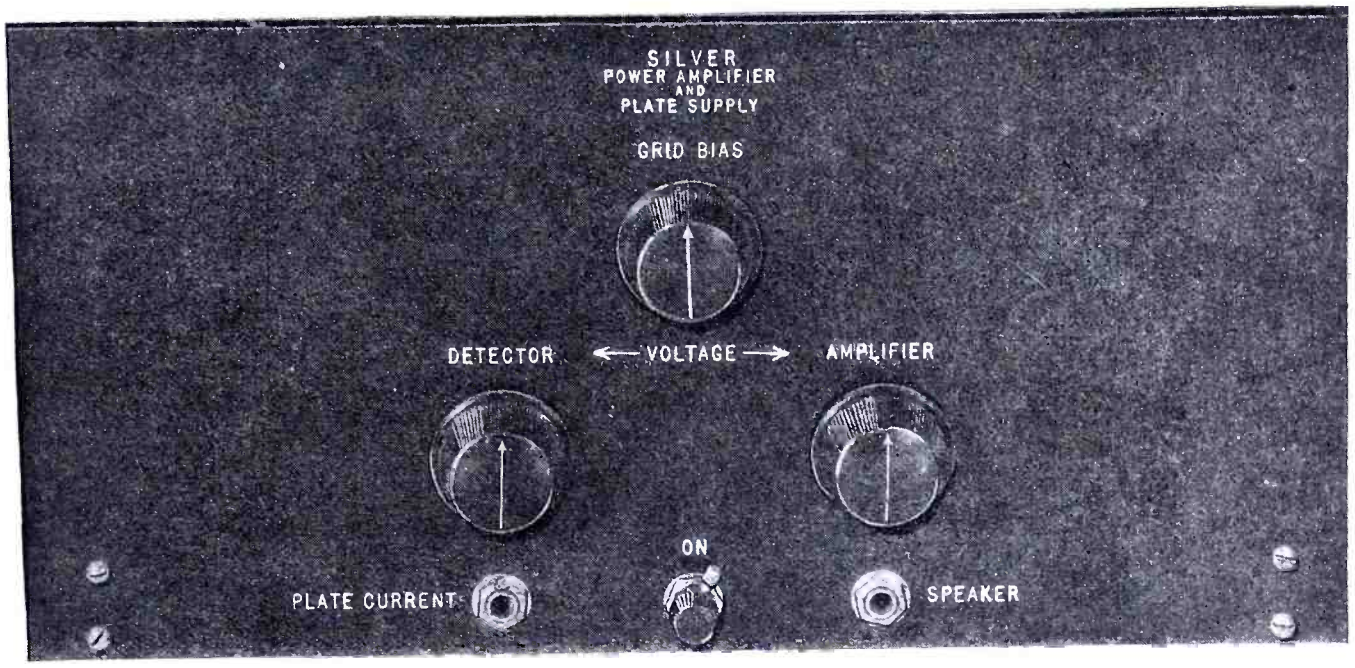
Bringing Last Year's Set Up to the Minute With a Power-Pack



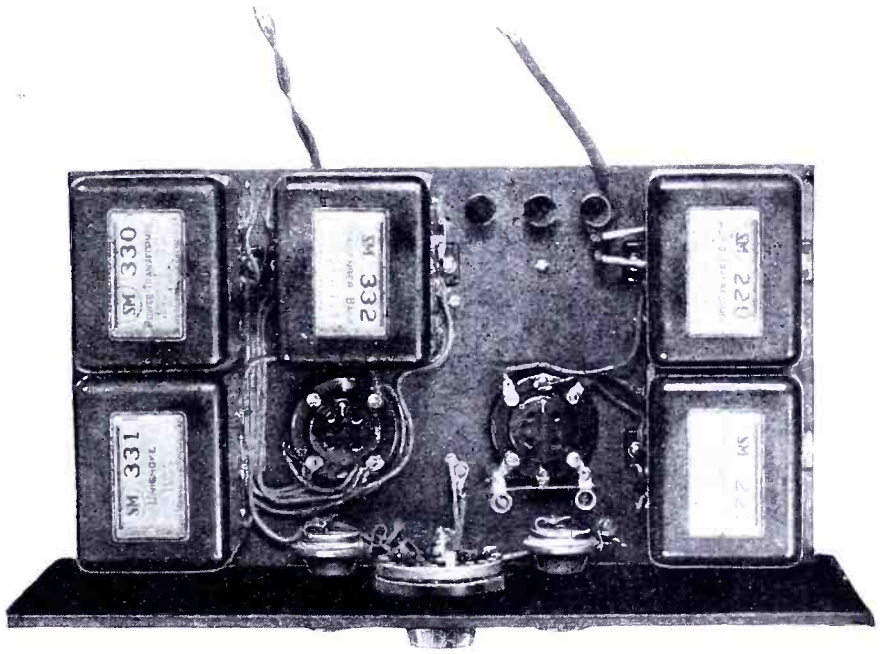
Front view of completed unit

F one were to compare receivers of the 1926-27 season with receivers in a similar class of one or two years ago, a rather interesting circumstance would be evident in view of the reputed tremendous progress that has been made in receiver design in recent months. This fact is that practically all the difference that may be found between good receivers of today and several years ago lies in improvements that have been made in audio amplification and simplification of tuning control. Thus, we find the popular receiver of today incorporating two stages of tuned radio frequency amplification, a detector and two stages of audio amplification. If we look back for several years, we can find exactly the same receivers and types of design, excepting the two points mentioned above.

A good neutrodyne or tuned radio frequency as produced in 23, 24 or 25 is for all practical purposes just as good as a receiver of similar type produced in the 1926 and 1927 season, so far as the actual production of results is obtained. Where the difference lies, if any, is in the ease with which the receiver may be operated. Three or more tuning controls were customary in the past, whereas one and two are the vogue now. So far as selectivity and sensitivity go, that is, ability to bring in a station when wanted, the receivers of different vintages are much on a par. It is true that this year sees a number of shielded receivers, but the shielding contributes, in many cases, only to more satisfactory quantity production in the final analysis. It also contributes to stability, a feature, not very serious, in which many of the older receivers were lacking. In one or two cases the additional third stage of radio frequency amplification allows of greater sensitivity, but it is hardly to be imagined that the hundreds of thousands of owners of good five-tube receivers a year or two old have any intention of discarding them for newer types which boast of only a slightly greater degree of sensitivity, when these owners of the older sets are getting all the stations that they desire.

The single vital argument for the 1926-27 receivers is quality of reproduction. In this matter there is no argument in the minds of those who know that would gainsay the fact that the quality of this season's broadcast receivers will be far and away ahead of that of those of previous seasons. For real strides have been made in audio reproduction in recent months.

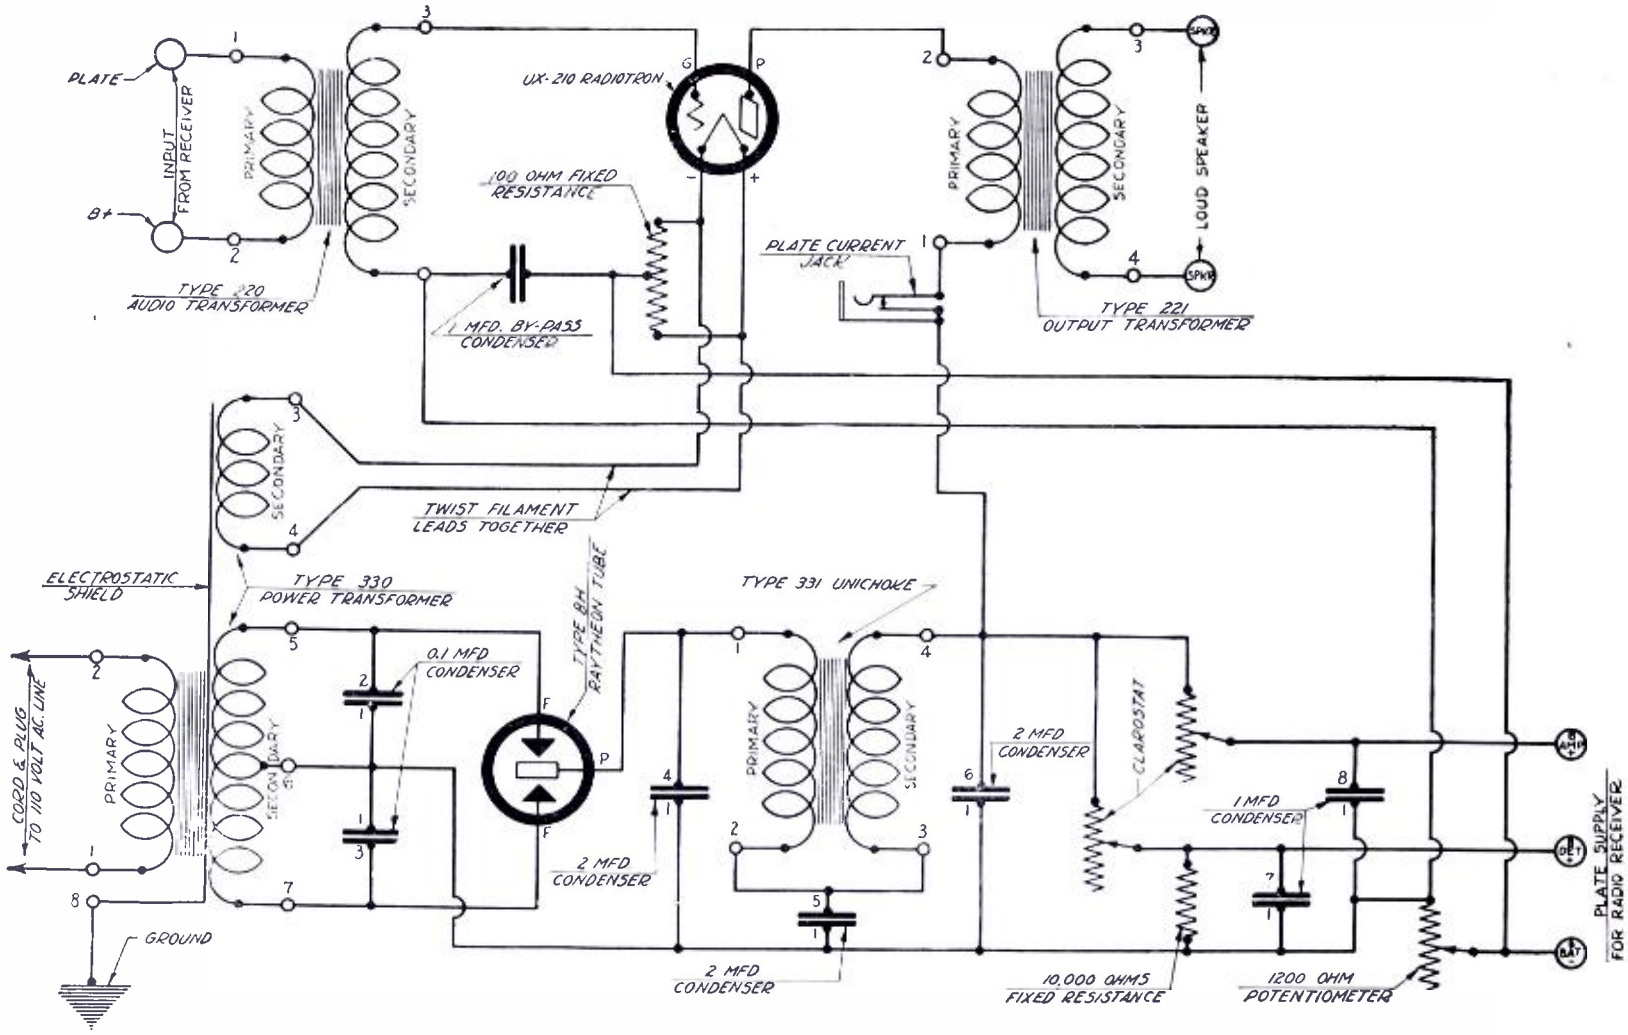
The purpose of this article is to show how the many owners of perfectly satisfactory receivers of all types (satisfactory except for audio quality) may bring their receivers up to date—up to the very last notch of perfection, and enjoy with these tried and true sets which they have used for several years, and which have become fixtures in their homes, the very finest reproduction. At the same time it is a very simple matter with properly designed equipment to eliminate the necessity for dry "B" batteries to operate these older receivers, thus allowing the user to have almost an entirely AC operated receiver, in that the storage bat-



Top view showing arrangement of parts

tery with its charger requires only intermittent attention and no actual battery replacement, while the bug-a-boo of running down "B" batteries is completely done away with.

The instrument illustrated in the photographs herewith consists of a single stage of power amplification together with a supply device which furnishes A, B and C power to it directly from the home lighting circuit. At the same time this power supply device furnishes all "B" battery potential for the radio receiver. Thus, with this instrument attached to any existing receiver, not only are all "B" batteries done away with, but the quality of repro-



Schematic wiring diagram showing all connections

duction is tremendously improved. Let the owner of a five-tube neutrodyne, built in the days when transformer manufacturers did not admit the existence of notes below 200 cycles, imagine, if he can, the experience of sitting before his favorite receiver, stripped of all "B" batteries, and listening to an organ recital, the low notes of which are the same as when one listens to them n a church.

The Power Amplifier and Plate Supply, as it is called, is illustrated by the two accompanying photographs. The front view shows only a plain panel carrying two jacks, three control knobs and an on-off switch. The upper knob controls the grid bias, or grid potential of the UX210 amplifier tube, and is a 1200 ohm potentiometer connected in series with the negative "B" supply line. Thus, as this resistance is varied, the voltage across it varies, and the actual adjustment for proper operating grid potential is very easily obtained.

The two lower knobs control the detector and amplifier plate voltage for the receiver respectively; the small jack marked "plate current" is for testing purposes only, and its use will be explained later. The jack at the right receives the loud speaker plug, while the small switch in the center turns the entire assembly on and off.

A rear view of this instrument shows at one end the type No. 220 audio transformer, No. 221 output transformer, and at the other end the type No. 331 unichoke and the 330 power transformer. In the rear center is the 332 condenser bank. The sockets for the two tubes, one a Raytheon type B.H., and the other a UX210, are plainly visible, together with the resistances on control panel. A small resistance connected across the filament binding posts of the UX210 tube socket is used to balance out the AC hum, as this filament is lighted directly from alternating current. The three binding posts at the rear of the subbase are for the negative, plus detector and plus amplifier, leads from receiver.

The audio transformer used has a rising low frequency characteristic. This means that as the frequency decreases the response of the transformer goes up, thus giving greatest amplification on low notes. This is a very valuable characteristic, as it compensates for exactly the opposite tendency in broadcast transmission, loud speaker design and average audio amplifier characteristics. The output transformer has a similar characteristic and is designed to couple the output of the power tube to a standard type of good cone type loud speaker. The design is such that the impedances of tube and speaker are approximately matched at 30 cycles.

The use of a UX210 tube, operating at from 250 to 300 volts plate potential, insures ample handling capacity for the last stage and a volume output far in excess of that obtainable in an ordinary second stage amplifier without distortion. As the plate current in this tube is rather high, it is effectively kept out of the loud speaker, which it not only might paralyze but might possibly damage as well, by means of the output transformer type 221. Using such an amplifier as this the quality obtained with it following a rather poor first stage, such as would be found in the older receivers, would actually be better than that obtainable from the first stage of the receiver alone. Thus, this amplifier actually overcomes some of the deficiencies of the older receivers themselves when they are operated together.

The power supply portion of the circuit is extremely interesting, as the filter presents an absolutely new principle in eliminator design. Instead of the customary brute force filter, a selective system is employed which effectively eliminates the unpleasant hum which frequently gets through from the AC lighting line in a poorly designed supply set. Further, the power output of this supply set is much higher than that obtainable with ordinary systems, thus permitting it to furnish not only A, B and C potential for the power amplifier, but the "B" potential for the receiver itself.

In constructing this amplifier the following parts will be necessary:

1—S-M No. 220 Audio Transformer
1—S-M No. 221 Output Transformer
1—S-M No. 330 Power Transformer
1—S-M No. 331 Unichoke
1—S-M No. 332 Condenser Bank
2—S-M No. 511 Tube Sockets
1—Yaxley 1200 Ohm Potentiometer
2—Clarostats

1—Aerovox 10,000 Ohm Resistance
1—Yaxley No. 10 Switch
1—Yaxley No. 1 Jack
1—Yaxley No. 2 Jack
1—Yaxley 100 Ohm Resistance
3—Eby Binding Posts
1—Phone Cord and Plug
1—Pair S-M No. 540 Brackets
1—Formica 7x18x3/16" Panel
1—Formica 7x17x3/16" Panel

The layout of the construction is very clear from the photographs and it should be a simple matter indeed to drill the necessary panels and mount the parts upon them. The wiring is all done with flexible Belden hookup wire, either fastened under the instrument's binding posts or soldered to lugs. There is little point in going into the details of wiring, as they are perfectly evident from the wiring diagram and photographs. There are, however, certain precautions to be observed in the construction and operation of the outfit which it is well to consider.

In wiring the outfit, it is necessary that terminal No. 8, the electro-static shield of the power transformer, go directly to ground—preferably to the same ground to which the receiver filaments are connected (if a loop set is used it will probably be necessary on this, as on other supply sets, to ground the filament circuit in order to eliminate hum). The resistance R-5 must be a potentiometer of at least 1,000 ohm resistance, preferably 1,200 ohm. If a 1,200 ohm potentiometer cannot be procured, then a 400 ohm type, with a fixed resistance of 400 to 800 ohms in series with it must be used.

The resistance R-2 may be of a standard potentiometer of any value if the fixed 100 ohm type cannot be obtained. Its center top need only be located approximately, but its purpose is to eliminate hum which might get through from the power transformer. It is necessary to twist the lower tube filament leads to the 330 transformer exactly as shown in the diagram, in order to localize their field.

In operating the outfit, a slight hum may be experienced, if the cord and plug connecting to terminals 1 and 2 of the No. 220 transformer have been reversed, since unless the cord is properly plugged into the set a hum will result.

In testing the amplifier a strong signal should be tuned in, say, as strong a one as will be received. Then the grid bias resistance should be adjusted for best quality. This adjusting can be facilitated if a low reading millimeter is available, which may be plugged into the jack marked "plate current." If this is done then the proper adjustment of the grid bias will be when the meter flickers a minimum amount on the strongest signal to be received.

In operating an outfit of this character, no endeavor should be made to use more than one stage of audio amplification preceding it. If two stages are used, continual howling will probably result that can only be eliminated by resistances on the order of 10,000 ohm connected across the secondaries of all audio transformers, which will serve to load them and produce a comparatively stable condition.

There is little or nothing to wear out in an outfit of this type, assuming the tubes not to be damaged, for both the Raytheon B.H. and the UX210 will last a very considerable length of time in normal use. The clarostat resistances may occasionally have to be readjusted to obtain a proper operating voltage to the receiver, but this can be done quite simply, the ear being the judge of the proper adjustment.

A New Ten Tube Receiver Using the Remler Infradyne Amplifier

PERHAPS the most striking recent example of a radical departure in radio design is the development of the Infradyne Intermediate Amplifier, having a peak frequency of 3,200 kilocycles or 95 meters. This design of intermediate frequency amplifier employs a hitherto neglected principle of heterodyning.

If a locally generated oscillating current is mixed in a circuit with an incoming frequency, two new frequencies are generated. One of them, the beat or difference frequency, is utilized in super heterodyne receivers. The other, known as the sum frequency, is used in the Infradyne amplifier incorporated in the receiver described herewith.

Research endeavoring to develop a sum frequency amplifier has been neglected due to the inherent difficulty of efficiently amplifying the extremely high frequencies. However, extensive experimentation has disclosed a means by which any frequency may be amplified to the same degree.

Actual tests under ordinary reception conditions have proven that only one oscillator dial setting is used for each station, as the method employed in the amplifier, when properly balanced, has the ability of eliminating harmonics of double or treble the station's wave length. Since the intermediate amplifier is very sharply peaked at 95 meters, it follows that maximum efficiency will be found only at that frequency. Therefore, tube noises and other interference, being at a higher wave length, will only be slightly amplified, making a much quieter receiver than heretofore possible.

When the condenser of the tuned radio frequency amplifier is adjusted to the peak of the incoming signal the tuning of the oscillator condenser will be slightly broader. This can be overcome by readjusting the tuning condenser so that it is not tuned directly to the peak of the incoming signal. If too long an antenna is used it may be necessary to insert a .00025 mfd. fixed condenser in series with it.

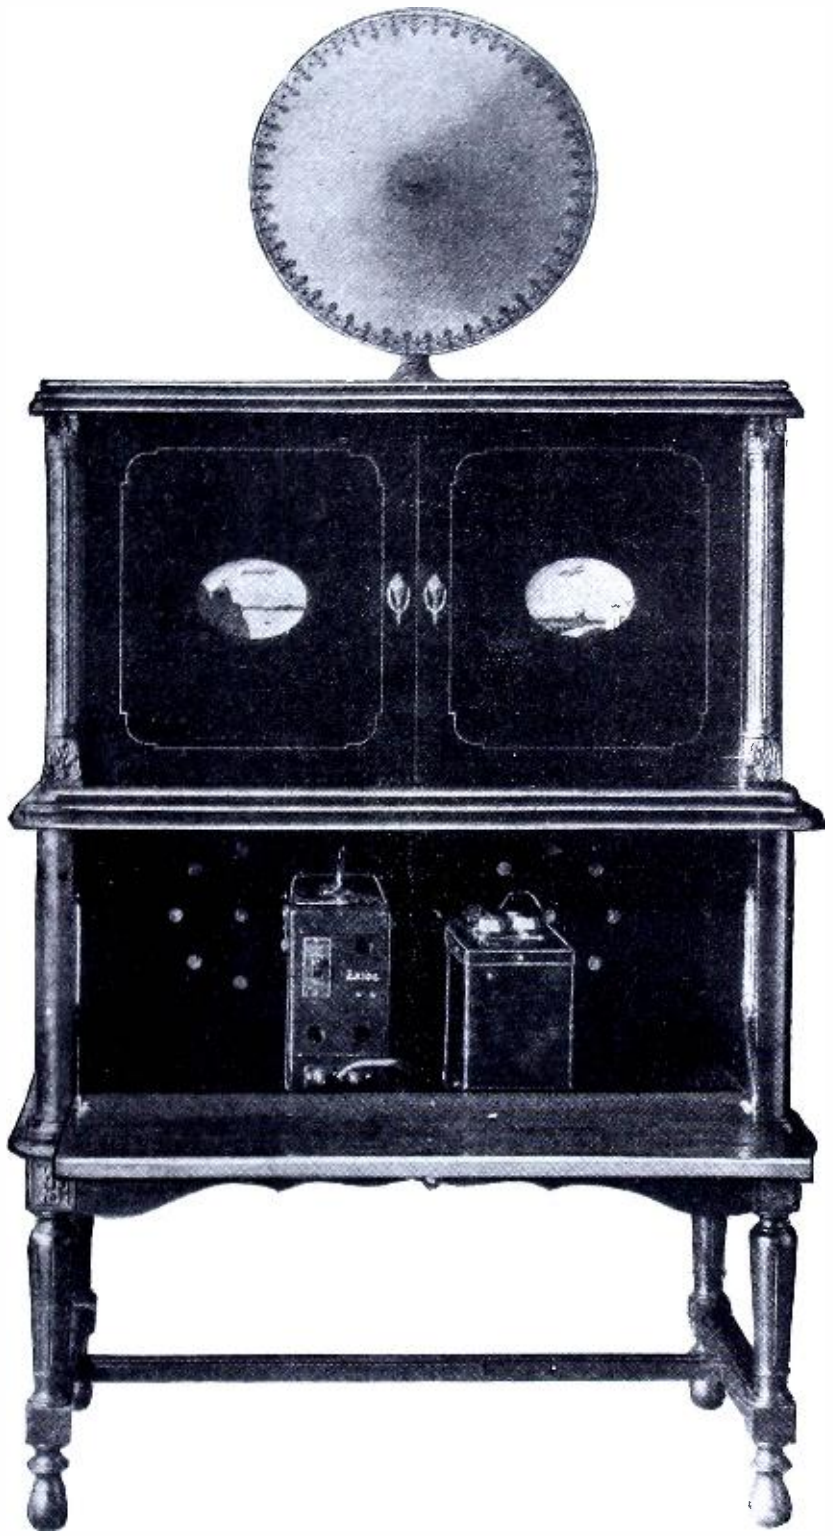


Photo A. Front view showing how receiver can be mounted in a console with suggested accessories

The receiver described herewith consists of two stages of tuned radio frequency with a detector, an oscillator circuit, three stages of 95 meter amplification, a second detector and two stages of audio frequency amplification.

Figure 4 shows a schematic wiring diagram of the complete receiver. A standard tuned radio frequency circuit tuned by a triple gang condenser, each of .00035 mfd. capacity, is used before the detector. To enable the constructor to insert a pair of phones in the circuit to properly test and balance the tuned radio frequency end of the receiver, a single closed circuit jack is inserted in the output of the first detector.

To receive distant stations when using the first three tubes only, it may be necessary to temporarily shunt a .001 or .002 mfd. fixed condenser across the terminals of the head phones.

The oscillator coupler is wound on a tube 1½ inches in diameter and 2 inches long in the following manner, using a No. 24 D. S. C. wire throughout. The detector plate coil, the oscillator plate coil and the oscillator grid coil consisting of 8, 14 and 14 turns respectively are wound in that order upon the tube. A space of 3/16 inch separates the detector plate and oscillator plate coils, while only 1/16 inch separates the oscillator and grid coils. The ends of each coil are securely anchored and a short length of wire allowed to project to facilitate connections. The tube is mounted in a vertical position with the 8 turn coil at the top. The ends of the coils are numbered as follows: Starting at the top, the beginning of the detector plate coil is number 1, and the end is number 2; the beginning of the oscillator plate coil is number 3, and so forth up to 6. This numbering is important, since all diagrams show the various terminals marked. Care should be taken that all three coils are wound in the same direction and the proper numbering applied to their respective terminals. If the constructor does not have the facilities to properly wind a coupler and desires a manufactured product, he may obtain a standard coupler, designed especially for this circuit.

A .0005 mfd. fixed condenser is in series with the plate lead of the .00035 mfd. oscillator condenser. This decreases the capacity of the variable condenser to approximately .000212 mfd., which is the correct capacity for maximum efficiency. This will prevent the burning out of any of the tubes in case the plates of the variable condenser happen to be "shorted."

Figure 1 is the front panel layout, plainly showing all mounting holes and the necessary engraving. The pair of countersunk holes in the lower corner at each end of the panel are for mounting the brackets supporting the sub-panel.

The baseboard layout shown in Figure 2 shows the location of

all apparatus in the completed receiver. Particular attention should be paid to the proper position of each part so that its terminals bear a correct relation to the terminals on other pieces of apparatus. This is very important and makes short leads possible. All terminals are plainly marked for this purpose.

purposes. This jack is also mounted under the sub-panel.

The assembling and wiring of the receiver is no difficult ta Just mount the sub-panel on the two supporting brackets. Th turn the amplifier unit over on its face and place a piece of s wood, 4 inches long, 2 inches high and ¾ inch thick against t

Photo B—Front view of receiver installed in cabinet

Figure 3, the sub-panel layout, shows the correct location of all holes. Those holes which are shown solid black are 3/32 inch drill. These holes are provided for the wires which pass through the sub-panel. The holes with the extra circle around them are 5/32 inch drill and countersunk for No. 6 flat head brass machine screws. These holes are provided for the mounting, under the sub-panel, of the Jones Multiplug, the supporting brackets, the two 1 mid. by-pass condensers and the two blocks of wood supporting the Infradyne Amplifier. The sub-panel is cut out so that the unit may be easily inserted into position and fastened into place.

case under each projecting flange. Carefully transfer the loc tion of the mounting holes in the flange to the wood, using small punch or pencil. Then drill a shallow hole at each ma and liberally countersink it. Replacing the blocks, insert a N 5x1 inch flat head wood screw into each hole and slowly tu it until the soft copper is drawn down into the depression arou the hole and the screw is flush or under-flush with the botto Turning the unit right side up, it may be easily inserted into t slot and securely fastened into place using four flat head wo screws through the sub-panel.

Next remove the two angle brackets on each Duoformer whi

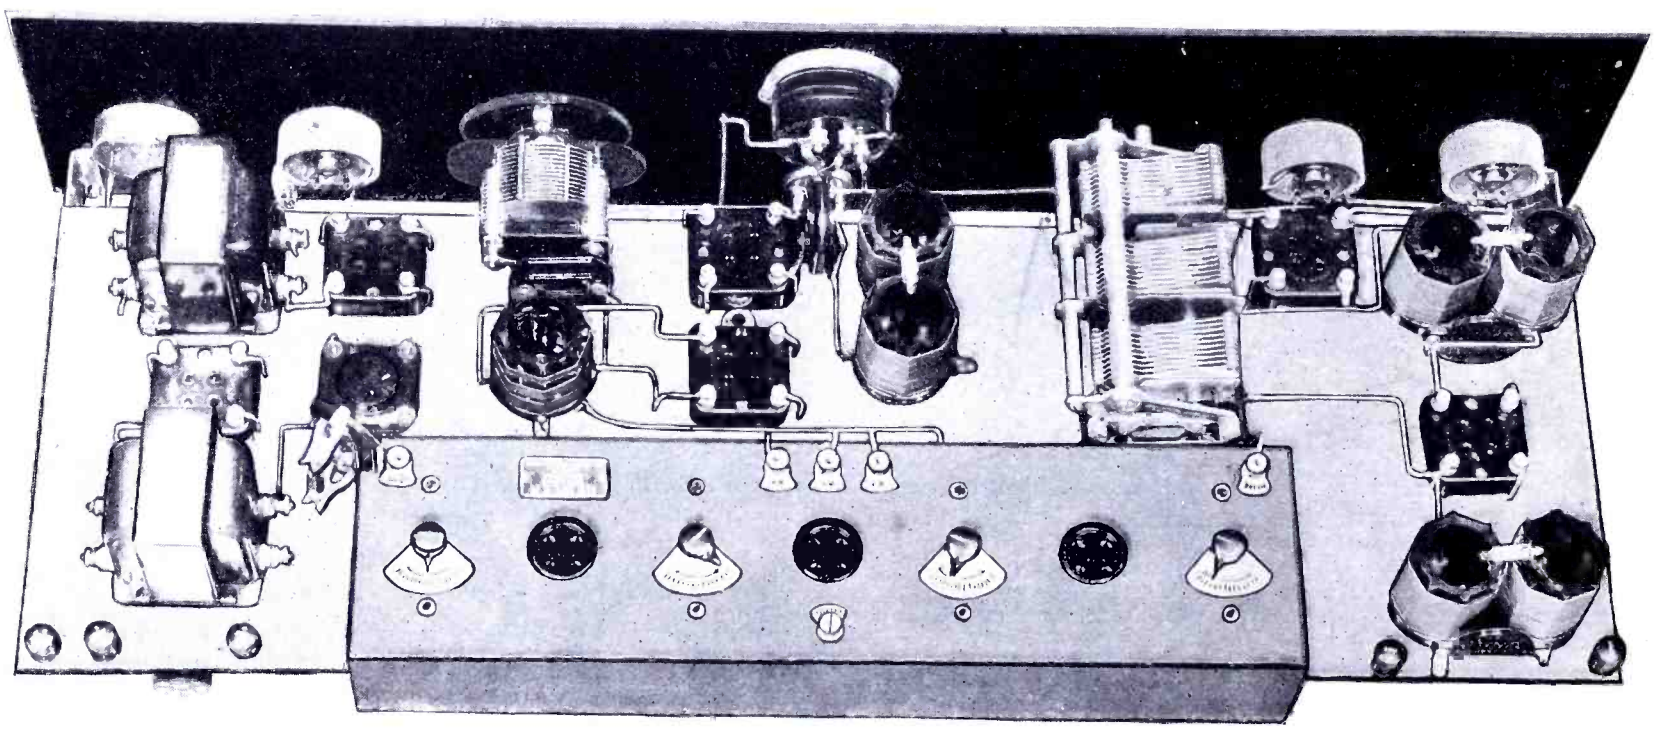

Photo C—Rear view of completed receiver

Nine holes are shown with a dotted circle around them. They are all ⅛ inch drill and tapped for a No. 6-32 machine screw. These holes are provided for mounting the four Carter fixed resistances and the Lynch grid leak mounting under the sub-panel.

The 5/16 inch hole near the center of the sub-panel is provided for the Frost No. 954 Three Spring Gem Jac used for testing

are normally used for mounting purposes. Replace the outsi lugs on the terminals marked 1 and F negative on the anten coil and the outside lugs on the terminals marked B positive a F negative on the two radio frequency transformers with t brackets. This arrangement allows soldering lugs to be plac under the nuts below the sub-panel in such a manner that

direct connection is made to the coils through the mounting screws, thereby obviating the necessity of drilling extra holes through the panel for the passage of wires. Great care must be exercised in the replacement of the terminals so that the ends of the windings are not broken from the inside lugs.

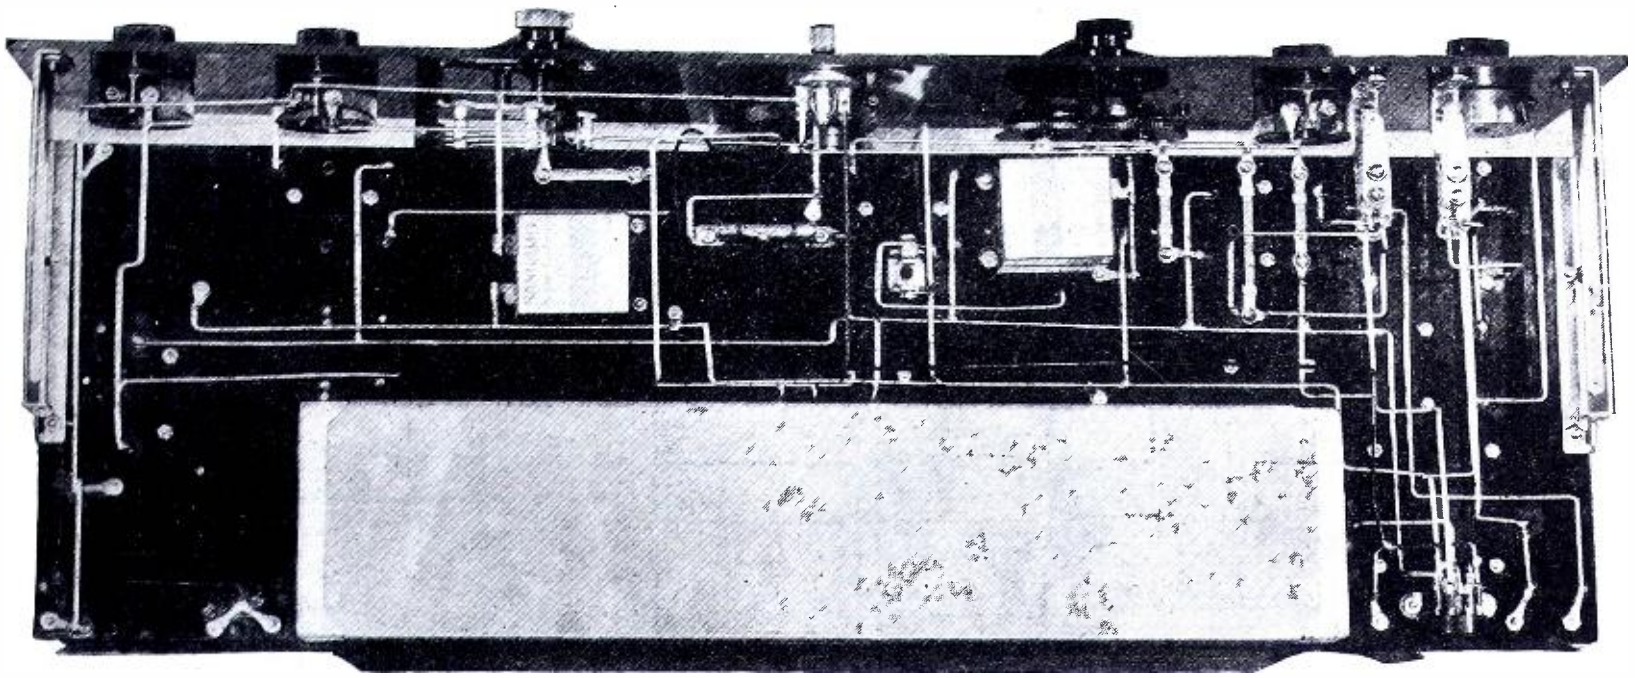

Photo D—Bottom view of receiver

Complete the assembling under the sub-panel by mounting the four Carter fixed resistances, the two 1 mfd. by-pass condensers, the Jones plug, the grid leak mounting and the test jack.

Turning the sub-panel right side up, fasten all remaining apparatus upon it, referring to Figure 2 for proper locations and so forth.

Next mount the rheostats, filament switch, the two jacks, the variable condensers, the variable resistance and the voltmeter on the front panel.

It is best not to mount the front panel on the brackets until all possible wiring is completed on the sub-panel. A careful study of the various photographs accompanying this article will show the best manner in which to arrange the wires. Either insulated or bare wires may be employed to wire up the set.

Three rheostats are used in this receiver. A ten ohm rheostat controls the two radio frequency tubes, a thirty ohm rheostat controls the first detector, and a four ohm fixed resistance in series with a thirty ohm rheostat regulates the intermediate frequency and oscillator tubes. The four ohm fixed resistance is inserted in the circuit as a safety device to protect the 199 tubes. It effectually prevents more than the normal operating voltage to be applied to the tubes, regardless of the amount of resistance "cut out" in the rheostat. *Under no circumstances remove any of the 199 tubes from a socket without first turning off the filament switch.* The fixed resistance will be insufficient to properly reduce the "A" battery current to such an extent that it will be harmless to the 199 tubes when less than four tubes are in the circuit.

Both the second detector and first audio tubes are each controlled by a Carter four ohm fixed resistance, while the last audio tube is controlled by a two ohm fixed resistance. Since the adjustment of these three tubes is not critical, this method is quite efficient.

A Frost 50,000 ohm variable resistance is shunted across the secondary of the first audio transformer. It functions admirably as a volume control and helps considerably in obtaining good volume.

A separate jack is used for the first stage of audio. The second stage uses a filament control jack which automatically completes the filament circuit of the last tube when the speaker plug is inserted.

A Weston Model 506 Type 217 double scale voltmeter is used in this receiver. When properly connected into the circuit as shown in the diagrams, the lower scale will show the filament voltage applied to the 199 tubes. The upper scale reading is obtained by pushing the button on the meter frame and shows the "B" battery voltage on the Infradyne Amplifier.

All connections on the Jones plug are as shown on the color chart supplied with the cable. The terminal normally used for the antenna connection has the 135 volt "B" lead connected to it while the ground terminal is not used. The proper "C" battery bias, 4½ volts for the first stage and 7½ volts for the second stage, is connected to separate binding posts located at the rear edge of the sub-panel.

All plate and grid leads are made on the upper side of the sub-panel except the plate lead of the second radio frequency

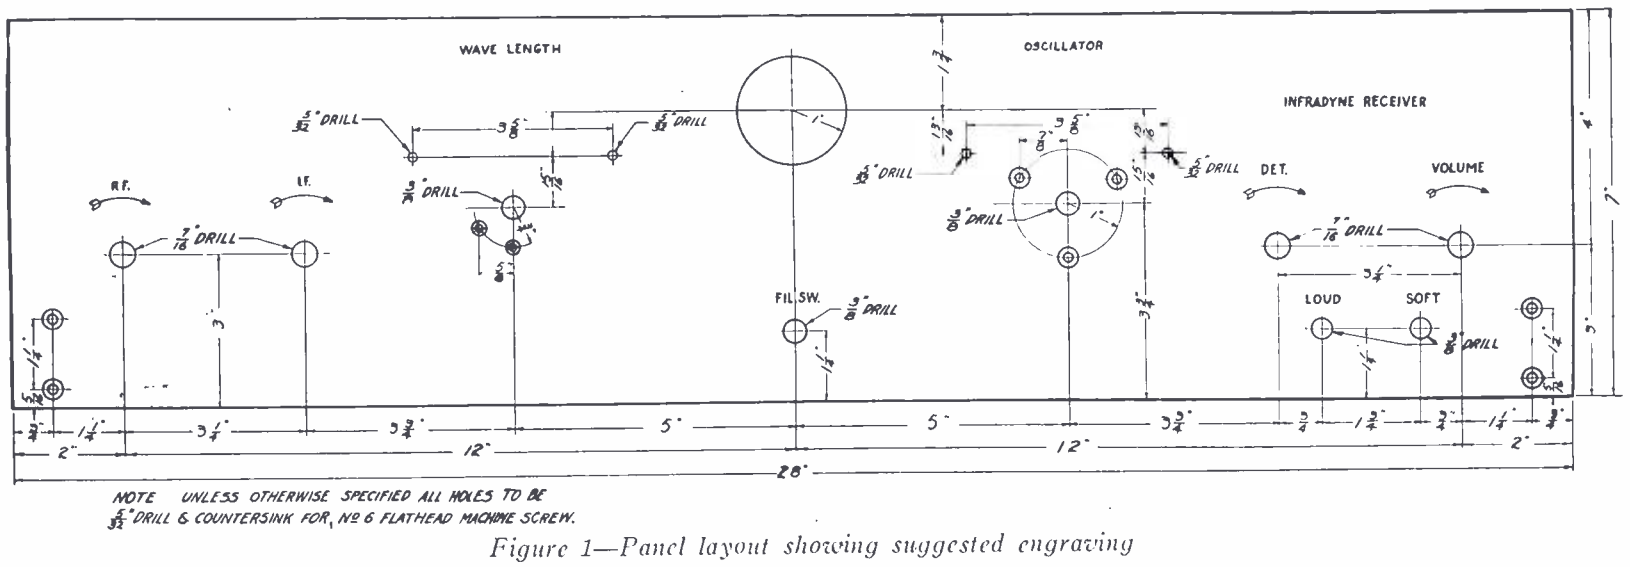

Figure 1—Panel layout showing suggested engraving

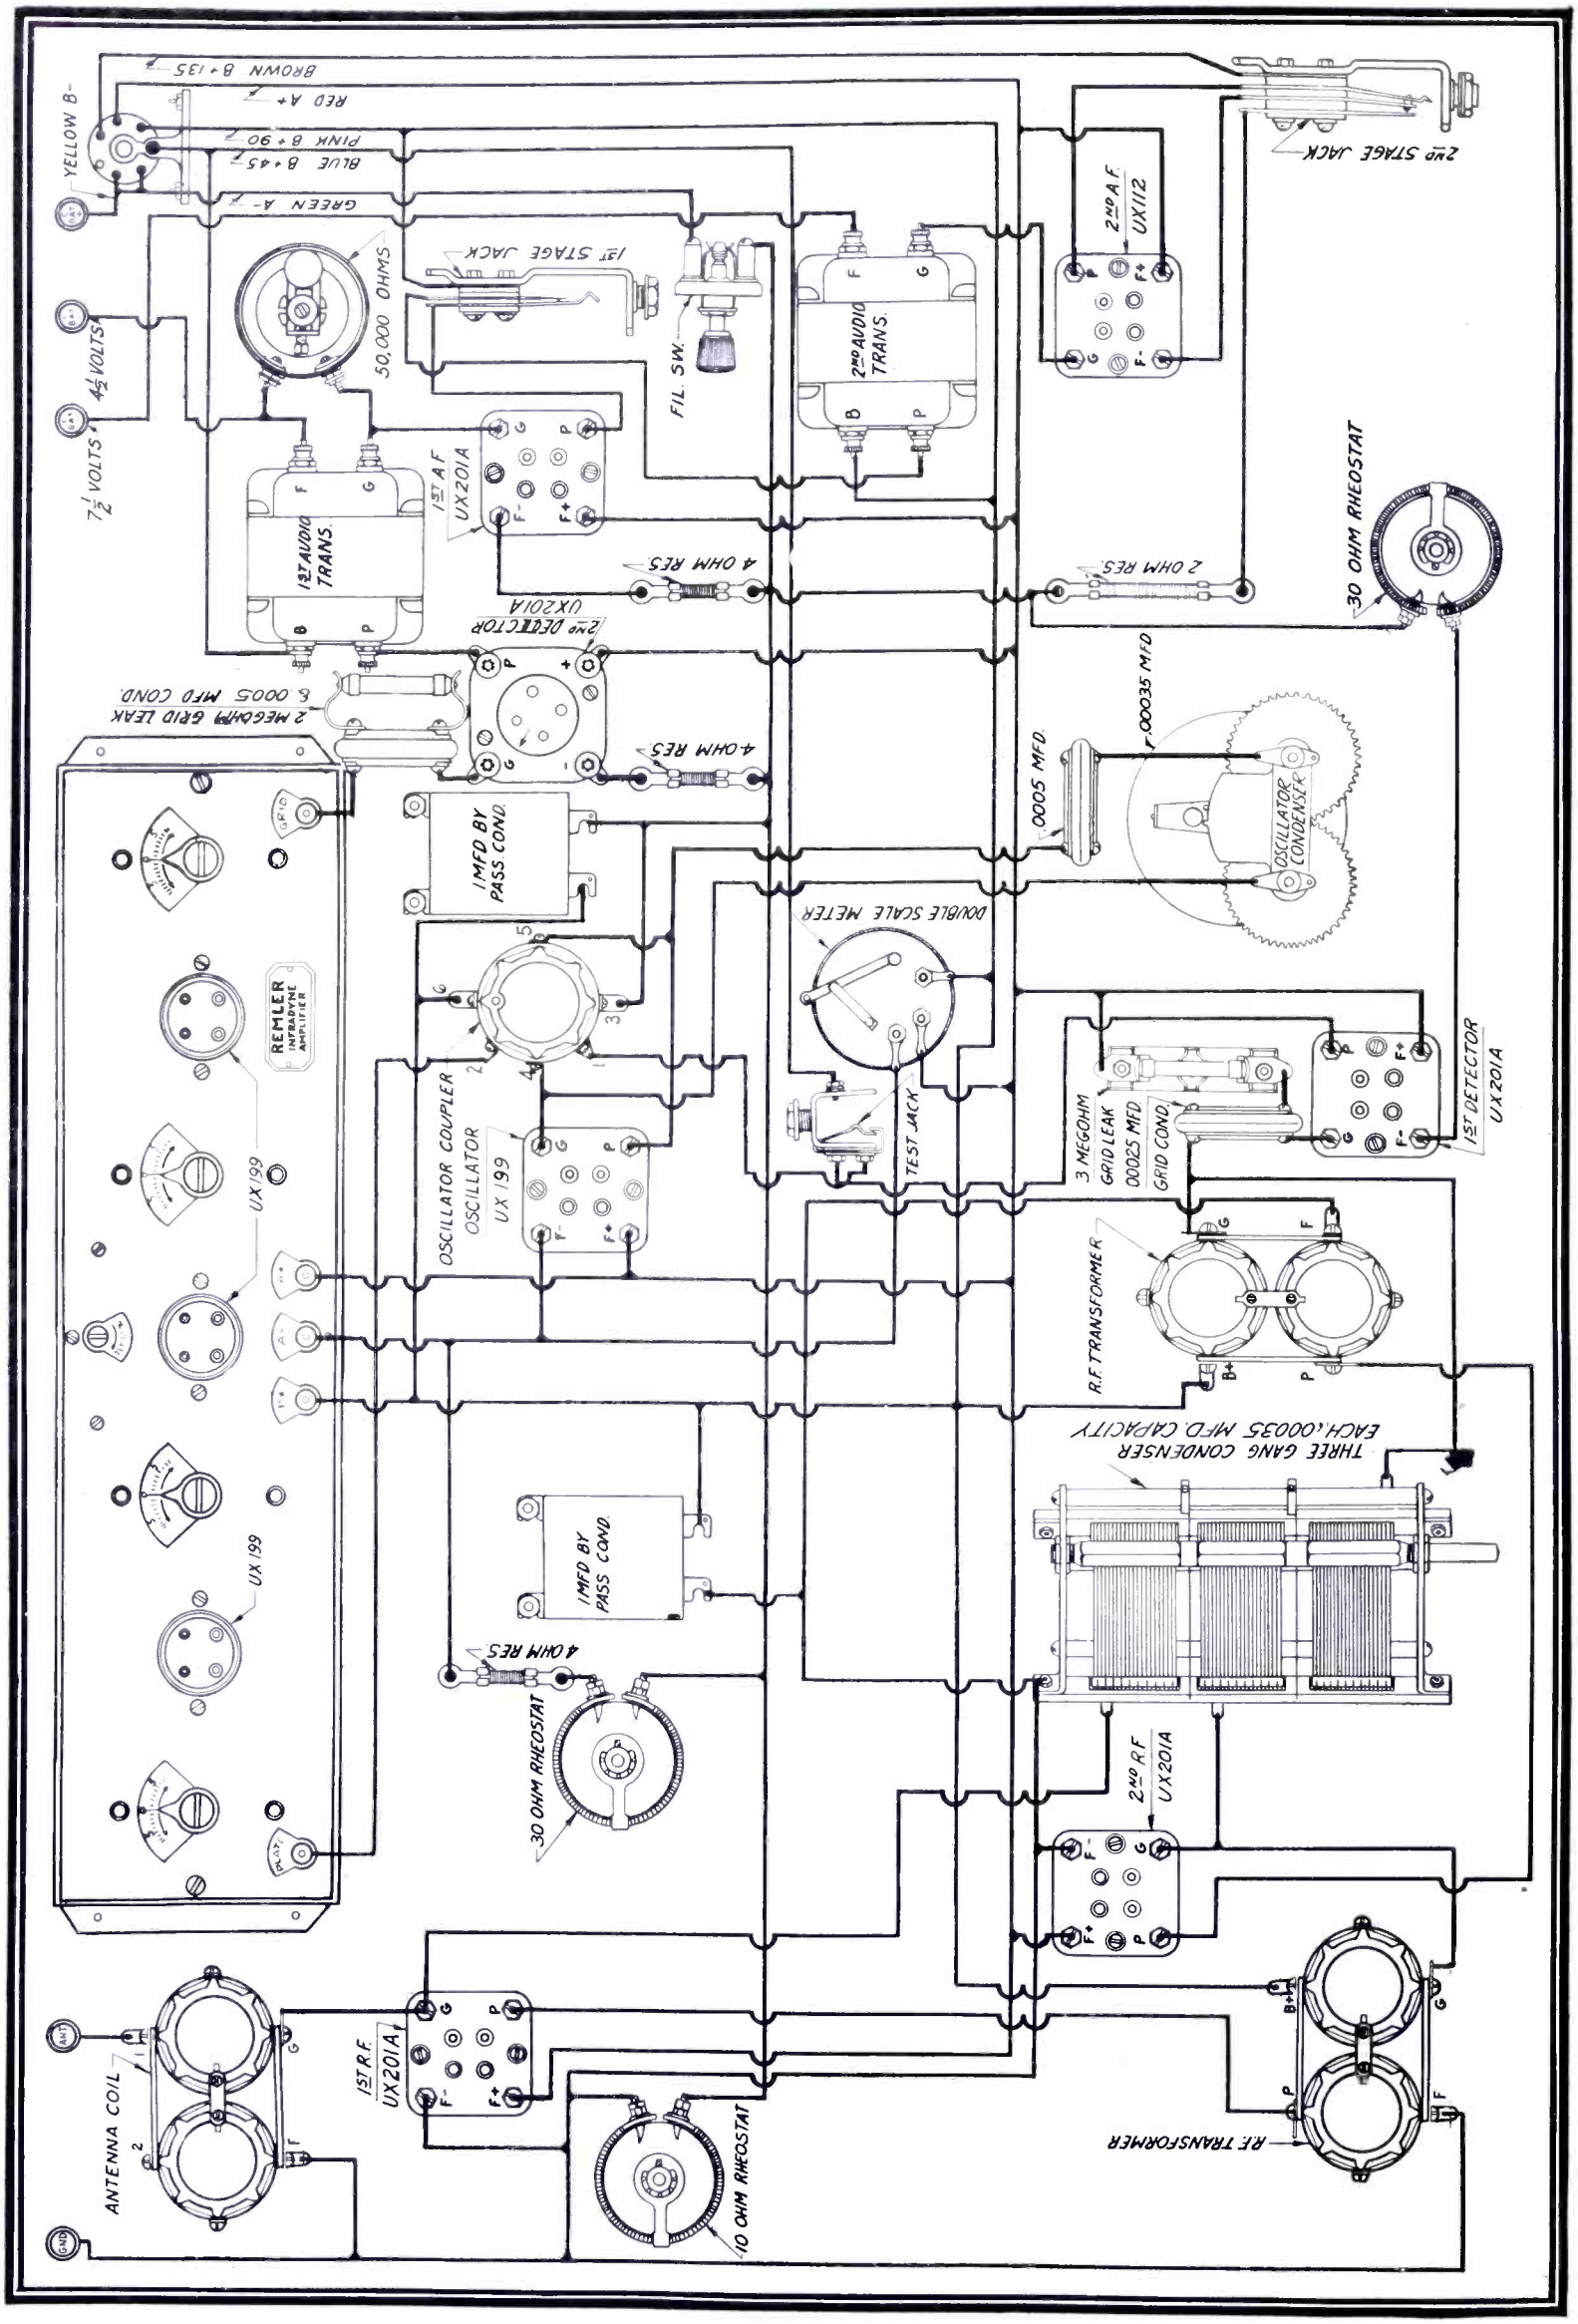

Figure 5—Graphic illustration showing all connections

be. This lead runs under the panel to the plate terminal of the cond radio frequency transformer.

After the receiver has been completely wired, carefully check l connections against the large graphic illustration shown in gure 5. Then connect the "A" battery leads only to the set. Insert ree UX 199 tubes in the Infradyne unit and one in the oscilla-

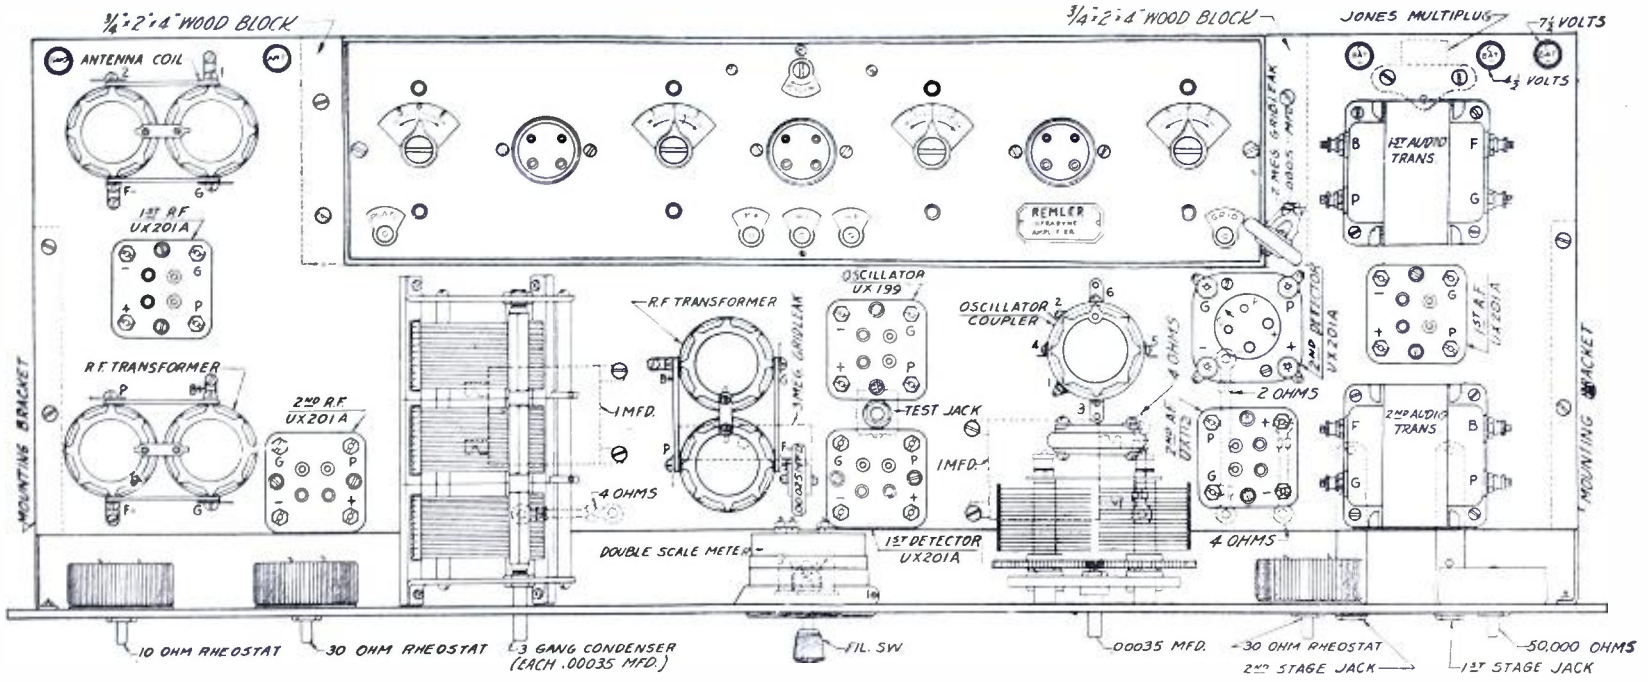

Figure 2—Baseboard layout

e socket. The last stage of audio uses a UX 112 power tube and h remaining sockets UX 201A tubes. Turn on the filament itch and turn up each rheostat, observing whether all tubes ght up and are controlled by the proper resistance. When all dications show that the tubes are properly connected, dis-nect the "A" positive lead and touch it in turn to the other ttery terminals on the receiver, noting each time whether any es light. If there is no indication of tubes lighting except en the "A" battery is properly connected, it is safe to con-ct up the rest of the batteries, attach aerial and ground and g in the speaker.

After removing all tubes except the first three, plug in with ad phones at the test jack and begin tuning with the three g condenser until some station of fairly good volume, located

it will go to the right. Then set the pointer on each of the four Vernier condenser knobs at zero. Slowly change the settings of the four knobs, using the wooden wedge furnished with the unit, until the combination is found which gives the greatest volume. As the settings of the knobs approach more nearly the values for the most satisfactory operation, the amplifier will be found to go into oscillation. This oscillation can be prevented by carefully loosening the adjusting screw marked "Increase." The vernier condenser settings should again be slightly changed until the point of best operation is obtained. Should the latter adjustment again throw the amplifier into oscillation it will be necessary to further slightly loosen the adjusting screw. If difficulty is experienced in obtaining maximum amplification in the unit, and all other instructions for placing the receiver in proper working order have been followed, the trouble may probably be remedied by inserting a coil of about 8 to 10 turns of No. 20 D. S. C. wire, wound around a finger, in the plus "B" lead just before it enters the Infradyne Amplifier. Once the above adjustments have been made and the settings for the most satisfactory operation found, the amplifier will function without fur-

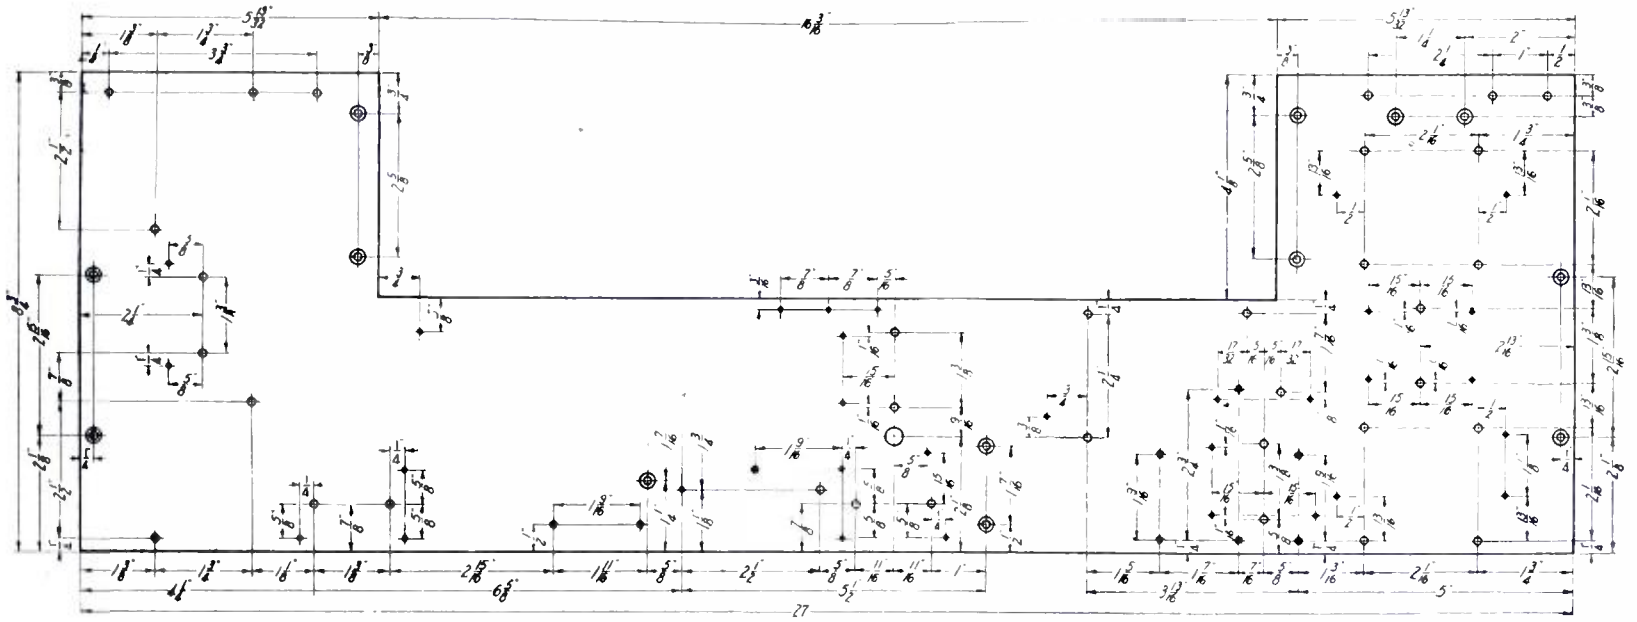

Figure 3—Sub-panel layout

a moderate distance, is found. Then carefully adjust the com-nsating plates on the condenser until the station heard comes in ry sharply only at one place on the dial.

Next insert all tubes and with the speaker plugged in its proper ck, tune in a station with a moderately weak signal. The sta-on should be at least 150 miles distant. The next procedure the balancing of the Infradyne unit, which is accomplished as llows: Turn the adjusting screw marked "Increase" as far as

ther attention other than the adjustment of the filament temperature.

An antenna no longer than 50 feet, including lead in, will serve very nicely. A good ground is absolutely necessary.

If no great volume is obtained from the audio amplifier, remove all the leads connected to the terminals of the voltmeter and connect separate flexible leads to them. Then test the filament voltage of the different tubes controlled by the fixed resistances.

This is a helpful hint for any type of receiver using various types of fixed resistances, as often various tubes do not consume the same amount of current.

If 4.8 to 5.2 volts are not indicated for the 201 A tubes and 2.75 to 3 volts for the 199 tubes, change either the resistor or the tube until the correct voltage is obtained. Amperites or any other resistor of the correct value may be used. 135 volts "B" battery is used on the plate of the last tube as specified in the illustration. The only necessary change to be made if other types of power tubes are used in the last stage is to change the 2 ohm fixed resistance to the proper size for the tube used and increase the "C" battery and "B" battery voltage as specified on the circular supplied with the tube.

This receiver has been very neatly arranged both for construction and wiring, and we advise that you do not change the location of any parts and use only those specified, although any of the minor controls may be substituted, providing they are of the same value as given. While Thordarson R-200 Audio Transformers and the Continental 3 gang condenser have been selected for this receiver, Silver-Marshall Audio Transformers and the Hammarlund 3 gang condenser, designed especially for this circuit, may be successfully substituted.

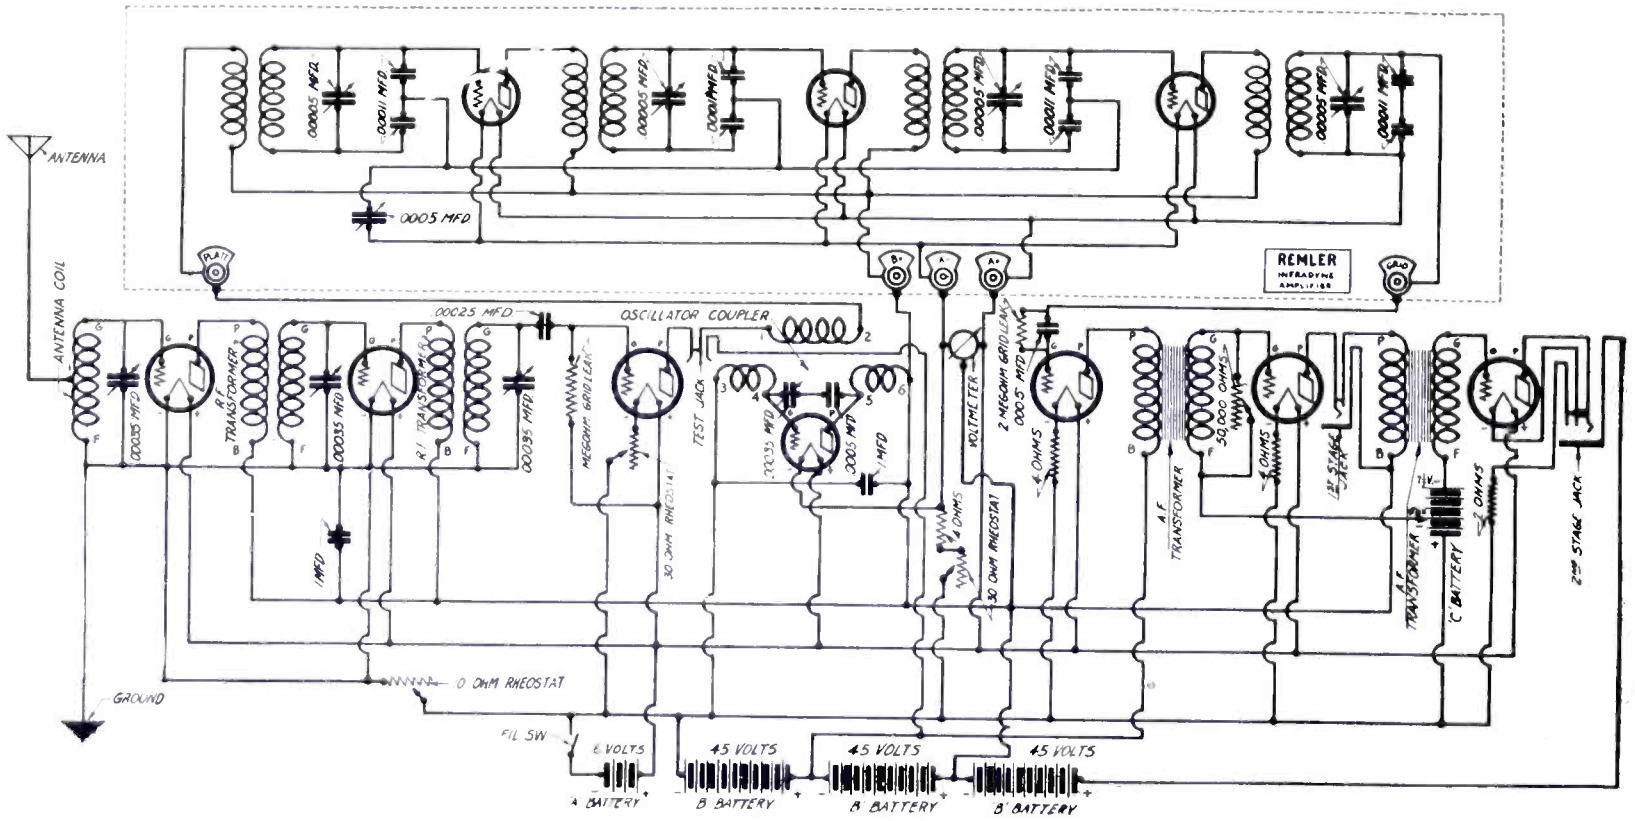

Figure 4—Schematic wiring diagram

It is unfair to expect the receiver to give phenomenal results the first time it is placed on the air. Being an extremely sensitive and selective instrument, it has certain peculiarities of tuning which must be experienced and thoroughly understood. When the little intricacies of tuning are mastered, a properly balanced receiver will perform in such a manner so as to give the utmost satisfaction in reception.

List of Parts

These parts or their equivalent will give satisfactory results:
1—7x28x3/16-inch Formica Panel
1—8¾x27x3/16-inch Formica Sub-Panel
1—Remler Type 700 Infradyne Amplifier
1—Remler Type 630 .00035 mfd. Variable Condenser
1—Continental .00035 mfd. 3-gang Vernier Condenser
1—Weston Model 506, Type 217 0-7-140 Voltmeter
1 Pair Benjamin Type 8629 Shelf Brackets
1—Benjamin Type 9040 UX Cushion Socket
1—Frost No. 710 10 ohm Rheostat
2—Frost No. 730 30 ohm Rheostats
1—Frost No. 608 Filament Switch
1—Frost No. 954 Gem-Jac
1—Frost No. 234 Pan-Tab Jack
1—Frost No. 235 Pan-Tab Jack
50 Feet Belden Tinned Copper Hookup Wire (12 gauge)
1 Package Kester Solder

The accessories shown in the Infradyne article consist of the following:

The "A" battery supply is furnished by an Exide "A Plant," which is connected into any convenient house lighting plug furnishing 110-volt A.C. This unit furnishes a 6 volt supply kept at full charge by a trickle charger, and is made by the Electric Storage Battery Co., Philadelphia, Pa.

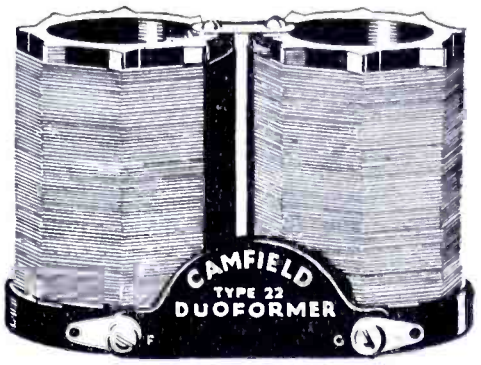
The "B" supply is furnished by the New Raytheon "B" Eliminator made by the Kokomo Electric Co., Kokomo, Ind. It will supply all necessary voltages to operate both detector and amplifier circuits.

The new Trimm Cone Type Speaker is shown, made by Trimm Radio Products Co., Chicago.

The Console is a piece of furniture of rare beauty. It has a sliding door arrangement so that when the doors are opened they may be pushed back out of the way. It is also beautifully decorated with genuine inlay work, and would be an ornament of the highest quality in any home. It is made by Detroit Woodcraft Co., Detroit, Mich.

(If any further information is desired about these accessories—kindly write manufacturer direct.)

Announcing



The New Camfield Duoformers

A Non-Oscillating Radio Frequency Transformer

Specially Matched for

"THE INFRA-DYNE CIRCUIT"

and

For Universal Use in Any Tuned Radio Frequency Circuit

Price of Kit $10.00

The Camfield Duoformers use a new and highly efficient system of preventing oscillation in tuned radio frequency circuits. They are specially matched for single control operation in the new "Infra-Dyne" circuit. They are also designed for use in any tuned radio frequency circuit—and for substitution in any five tube receiver giving oscillation trouble.

If you own a set that gives oscillation trouble or are planning to build a new set, write for our book, "Radio Frequency Amplification Without Disturbing Oscillations."

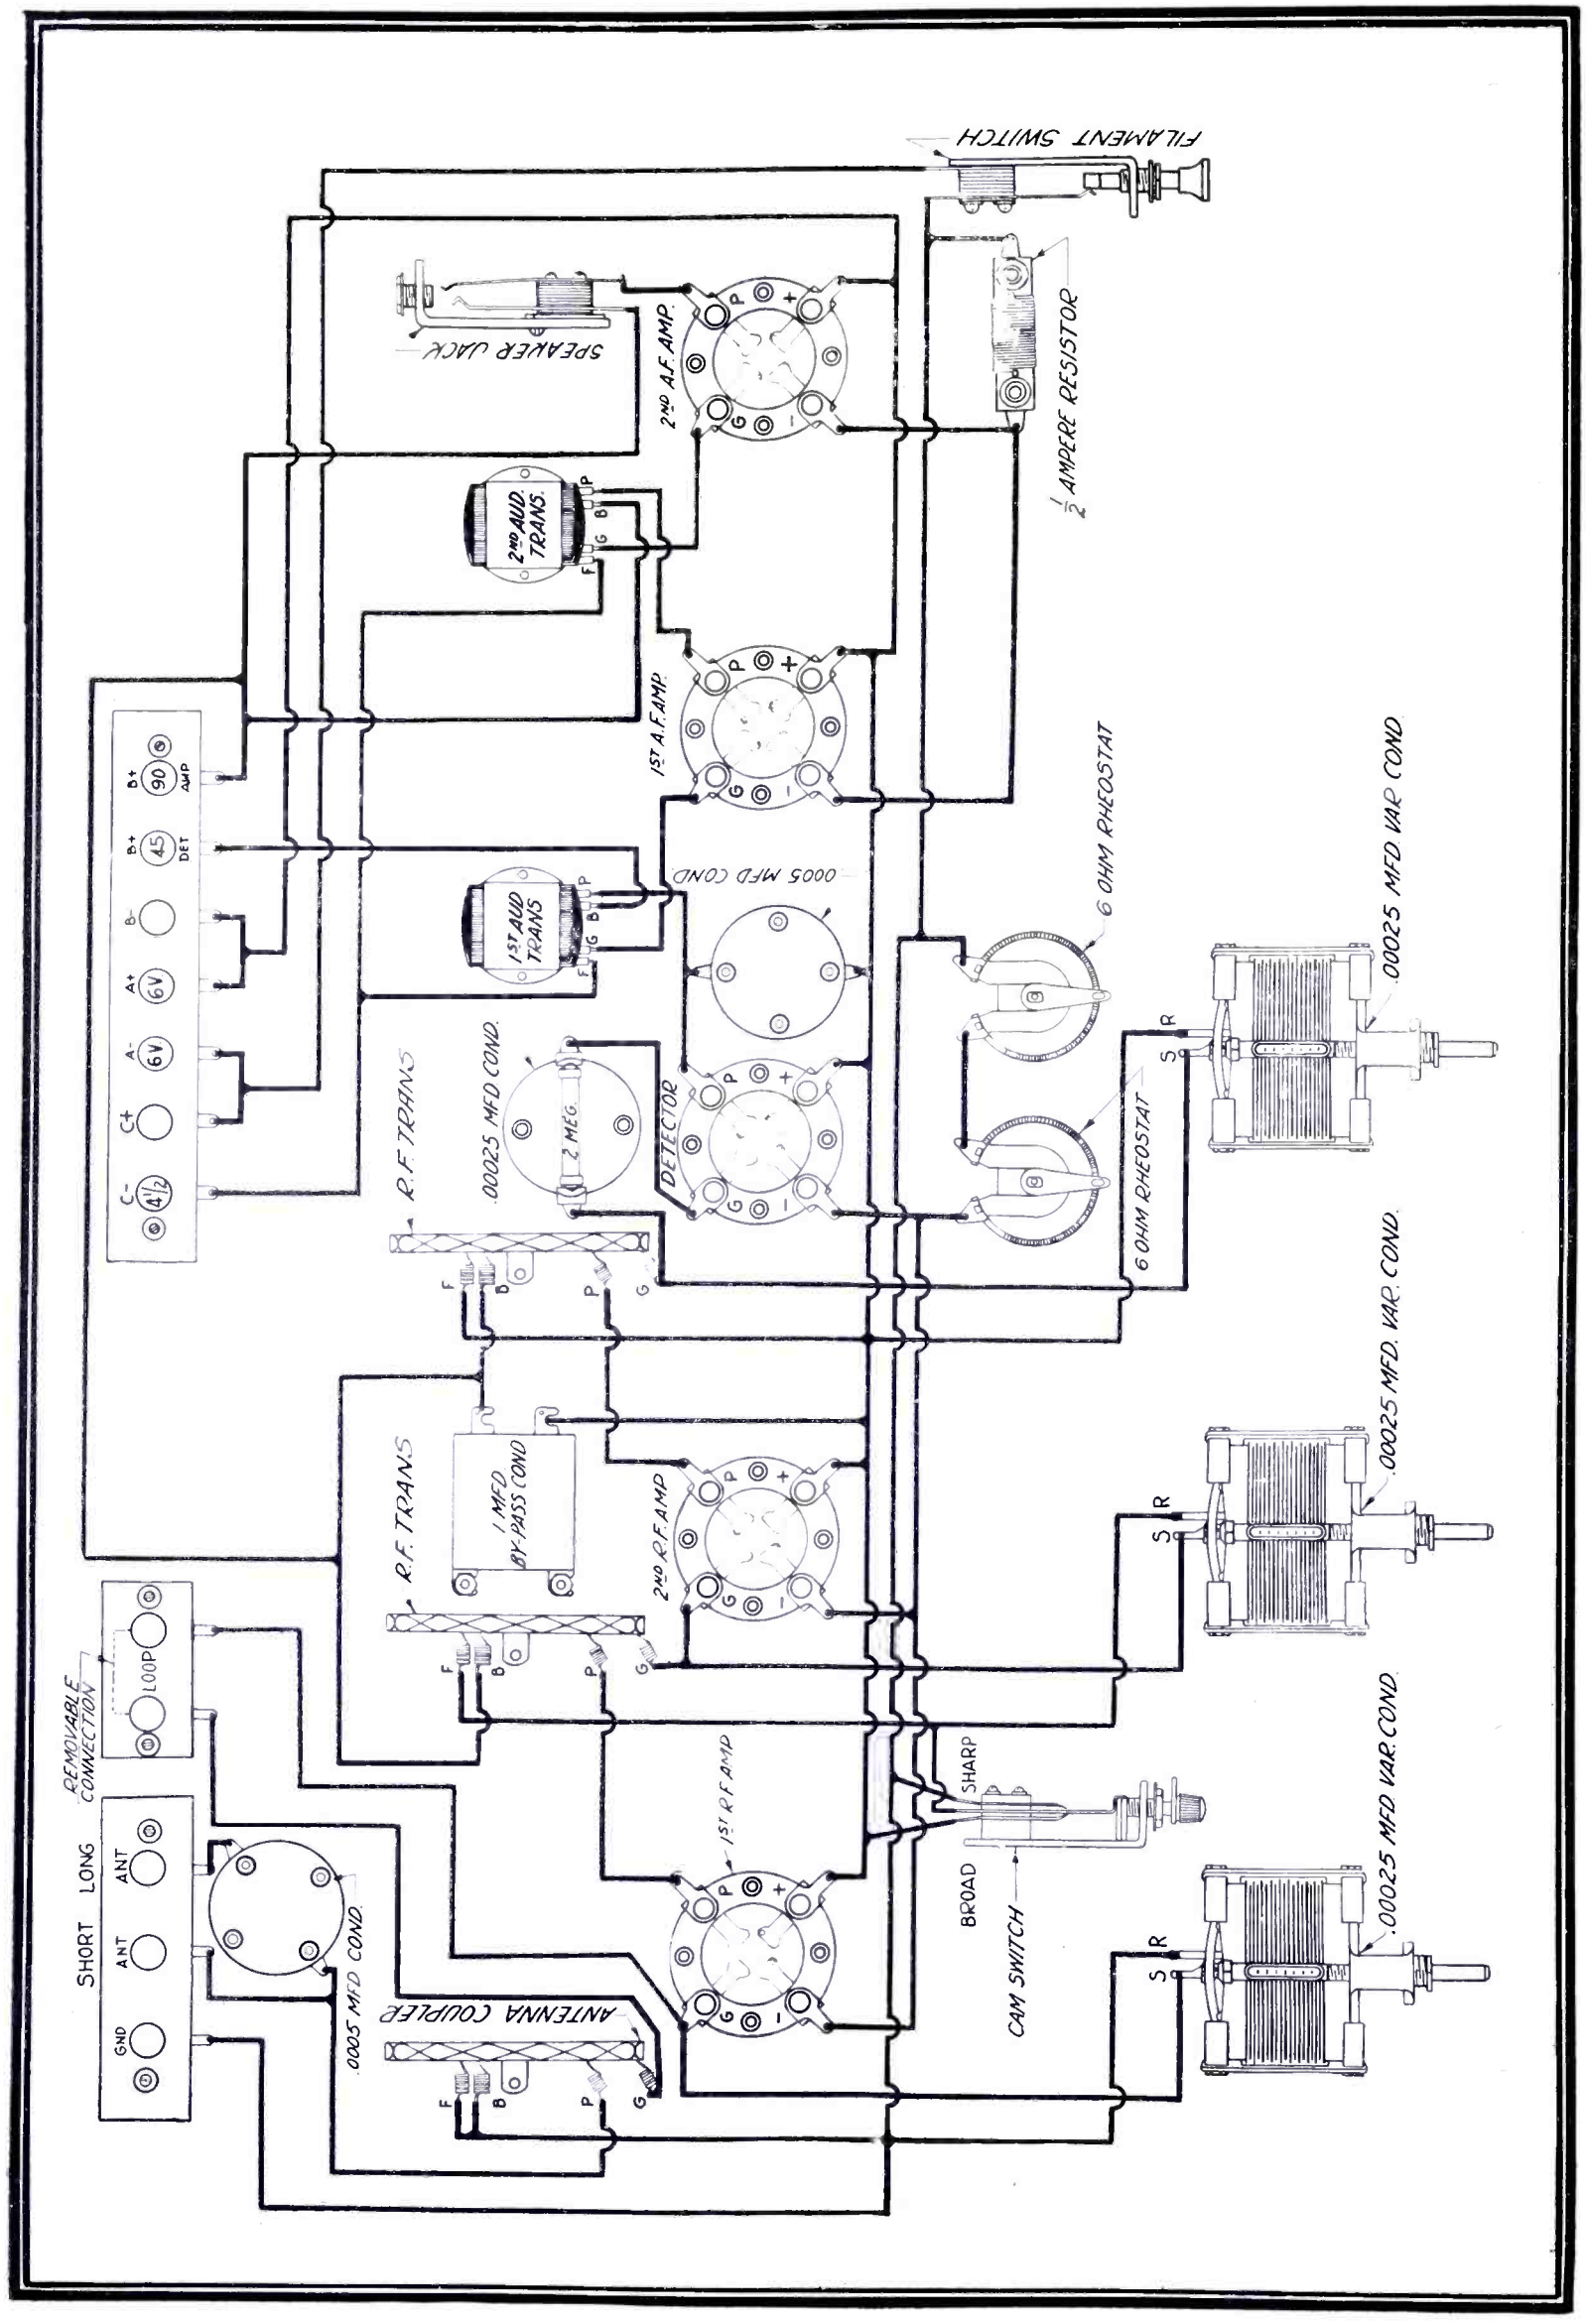
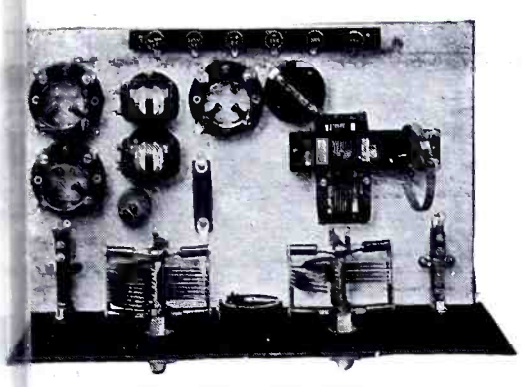
The Premier Five-Tube Tuned Radio Frequency Receiver



DX Fans—Improve Your Short Wave Set



Get Big Thrills

The real thrills of radio are "on the air" in the rt wave lengths, and you cannot get them all ess your set is operating at the highest point of ciency.

Premier Quality Radio Parts have all been scien- ally designed with a view to conserving all rgy received and obtaining minimum losses, with result that our "Crofoot" Condenser—"Lo- s" Tube Socket—"Hegehog" Transformer—and rctic" Rheostat enjoy an enviable reputation for wave efficiency, and are the choice of engineers. know.

Your set can be improved wonderfully by the stitution of Premier Quality Radio Parts, or ybe you would like to rebuild it entirely, and if our complete parts kit is arranged for your con- ience, and consists of the following:

Complete Parts Kit

Bakelite Panel, 6"x 15"x⅛"	3 Premier "Lo-Loss" Tube Sockets
Sub-base, 9"x14"x ½"	2 Premier "Hegehog" Transformers
Premier "Crofoot" Condenser, .00015 M.F.	1 Premier Phone Jack
	1 Premier Battery Switch
Premier "Crofoot" Condenser, .00025 M.F.	1 Premier Filament Resistor
	1 Premier Choke Coil
Premier "Micro-Dials"	1 Premier Grid Condenser
	1 Premier Grid Leak
Premier "Arctic" Rheostat, with knob	1 Premier Binding Post 6-Point Block

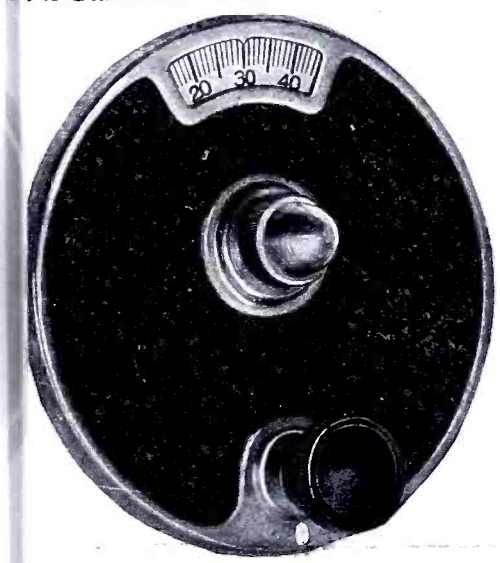
ice, complete as above listed **$22.00**

Your Low Wave Lengths Coils which you prob- y think are wonders, can be used with the above mier Combination to complete your set, but if are not so sure about their efficiency, we rec- mend the "Aero" which are a plug-in type, and ich are quite widely known and used, and are ced as follows:

"Aero" Coils, with mounting, 15 to 130 meters	$12.50
"Aero" Coil, 125 to 250 meters	4.00
"Aero" Coil, 235 to 550 meters	4.00

Premier dealers usually carry "Aero" Coils, and l be glad to supply you along with our parts . but if there is none convenient in your town, mit direct to us and they will be sent postpaid.

Premier MICRO-DIAL



Improves Reception

Replace your antiquated dials and "pep" up the ks of your set and get all the stations with this curate high ratio vernier dial.

An all-brass dial—4 inches in diameter—beauti- lly finished in gold and black—friction drive mooth as silk"—no back-lash or lost motion.

ice **$1.00**

your dealer hasn't them, remit direct to us, less % and give us your dealer's name. They'll be t postpaid.

TRADE IN your "Bloopers"

Take this ad to your radio dealer and show it to him so that he will know that Premier will make you a substantial cash allowance on any 3, 4 or 5 tube table type set, regardless of age or condition, as part payment for one of our Premier "Everybody's" Model Console Radio Receivers. Have him send in coupon attached.

If your dealer isn't interested or if there is no dealer in your locality, clip the attached coupon and mail it to the Premier Electric Company, Chicago, and we will make you our proposition direct.

Quality Radio at a Sane Price

Premier "Everybody's" Console Radio Receiver is the greatest value ever offered in a receiving set. The cabinet is well constructed and has a very attractive Duco, two tone walnut finish which will harmonize with the furnishings of most any room. The loud speaker is the same that we use in all our higher priced sets and is built in the cabinet and gives great volume with a naturalness of tone unsurpassed.

Has drop shelf and arm rest to assist in accurate tuning, and a well ventilated battery compartment, ample size for all batteries and charger. Dimensions over all, 45" x 25" x 15" deep.

FEATURES

FRONT PANEL is 7"x21"x3/16" genuine Bakelite, finished in an exact reproduction of beautiful, black walnut.

DIALS are Premier "Micro-Dials" of the vernier type, all brass, gold and black finish which presents a pleasing appearance to the eye in contrast to the walnut panel.

VOLTMETER permits instant test of the "B" battery voltage, allowing an easy check-up on this most important accessory to the performance of your set.

OSCILLATION CONTROL is accomplished instantly, permitting broad or extremely sharp and selective tuning.

VOLUME is uniform and unusually good on the loud speaker over the entire wave band range.

DISTANCE RANGE is guaranteed the equal of any 5-tube T. R. F. set, and under favorable weather conditions extends from coast to coast.

TONE RANGE is from low bass to the highest treble with the naturalness of reproduction provided only in sets costing three or four times as much.

SELECTIVITY—sharp enough to separate all stations even in congested areas like New York and Chicago.

LOOP OPERATION is provided for and when used in large cities gives extreme selectivity and good distance.

Premier Electric Company of Canada, Ltd.
London - Ontario
Exclusive Dist. for N. E. Can.

"Everybody's" Console Receiver

Is of the Tuned Radio Frequency type, and is manufactured under license granted us by the U. S. Navy Department which permits its manufacture under patents controlled by our government.

Construction

Every component part is made from only best of raw materials in our own plant and assembled into the completed whole by expert radiotricians.

Guarantee

Every Premier Radio Receiving Set is guaranteed to be everything that we claim, and to perform and function properly when installed according to directions. Our responsibility is back of this guarantee and that, we believe, is sufficient to make it mean something.

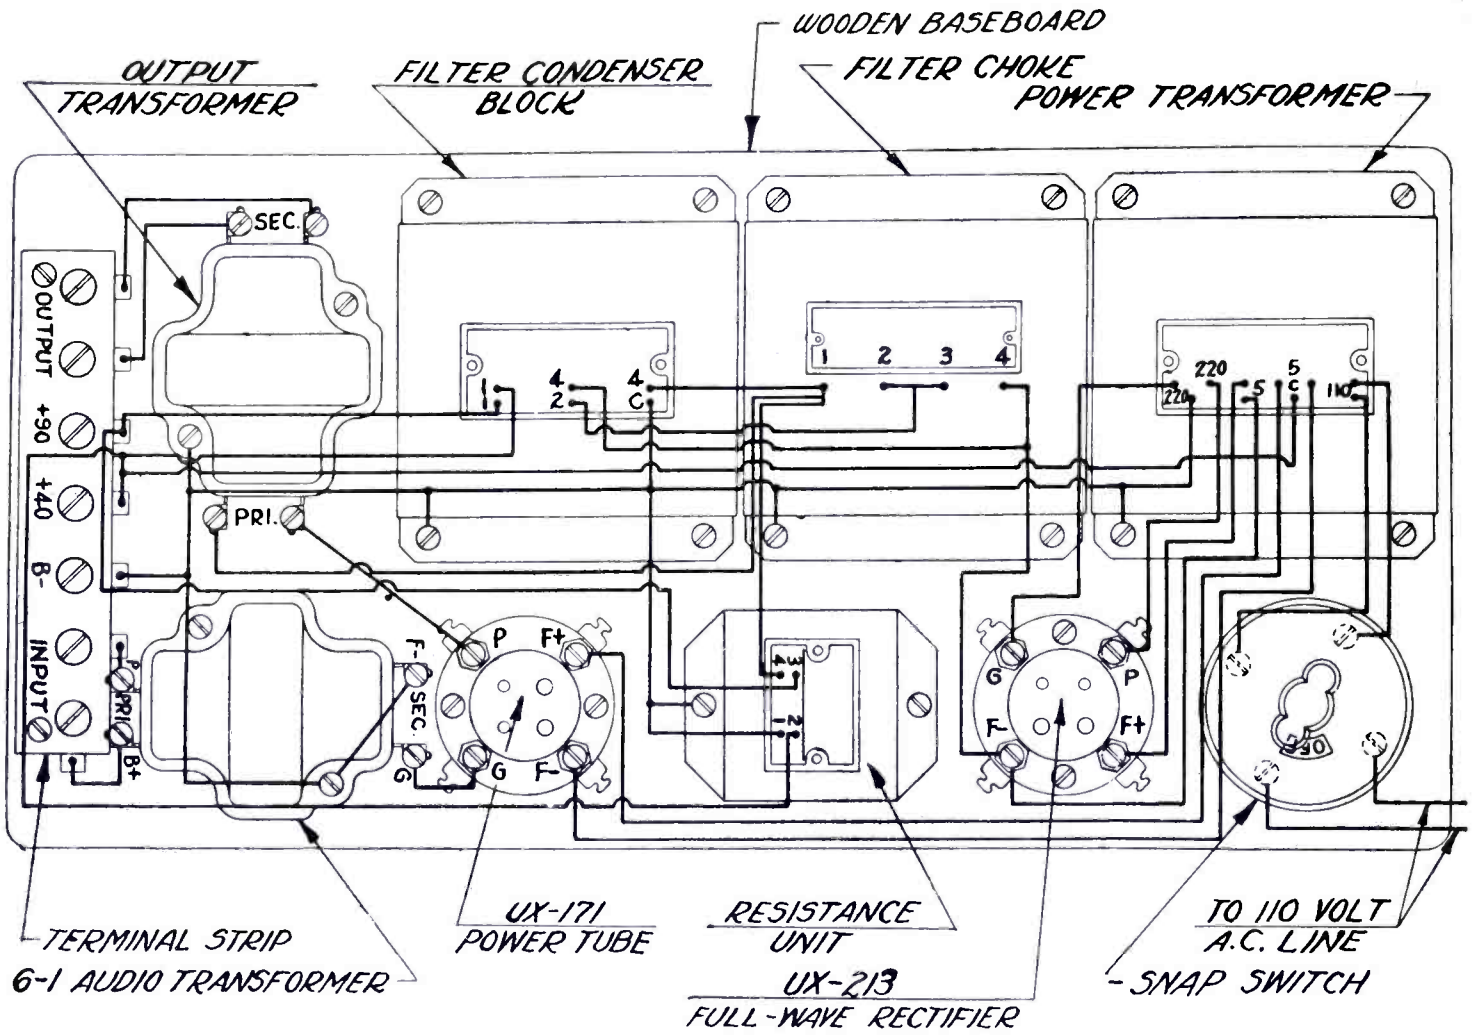
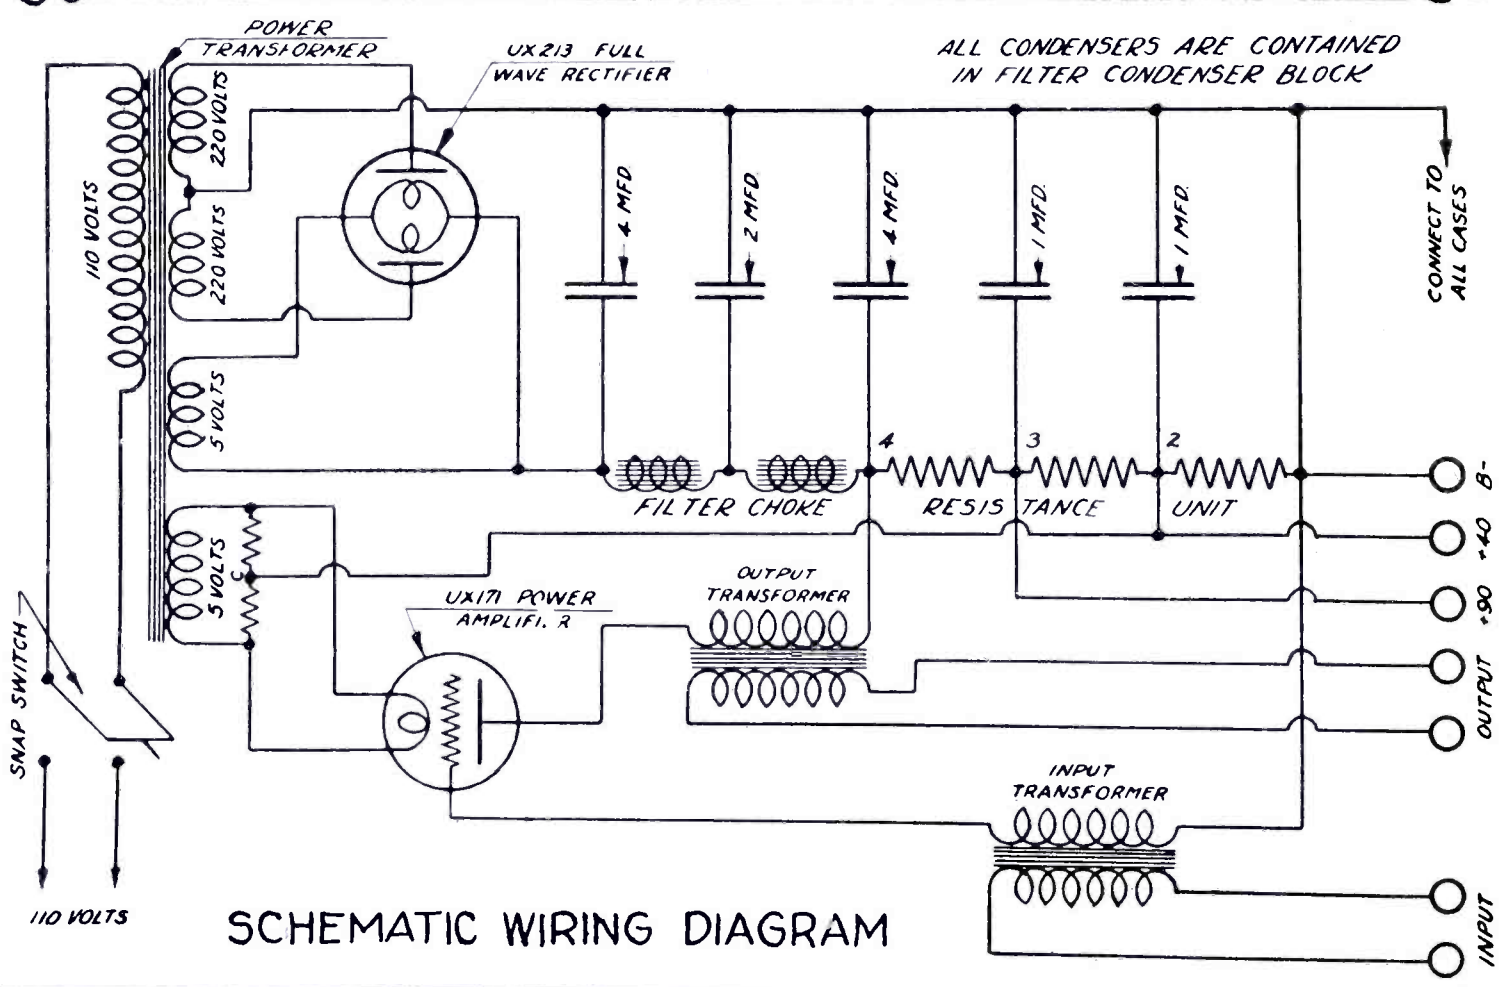
The Thordarson Power Amplifier and "B" Eliminator

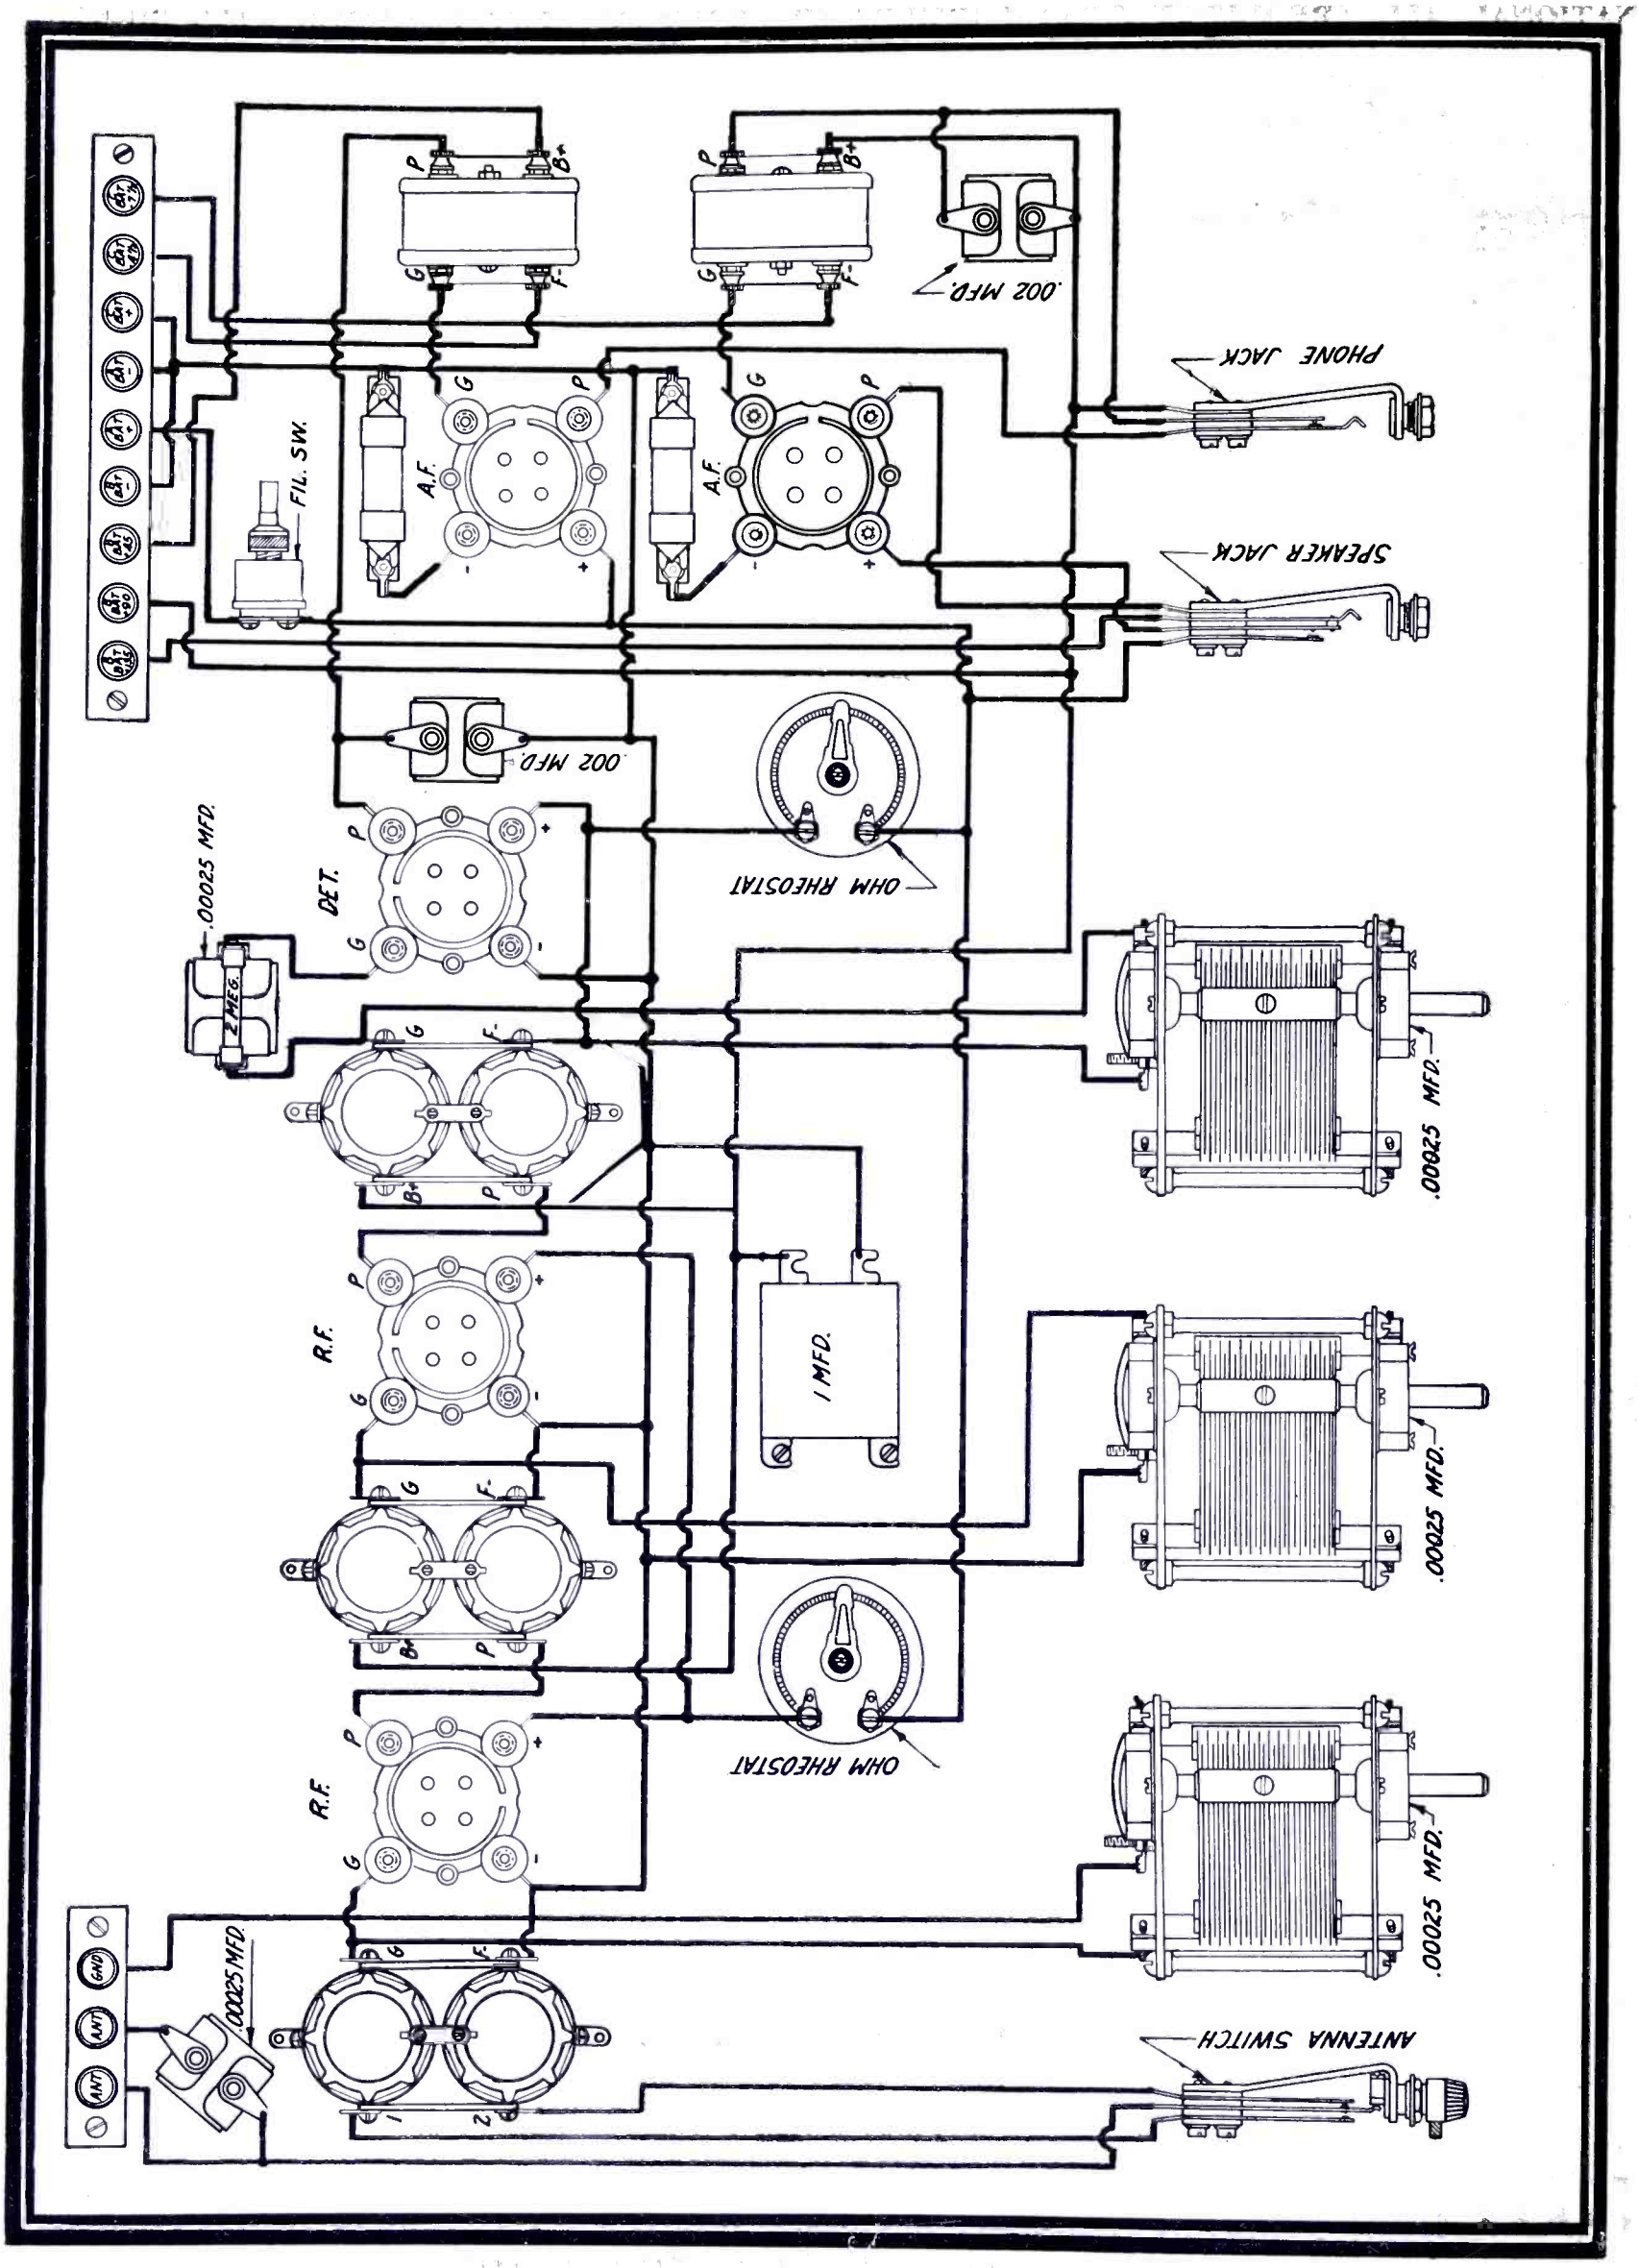
GENERAL RADIO RECTRON "B" ELIMINATOR & POWER AMPLIFIER



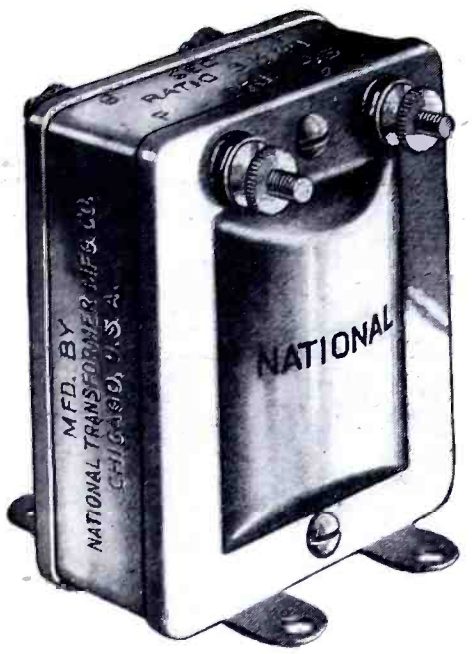
PICTORIAL WIRING DIAGRAM



SCHEMATIC WIRING DIAGRAM



NATIONAL ALL-FREQUENCY TRANSFORMERS SPECIFIED BY CITIZENS RADIO CALL BOOK



AMAZING Money Saving OFFER!

The wonderful National All-Frequency Audio Transformers specified by Radio Call Book in the article beginning on the next page—offered special at less than half regular price. But—you must act NOW—supply is limited!

Bass Note Amplification Only $1.97

Seldom comes an opportunity like this. Certainly—you should take instant advantage of it—because never again will such a startling offer be made. Just think! National Transformers, the new type all-frequency units that amplify the lowest bass and the highest soprano with equal volume and clarity. And instead of paying their regular price of $4.50, you can buy them for only $1.97 each. Truly, the very money-saving opportunity you have been watching for.

INSTANTLY—You'll Notice a Tremendous Improvement in Volume and Tone

Rip out your old audio transformers—no matter what they are, or how good you think them. Put these oversize, nickel-plated giants of amplification in place and prepare yourself for a distinct revelation. An orchestra will sound like an orchestra. You'll hear every instrument, round, full, clear, natural. No more jumbled mess, no more flat, tin-pan noise when the musical program happens to be at the lower end of the musical scale. National All-Frequency Transformers cover *the whole scale*, perfectly. And instead of paying $7, $8, or $9 for this kind of amplification, you can NOW, for a limited time, get it for only $1.97.

Why "NATIONAL'S" are BETTER

The secret of National's Supremacy is in its extra large, especially shaped, high grade silicon steel core, and its oversize special-wound core. No other transformer, regardless of price, can boast of the same combination of ideal features. Hence, no other transformer, regardless of price, can out-perform the National—in amplification, in fidelity of reproduction. Then think, too, of the improvement these wonder transformers will make in the appearance of your set. They are heavily nickel plated, all over, and polished so they are just like mirrors. To make a neat looking job of any set they can't be beaten.

SAVE MONEY!

Hundreds of thousands of National Transformers have modernized radio sets everywhere in the land. Thousands upon thousands of fans have found them to be the final answer to perfect tone reproduction of voice and music. And, everyone else who has ever bought National's has paid the full, regular price of $4.50 each. They are a bargain at that price. They are a super-bargain at our price of $1.97 each. Think! You save $2.53 on each transformer, or more than $5.00 on a pair. Money talks! Order now.

USE COUPON! This OFFER LIMITED!

Only a few thousand National All-Frequency Audio Transformers are in our present stocks. The special, low price of $1.97 will hold only so long as this stock lasts. The thousands of set building fans who have used Nationals will order as many transformers from this stock as they can—because *they* know there is no better transformer at *any* price. This will take most of our present supply. If you want to make sure of obtaining a pair of Nationals for your own set, order at once. Use the coupon below, being careful to write your name and address plainly. Save money. Order TODAY!

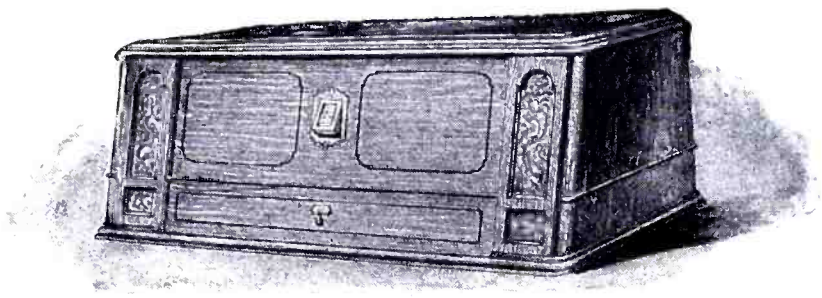
All Frequency Audio Transformer

Counterphase-Eight
Bremer-Tully's Crowning Achievement

That B-T products have been more than ordinarily successful is known the world over. The "NAMELESS" created a sensation eclipsed only by the subsequent "COUNTERPHASE SIX."



Now—the Counterphase-Eight—B-T's greatest effort

Exclusive features you cannot afford to miss—even if it's only to learn what's new in Radio.

A new cabinet design, straight line selectivity, no "oscillation control" yet set cannot squeal or howl —and it's "hot" across the entire scale, Visual Indicator, accurate calibration of each receiver, Rejector stage, one station selector and—selectivity never before equalled, even in B-T Receivers!

B-Power Unit

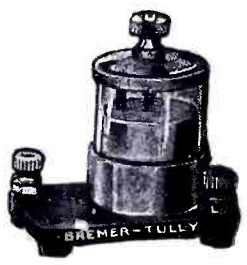
A Unit designed to be used with our receivers, the best endorsement we can give it. No guess-work, no knobs to turn—no fussing around with adjustments and uncertain results—You *know* what the B-T Power Unit delivers.

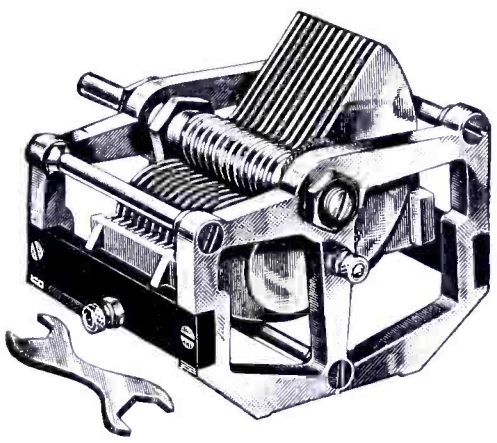
Price $49.50

Mikro Mike Condenser

Accuracy and precision are at once evident. A short circuit is impossible. Glass dielectric is unaffected by moisture. Capacity 1½ to 25 mmf.

Price $1.00





Lifetime Condensers

Still the choice of experts. A design and workmanship that has set the pace for years and it's still ahead. Made in all popular sizes and priced from $4.25 to $5.00.

"Better Tuning"

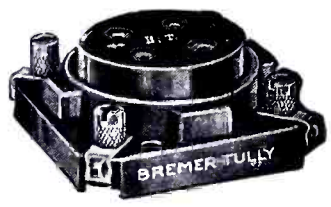
If you want to know more about the new COUNTERPHASE set models, you will find a complete discussion in the 10th edition, "Better Tuning."

Before spending the price of a B Eliminator you should investigate the results of several years' research made by B-T.

The 10th Edition tells the whole story. You cannot afford to miss it. Sent postpaid on receipt of 10c in stamps or coin.

Bremer Tully

Manufacturing Co.
520-532 So. Canal St.
Chicago
"Pioneers of Better Tuning"

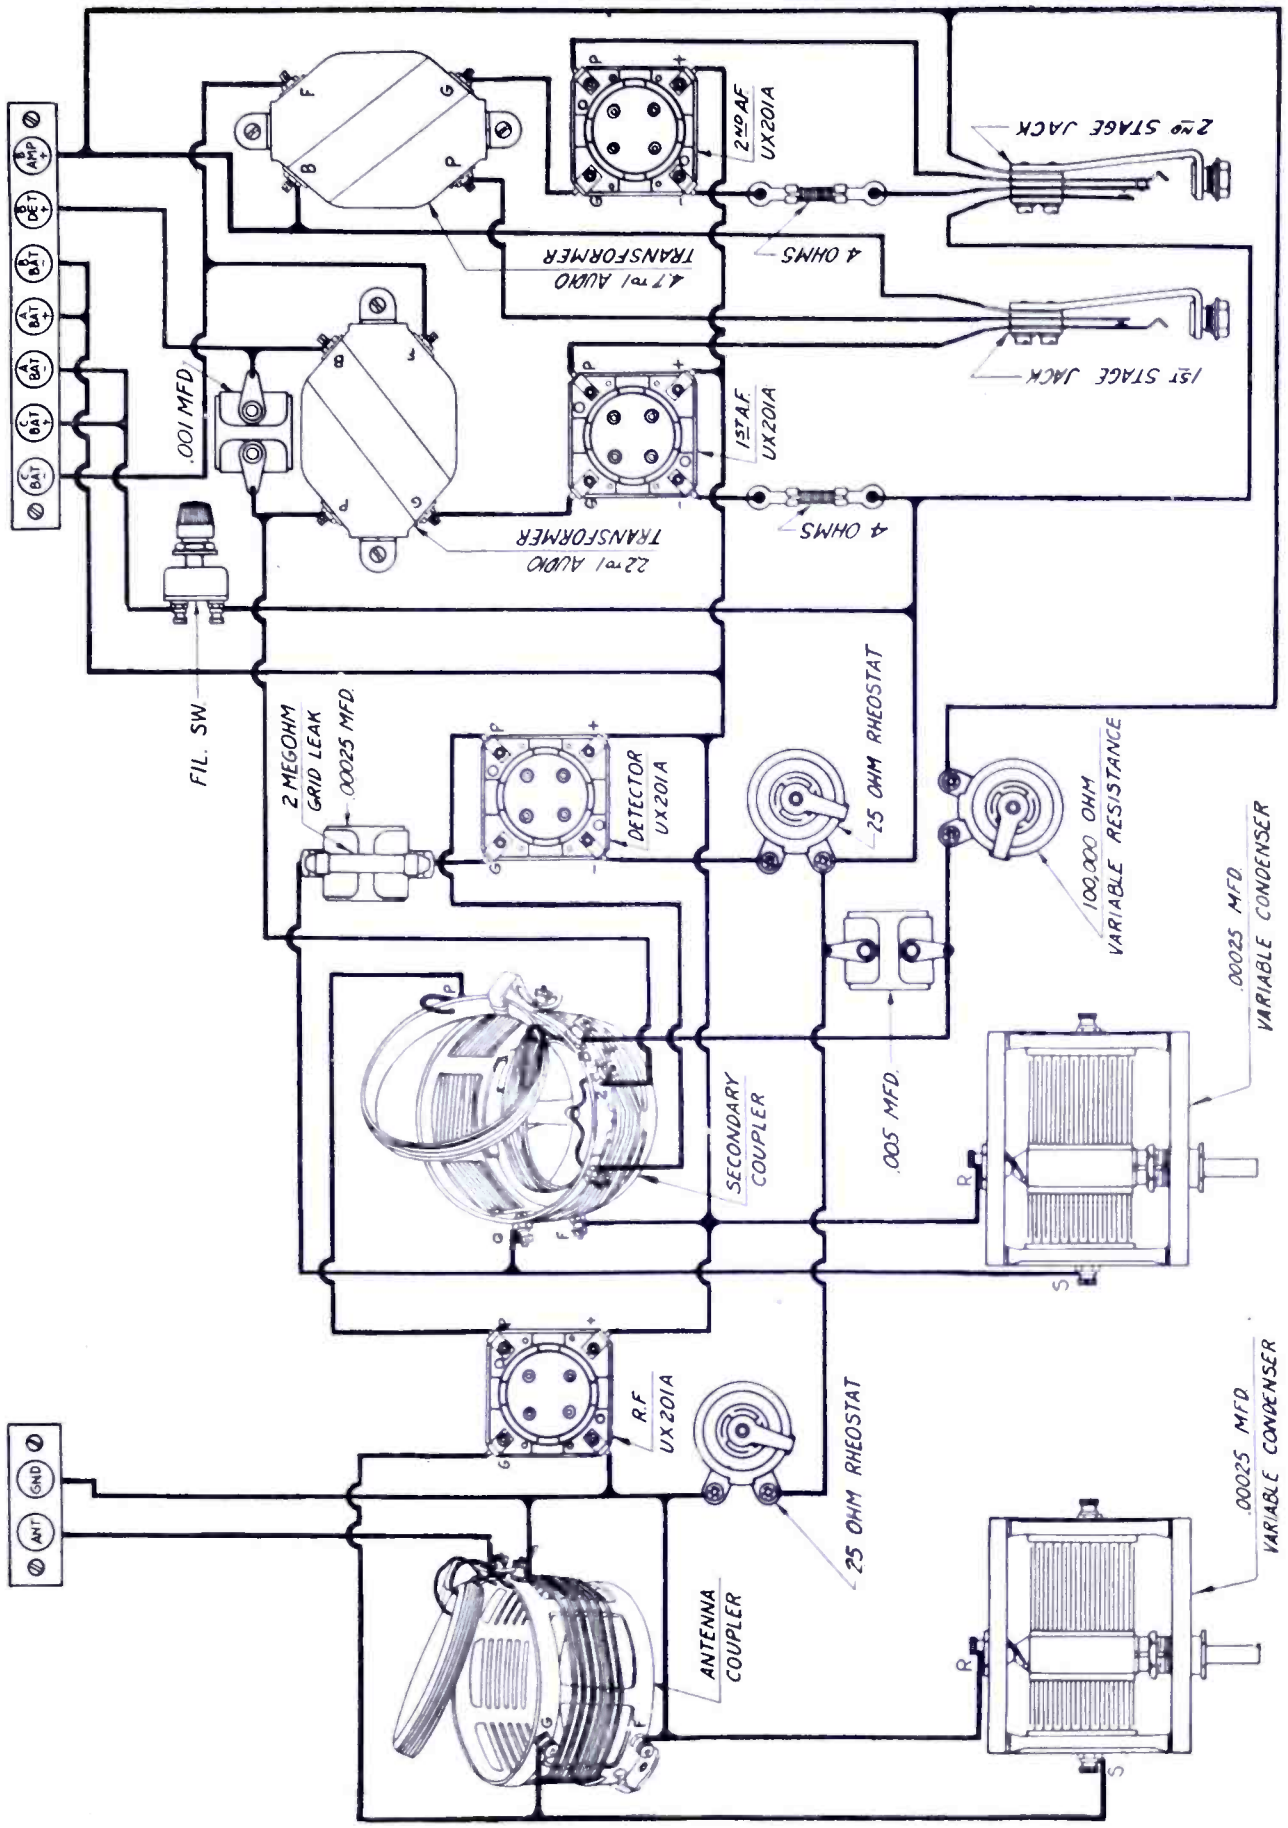


UX Absorber Socket

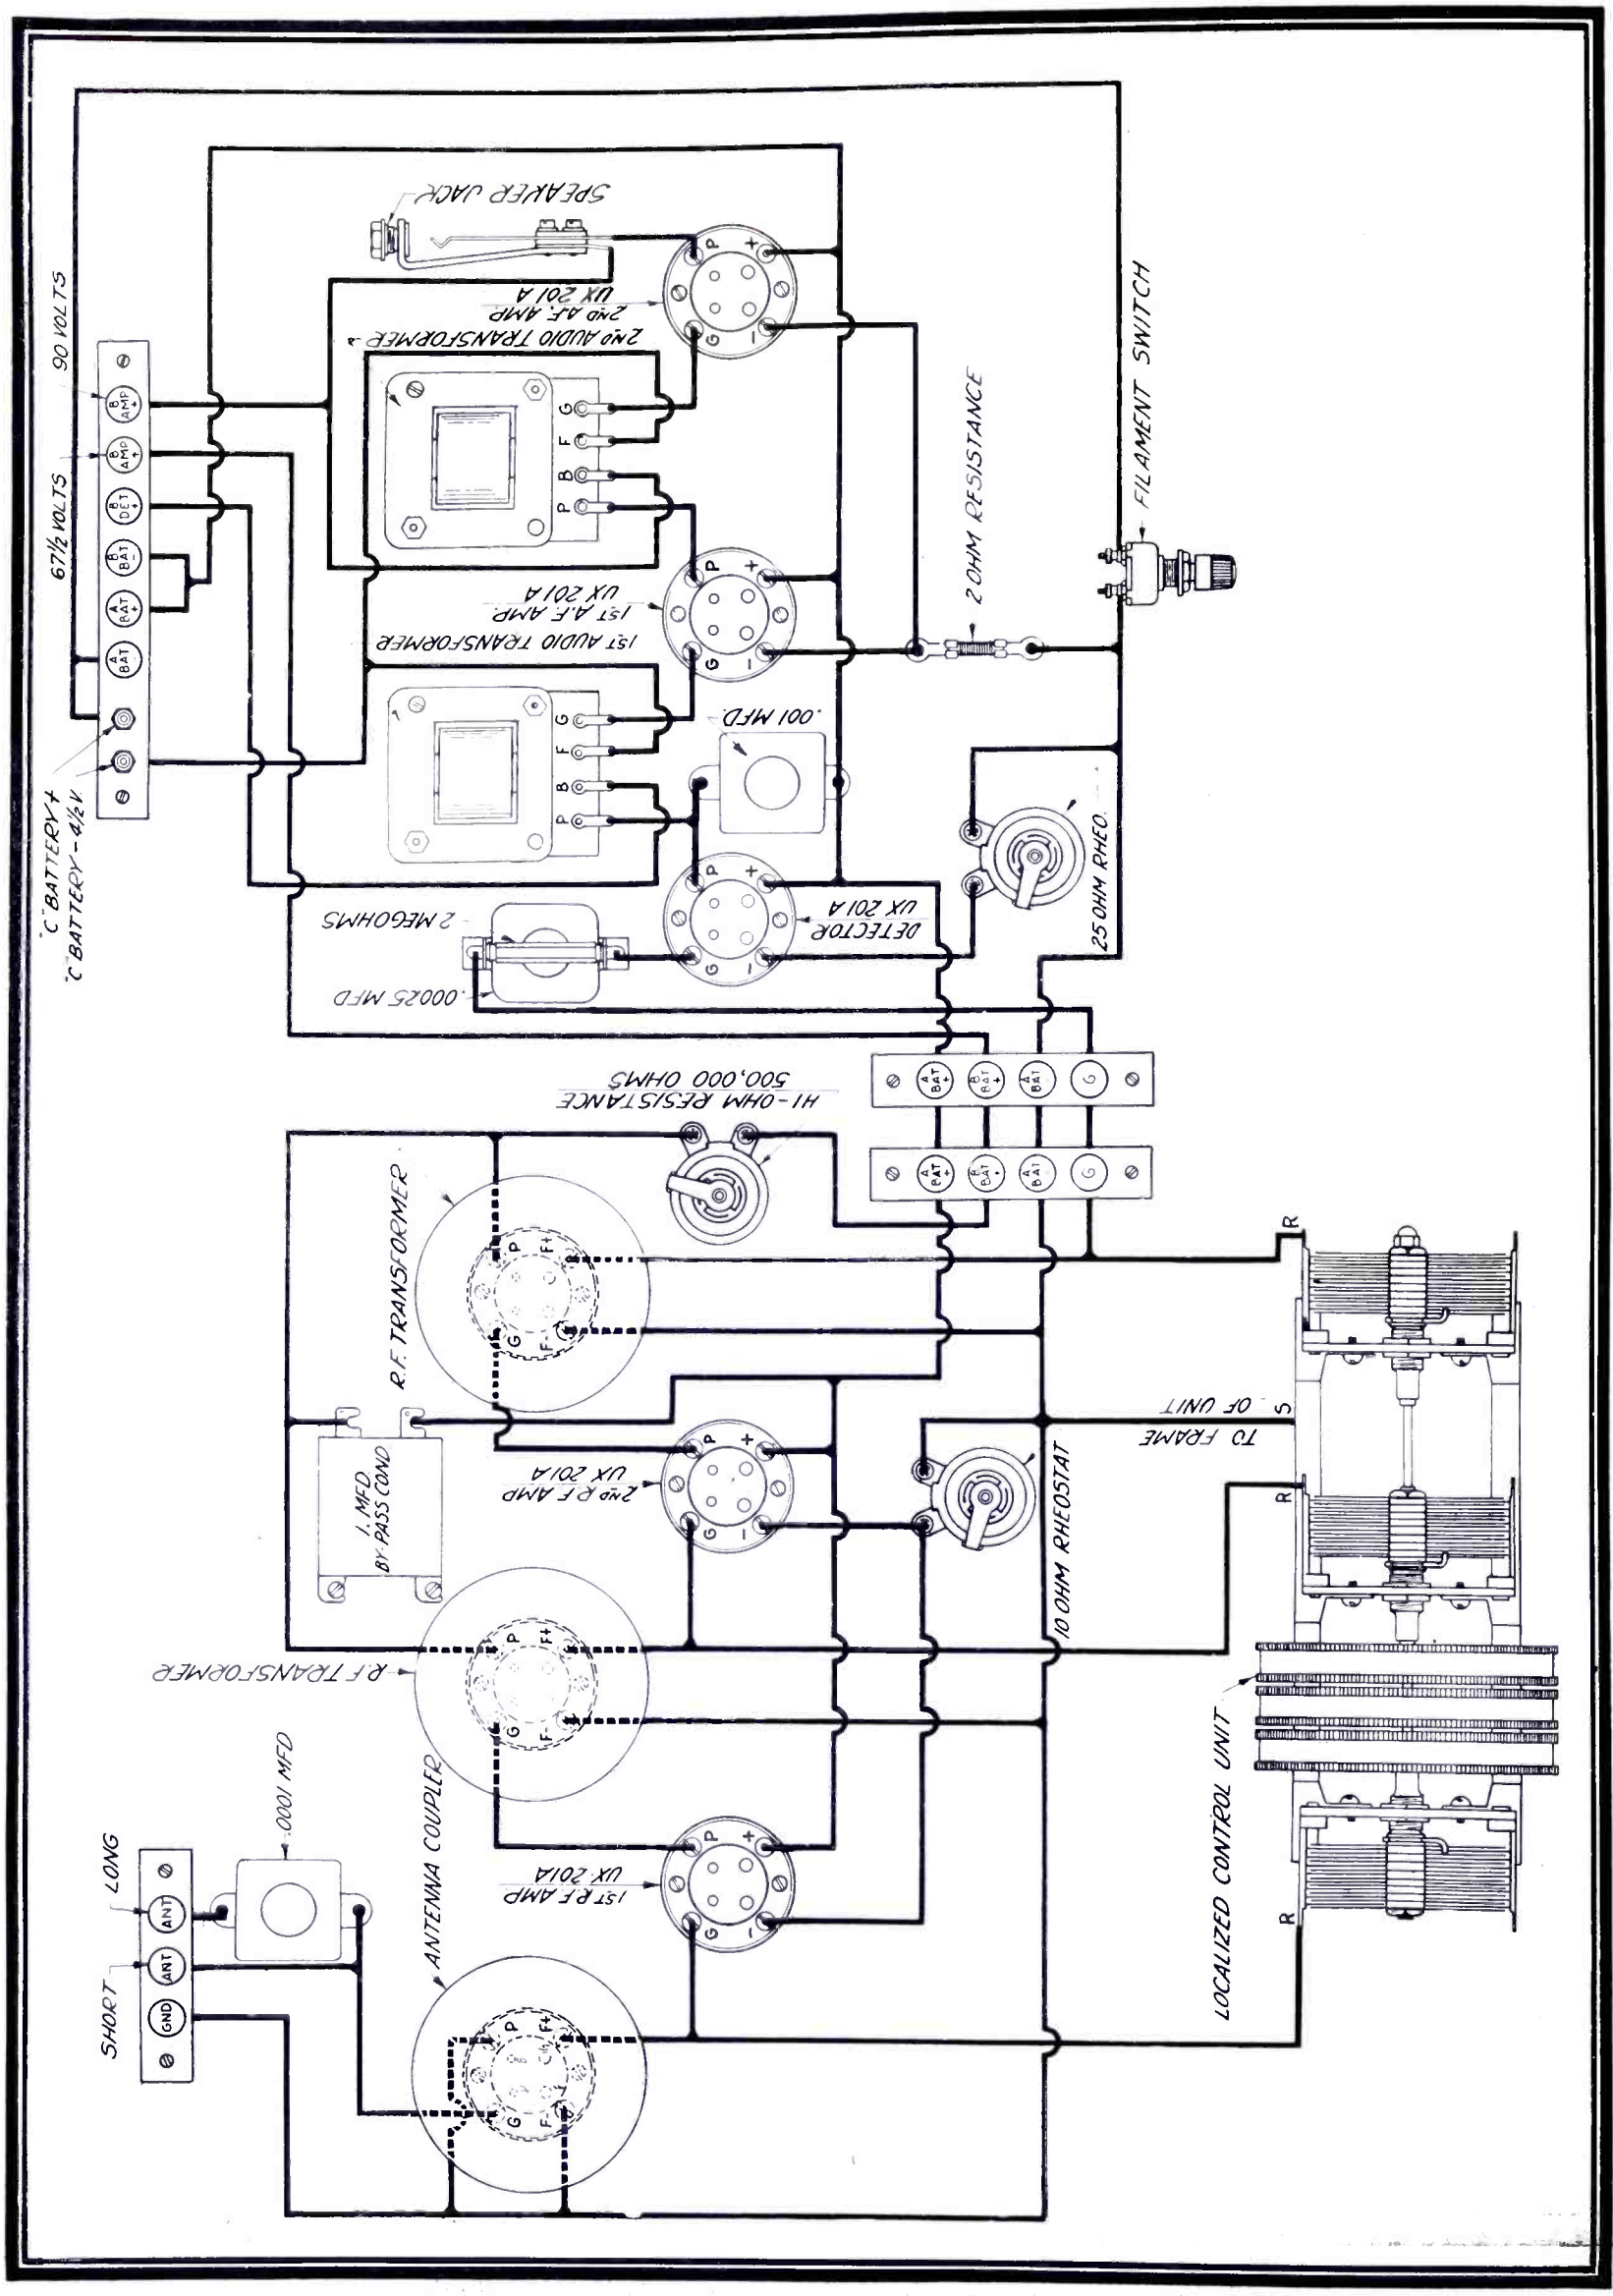
Springs may prevent shocks but the vibrations which follow must also be prevented. The UX Absorber Socket does it by exclusively B-T methods, resulting in longer tube life and quieter reception.

Price 75c

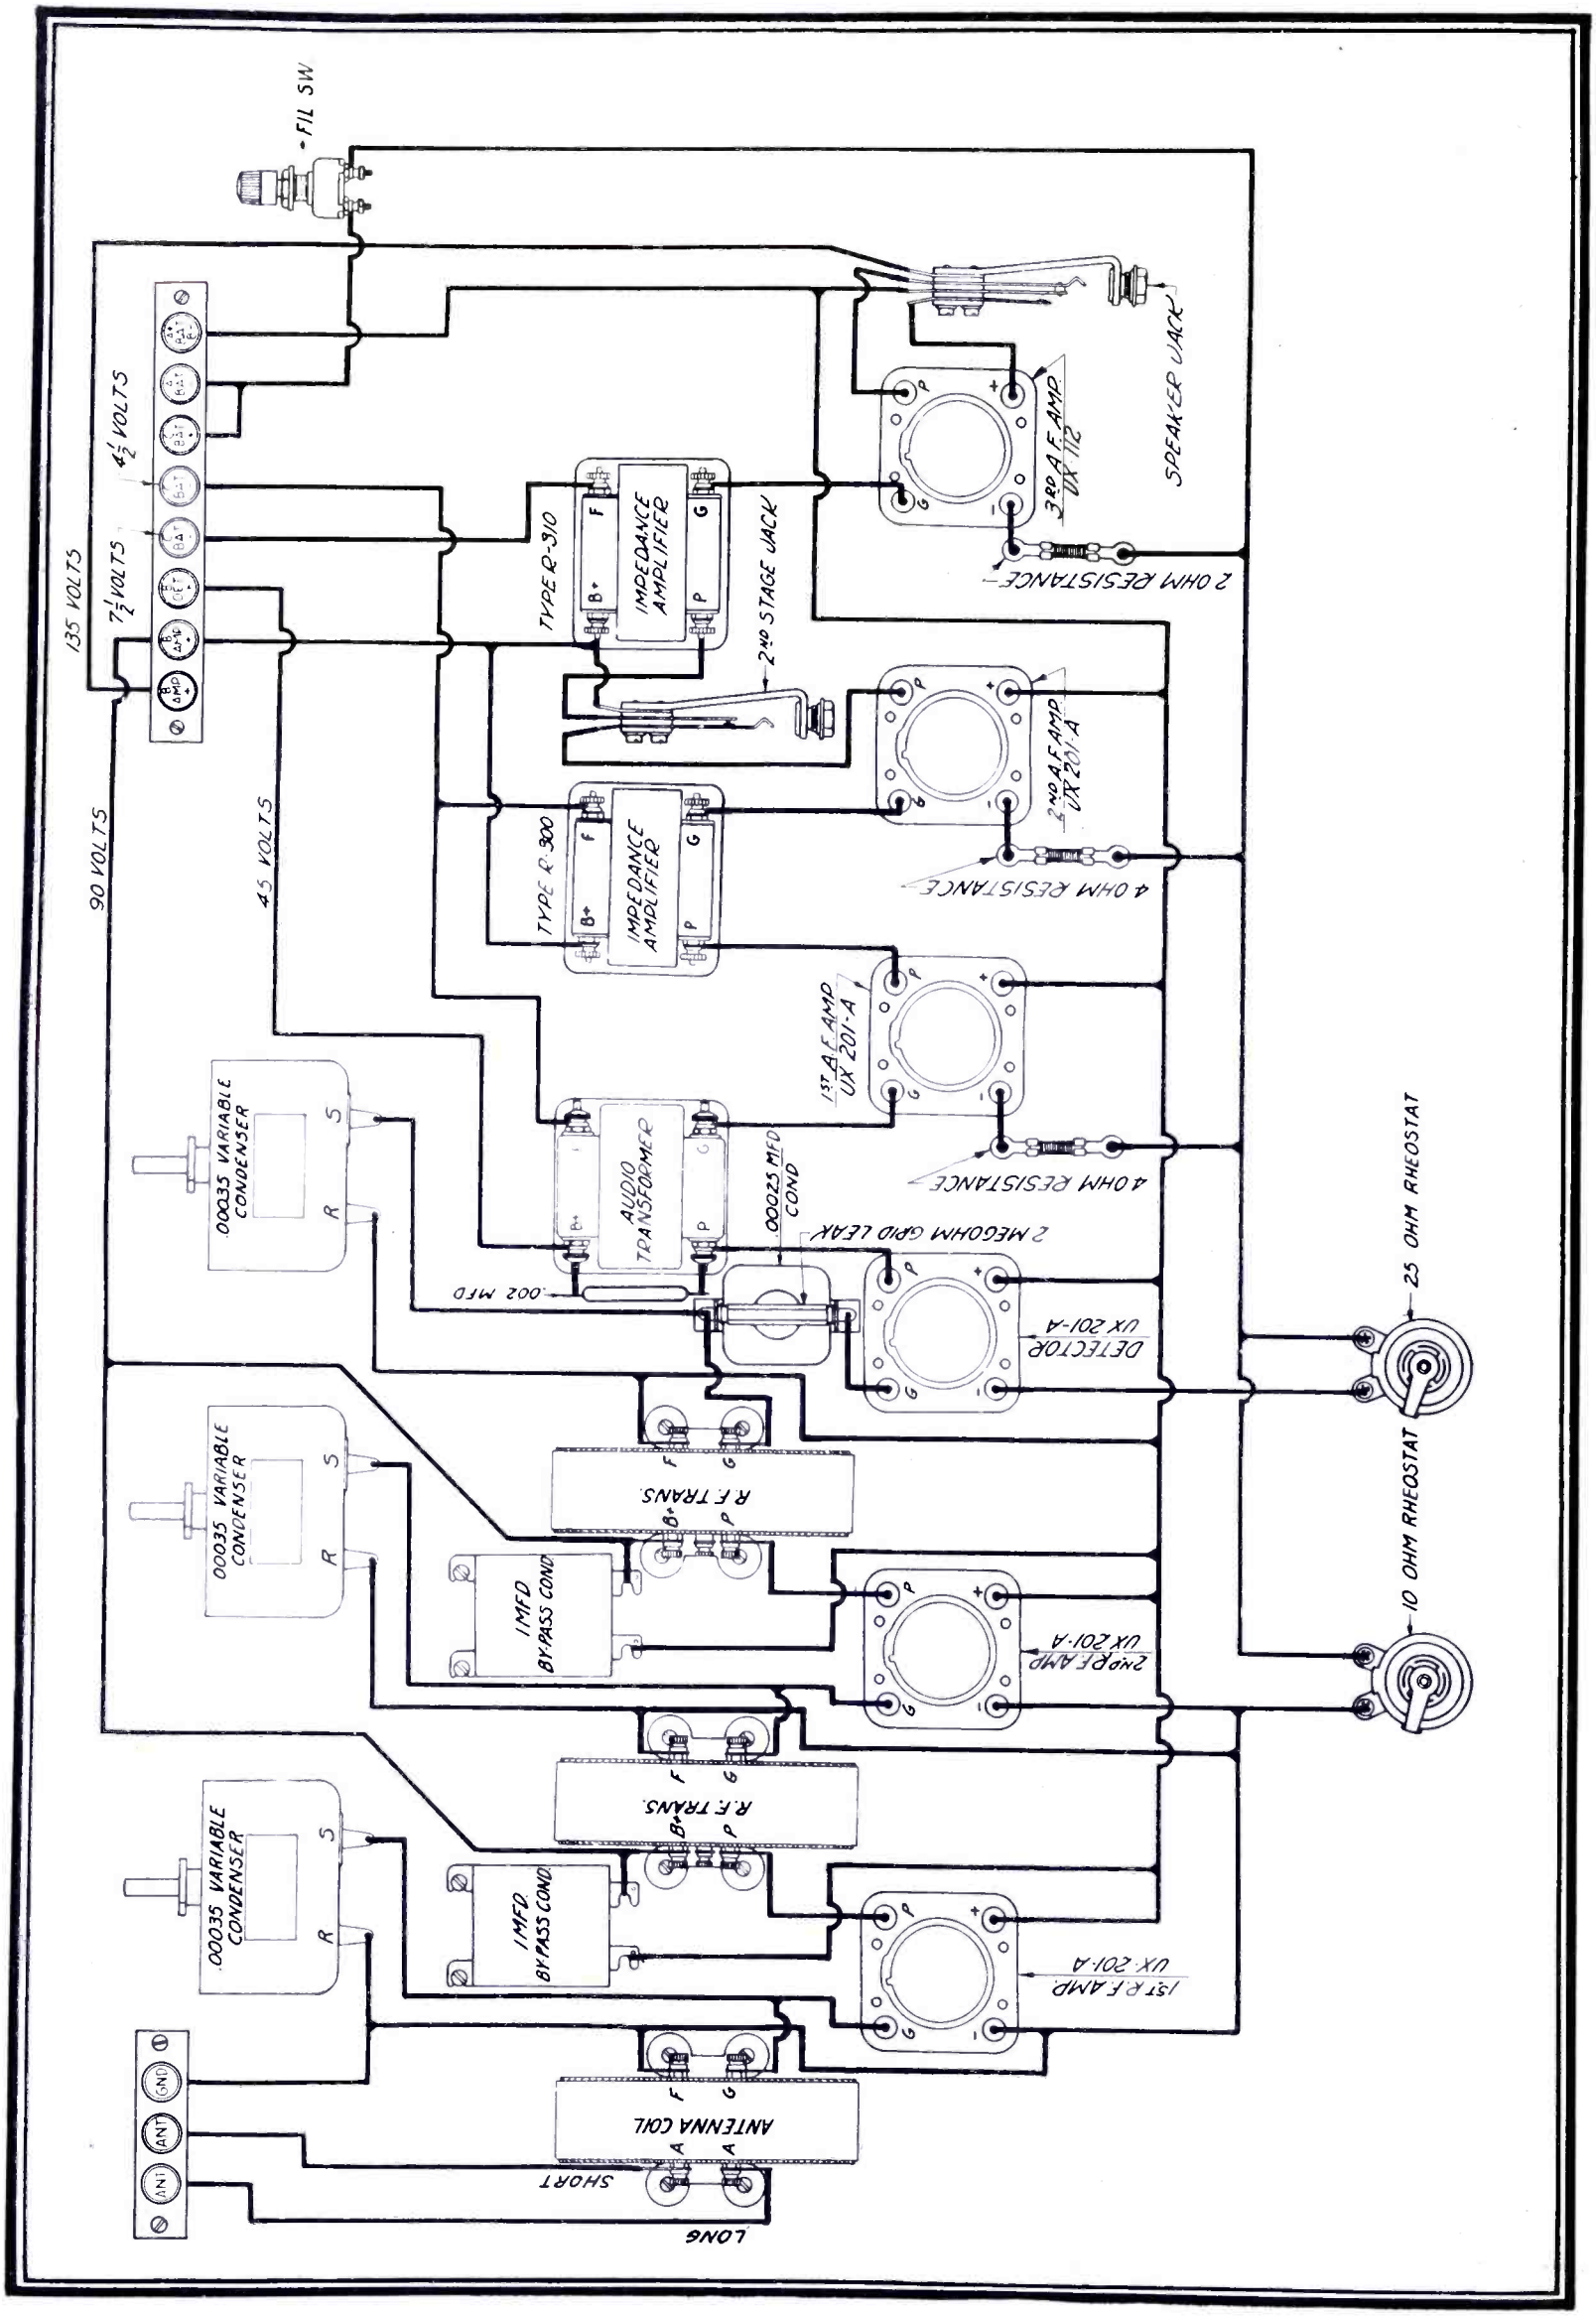
UX Detector Socket—$1.00.



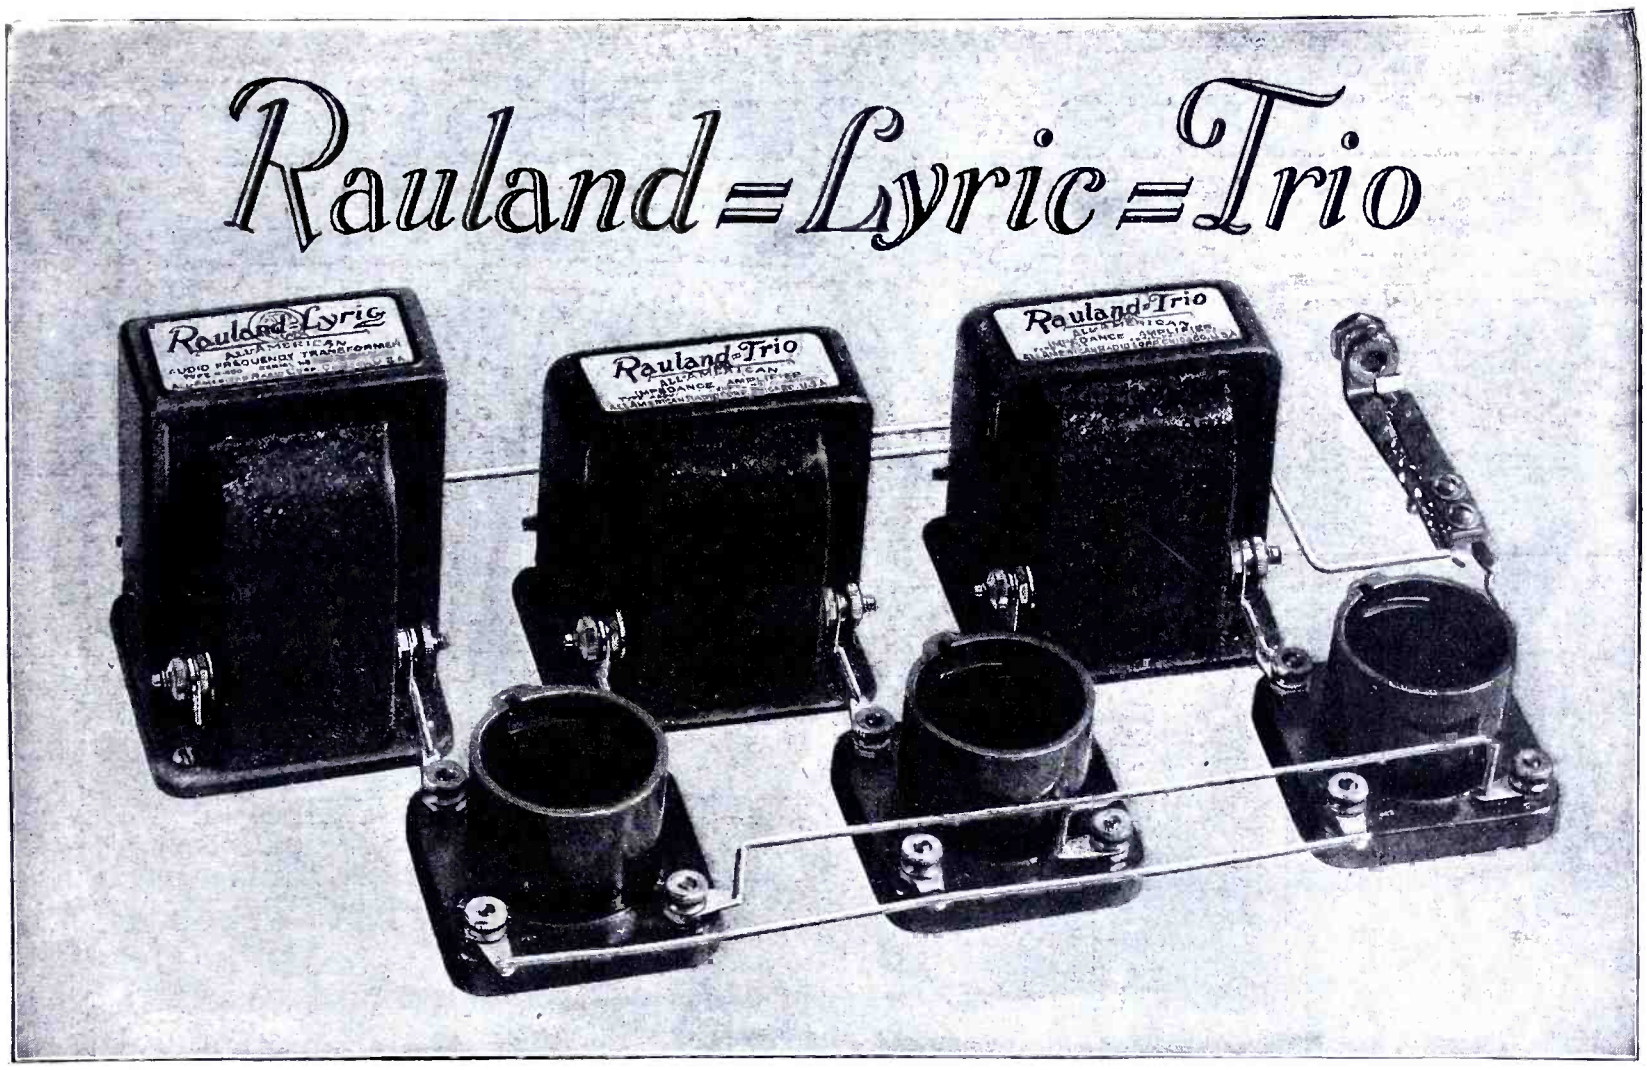
A Four-Tube Non-Reradiating Receiver



Five tube tuned radio frequency receiver using the new Alden gang condenser



The All-American Tuned Radio Frequency Receiver Using Toroid Coils and the Rauland Lyric Trio Audio Amplification



A remarkable improvement in audio amplification

New unit perfected by All-American Engineers gives you the full, pure, natural tone you have always sought

YOU have always wanted the ideal result in audio amplification—pure, natural tone with good volume. The laboratories of All-American Radio Corporation have developed a new method of audio amplification and now bring to you this long sought ideal result in the—

Rauland-Lyric-Trio

You know the Rauland-Lyric transformer. Its exceptional tone perfection has made it the largest selling quality transformer in the world. The Rauland-Lyric is now used in combination with the new Rauland-Trio (impedance units) to produce the Rauland-Lyric-Trio amplifier—the highest known perfection in three stage audio amplification.

It is well known that any system of amplification using instruments of similar characteristics has inherent disadvantages. Rauland-Lyric-Trio successfully combines the two leading systems—transformer and impedance coupling—coordinated to retain the advantages of both and to eliminate their weaknesses.

This new method consists of a Rauland-Lyric transformer for the first stage, a Rauland-Trio Type R-300 impedance for the second stage, and a Rauland-Trio Type R-310 impedance for the third stage.

Rauland-Trio

This is a triple feature instrument containing an inductance, a capacity and a resistance in one compact impedance unit. Through laboratory tests of utmost precision, absolutely correct balance is maintained between these important factors. You secure full advantage of impedance amplification and overcome the common variance of commercial types of condensers and resistances. Rauland-Lyric-Trio is the last word in audio amplification.

ALL-AMERICAN TRADE-MARK

A free book, "Modern Audio Amplification," tells more about this interesting new development. Write for handbook B-90.

A 5-Tube Tuned Radio Frequency Receiver Operating from the Light Socket Using Rational A-C Tubes

FEW recent inventions in radio have created more intense interest than the development of an efficient radio tube operating from the A-C current supply.

Receivers were designed which operated from power lines, but the necessary equipment for filtering out the hum has been so imposing and the results so unsatisfactory that the only logical direction of research open to the engineer has been the development of an A-C tube. It was important that this tube operate directly from an A-C source without the necessity of inserting any filtering devices to eliminate the hum. In addition, it was necessary that the new tubes have the same characteristics as the other tubes using D-C for heating their filaments, so that either tube could be substituted for the other with only a very few changes in the circuit.

A new type of radio tube, the Rational A-C Tube, is used in the receiver described herewith. It differs from the other A-C tubes in that a greater electron emission is realized, thereby giving greater volume and more power. The life of the tube is far in excess of the minimum 1,500 hours set by factory specifications. The tube is absolutely non-microphonic, thereby eliminating the necessity of cushion sockets. An extremely rugged and sturdy construction is used in the design of the tube. No A-C hum is heard when using a loud speaker.

Each tube draws about one ampere at 3 volts in the heater circuit and five milliamperes in "B" current when operating at its maximum with zero grid bias. The proper bias of course will reduce the "B" circuit considerably. In all other respects the tube has very nearly the same electrical characteristics as a standard 201-A tube or its equivalent. It can therefore be substituted in any circuit where a 201-A tube is used by making a few changes.

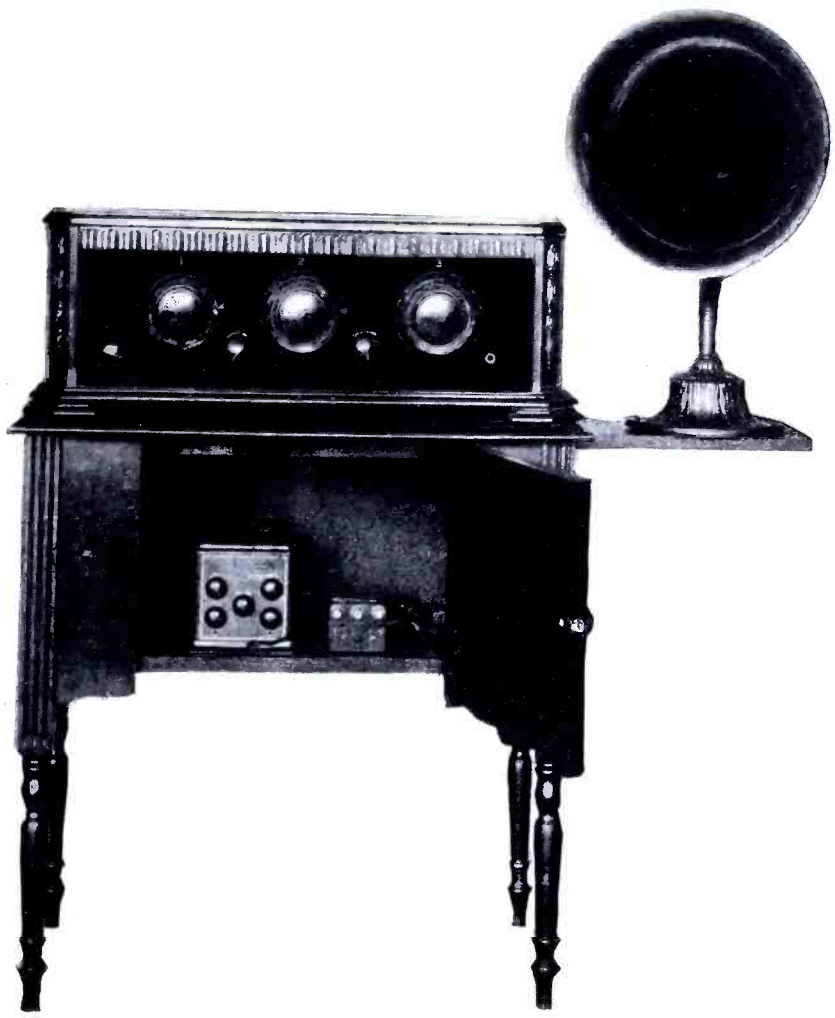

Photo A. Front view of receiver showing suggested accessories

We have designed in our laboratory a simple tuned radio receiver using the Rational A-C Tube. A small step-down transformer for reducing the 110 volts to approximately 3 volts is used to heat the cathode. The transformer in this receiver serves the same purpose as the storage battery in the average set. This receiver is identical to any other tuned radio frequency receiver except that the usual filament circuit is discarded and all of the filament binding posts on the sockets are connected together by one common bus wire. This now becomes the cathode lead and is connected to the positive of the "C" battery and the grid return of the detector tube. The ground and negative of the "B" battery are also connected to this lead.

The grid returns of the radio frequency tubes are connected together and go to the negative 3 volt "C" battery, which establishes the grid bias in the radio frequency circuits. The connections to grids and plates of all tubes are made in the usual manner. Plate voltages up to 150 volts may be used on the amplifying tubes and 22½ to 40 volts on the detector.

A 200,000 ohm variable resistance is in series with the 90 volt lead running to the plate return of each radio frequency tube. This acts as a very efficient volume control and prevents undesirable oscillations and distortion.

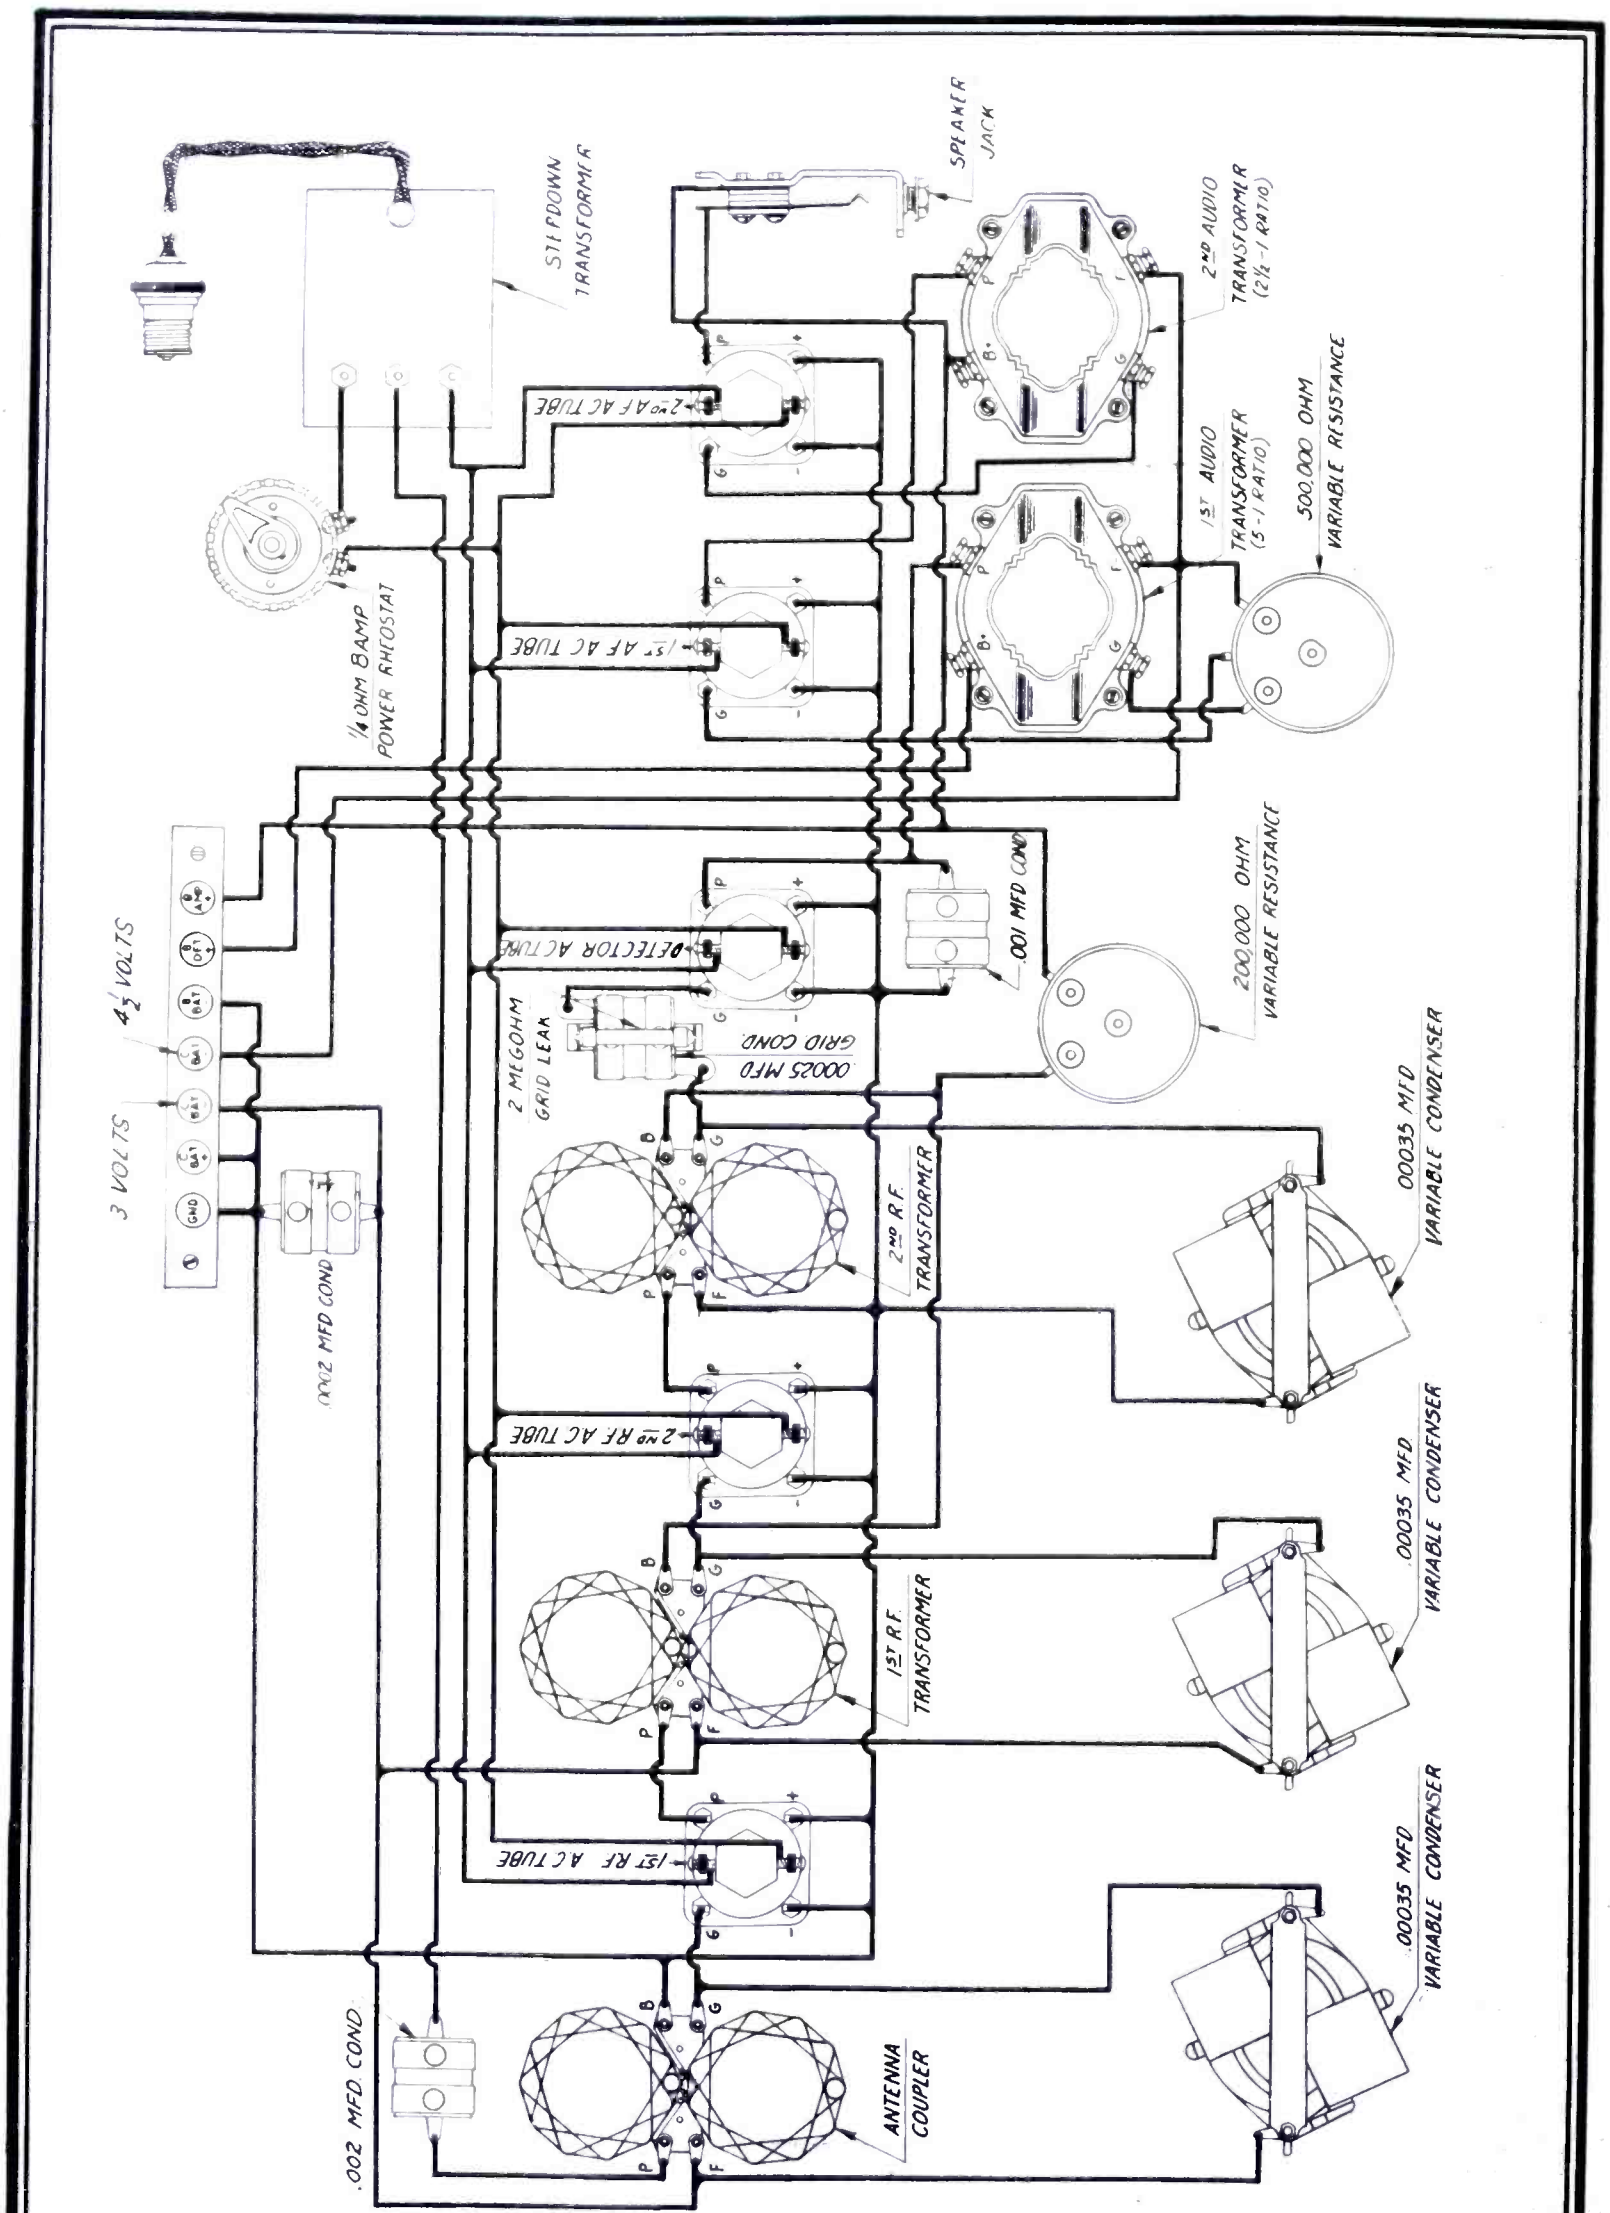
The Audio Amplifier is connected in the usual manner. The primary of the first Audio Transformer has a .001 mfd. by-pass condenser shunted across it which effectually bypasses any stray radio frequency currents. A 4½ volt "C" battery bias is used on both audio transformers. If a higher "B" voltage than 90 volts volts is used for the amplifier, it will be necessary to increase the bias in the proportion of 3 volts for every 45.

The unique feature of this circuit lies in the fact that absolutely no antenna or loop is required for operation. The terminal of the antenna coupler, usually connected to the aerial binding-post, is fastened to the center post of the step-down transformer. This post is the center tap of the secondary winding and since there is static coupling between the primary and secondary windings of the transformer, the 110 volt power line is utilized as an antenna. A good ground connection is very necessary for the proper operation of the receiver.

The cathode heaters are connected together in parallel with not less than a No. 14 flexible insulated wire. The heater voltage should never exceed 3 volts. It is advisable to connect a voltmeter across the heater line to indicate the voltage applied. A ¼ Ohm, 8 Ampere power rheostat is inserted in one side of the heater circuit and controls the voltage at all times.

A laboratory test of this receiver showed remarkable efficiency in reception. Complete absence of A-C hum, exceptional volume with excellent tone quality and clearness was secured on all stations received. The tuning is quite sharp with no interference encountered from nearby stations.

With the addition of a "B" battery and "C" battery eliminator, the set is made entirely battery-less, consuming electric current equivalent to only a 60 Watt lamp.



A Five-Tube Tuned Radio Frequency Receiver Using Rational AC Tubes

List of Parts

1—7x26x3/16-inch Radion Panel
1—8½x25x½-inch Wood Baseboard
1—Frost Open Circuit Pan-Tab Jack
5—Frost UX Sockets, Type No. 530
1—CRL 200,000 Ohm Variable Resistance
1—CRL 500,000 Ohm Variable Resistance
1—¼ Ohm 8 Amp. Power Rheostat
1—A.C. Step-Down Transformer
5—Rational A.C. Tubes
2—Precise Audio Transformers (1 high and 1 low ratio)
3—Gen-Ral Radio Frequency Transformers
1—Electrad .00025 Grid Condenser
1—Electrad 2 Megohm Grid Leak
1—Electrad .0002 mfd. Fixed Condenser
1—Electrad .001 mfd. Fixed Condenser
3—Signal .00035 mfd. Fixed Condensers
7—XL Binding Posts
3—Radion 4-inch Dials
1—Package Kester Solder
50 Ft. Belden No. 12 Wire
1—Blackburn Ground Clamp
Misc.: Wire, Lugs, Screws, Etc.

A complete kit containing all necessary equipment for constructing an aerial may be purchased at most all first class radio stores. They are manufactured by Brach Manufacturing Company, Newark, N. J.

The accessories shown are: The new Webco Little Giant Power unit provides the proper current variations to "B," "C" and detector circuits. The detector allows a variation of from 5 to 100 volts and the amplifier variation from 20 to 120 volts. The power tube supply may be adjusted to the exact value needed in any receiver with any power tube up to 125-180 volts. Manufactured by Webster Electric Co., 3510 West Lake Street, Chicago.

The speaker is a new Qualitone model, manufactured by the Duro Metal Products Co., Chicago.

The radio table is by the Watsontown Table & Furniture Co., Watsontown, Pa.

(If any further information is desired regarding any accessories shown they will be supplied by the manufacturer if you will address them direct.)

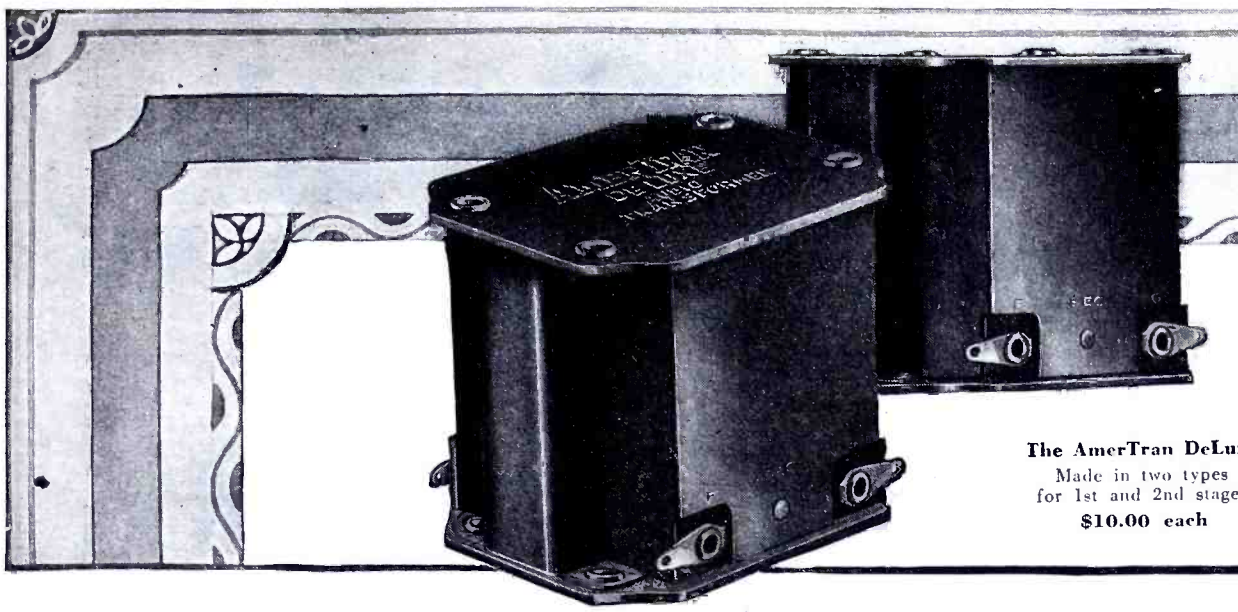
Tuned Radio Frequency Receiver using the New Sickles Shielded Coils



The AmerTran DeLuxe
Made in two types
for 1st and 2nd stages
$10.00 each

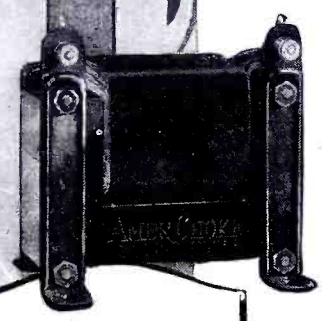
AMERTRAN RADIO PRODUCTS

STANDING out prominently among recent developments toward better reproduction, the AmerTran DeLuxe sets an entirely new standard of audio amplification.

Here is an audio transformer which reproduces the deep boom of the bass drum, the roll of the pipe organ and the lowest tones of the bass viol with startling realism, at no sacrifice of the highest sounds within the audible range. Used in connection with the new cone speakers and new tubes these transformers amplify uniformly over the entire audible range. The approach to absolute perfection is so close that the human ear is unable to note further improvement.

The AmerTran DeLuxe is made in two types—first and second stages and should be used by the pair!

The AmerTran Power Transformer and the AmerChoke are the result of over twenty-five years' experience in transformer building. They are among the finest units available for the construction of a power supply of the better type. The Power Transformer has filament supply windings for the rectifying tubes and furnishes sufficient plate current, after rectification, for the operation of the set.



The AmerChoke Type 854
This is a scientifically designed impedance or choke coil of general utility, designed primarily for use in filter circuits. As an output impedance for by-passing direct current from the loudspeaker it is both efficient and economical.
$6.00 each

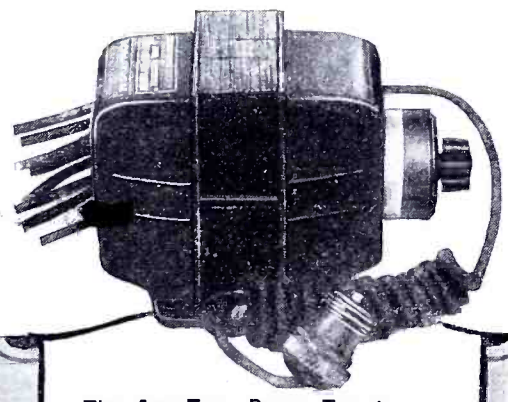
AMERICAN TRANSFORMER COMPANY
178 Emmet Street, Newark, N. J.

"Transformer builders for over twenty-five years"

AmerTran products are sold only at Authorized AmerTran Dealers.

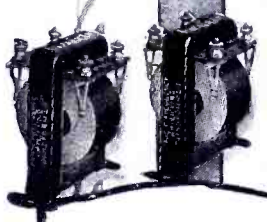
Other AmerTran products:

AmerTran Resistor Type 400.....$7.50
AmerTran Heater Transformer Type H-28 (for A. C. tubes) $10.00



The AmerTran Power Transformer Type PF-52, 65 VA—60 Cycles
Type PF-52 is intended for use in the best power supply developments. It will convert the standard 110-volt, 60-cycle alternating house lighting current to a higher voltage for the plate and low voltages for filament supply.
$18.00 each

Write today for interesting free booklet, "Improving Audio Amplifier," and other data on the subject of better radio.



AmerTran Types AF-7 and AF-6
AmerTran Audio Transformers types AF-7 and AF-6 have been considered among the leaders in audio amplification. These popular and efficient models may now be purchased at a considerable saving in cost.
Types AF-7 (ratio 3½:1)—AF-6 (ratio 5:1) $5.00 ea.

SET BUILDERS

who earn their livelihood by building and installing radio receivers

Write to Morison's for Full Particulars on The New

VARION

Battery B&C *Eliminator*

Morison's is exclusive wholesale distributor for parts for The New Varion B and C Eliminator and the marvelous Varion A. C. Operated Set. They are among the most talked-of radio developments this fall.

Endorsed by 11 Leading Radio Manufacturers

Eleven of the country's best-known manufacturers endorse The Varion Eliminator. Their combined engineering and research facilities have gone into its development. You have their assurance and guarantee that the Varion is as fine an eliminator as engineering skill and money can produce. Nothing has been sacrificed, no expense has been spared to make The Varion the standard by which others will be judged.

An Opportunity for the Dealer and Set Builder

The Varion Eliminator and A. C. Operated Set give the dealer and set builder a splendid opportunity to "cash in" this season. Strong advertising and publicity plans already under way—and more coming right along. It's a coast to coast campaign. You'll see The Varion Units featured in prominent magazines and newspapers everywhere.

CENTRAL RADIO LABORATORIES

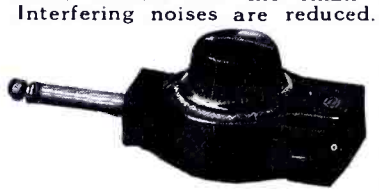
PRODUCTS 1926·27

IN the past season more than 2000 newspapers recommended Centralab Products. Most radio magazines mentioned them frequently in circuit articles. Every product has distinctive features and obvious **high quality.**

Centralab Modu-plug

The New Tone and Volume Control

Tone improvement is this year's only real radio advance. Just one change will modernize your present set. Replace your loud speaker plug with the Centralab Modu-Plug and your set will equal the tone performance of the latest high-priced receivers. Gives any degree of tone volume. No other control but the small knob on the plug. Interfering noises are reduced.



No. 1. Standard Type Modu-Plug for sets with one or more jacks, $2.50.

No. 2. Cord Type Modu-Plug for sets not equipped with jacks; has 24 in. phone cord, $2.50.

NEW Heavy-Duty RADIOHM

For Simple Control of "B" Battery Eliminator

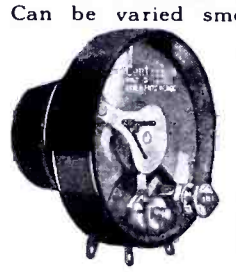
Get full efficiency from your "B" Battery Eliminator by installing a Centralab Heavy-Duty Radiohm. By using this device a single turn of the knob gives full resistance variation to control the output voltages. **Tested and approved by Raytheon Laboratories.**

Resistance remains permanent as adjusted (no carbon particles or discs) and remains same for any knob setting regardless of how often adjusted. Bushing and shaft insulated to withstand 1500 volts.

Resistances 2,000, 10,000 or 50,000 ohms.....$2.00

Centralab Standard Radiohms

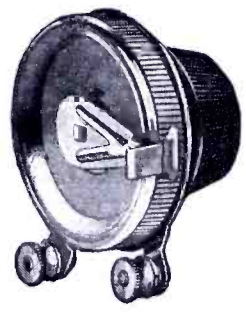
Can be varied smoothly throughout their entire range from zero to maximum resistance. Gives full resistance variation with single turn of the knob. Non-inductive, permanently noiseless in adjustment; no sliding contacts carrying current; maintain exact resistance values as adjusted.



Resistances 2,000, 25,000, 50,000, 100,000, 200,000 or 500,000 ohms.....$2.00

Centralab Rheostats

Centralab Rheostats always operate smoothly and noiselessly, for the resistance element is firmly clamped between insulated metal discs so that it cannot move or warp. This maintains uniform spacing between windings, giving even regulation and eliminating dead spots. The large area of metal aids in cooling, and they carry unusually heavy current for their size. Centralab Ribbon Type Rheostat is wound with flat ribbon instead of wire. Will handle five to ten tubes with smooth, noiseless control.



Wire wound: 6, 10, 20 or 30 ohms $1.00

Ribbon wound: 2 or 3 ohms, price $1.25

Purchase any Centralab product at your dealer's, or we will mail direct on receipt of price.

How to Build the Varion "B" and "C" Eliminator

An Efficient Battery Eliminator of Extreme Flexibility Adaptable to Both "B" and "C" Voltage Requirements

FROM the very day that multi-tube sets became popular with the radio public, battery elimination gained in popularity by leaps and bounds. Economy was, of course, the main factor in determining this trend of public opinion. A t using five or six tubes and in operation three or four hours day will just about use the equivalent cost of a good battery iminator in dry cell B Batteries in the course of a year.

The recently introduced power tubes requiring high plate voltges have further emnasized the desirability efficient battery elimiation. Incidentally, he modern receiving t, using from five to n tubes, requires an iminator of extreme exibility, when one onsiders the number of pecial purpse tubes ow on the arket, each ith its own articular equirements in the atter of ate and rid bias oltages. It is safe to say that the majority of radio owners toy are using these special combinations of tubes rather than one rticular tube for all purposes.

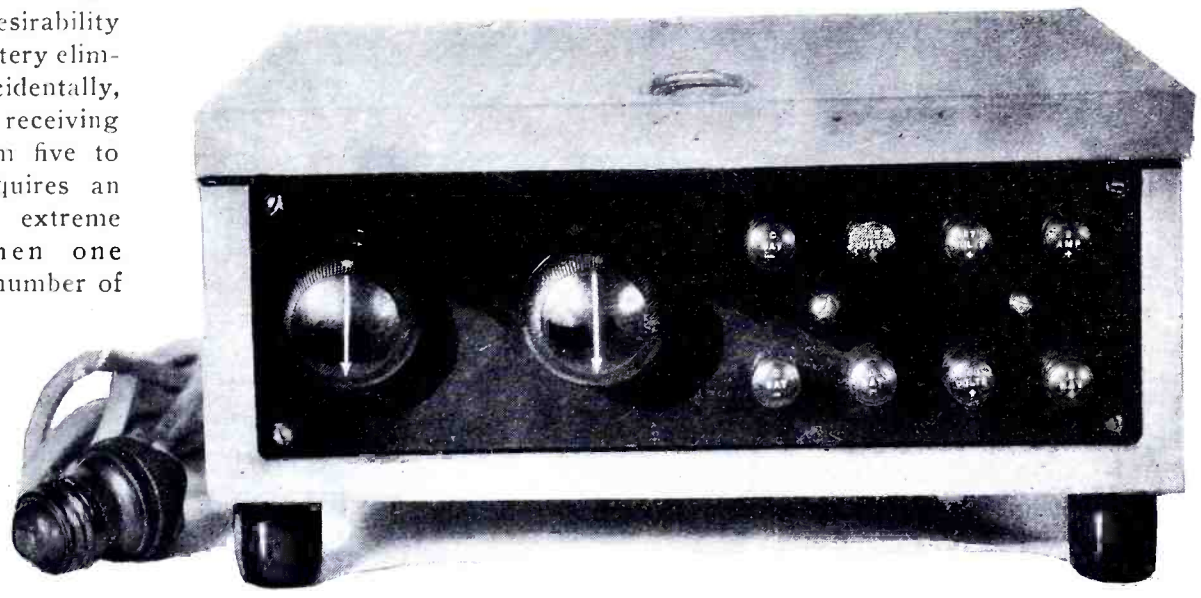

Photo A. Front view of completed Varion

Not only must the modern eliminator be adaptable in the atter of B voltages, but in C voltages as well. Consider that te 201A tubes, used as first stage audio amplifiers, require as ltle as 4½ volts C bias, while the 171 power output tube calls for high as 40 volts C bias.

In designing the two models of the Varion Eliminators, deribed here, the requirements of the multi-tube set as well as of the latest type power tubes, have been kept constantly in mind. The result is a design which supplies constant B voltages from 22 to 250, covering the range required by the softest type detector tube to the high voltage 171 or 210 power output tubes. In both models there are two C voltages available, with variations from 0 to 45 volts.

B and C Current Fluctuations Compensated

As C bias voltages are dependent entirely upon the applied plate voltages, the designers of the Varion chose a logical method of securing C voltages by drawing it from the same source from which the plate potential is taken. Minor variations in the plate supply are then taken care of automatically. This feature which is incorporated in both models of the Varion shown here will be well appreciated by those to whom changes in tone and volume are objectionable.

Upon the efficiency of the rectifying device used depends the efficiency of the completed eliminator to a large extent. Without going into the technical side of the subject, we believe that the newly developed Raytheon tube is the most logical to use. Its highly satisfactory performance as a rectifier, its rugged construction, long life, and practically foolproof operating characteristics make it almost ideal for work of this kind.

Summary of Specifications of the Varion Eliminators

The circuit diagrams for two types of Varions are shown.

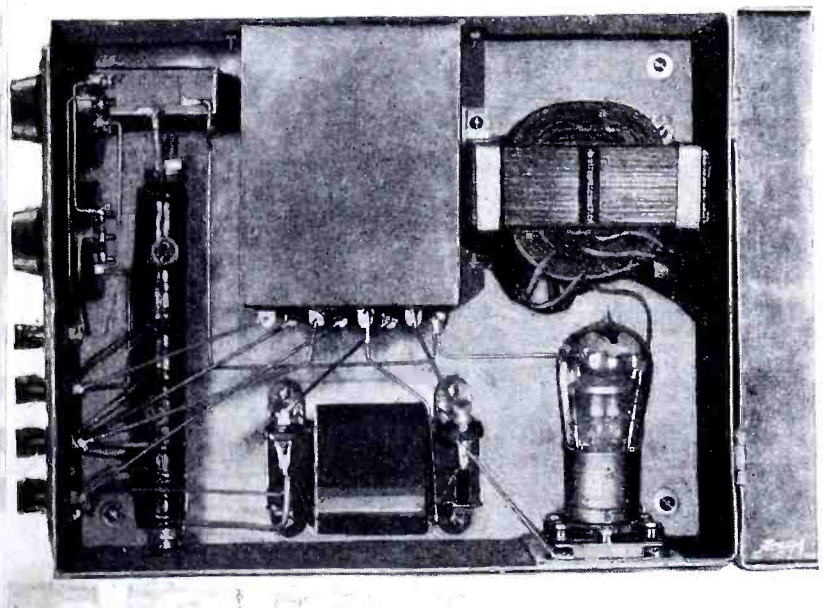

Photo B. Top view of Varion with lid open

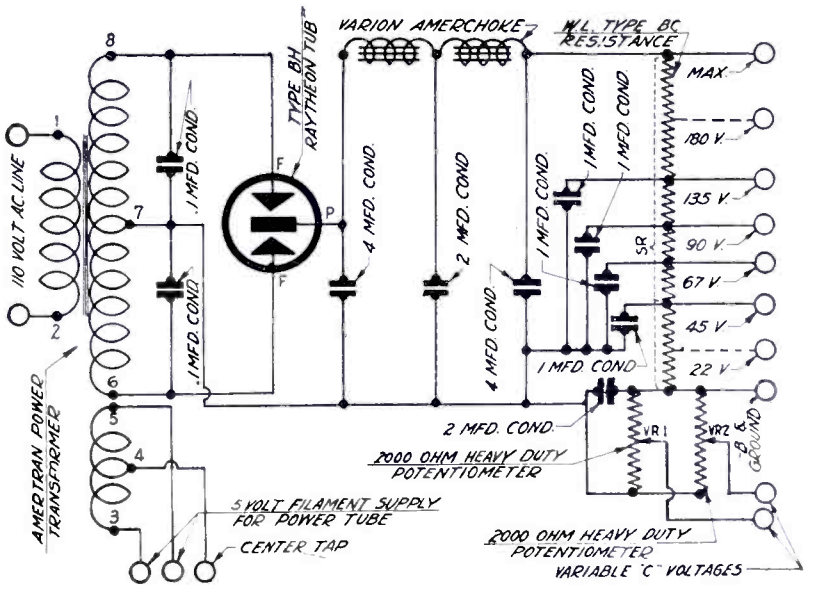

Figure 1. Schematic wiring diagram of Type A Varion

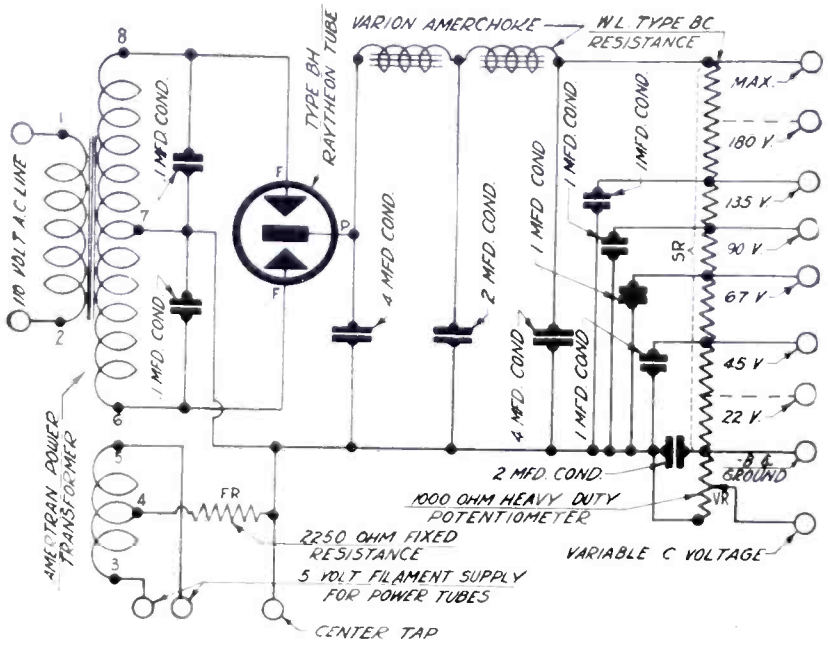

Figure 2. Schematic wiring diagram of Type B Varion

Figure I gives the circuit diagram of the Type A Varion. In this model there are no changes in the receiver to be made and the B and C voltages are drawn from the eliminator exactly as though batteries were being used. The 5 volt, center tapped, filament winding is not used.

The circuit diagram of the Type B Varion shown in Figure II shows slight variations from the other model. While the B voltages are the same, only one variable C voltage is available and the 5 volt center tapped filament winding is used to provide filament current for a power tube of the 112 or 171 type. The resistance FR is in series with the negative B return and the voltage drop across this resistance is utilized as the grid bias voltage. The value of this resistance is 2250 ohms and due to a fortunate coincidence, no change in this value is necessary to produce the correct C bias for either a 112 or 171 type tube.

Operating Power Tubes

It is suggested that where the set with which the Varion is to be operated is already equipped for power tube operation, that the Type A Eliminator Circuit be followed. If the set is not wired for power tube operation or if dry cell tubes are used, the Type B Varion should be constructed. Figure III shows the few changes necessary to change your set so that the filament of the power tube is operated from alternating current.

Parts Used in the Varions

1—Amertran Varion Transformer.
1—Amerchoke, Varion Type.
1—Raytheon Tube, BH Type.
1—Eby UX Socket.
1—Sangamo Varion Condenser Unit Containing 2-1 Mfd. Type B Condensers.
1—Sangamo Varion Condenser Unit containing:
  1—4 Mfd. Type B Condenser.
  1—2 Mfd. Type A Condenser.
  1—4 Mfd. Type A Condenser.
  4—1 Mfd. Type A Condensers.
1—Sangamo 2 Mfd. Type A condenser.
8—Eby Ensign Posts.
1—Ward Leonard Varion BC Resistance.
1—Varion Steel Case.
Solder, wire, etc.

Used With Above in Type A Varion Only:
2—Centralab 2000 Ohm Type HD Potentiometers.

Used With Above in Type B Varion Only:
1—Centralab 1000 Ohm Type HD Potentiometer.
1—Ward Leonard Varion FR Resistance.

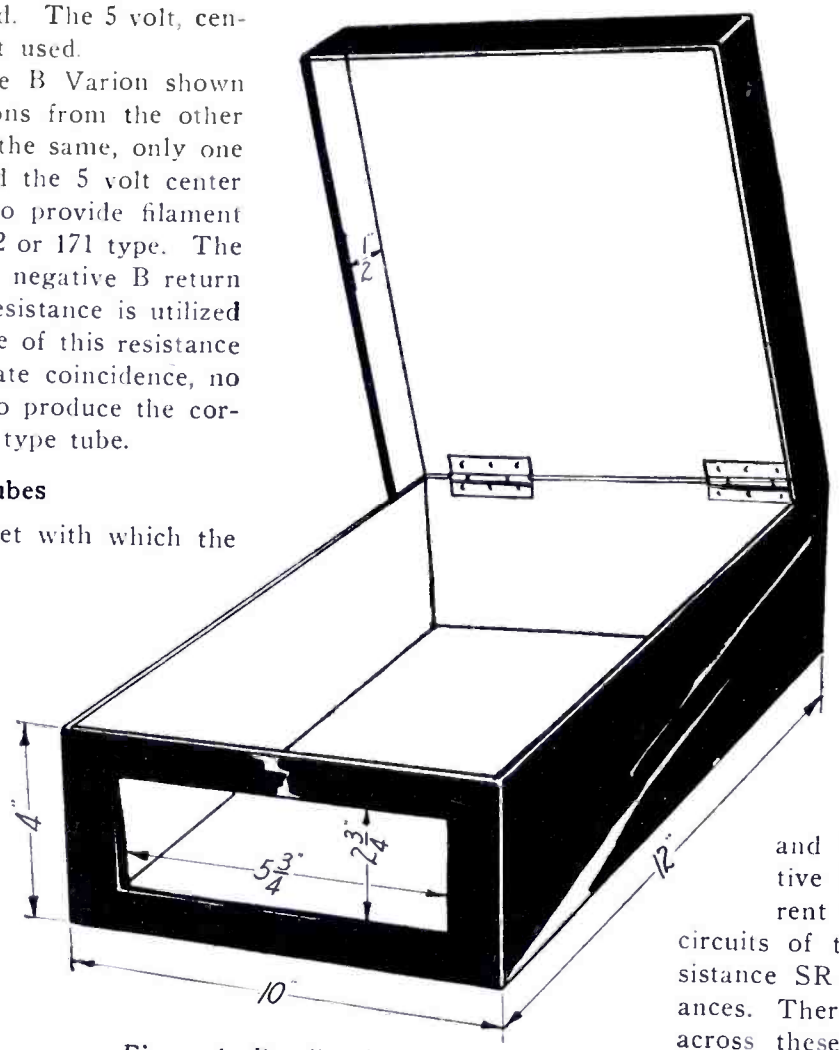

Figure 4. Details of iron box

Characteristics of the Varions

The operating characteristics of both Varions is identical with the exceptions noted above.

Type of Circuit: Raytheon Full Wave Rectification.

Load Capacity: 60 Milliamperes Drain at 180 Volts.

Plate Voltage Output: Maximum of 250 Volts with 4 available combinations of the following Voltages: 22-45-67-90-135-180.

C Bias Voltage Output: Model A: 2 Variable C Bias Outputs, each Variable from 0 to 45 Volts. Model B: 1 Fixed C Bias for 112 or 171 power tube and 1 variable C Bias from 0 to 45 volts.

The parts used in the Varion Eliminators have been chosen solely upon their merit as parts of these eliminators. Certain of them, such as the Amertran, Ward Leonard, and Sangamo parts are of special manufacture for use here.

As the filter circuit, with the exception of the rectifying device, is the most important part of an eliminator, it deserves some special mention. The tapped Varion Amerchoke has an effective inductance of 100 Henrys which is far in excess of the average inductance employed or available. This choke, in combination with the Sangamo condensers form a very effective filter circuit which guarantee an absolutely humless output under all conditions.

The special Ward Leonard Varion Resistances used across the output are wire wound and vitreous enamelled. These resistances are rated at 25 watts dissipation and possess a zero temperature coefficient. These characteristics assure quiet, even output under all loads.

The Centralab Heavy Duty Potentiometers are used to obtain the C bias voltage for the amplifier tubes as has been explained previously. Their placement in the circuit and the manner in which the bias voltages are obtained may be of interest. Glancing at Figure 1, it will be seen that the resistances VR1 and VR2 are in series with the negative B lead. Obviously, then, all current flowing through either the plate circuits of the various tubes or through resistance SR must pass through these resistances. There will be, therefore, a voltage drop across these resistances and by placing the center arm of the potentiometers at various points, voltages from zero to the maximum

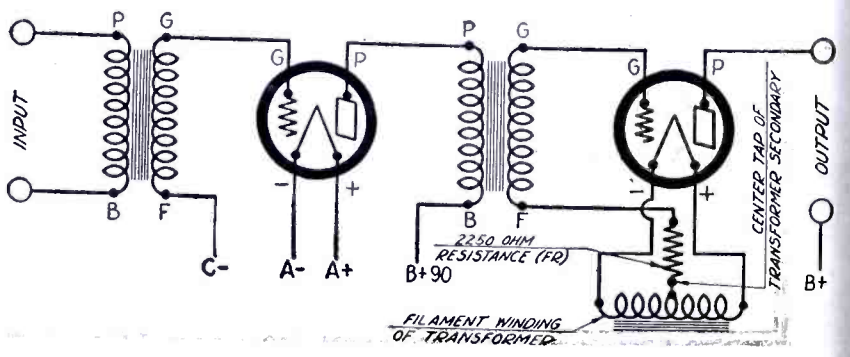

Figure 3. Method of using filament transformer for power tubes

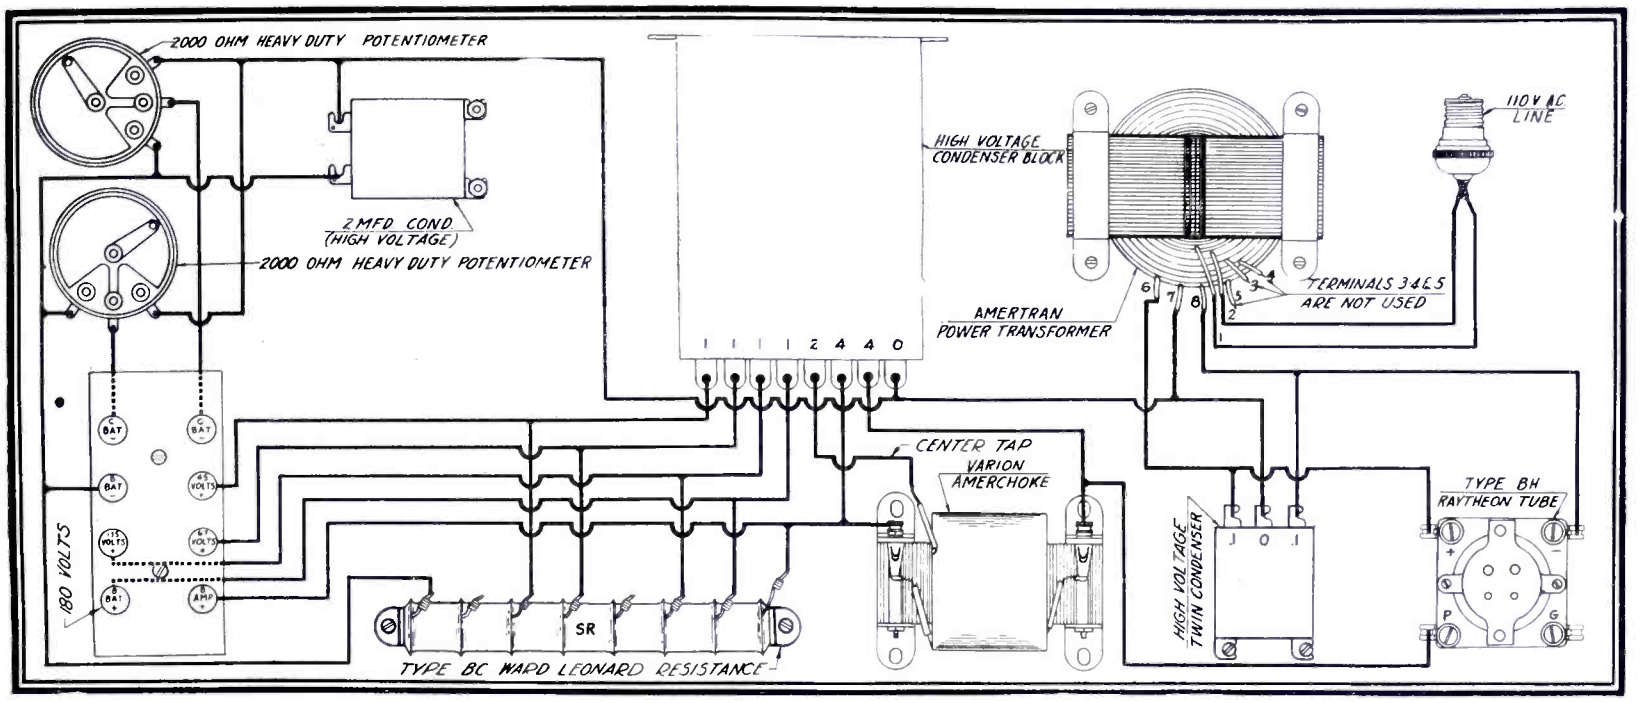

Figure 5. Pictorial wiring diagram of Type A Varion

drop across each resistance may be obtained. In the case of the Varion, the circuit characteristics are such that a maximum drop of 45 volts is obtained. The changes in grid current for various bias voltages may be discounted as negligible in the case of any amplifier tube now on the market and they will not affect the output of the amplifier or the voltages at any of the taps.

Assembly and Wiring

The first step in completing either of the Varions is to mount the apparatus in the steel case. This may be made by your local metal worker or purchased already made. If you buy it assembled, the case will be supplied fully drilled and the mounting of parts is quite simple. If the can is made locally, the data given in Figure V will be sufficient to have it turned out properly.

When the instruments are mounted, turn to either the schematic or pictorial diagram of the model you have selected, and carefully wire the job with Belden No. 18 Rubber Covered Flexible Wire. Do not attempt to run the leads in a particularly orderly fashion. A straight line is always the shortest and best path in radio wiring. The high voltage A. C. Circuits should, of course, be kept away from the D. C. output.

Testing and Operating the Varion

Connect the Varion to your receiver and insert the Raytheon Tube in its place. Then turn on the Alternating Current. A sudden blue glow or haze will probably surround the Tube elements. This, however, should cause no worry as it will disappear as soon as the tube warms up. In the case of the Model B Varion, the power tube in your set will also light up. It is not necessary to attempt to regulate the filament voltage on this tube as the applied voltage will never exceed five.

The voltages from the Varion may be tested with fair accuracy with any high resistance voltmeter such as those manufactured by Weston or Jewell. A cheap voltmeter, it must be remembered, draws an excessive amount of current and the reading from such a voltmeter will be far below the actual voltage.

When a station has been tuned in, the C Bias Voltages can be adjusted. It is only necessary to set the controls to a point where the volume and tonal quality are satisfactory.

In conclusion, a word or two of caution in the construction and operation of the Varion Eliminator. Never make any adjustments or repairs in the eliminator itself while the house current is on. Never leave the cover of the eliminator off while it is operating, for someone is apt to come along and investigate—with results painful but not usually severe.

As the case of the Varion is of metal and grounded, the eliminator may be placed fairly close to the set without the difficulties of interference usually encountered when this is done.

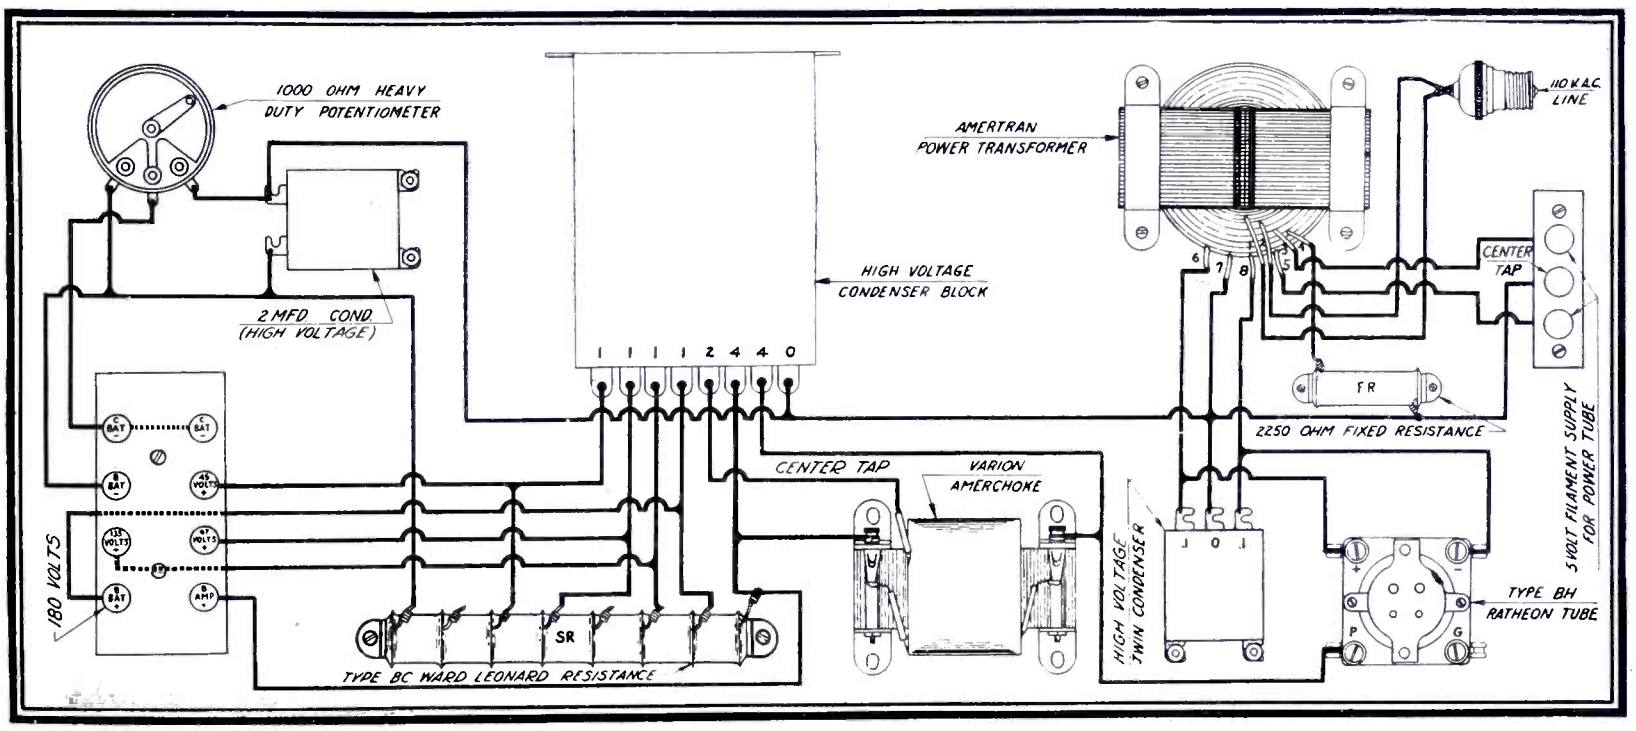

Figure 6. Pictorial wiring diagram of Type B Varion

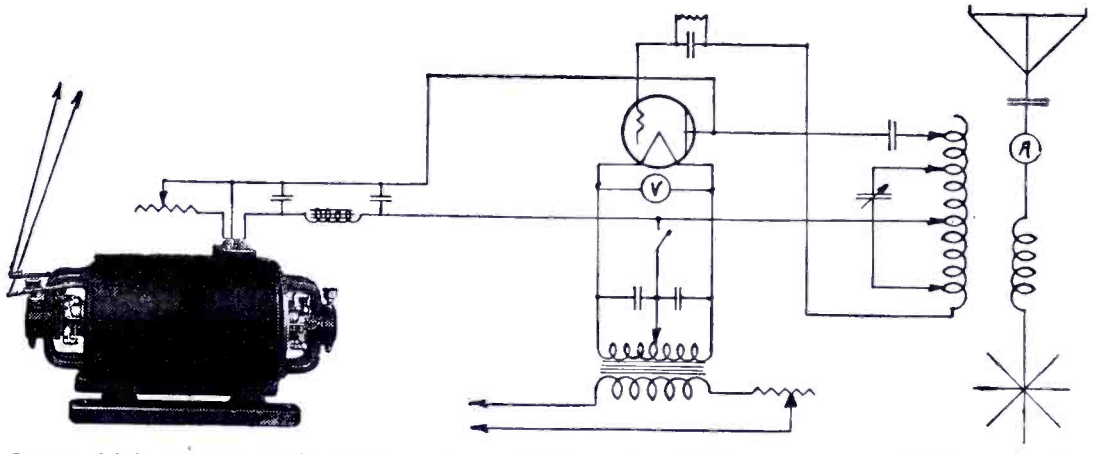
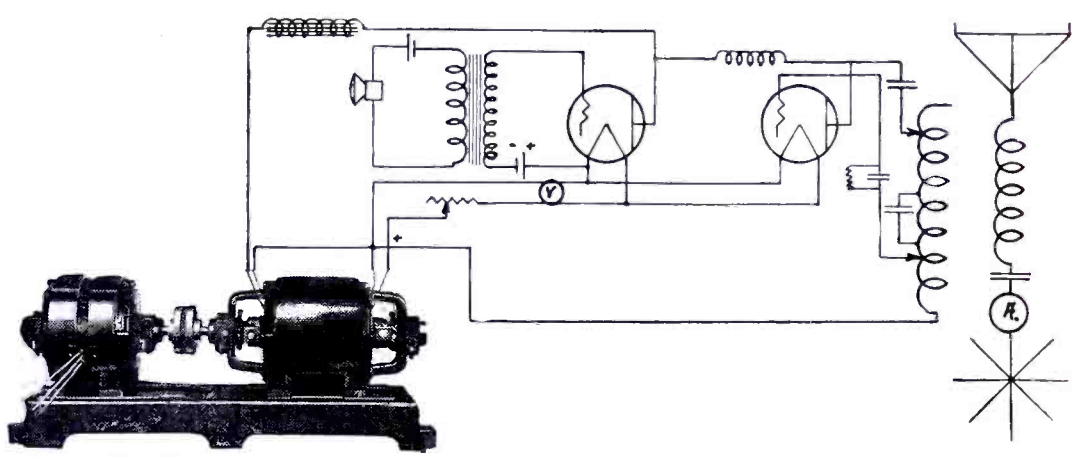
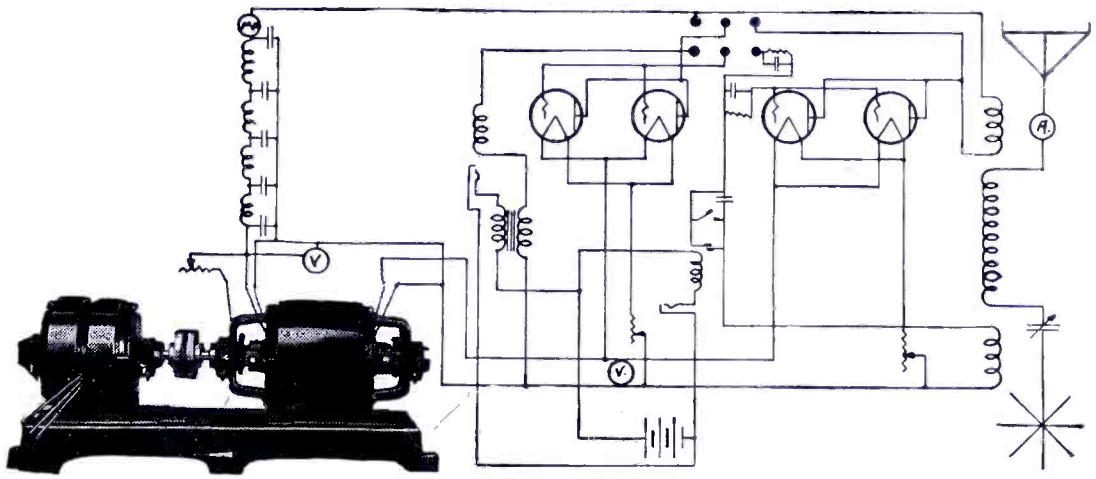


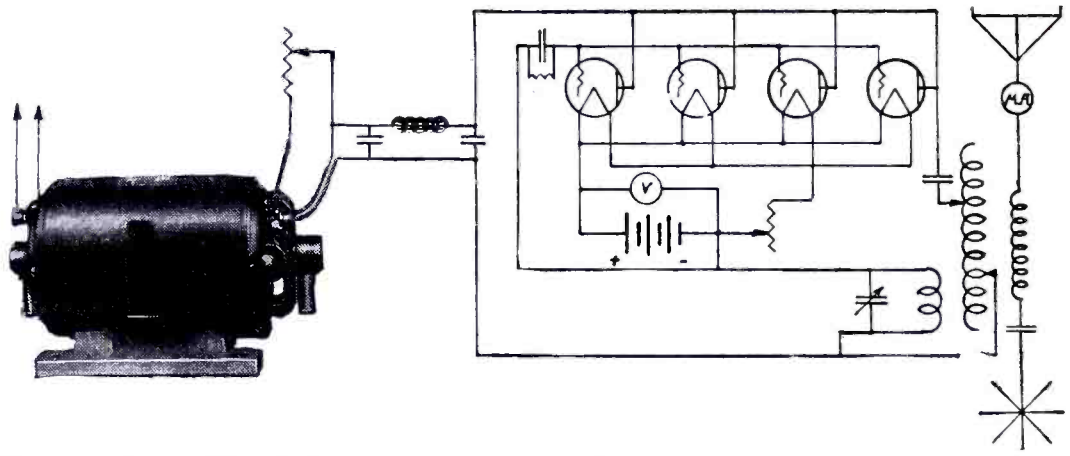
Item 11A, Type MG-343S output 1000 volts, 300 watts, an efficient and compact Power Supply for one or two 50 watters. This machine is built ruggedly yet designed to take a minimum of space. It is a machine that not only will stand the kicks of hard usage, but will also give your Station a kick that will turn the Q.R.Z.'s into Q.S.A.'s.



Item 35. Two unit four bearing set. Furnished with ring oiled or ball bearings. Motor to suit local supply. This "ESCO" set delivers 1000 volts, 300 watts for plate supply and 12 volts, 150 watts for filament supply. This set driving two 50 watters will make a good consistent station.



Item 37, 2 unit four bearing set, delivering 1000 volts, 600 watts for plate and 12 volts, 300 watts for filament. The "ESCO" Set is shown here furnishing Power Supply for 4—50 watters in a phone or telegraph set. This is the Item used by CBZ8 in pioneer achievement of the first two way amateur wireless communication between North and South America.



This is Item No. 8 furnishing Power Supply for 4/5 watters in the reversed feed back hook up.
Item 8 can be furnished with either AC or DC motors, or as a separate generator. The machine is two bearing, wick oil, and its output is conservatively rated at 500 volts, 150 watts. It's a real little maximum miles per watt DX getter.

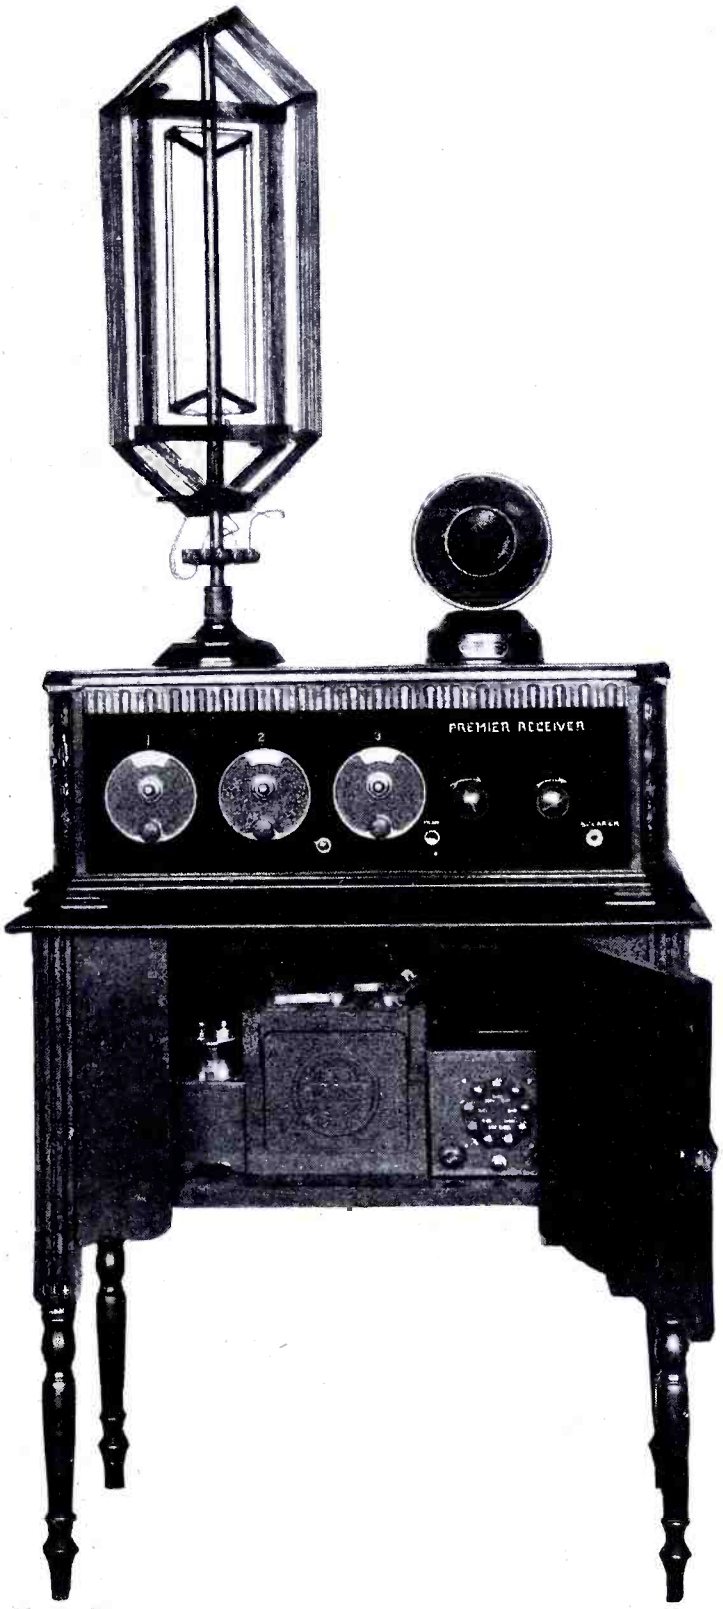
Announcing Our New Question and Answer Department

We receive thousands of questions yearly from our readers on every phase of Radio maintenance, construction and design. In order to handle this on an economical basis we are going to make a slight charge for this service. Our engineers will answer your questions under the following conditions:

1. Make your questions brief and to the point.
2. No more than four questions allowed to one person.
3. Write on one side of the paper in ink or on the typewriter.
4. Schematic wiring diagrams must be submitted on separate sheets.
5. We cannot answer questions free of charge. Send 25c in stamps or coin.
6. If your question requires considerable laboratory work or an unusual amount of time for research an extra charge will be made, but you will be informed of that charge.
7. Do not send us checks.

Avail yourself of this service. It is conducted to help You.



View of receiver mounted on table, with accessories

The Premier Five Tube Tuned Radio Frequency Receiver

(See Page 144 for diagram)

THERE is no doubt as to the efficiency of a tuned radio frequency receiver. The continued popularity of this type of circuit among the radio public serves well to show this fact. It is the aim of every prospective set builder to construct a receiver having good volume with excellent reproduction and is selective with a minimum number of controls.

The Premier Tuned Radio Frequency Receiver described herewith is a five tube set embodying all these good features and is extremely easy to assemble and hook-up. The majority of apparatus, as may be seen from the list of parts, is manufactured by the Premier Electric Company. The manufacture of parts is controlled from the raw material stage to the finished piece of apparatus, thereby assuring a product which is uniform in quality at all times. A very compact radio frequency transformer of the diamond weave type is used. It is only 3⅝-inches in diameter, has a very small field and a very low distributed capacity.

The sockets consist of a moulded bakelite frame of extremely small cross section and a highly nickeled metal collar for supporting the tube and holding the pin. The contact springs and lugs are of phosphor bronze, also nickeled and so arranged that capacity between them is negligible.

Excellent volume with reproduction of both upper and bass notes is due to the audio transformers. They are extremely compact pieces of apparatus and while only a fraction of the size of the best audio transformers, they equal them in efficiency.

Three major tuning controls are used in this receiver. They are each a .00025 mfd. variable condenser of straight frequency tuning characteristic. The rotor plates are concentric in shape and therefore balanced.

The circuit used is a standard tuned radio frequency hook-up with two stages of transformer coupled audio amplification and a novel method for controlling oscillations. This is accomplished by the insertion of a cam switch in the plate circuit of the first radio frequency transformer and varies the grid return of the second tube. This allows an instant control of oscillation as well as permitting broad or sharp tuning.

A long or short antenna or a loop may be used with this receiver. If a loop is used, the connection between the two loop binding posts on the receiver is removed. However, the connection must be in place when an antenna is used.

The first three tubes are regulated by two 6-ohm rheostats connected in series. This allows a very critical adjustment on both sides the radio frequency tubes and the detector, for the proper selectivity and volume. A ½ ampere resistor controls the two audio amplifiers. The proper "C" battery grid bias on the amplifier tubes is in proportion to the "B" voltage. 4½ volts "C" battery is sufficient for ninety volts and 7½ for 135. Using

a "C" battery is good practice, since it effects a considerable saving in "B" battery current as well as improving reproduction.

This receiver should give excellent reception at all times which under favorable conditions will be from coast to coast. Its selectivity is sharp enough to prove of value in those metropolitan districts like New York and Chicago, where the air congestion is quite severe.

List of Parts or their equivalent will give satisfactory results

A complete kit containing all necessary equipment for constructing an aerial may be purchased at most all first class radio stores. They are manufactured by Brach Manufacturing Company, Newark, N. J.

The accessories shown are:

Kodel Microphone Loud Speaker, manufactured by Kodel Radio Corp., Cincinnati, Ohio.

The Trickle Charger shown is by the same company.

One standard 6-volt Radio Battery is shown which is made by Willard Storage Battery Co., Cleveland, Ohio.

The Radio Table is one of the many models made by the Watsontown Table and Furniture Co., Watsontown, Pa.

Cabinet by D. H. Fritts Co., Hearst Square, Chicago.

This Receiver was designed for either loop aerial or outdoor antenna. The aero loop illustrated can be used in two ways, either as a straight loop using only the outside windings, or the antenna and ground can be connected to the small winding inside the loop and the outside terminals to the loop terminals of the receiver.

If volume is such that no outdoor aerial is needed, it is not necessary to use the antenna section of the loop, and if greater sensitivity is required, both antenna and loop can be used at the same time. Made by Utt-Williams Electrical Products Co., Santa Ana, Cal.

The "B" Battery Eliminator shown will supply all necessary voltage to detector and amplifier circuits. Manufactured by De Witt La France Co., Cambridge, Mass.

(If further information is desired regarding any accessories listed it will be supplied by the manufacturers if you will address them direct.)

The Thordarson Power Amplifier and "B" Elminator

(See Page 146 for diagram)

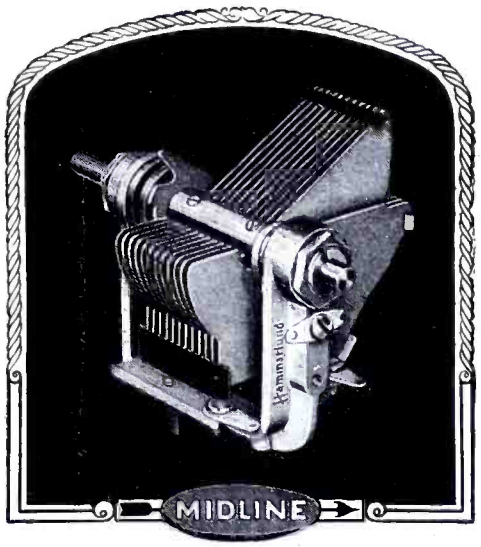
POWER amplification is the increase of the strength of radio reception, without distortion, through the use of larger capacity tubes, capable of handling many times the volume of the tubes ordinarily employed.

"But," you may say, "my set has plenty of volume as it is,—more, in fact, than I can listen to in comfort; and the quality is excellent." Power amplification has a much more important function than

HAMMARLUND QUALITY PRODUCTS
Simplify Your Radio Problems

"Quality" is the most potent word in radio parlance. Quality parts will often improve a poor circuit, but poor parts will inevitably prevent a good circuit from doing its best.

Sixteen years' experience is back of Hammarlund Quality Products. Radio experts concede them to be unsurpassed in design, workmanship and efficiency. Their world-wide reputation is your safeguard.



Avoids Crowding at Any Part of the Scale

Hammarlund "Midline" Condensers are made in six standard capacities for the broadcast and short-wave bands. .0001 to .0005 mfd. Price, $4.25 to $5.00. Also dual and triple models in tandem. $7 to $12.

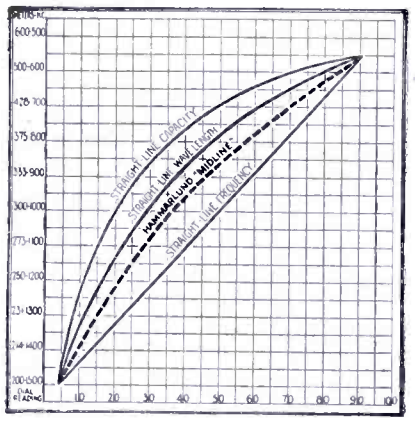
"Hammarlund, Jr." *(Midget)*

A high ratio, shielded midget condenser with all the distinctive earmarks of Hammarlund design and workmanship. Many uses are shown in circulars packed with each condenser. Made in four sizes: 16, 32, 50 and 75 mmfd. Price, $1.80 to $2.00.

Space-wound Coils

Hammarlund Coils give extreme sensitivity and sharp tuning, owing to their space-winding on a mere film of dielectric material. Distributed capacity and resistance are at a minimum. Short-circuits are impossible. Made in styles and sizes for all standard circuits, *including short wave*. Prices on application.

Hammarlund's New Creation
The "MIDLINE" Condenser



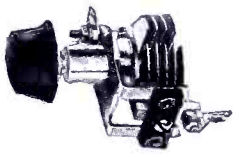
"Straight-line-Capacity" crowded the low waves; "Straight-line-Frequency" crowded the high waves; "Straight-line-Wave-Length" merely compromised between the two. But the Hammarlund "Midline" retains the important advantages of these earlier types, without any of their disadvantages.

The new Hammarlund "MIDLINE" Condenser makes its bow with the claim of superiority over any other type ever produced.

Experience (yours and ours) is responsible for its many excellent features.

All of the tried and true Hammarlund principles are included: soldered, non-corrosive, brass plates with tie-bars; rib-reinforced aluminum alloy frame; minimum dielectric; one-hole mounting with anchoring screw; bronze clockspring pigtail; friction brake. *In addition, there have been added ball and cone bearings, and a full-floating rotor shaft. This shaft supports no weight; it may be entirely removed and a longer shaft inserted for coupling to other condensers in tandem, or for mounting a variable primary coil.*

The "Midline" is much more compact and even stronger than previous Hammarlund Models. It is built for a long life and a happy one.



The New "Verni-tune" Dial

An unusually attractive and efficient dial. Four inches in diameter: 10 to 1 ratio. Turns full 180 degrees in either direction. Molded bakelite with black satin finish. Adjustable, brass friction mechanism. No gears. No backlash. An exclusive and important feature is the bakelite sleeve over the main rotor shaft, which completely shields the shaft from detuning effects by contact with the hand. Price $2.50.

merely to increase volume. It gives the set power to reproduce the heavier tones and overtones which cannot find release, even at moderate volume, through the customary method of amplification. Power amplification gives radio reproduction the fullness of a third dimension, reproducing every sound from the highest treble to the deepest bass of the broadcast program with almost unbelievable realism.

If driving a car were narrowed down to moving smoothly along a level paved road at a speed of not more than thirty miles an hour we could get along with much less power than the average car possesses. But there are times when we need a good pick-up, there are occasional steep hills and mud holes or sand pits that require many times the power used in the normal run. We do not make a practice of traveling through traffic at 60 miles an hour, but there are times when we need that power.

If radio reception were put to no greater task than reproducing the music of the violin, power amplification would be unnecessary. There are times, however, when broadcast reproduction demands many times the power consumed in duplicating the music of the original violin.

It is not difficult to appreciate the fact that the beat of a drum or the deep vibrations of the pedal diapason of the organ require a much greater expenditure of *mechanical* energy than does the bowing of a violin or the playing of a flute. Likewise it is easy to understand that the consumption of *electrical* energy must be proportionate to the mechanical energy expanded. A radio tube with the capacity just sufficient to amplify comfortably the music of a violin cannot be expected to do justice to the tones of the heavier bass instruments.

The development of the UX-210 power amplifying tube has meant much in the advancement of quality reproduction. The standard amplifying tubes in common use today—the UX-201-A and CX-301-A—have a maximum undistorted power output of .015 watts when operated at the normal of 90 volts on the plate. The undistorted power output of the power tubes mentioned above is much greater,—measuring 1.54 watts, or more than 100 times the output of the ordinary amplifying tube. This is sufficient to amplify the music of any broadcast program without tube distortion or sacrifice of bass notes.

A tube producing so much power necessitates the use of more power to operate it. These power tubes require the special voltages of 7½ on the filament and 425 on the plate for maximum results. Batteries, to supply the current of proper values, would be so costly, inconvenient, and bulky as to make their use prohibitive. The Thordarson power supply transformer R-198 furnishes the proper values of current for both plate and filament of this power tube.

The current for the plate is rectified from A.C. to D.C. through the radiotron UX-216-B tube designed for this purpose, after which it is "ironed out" through the usual filter circuit of condensers and chokes.

One very convenient feature of the Thordarson power amplifier is the use of the voltage regulator tube, UX-874 which eliminates all controls, making manual voltage regulation unnecessary. This makes it possible to put the amplifier in the battery compartment, out of the way.

In addition to serving as the supply for the power tube, the complete assembly shown in sketch (G) also provides the proper values of B-voltage to take care of the needs of the entire receiver, furnishing 45 volts for the plate of the detector tube and 90 volts for the stages of ordinary amplification. This B-elimination feature operates, as does the amplifier itself, with no internal hum or other noises. It would be well for the man contemplating the construction or purchase of a B-eliminator alone to bear in mind the great advantage of the combination of power amplification with B-elimination which this circuit affords him at but a slight increase in cost.

1—Thordarson Power Supply Transformer (R-198)
2—Thordarson Chokes, 30 henries (R-196)
3—2 mfd. high voltage condensers. (Not less than 400 volts normal load and 1500 volts D.C. flash test)
2—1 mfd. condensers (standard by-pass type)
1—4 mfd. condenser (standard by-pass type). (Use either Potter Tobe, or Dubilier)
1—8000-ohm resistor (capacity to carry 40 milliamperes. Ward Leonard)
2—Tobe 10,000-ohm resistors (grid leak type)
1—1,000 ohm resistor (capacity to carry 25 M. A. current).

This 84 Page Wonder Book of RADIO Bargains

Over 2000 -ITEMS- Everything in RADIO

Send for this guide to Radio prices and Radio quality. All of our vast resources and radio experience have been utilized to assemble for you in one gigantic institution, the best and newest things in radio. The Randolph catalog is indeed the radio market place of the world — a masterpiece of merchandising that befits our house—**the largest exclusive radio mail order house in the world.**

What Our Catalog Contains

Over 2,000 items—from the most beautiful, fully equipped console model radio set, down to the smallest part or tool for the set builder—kits, parts, and supplies of every conceivable type and style. All beautifully illustrated and interestingly described. And to give this book added value, we have included radio data that makes it an invaluable text book for every lover of today's most fascinating and most wonderful achievement—RADIO.

Radio Sets

In this great radio market place you will find table model sets and console types with built-in loud speakers; the newest ampliphonic console sets; new Spanish period consoles; **five, Six, seven, and eight tube sets.** with three dial, two dial, and the **newest and most popular single simplified control.** All sets are assembled in beautiful, genuine mahogany and walnut cabinets in a choice of latest types and designs.

5 Tube sets as low as $24.90
Latest 1927 Models

All Randolph sets are sold at amazingly low prices. No matter what kind of set you want—no matter how little you want to pay—you can select YOUR SET AT YOUR PRICE from the Randolph catalog.

Radio Kits

Includes the following well known circuits, designed and approved by the world's foremost radio engineers: **Madison Moore Super; Victoreen Super; Silver Marshal Six; Sargent's Infradyne; Remler Super; Short Wave Kits; 9-in-Line Super; New Acme Reflex; Cockaday; Neutrodyne; Browning-Drake;** all classes of **radio frequency, Super Heterodyne** and every other approved popular circuit.

Radio Parts and Supplies

The Randolph catalog also contains a most complete line of **"B" Battery Eliminators.** including the famous **Raytheon Eliminators;** the latest type of Loud Speakers, Cone Speakers, a complete line of quality "A" power units — in fact, you will find listed in this wonder book every part that goes into the construction of a radio set, or any accessories you desire, at prices that mean a **substantial saving to you.**

Free Radio Service

Everyone has need for radio service. The average man has no time to keep up with the rapid developments of radio. We employ Radio Engineers who have made radio their life work. Their expert advice and helpful suggestions solve every radio problem of our customers.

Our Guarantee

Every article in our catalog is based on careful laboratory analyses and tests. We guarantee to back up every item in our catalog with our own as well as manufacturer's assurance of quality.

YOU MUST HAVE THIS BOOK

Space limitations here prevent our telling you more about the Randolph Catalog. Simply fill out and mail the coupon—or you may send a postal or letter—and this truly remarkable Radio book will come to you **ABSOLUTELY FREE. MAIL THE COUPON NOW.**

Tell 'Em You Saw It in the Citizens Radio Call Book

1—U. X. 216-B or C. X. 316-B rectifying tube.
1—U. X. 874 or C. X. 374 voltage regulator tube.
2—Standard tube sockets.
1—Thordarson R-200 Amplifying Transformer.
1—Thordarson Choke, 30 henries (R-196)
1—2 Mfd. high voltage condenser (same specifications as above).
1—U. X. 210 or C. X. 310 power amplifying tube.
1—Standard tube socket.

Caution.—Before laying out your apparatus or beginning your wiring remember that you are dealing with alternating current voltages up to 500,—strong enough to give a very uncomfortable shock to the unwary. Use rubber covered wire or bus bar wire covered with rubber tubing when connecting up the amplifier.

Where space permits we recommend following the layout of the accompanying sketch. If space for this arrangement is not available, much room may be saved by mounting the condensers under the chokes. The three high voltage condensers of the power supply may be placed side by side with their cases touching. If all four high voltage condensers are grouped together, or if the apparatus is mounted on a metal base plate, insulate the case of the condenser of the power amplifier from the cases of the other high voltage condensers. The purpose of this is to prevent the 60-cycle hum of the light circuit from being inducted into the power amplifier itself.

To further prevent any inductive pick-up in the power amplification stage, it is advisable to twist the 7½ volt filament leads of the U. X. 210 and the U. X. 216-B tubes. These are the leads extending from either end of the transformer (R-198).

The 8,000-ohm resistor between the (power) B tap and the 90 v. B tap should always have a capacity of not less than 15 watts continuous duty rating. The Ward Leonard Company make such a resistor which mounts conveniently into a standard electric lamp socket.

The 10,00-ohm resistor, designated as No. 1, is of the proper value for supplying one tube (detector) with 45 volts on the plate. If value for supplying one tube (detector) with 45 volts on the plate. If 45 volts B-supply is desired for more than one tube, it is necessary to decrease the resistance with the increase in the number of tubes used. Some sets, particularly superheterodynes, use 45 volts as the B-supply for five and six tubes. In this case, a 2,000 resistor should be used as No. 1.

The assembly of the Thordarson Power Amplifier and B-supply is simple. The only tools necessary are a soldering iron, a pair of pliers, a screw-driver and a small drill. Following the above instructions, and using quality apparatus, you will be able to build this amplifier in an evening's time—and at last you will realize full reproduction.

The Camfield Duodyne Circuit

(See Page 150 for diagram)

IN ORDER to understand the method used in the Duodyne Circuit to prevent oscillation, we must first make a brief survey of the causes of oscillation in a tuned radio frequency amplifier.

Oscillation in a tuned radio frequency amplifier is caused by coupling between the plate or output circuit of the tube and the grid or input circuit. One or more of the following forms of coupling are always inherent to some degree in tuned radio frequency amplifier circuits:

First—Inductive coupling between the windings of interstage radio frequency transformers.

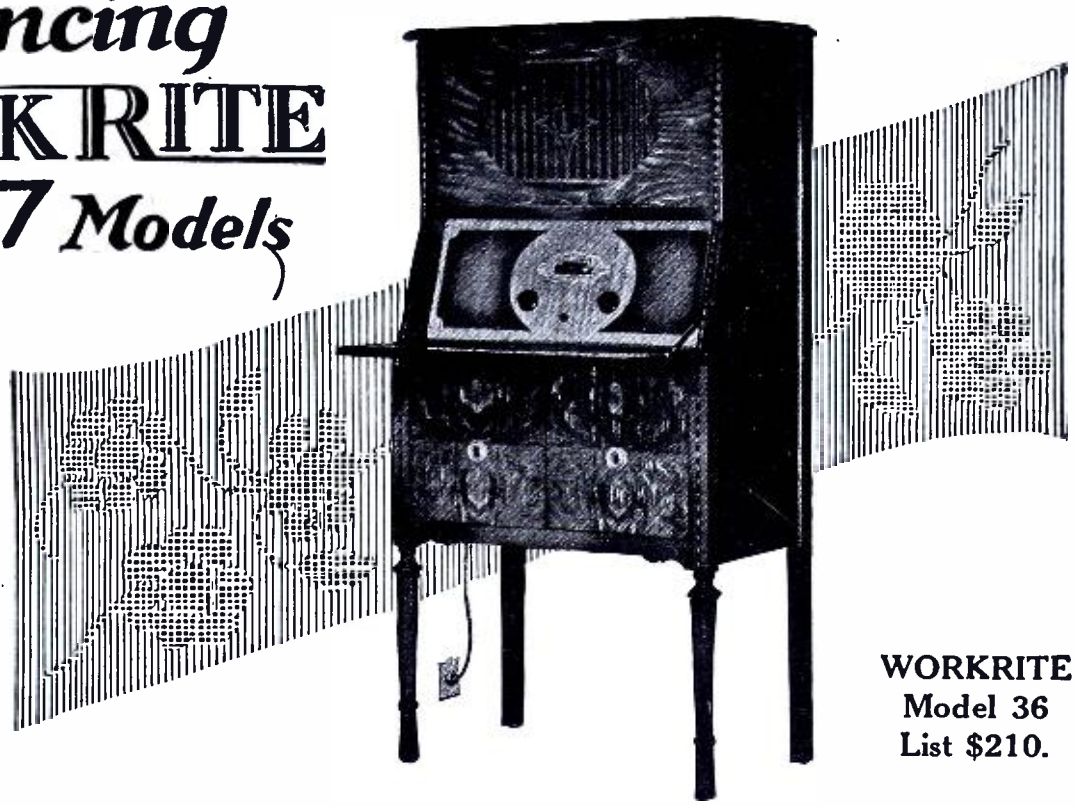
Second—Capacity and conductive coupling in the wiring of the set.

Third—Capacity coupling between the two circuits due to the capacity between the grid and plate of the vacuum tube.

The first and second causes of oscillation are comparatively easy to eliminate. The Camfield Duoformer has been designed to minimize its effective external magnetic field. Thus, when three of these transformers are used in a set, magnetic coupling between them is negligible.

The second cause of oscillation may be eliminated by the proper arrangement of parts and wires in the set and the proper use of by-pass condensers. This has been done in the set lay-out recom-

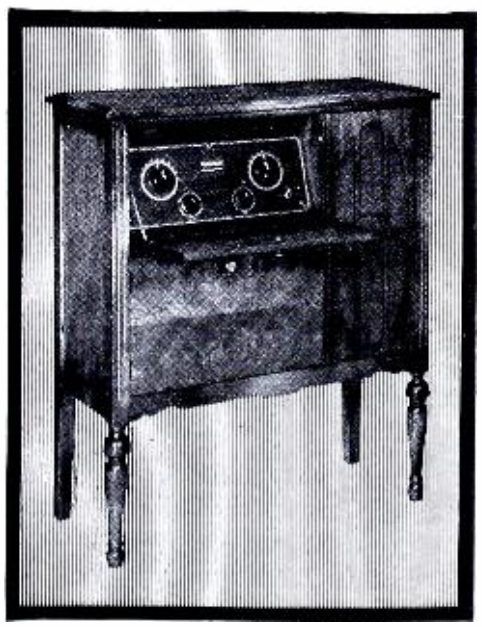
Announcing WORKRITE 1927 Models



WORKRITE
Model 36
List $210.

The New WORKRITES embody every down-to-the-minute improvement that is practicable

WORKRITE MODEL 16
6 tubes — 2 controls, no verniers necessary. Walnut Cabinet with panel and dials to match, gold trimmed. List Price, $80.00.



WORKRITE MODEL 26
Same chassis as above mounted on a small floor console with high grade loud speaker enclosed. List Price, $145.00.

Licensed by Independent Radio Manufacturers, Inc. Reg. U.S. Pat. Off. NEUTRODYNE Reg. U.S. Pat. Off. Pat. March 27 1923 and April 1, 1924. Signalling Pats. Nos. 1,450,080 and 1,480,228 Other Patents Pending.

All models use six tubes—two stages radio, detector, one stage transformer coupled and two stages resistance coupled audio. Three way switch giving "Off, Soft, Loud," straight line broadcast condensers, battery cable and cabled wiring, beautiful cabinets and panels, gold trimmings, wired for new power tubes using batteries or power unit supply from electric light socket. One or two dial control of new design.

WorkRite Super Neutrodyne radio sets are made and sold by a conservative, well financed company. You won't have an orphan set if you buy a WorkRite.

Because of long radio manufacturing experience, WorkRite radios are manufactured on a standardized economical basis. That's why they can be sold at these remarkably low prices.

WorkRite dealers are especially selected franchised dealers. They know that WorkRite radios are going to be increasingly popular year after year.

Visit a WorkRite dealer now and ask for a demonstration or write direct to us for descriptive literature.

SUPER NEUTRODYNE RADIO SETS

Tell 'Em You Saw It in the Citizens Radio Call Book

mended for the Camfield Duoformer, and for this reason it is advocated that the builder of a set using these coils follow our detailed instructions as closely as possible.

The third cause of oscillation, that is, the grid plate capacity of the vacuum tube, cannot be eliminated without entirely changing the design of the tube itself, and it is doubtful whether or not a tube designed with a sufficiently low grid to plate capacity would be efficient in other respects.

In the past few years, several methods of compensating for the energy fed back from the plate circuit to the grid circuit through the tube capacity have been developed. The most noteworthy of these is the use of some means to feed back additional energy from the plate circuit to the grid circuit in such a manner that it is out of phase with the energy fed back through the tube, thus preventing oscillation. Several different ways of doing this are in use today, and some of them unquestionably have a great deal

View showing receiver mounted in cabinet, with accessories

of merit. However, this system has several disadvantages, principal among them being that the means of feeding back compensating energy is often very critical in its adjustment, and that circuits using it are not equally efficient over the full range of wave lengths.

Another means of preventing oscillation in general use today is to place a resistance or in some other manner to introduce a loss in the grid circuit of the tube. It is very easy to prevent oscillations in this manner, but at the expense of decreasing the sensitivity of the circuit and broadening its tuning.

Some set and part manufacturers prevent oscillation by using tuned radio frequency transformers of very low efficiency, so that the over-all gain in each stage of the radio frequency amplifier is so low that oscillation are not produced. This is generally accomplished by making the primary inductance so small that the proper degree of coupling between the primary and secondary is not obtained. Practically all transformers that do not necessitate the use of some form of compensating feed-back or resistance in the grid circuit are made in this manner. They usually have the characteristic of being fairly efficient on the low wave lengths and inefficient on the upper range of the broadcasting scale.

In support of this comparatively inefficient type of transformer, some manufacturers and technical writers have made the radical statement that the minute capacity between the grid and plate of a tube does not cause a sufficient transfer of energy to produce oscillation. They claim that oscillations are caused entirely by

Whatever set you build, remember this—

There are many makes of every part specified. Your set will receive, after a fashion, with whatever parts you use—within reason. Experienced amateurs know that there is usually **one outstanding** make in each group of parts that gives the best results. Often the best make costs no more—sometimes **less** than the other kinds. This holds true particularly of insulation parts—panels, dials, sockets, coil forms, etc. The man who uses RADION gets what he goes after—true insulation—that gives adequate protection to the circuit.

RADION

RADION is a material **entirely different** from the ordinary insulation, notwithstanding that all insulating materials look more or less alike.

Electrical tests immediately establish its superiority. RADION has

1—The lowest angle phase difference
2—The lowest dielectric constant
3—The highest resistivity
4—The lowest power factor loss
5—The least moisture absorption

It is more beautifully finished and is easiest to work with home tools

RADION PANELS made in a full range of standard sizes to fit any regular type set. In black or mahoganite, beautifully finished.

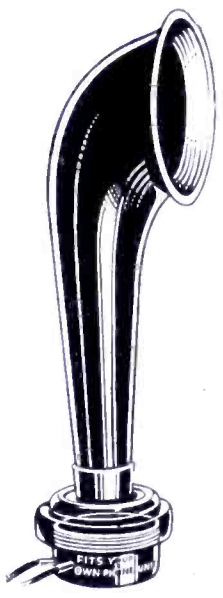
3/16x7x10 in.	3/16x7x14 in.	3/16x7x21 in.	3/16x7x26 in.
3/16x7x12 in.	3/16x7x18 in.	3/16x7x24 in.	3/16x7x30 in.

RADION DIALS

Regular sizes 2, 2½, 3 and 4 inch diameter, black and mahoganite to match Radion Panels fitted with set screw and bushing.

RADION SOCKETS

made to take new UX tubes or with collar (as shown) to fit old type of UV tubes as well.



RADION HORNS

Small, compact, non-metallic. Fit standard loud speaker units. Ideal for portable sets.

Where to buy RADION

Radion Panels and Parts are sold by reliable dealers everywhere. It is not necessary to accept substitutes for if your dealer does not have Radion Panels and Parts, write for catalog and we will see that your needs are promptly supplied.

American Hard Rubber Company

coupling between transformers and couplings in the wiring, and that it can be overcome by the use of closed-field transformers. This, however, is not the case. Feed-back due to tube capacity does exist in all well-designed radio frequency amplifiers and must be compensated for if the circuit is to be prevented from oscillating. To substantiate this, we quote the following statement from "Principles of Radio Communications," by J. H. Morecroit, chapter six, page 432:

"It would seem as though the capacity (electrostatic) of a vacuum tube is so small as to be negligible, but such is far from the truth. The internal capacity of a tube may have very great effect on its operations, especially at high frequency."

In designing the Duodyne Circuit, the engineers of the Camfield Radio Manufacturing Company fully recognize the existence of feed-back through the tube capacity and the necessity of compensating for it in order to prevent oscillations when all stages of radio frequency amplifiers are tuned to resonance. Not satisfied with the means previously employed, which either resulted in inefficient operation or in the necessity of making critical internal adjustments, our engineers worked along an entirely new line.

Under the usual conditions existing in tuned radio frequency amplifiers, the currents fed back from the plate circuit to the grid circuit through the tube capacity are of such phase as to add to the voltage already existing between the grid and filament of the tube, and therefore cause oscillation. It obviously follows that if the right phase relation is obtained between the current fed back through the tube and the current existing in the grid circuit, oscillation would not be caused.

It is well known that the phase relation between current and voltage in any circuit or group of circuits depends upon the relative constants of such circuits, namely, the inductance, the resistance and the capacity. In the case of transformers, the mutual inductance and the distributed capacity between the primary and the secondary must also be taken into consideration.

In designing the Duoformer, our engineers arranged the relative proportion of all of the constants, mentioned above, in such a manner that the current fed back from the plate to the grid circuit of the tube used in connection with these transformers would be in the proper phase relation with the current in the grid circuit to prevent oscillations.

This feature, combined with the physical design of the Duoformer Coils, which practically eliminates all electro-magnetic coupling between successive stages, and a circuit design embodying the proper use of by-pass condensers, makes it possible to build a five-tubed tuned radio frequency set that is extremely simple to construct, and that has a high and uniform efficiency over the entire range of broadcast wave lengths.

LIST OF PARTS

These parts or their equivalent will give satisfactory results.

1—7x24x3/16-inch Radion Panel

Tell 'Em You Saw It in the Citizens Radio Call Book

1—Acme 5-Wire Cable
Miscellaneous Lugs, Wire, Screws, etc.

A complete kit containing all necessary equipment for constructing an aerial may be purchased at almost all first-class radio stores.

They are manufactured by Brach Manufacturing Company, Newark, N. J.

The accessories shown are: one 6-volt Standard Radio Battery made by Willard Storage Battery Co., Cleveland, Ohio.

A Westinghouse Tungar Charger is shown which will keep the "A" battery charged. This is made by Westinghouse Electric and Manufacturing Co., East Pittsburgh, Pa.

The new Pacent "B" Battery Eliminator and Power Amplifier will supply all necessary voltages to both detector and amplifier circuits and permits a wonderful range in the power circuit from a whisper to a roar. It is compact, 8x8x10, and weighs only 32 pounds. Made by Pacent Radio Corporation, 156 W. 16th Street, New York City.

The cabinet is by D. H. Fritts Co., Hearst Square, Chicago.

The speaker is the neat appearing Rola Re-Creator Cone Type, made by Rola Radio Co., Oakland, Calif.

The table is by United Cabinet Mfg. Co., Chicago. There is ample room in bottom of table to place all necessary accessories, and a panel covers them completely when in place.

(If any further information is desired regarding accessories please write manufacturers direct.)

A Single Control Tuned Radio Frequency Receiver Using New Design of Gang Condenser

(See Page 154 for diagram)

NUMEROUS tuned radio frequency receivers have appeared from time to time endeavoring to reduce the number of tuning controls to a minimum. Various methods have been devised by which this end has been attained, the underlying principle being the mechanical coupling of the tuning condensers so that they operated as one unit. Invariably the amount of backlash and lost motion present, as well as the difficulty of properly adjusting each condenser for maximum selec-

tivity, was of such serious consequence that the fullest degree of efficiency and versatility of control could not be realized.

In view of this fact a new type of gang condenser has been designed which is extremely well constructed electrically and very clever in mechanical design.

It consists of three modified straight frequency variable condensers mounted on a metal chassis. Located between the first and second condensers are three dials, with corrugated peripheries, provision being made for the insertion of graduated strips so that loggings may be marked. The construction is such that any one condenser may be rotated independently of another by turning the proper dial, yet used as a single dial at will.

Contrary to regular practice, the unit is mounted with its axis of rotation parallel to the baseboard and panel. The dials appear through a window in the panel and the operator places three fingers of one hand on the three discs which are grooved to fit the fingers. By a downward or upward movement, either one, two or all three of the dials may be rotated.

The circuit used in this receiver consists of two stages of tuned radio frequency detector and two stages of transformer coupled audio frequency amplification.

The radio frequency unit consists of a shielded antenna coil and two shielded radio frequency transformers. The coils are of a solenoid construction and are provided with an arrangement similar to a tube by which they may be plugged into a socket. Compact arrangement of parts is possible and advised, since the burnished copper shield covers the coils and prevents interstage coupling as well as keeps out strays.

The detector amplifier unit is also very compact. Two very efficient audio transformers, capable of excellent volume with the reproduction of both the upper and lower audible frequencies, are used.

The two radio frequency tubes are controlled by a 10 ohm rheostat, the detector by a 25 ohm rheostat, and the two audio tubes by a 2 ohm fixed resistance. A 500,000 ohm variable resistance is in series with the 67½ volt lead running to the two radio frequency transformers. This acts as a very efficient volume control and also prevents undesirable oscillations in the radio frequency circuits.

UX sockets of an extremely well make cushion type are used throughout the receiver. Both the shielded coils and the tubes are mounted on them.

The two units are connected together electrically by the two sets of four binding posts on each unit. The two Lastite connectors are for a 4½ volt "C" battery.

Either a long or short antenna may be used with this receiver. A .0001 mfd. condenser in the antenna circuit automatically increases the selectivity of the receiver if the antenna is too long.

The low distributed capacity and negligible resistance of the parts used in this receiver make it very sharp in tuning. It cannot pick up undesirable signals, since the shielding of the coils nullifies and stray currents which may arise.

The accessories shown are:

Kodel "A" power plant which operates direct from A.C. house light socket. Manufactured by Kodel Radio Corp., Cincinnati, Ohio.

The new Valley "B" Eliminator operates from any convenient house light socket and will deliver all necessary voltages for detector and amplifier circuits. Made by Valley Electric Co., St. Louis, Mo.

A Standard Utah Loud Speaker is shown which is manufactured by Utah Radio Products Corp., Chicago.

The Radio Table is made by the United Cabinet & Mfg. Co., Chicago, and has ample room to store all accessories.

(If further information is desired regarding any accessories shown it will be supplied by manufacturers if you will address them direct.)

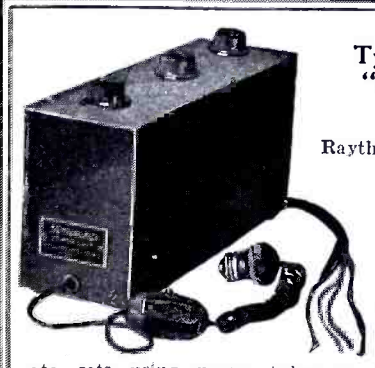
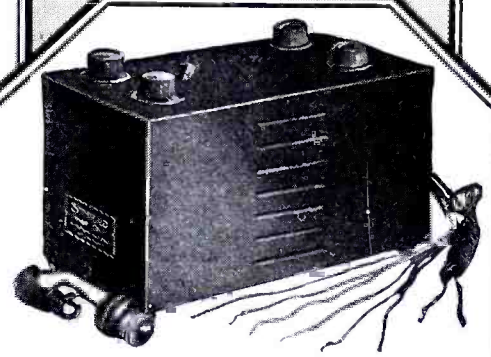
STORAD
Radio Power Supply



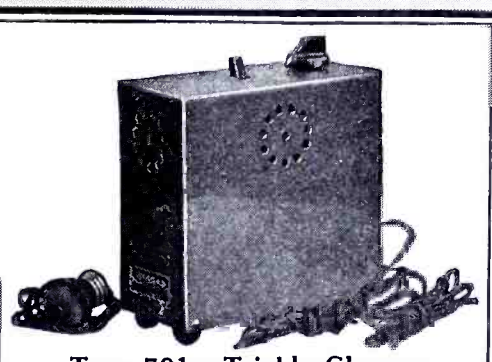
Type 101—"B" Power Supply

Raytheon Tube Type Unit. Surplus capacity. Storad special transformers and filter. Tobe Deutchman heavy duty condensers. Will operate sets using power tubes on last audio stage. 3 variable controls from 180 volts down. Operates on house lighting circuit.



Type 201—"B" Power Supply and Trickle Charger

Raytheon Tube Type "B" Power Unit—high capacity, with a bulb type Trickle Charger for A Storage Battery. Storad Special transformers and filter. Tobe Deutchman heavy duty condenser. Operated from 1 switch which turns off switch and B supply and turns on Trickle Charger. Charging current ½ of 1 amp. 4 variable controls.



Type 701—Trickle Charger

Sufficient capacity for A batteries used with larger sets. Switch turns on charger when set is turned off. Charging current ½ of 1 amp. Variable control regulates charging current.

Eliminators-Chargers and Storage "A" and "B" Batteries

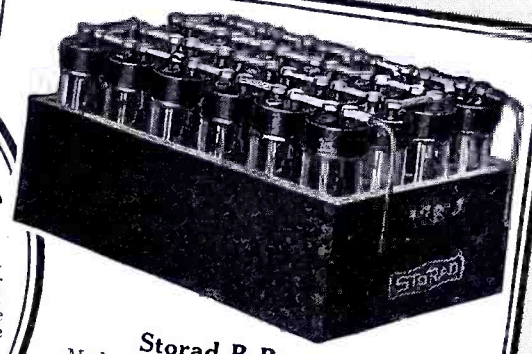
TYPE 501—Storad Combination Power Amplifier and B Power Supply

gives undistorted quality and large volume. The B Power Supply is from a Raytheon Tube Type Unit of large capacity. Built with Storad Special Transformer and Filter, and Tobe Deutchman Heavy Duty Condensers. Variable controls from 180 volts down.

Storad A Battery

Rubber case. Non-corroding rubber terminal nuts. Made in three sizes.

R3— 60 amp. hr.
R4— 80 amp. hr.
R5—100 amp. hr.



Storad B Battery

Made in two sizes, No. 4548, 4500 milleamp hr. 48 volt, No. 4524, 4500 milleamp hr. 24 volt.

Ask your dealer about these Storad Units. Complete descriptive literature sent on request

The All-American Tuned Radio Frequency Receiver Using Toroid Coils

(See page 156 for diagram)

MANY home builders of radio receivers have expressed a desire to construct a set identical to one built in a factory. The receiver described herewith is the counterpart of the All-American Model R Receiver, with one or two changes made in order to make it practicable for the home builder.

A set made up following the diagram, accurately and properly wired with the parts named, should perform in every way as well as the actual manufactured receiver. The circuit is a standard tuned radio frequency tuner with a new design of audio amplification using a transformer and two impedance units.

The unusual clean-cut appearance of the set is largely due to the use of toroid coils and tube sockets of a type well suited to it. That is, the sockets are of a type such that the binding posts may be inverted so as to bring the lead under the sub-panel, and in this way all of the filament wiring is brought out of sight. The binding posts on the coils are set very low, so that they are easily reached by short leads through the holes in the sub-panel.

The new method of audio amplification is the result of considerable experimentation in the laboratories of the All-American Radio Corporation. Being a successful combination of both transformer and impedance coupled radio amplification, it retains the advantages of both and eliminates their weaknesses. The system consists of a Rauland Lyric transformer for the first stage, a Rauland-Trio Type R-300 impedance for the second stage, and a Rauland-Trio Type R310 impedance for the third stage. The impedance units are triple feature instruments containing an inductance, a capacity and a resistance in one compact piece of apparatus.

This system of amplification gives a very faithful reproduction of both voice and music with excellent volume when a good quality of disc speaker is used.

A 10 ohm rheostat controls both radio frequency tubes, a 25 ohm rheostat the detector and each of the first two audio tubes by a 4 ohm fixed resistance. The last audio tube has a 2 ohm fixed resistance in the filament lead to regulate it. 201A tubes are used throughout the receiver with the exception of the last stage of audio. Here a UX112 power tube is used. Either the old navy base type or the new UX base tubes may be used, since the socket will take either.

NEW CONSOLE MODEL

BANK FIAT WOUND LOOP

"Remarkable Efficiency Combined with Unusual Beauty"

Sells on sight. Makes good in use. Quick turnover. Good profits. Satisfied fans. Everybody happy.

New Fiat an ornament to any set. In harmony with finest surroundings anywhere.

Made of solid American Walnut, with natural lacquer finish hand rubbed.

Easily erected by simply inserting center support in pedestal and turning until wires are taut. Reverse process as quickly takes it down.

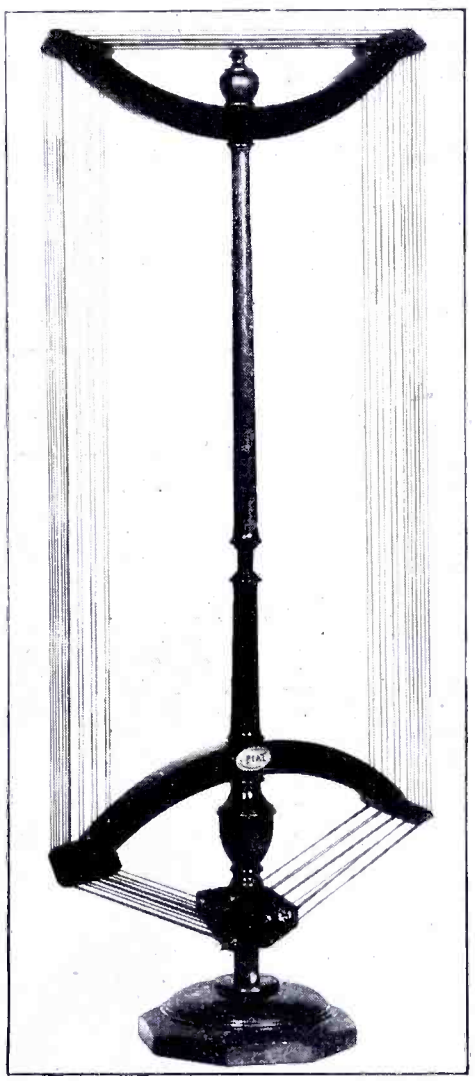
Size erected—13½" wide by 30" high. Turns on 7" radius.

Individual package—12"x14"x4½".

Our patented method of Bank Winding makes the small size possible. The long perpendicular side effects gain in directional efficiency. The Bank Winding by our exclusive patented method secures a high ratio of inductance to distributed capacity insuring an unusual degree of sensitivity.

The Fiat is specified with St. James, Madison-Moore and other Super-Heterodyne sets. (See articles in September, 1926, issue Citizen's Radio Call Book, pages 68 and 103.)

Browning-Drake and Neutrodyne or any tuned radio frequency receiver can be converted for FIAT Loop operation by slight circuit modifications. (Circuits upon request.)



Patented Oct. 27, 1925—Other Patents Pending

SPECIFICATIONS—TYPE C CONSOLE

Woodwork—Solid walnut.
Metal—Rose Gold Plated Fittings.
Wire—Special H. F. cable, 65 strands No. 38 copper, brown silk covered.
Base—Equipped with felt bottom.
Finish—Natural laquer, hand rubbed.
Dielectric—Bakelite throughout.
Size—Erected 13½" wide by 30" high. Packed 12"x14"x4½". Twelve to standard case.
Spacing Combs—Patented construction, wires locked.
Binding Posts—Special type between bottom combs. Also has center tap.
Pivot—Extra large with bushing in base.
Weight—3 lbs. boxed.
Type A Folding Diamond Shape Portable Loop also available.
Height 29⅝" overall. Width 26¼" overall. Sides 18" each. Folded 21" overall.

Laboratory Test

Self inductance, 0.00019 Henries; distributed capacity, 17.38 M.M.F.; natural wave length, 108 Meters; Resistance at 1,000,000 cycle, 8 Ohms; Wave band covered with .0005 M.F.; Condenser, 180 to 600 Meters.

JOBBERS

For selling beauty and making-good merit, the Fiat is the Loop to stock. To profit by its phenomenal success this season, write us at once for our liberal discounts and terms. Good territory still open to recognized jobbers and distributors.

Price, $12.50 each; West of Rockies, $13.50. Canadian $15.50; Foreign $17.00

In case your jobber or dealer does not carry Fiat Loops, order from us direct. Sent postpaid on receipt of list price.

THE FIAT GUARANTEE—

Every FIAT Loop is guaranteed against any mechanical or electrical defects. Any FIAT Loop that does not prove entirely satisfactory will be replaced or repaired free of charge providing the loop does not show signs of misuse.

RADIO APPLIANCE CORPORATION

4884-90 North Clark Street, Chicago

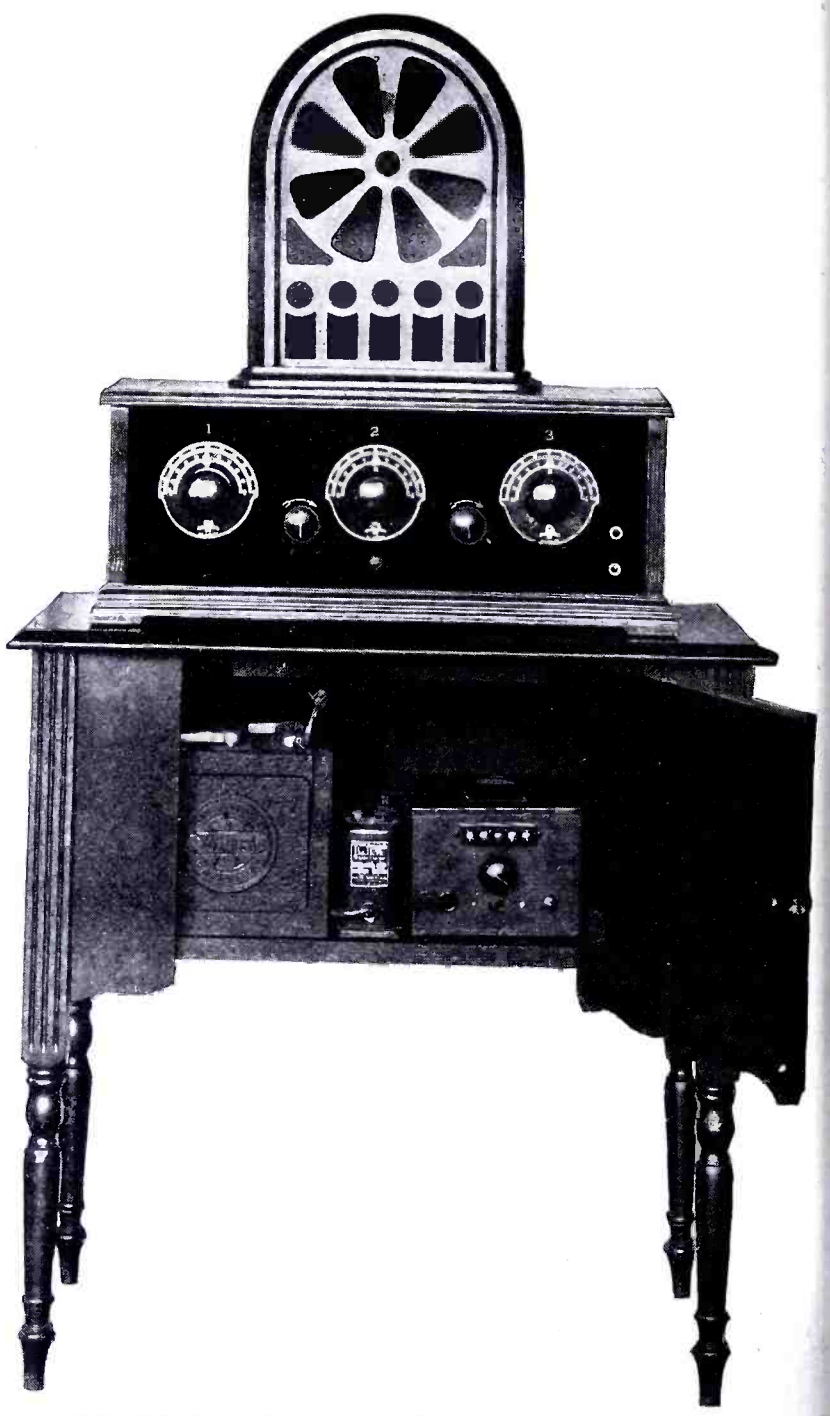
Cable Address FIATCO

With condensers having a strictly straight-line frequency tuning characteristic and fully 360 degrees rotation, there is no need of vernier mechanism, thus still further simplifying the set without sacrificing any ability to tune in all stations of whatever wave length.

The accessories shown are:

All-American New Cone Type Loud Speaker made by All-American Radio Corp., Chicago.

The "B" Eliminator is the Raytheon type made by the same company and will deliver all necessary voltages to operate the detector and amplifying tubes.



Completed receiver mounted on table with accessories

A Balkite Trickle Charger is shown in connection with a standard 6 volt Willard Radio Battery which when plugged into any A.C. house light socket will supply all "A" battery current necessary to operate your tubes with very little further attention. The trickle charger is made by Fansteel Products Co., Inc., North Chicago, Ill. The 6-volt battery, Willard Storage Battery Co., Cleveland, Ohio.

(If any further information is desired regarding these accessories, please write manufacturers direct.)

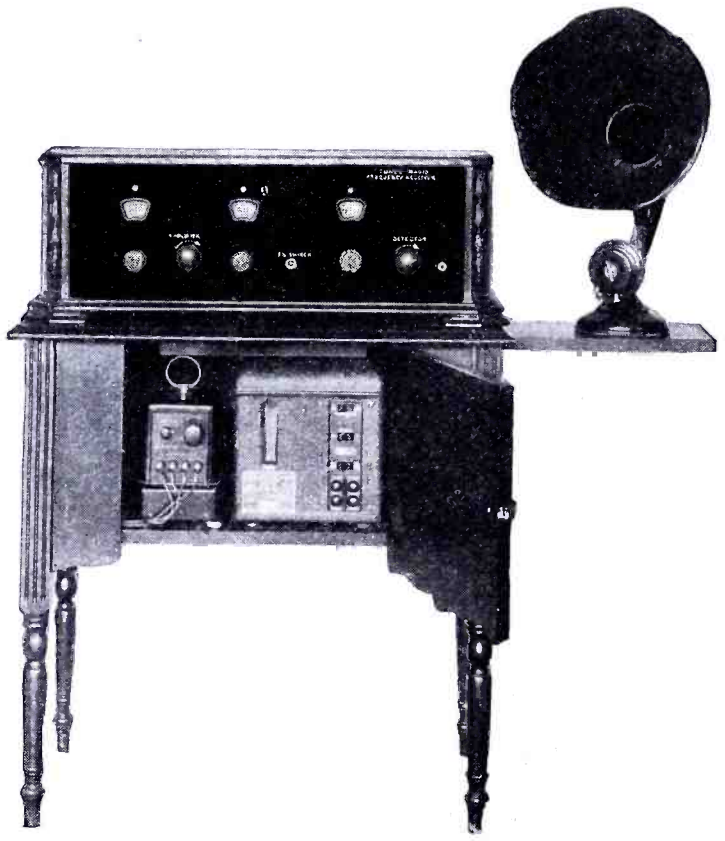
A Tuned Radio Frequency Receiver Using a New Shielded Transformer Coil

(See page 162 for diagram)



Front view showing new Marco illuminated dials

HERE is a receiver using an entirely new design in a shielded tuned radio frequency transformer. The size of the shield is only three inches in diameter and one and one-eighth inches high, and is composed of pure copper, nickel-plated. It contains a transformer coil consisting of primary and secondary and designed to tune from 200 to 550 meters when the secondary is shunted by a .00035 mfd. variable condenser. The grid, plate and plug B terminals project through insulating bushings, while the grid return is grounded to the shield.

These coils tune extremely sharp and possess a nearly straight line oscillation curve over their total tuning range. When placed in a tuned radio frequency circuit oscillation may be controlled by the radio amplifier tube rheostat without the use of any other means of neutralizing. When 90 volts is applied to the plates of

Glowing spots of light . . . *in place of dials*

MICROMETER TUNING ACTION to bring out the best your set can do . . . .

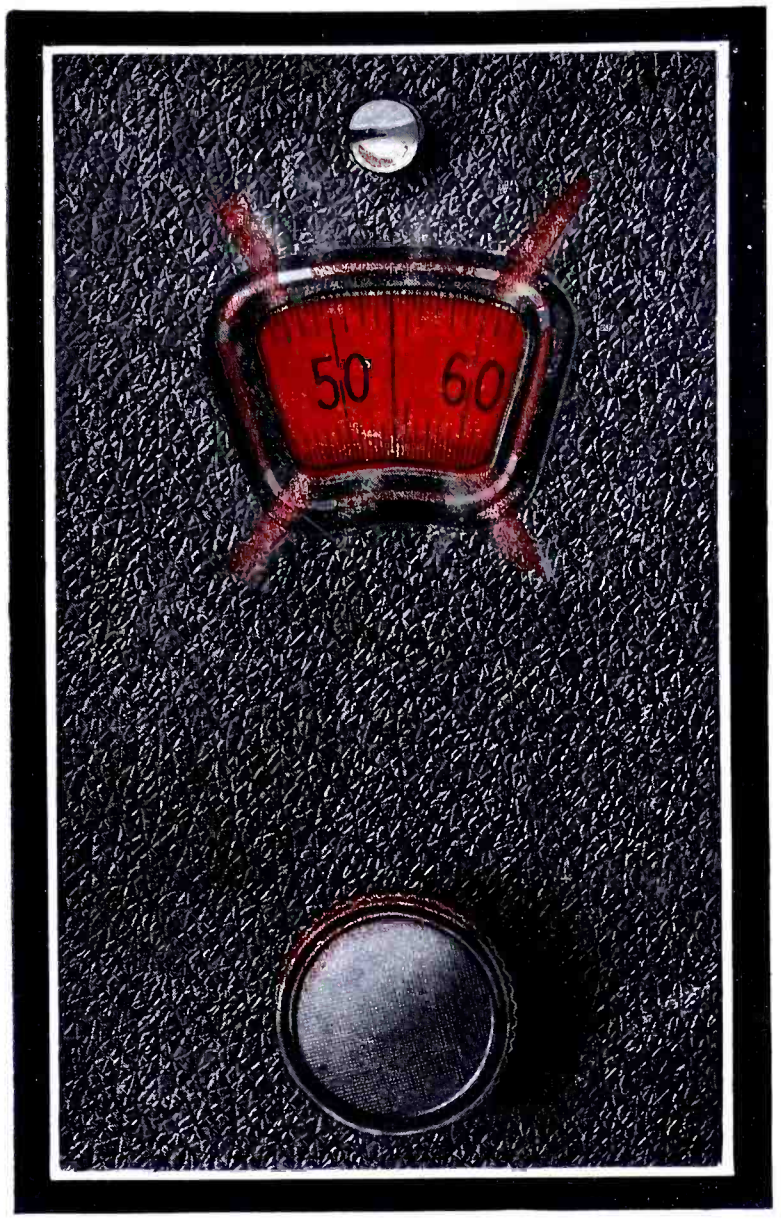
Smooth, gearless "friction-drive" to banish backlash forever . . . .

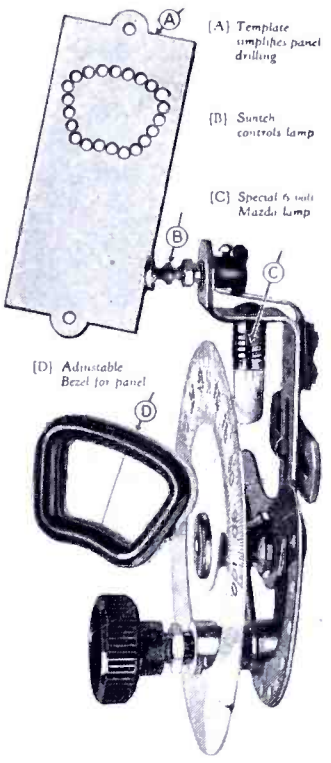
Soft illumination to add swifter readability to scale and flashing beauty to the panel . . . .

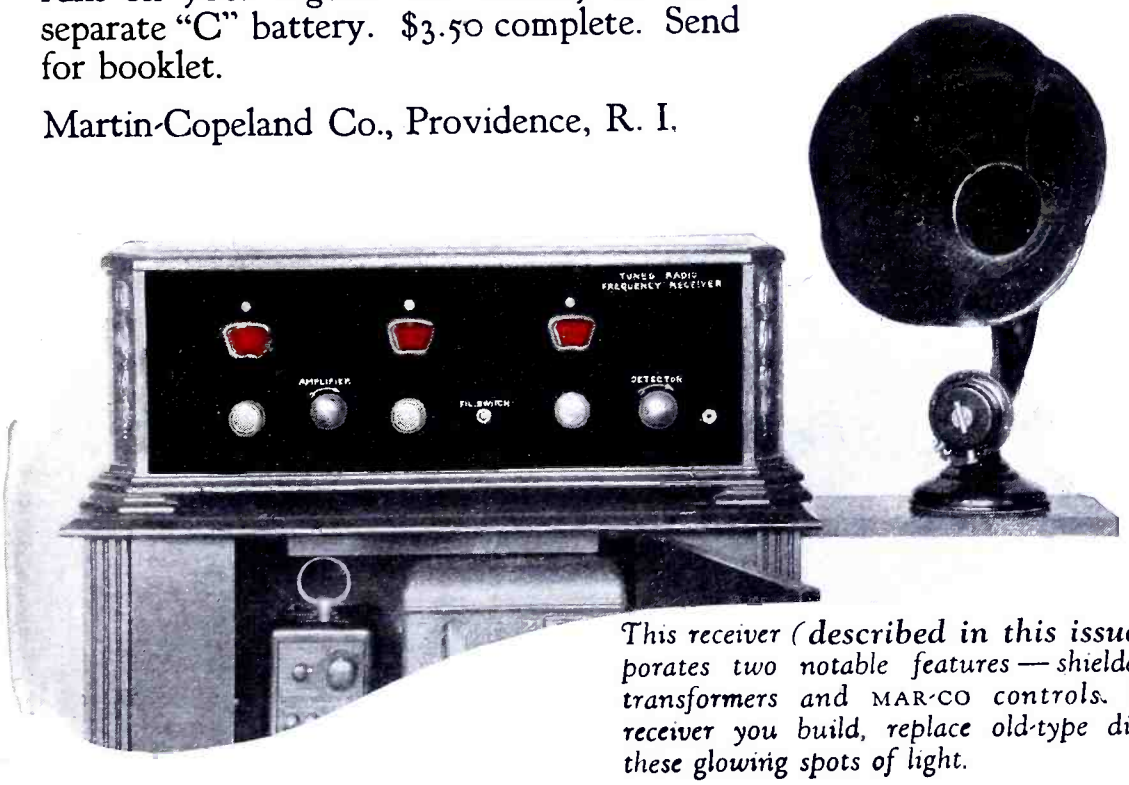
. . . . these are the advanced features that distinguish the set you equip with MAR-CO illuminated controls.

Any receiver—the new one you build, or the old one you remodel—can have MAR-CO controls. They fit all standard condensers. Scales read 0 to 100, or 100 to 0, as preferred. The template makes mounting a simple 10-minutes' undertaking. Special Mazda lamp supplied runs on your regular "A" battery or on a separate "C" battery. $3.50 complete. Send for booklet.

Martin-Copeland Co., Providence, R. I.







This receiver (described in this issue) incorporates two notable features — shielded TRF transformers and MAR-CO *controls. In any receiver you build, replace old-type dials with these glowing spots of light.*

MAR·CO *Illuminated* CONTROLS

the radio amplifier tubes the full plate current for which the tube is rated may be used before oscillation takes place.

All of the shields are connected to minus A and grounded. It will be noticed that a positive grid return is used on the detector tube. This allows a 201A tube to be used as a detector. The shields may be placed very close together for compactness without detrimental effects. This compactness of shield and assembly is made possible by the use of new principles in coil design.

A standard five tube tuned radio frequency circuit is used in this receiver. The two radio frequency tubes are controlled by a 10 ohm rheostat, the detector by a 25 ohm, and the two audio tubes by a ballast resistor. A .5 mid. by-pass condenser is shunted across the "B" 90 volt lead and the grid return of the detector tube. This helps considerably in stabilizing the radio frequency circuit. Only one jack is used in the output, since the radio frequency rheostat serves admirably as a volume control. Three major tuning controls, each consisting of a variable condenser of straight frequency tuning characteristic, tune the receiver. A new departure in an indicating device is the incorporation of the Marco Illuminated Control in this receiver. This unit offers the solution of many problems and is the first device of its kind to appear on the market. There has been a general feeling that dial housings with their attendant mechanisms should be behind the panel with other apparatus. The Marco Illuminated Control consists of a translucent dial, of extra large size, with attendant lamp socket for a low current consumption bulb designed to operate from the filament battery. A switch is provided for this lamp. The graduations and figures are large enough to read under circumstances which would render the ordinary dial scale illegible. All mechanism and the dial itself are mounted behind the panel. The unit is heavily constructed so that instruments may be mounted directly on the dial frame.

The audio transformers are capable of amplifying all audible frequencies now broadcast. Excellent reproduction should result if a good speaker is used.

With this receiver it is possible to tune a powerful local station within a few degrees on the dial, or in localities where there are several local stations any one of them may be tuned in without interference, and distant stations received while locals are operating.

The accessories shown are:

One 7x26 Super Cabinet made by D. H. Fritts Company, Hearst Square, Chicago, Ill. The Burns "B" Eliminator delivers all necessary voltages to operate both detector and amplifier circuits, made by American Electric Company, Chicago. The speaker is also by the above mentioned company. A Willard "A" Power Plant is shown and when connected in any convenient A.C. house light socket requires very little further attention. Manufactured by Willard Storage Battery Company, Cleveland, Ohio.

(If further information is desired regarding any accessories listed it will be supplied by the manufacturers if you will address them direct.)

Instructions for Assembling the General Radio Type 390 Rectron "B" Eliminator and Power Amplifier Kit

(See Page 148 for diagram)

ONE of the necessary requirements of any radio receiver using vacuum tubes as detectors or amplifiers is the "B" battery, the chief function of which is to supply a relatively high positive charge to the anodes or plate terminals of the tubes. This positive potential is necessary in order that the negatively charged electrons emitted from the hot filament of the tube may be drawn across the intervening space to the plate and a current of electricity established.

The most universal method of supplying this positive potential is by the use of small dry cells, which are usually supplied assembled in block units of multiples of 22½ volts. Such batteries are limited in their useful life, and upon aging are apt to give an unsteady voltage which introduces troublesome noises into the radio receiver. Furthermore, they deteriorate even while not in use, affording, thereby, an uncertain service, and requiring inconvenient and rather expensive renewals.

Batteries constructed of groups of small capacity storage cells are frequently used for supplying the desired "B" voltage. Such units, while quite saisfactory for the purpose, require proper charging and considerable attention to keep them in prime condition. They are cumbersome and difficult to keep properly clean, and so are rather undesirable to the average man who desires a maximum amount of service for a minimum amount of attention from his radio.

The electric lighting service with which the great majority of homes are equipped affords a very inexpensive source of electrical power for "B" battery purposes. Except within limited metropolitan areas this service is almost universally supplied by 60 cycles alternating current. Before this alternating current can be utilized for the purpose, it must first be rectified or made to flow in a single direction and then filtered to convert the intermittent ripple of current into a continual, steady flow. The rectifying device and the filtering system constitute the chief components of the "B" battery eliminator.

The great majority of radio sets using low-power vacuum tubes, that is, tubes having filaments which draw such small currents that they may be lighted by means of dry cell "A" batteries, are rarely able to supply a sufficient power output to operate a loud speaker successfully without danger of overloading the last tube of the audio amplifier. Such overloading invariably causes a distortion of the reproduced music or speech and seriously cripples what would otherwise be an excellent radio set. The use of a higher power tube in the last audio stage is then quite desirable, but such tubes require more filament current than may be economically drawn from dry cells, while on the other hand a storage battery is so troublesome that many persons continue to use the smaller power tubes.

To overcome this difficulty the General Radio Company have incorporated a power amplifier unit into their "B" eliminator kit. This power amplifier, which should comprise the last stage of audio amplification, employs alternating current of the proper voltage for lighting the filament of a vacuum tube designed to handle a sufficient intensity of signal to give true and undistorted music and speech on a loud speaker with all the volume desired under any ordinary circumstances.

The Rectron tube, Type UX-213, is used as the rectifying device in this kit. This tube, which is a double-wave rectifier, is efficient in operation, is free from tube noises, and, supplied with a

moderate filament current, has a very long life. A suitable transformer, Type 391, was designed to be used with this tube. The primary coil is connected through a switch to the ordinary 110-volt, 60-cycle house-lighting current. The transformer has three secondary coils, one having an open circuit of 440 and provided with a center tap. There are also two independent five-volt secondaries, one intended to light the filament of the Rectron tube and the other to light the filament of the power amplifier tube, Type UX-171, for which this kit is designed. A resistance of 60 ohms, having a center tap, is connected inside the transformer case across the terminals of the amplifier filament coil.

The filter circuit comprises two choke coils mounted in a single unit, Type 366, and a block of waxed-paper condensers mounted as a separate unit, Type 392. Extensive experiments have shown the filter combination of four, two and four microfarads to be quite satisfactory for the purpose. The Type 392 unit also contains two one-microfarad condensers used as by-pass capacities across certain portions of the resistance unit. Such a filter passes a steady flow of current with an entirely negligible amount of hum. Any noticeable hum observed on a radio used with this kit must necessarily arise from some other source, as induction from power mains, etc.

In order that various "B" battery voltages may be obtained for use in the radio set, the Type 393-A resistance unit is connected across the output of the filter. Various "B" eliminators on the market make use of adjustable resistances for this purpose whereby variations of voltage may be obtained according to the output of current furnished to the set. In the great majority of cases such adjustments are troublesome and are of little real value. Furthermore, the variable resistance units employed are of such a nature that they are quite apt to be irregular in action, giving rise to troublesome noises in the circuits. The Type 393-A resistance unit is constructed of a series of wire-wound fixed resistances so proportioned, after careful study, as to give the desirable voltage required by the great majority of sets, and to maintain these voltages with a sufficient approximation with the "B" battery currents, which are required by all but the exceptionally heavy-duty sets.

Two voltage taps are provided for use with the radio receiver, one giving about 40 volts and the other about 90 volts. For use on the detector tubes and small power amplifier tubes the 40-volt tap is recommended, while the 90-volt tap provides a source of higher potential for use with amplifier tubes when desired. The still higher voltage required by the UX-171 power amplifier tube is supplied directly from the set, likewise the 30 to 40 volt "C" bias required by this tube.

By substituting a different resistance unit for the Type 393, a variation in the available voltage may be obtained, but it was decided that the unit as designed would fit the great majority of sets, would require no bothersome and uncertain adjustments, and would be thoroughly reliable in operation.

For use with the power amplifier the Type 285 input transformer having a ratio of 1:6 is employed. This operates very well in conjunction with the UX-171 tube. This tube has only a moderate amplification factor, but is designed to handle an unusually large signal without distortion, which is the more important consideration in a power amplifier. No rheostat is used with this tube, the proper voltage being supplied directly from the transformed. Thus there are no adjustments whatever to cause trouble—a desirable feature.

The Type 367 output transformer is used in the plate circuit of the power amplifier tube. This removes the direct current from the loud speaker, helps still further in reducing distortion and is in other ways desirable.

LIST OF PARTS

The kit contains the following parts:

1. One panel board properly drilled for mounting the various pieces of apparatus.
2. One power transformer, Type 391.
3. One filter choke, Type 366.

MIRACO RADIO GETS 'EM COAST to COAST

Send for Proof!

NOTICE! Enormous sales of the celebrated Miraco 6-tube Receivers (resulting from delighted users so highly endorsing them to friends) again enable us to add hosts of costly new features, latest refinements and up-to-the-minute improvements such as you might expect to find only on much higher priced sets. Miraco's this year are still better—more beautiful—more selective—more powerful—for less money than ever before!

Reports from users everywhere leave little for us to add. These are only a few of the many in our files and which we receive daily. Send coupon for plenty of additional proof and testimony of nearby users.

WISC. USERS HEARD FRANCE Kenosha, Wis. I was one of Kenosha's International Test Listeners during the test week Jan. 24 to 30.

Am sending a clipping of the Kenosha Eve. News to prove I had PTT Toulouse, France. On Thursday night I picked up LOX at Argentina. Both verified by Kenosha Eve. News is having some of the program. We have sold a number of Ultra-5's, and two of the sets reported having PTT also. Horace R. Boylan.

OREGON HEARS FLORIDA—MEXICO. Antelope, Ore. Comparison with higher priced radio sets has proved the Miraco everything you claimed for it. I have had about 100 stations from Florida to New York and from Mexico City to Canada, all on the loudspeaker. Vernon Hill.

THRU LOCAL COAST TO COAST Cleveland, O. Located about 1 1-2 miles from WTAM, I can tune them out on 3 degrees of the dials. I have gotten: 9 New York stations; 14 Chicago stations; Mexico City; Los Angeles; Denver; Cuba and Miami, Fla. all with good loudspeaker volume. Geo K. Montgomery.

ALL. HEARS LONDON--LOS ANGELES. Danville, Ill. List enclosed of stations logged this week on Miraco Ultra-5. Received several foreign stations on loudspeaker. 2LO London was heard plainly. I had Cuba and Mexico City several times. Also logged KFI, Los Angeles. Earl Everett.

THRU CHICAGO LOCALS--COAST TO COAST. Chicago, Ill. Some of the stations I get on Ultra-5 with all Chic. stations broadcasting; KFAE Pullman, Wash.; WEAF New York; KFAL Denver, Colo.; KFI Los Angeles, Cal.; KFKX Hastings, Neb.; KOA Denver, Colo.; 6WK Tuinucu, Cuba, WBPA Ft. Forth, Tex.; WBT Charlotte, N.C.; WCAP Wash. D.C.; WGY Schnectady, N.Y.; WJZ N. Y. WJAX Jacksonville, Fla. A. Huff.

EQUALS HIGH PRICED SETS. Pittsburgh, Pa. I am getting the very best results in Radio Reception that can be found in any high priced super set or any costing 6 times the price of my Miraco Ultra-5; Sunday evening 11.15 P. M., Madrid, Spain, entertainment was clear. I tune them in on the loudspeaker, coast to coast and then some more. If there is anything on the air the Miraco will bring it home. J. H. Adamson.

N.Y. HEARS LOS ANGELES. Glenfield, N. Y. Have logged 93 stations in 8 weeks on our Miraco Set all on the loudspeaker including stations in Canada, Florida, Cuba, and Los Angeles. Mrs. LeRoy Burdick.

COLORADO "TOURS CONTINENT." Jareso, Colo. It is really wonderful what your Miraco Ultra-5 can do. I have gotten Seattle, San Francisco, Los Angeles, Phoenix, Ariz., San Antonio, New Orleans, Miami, Florida, and Atlantic City and New York City and CKY in Canada. Now I'll say that is touring the continent. Stewart L. Medill.

NEBR. HEARS N. Y. TO CALIF. Geneva, Nebr. Having fine success with your 5 tube set. Have picked up stations as far away as WSB Atlanta, Ga.; WEAF New York; WSMB New Orleans; WFAA Dallas, Tex.; WGO Oakland, Cal. R. D. Hampton.

BEATS OTHERS IN TESTS. West Salem, O. Have demonstrated Miraco beside a good many different sets and not one of them was as good. During International Radio Week Jan. 27th, at 11:28 P.M. EAJ Madrid, Spain was heard plain At 11:40 an announcement was made from Hamburg, Germany. Also heard CGZ Mexico City and WKAQ Porto Rico. Have 75 other distant stations on my log including KFI Los Angeles, Cal. KGO Oakland, Cal. 6KW Tunicuco, Cuba Howard Snoddy.

COAST TO COAST ON SPEAKER Claude, Tex. Very much pleased with my Miraco. I have gotten stations all over the United States with it. Received New York and within a few minutes I had brought in Los Angeles on loudspeaker. That is truly "coast to coast" reception. L. Wiegman.

PERFORMS LIKE $175, $200 SETS. Ringgold, Va. To say that my Miraco is a "wonder" is a small expression. Friends say that it is as clear and plain as sets that cost $175 and $200. Have heard WDAF Kansas City, Mo.; WABI Bangor, Me.; WPG Atlantic City, N. J.; KFJF Okla. City; KFI Los Angeles, Cal.; WEAF New York, N. Y. Berry Beasley.

ALA. CUTS THROUGH LOCALS Camp Hill, Ala. My Ultra-5 is doing fine. Can get most any station I want from Mexico to Mass. from Cuba to Canada with all of our local stations going full blast. R. C. Whetstone.

VIRGINIA HEARS CALIFORNIA Mt. Sterling, Va. Miraco Ultra-5 sure gets them. It's as easy to operate as a Ford. I have over 92 stations to my record. Programs come in on the speaker from Ottawa, Canada, Ont. and Montreal, Que. to Havana and Tuinucu, Cuba, also Mexico City and from New York to Los Angeles, Calif. E. H. Baker.

CAL. FINDS MIRACO EXCELS Suisun, Cal. Am ordering another Ultra-5, the set sure does all you claim. I have tried it out with many other sets costing twice or three times as much only to find the Ultra-5 as good or better in most cases. Earl Branscombe.

SELECTIVITY! CUTS THRU LOCALS. Detroit, Mich. I am satisfied with Miraco. Can cut thru WWJ WCX WJR WGHP very very strong local stations. Charles Paul.

Big Powerful New MIRACO Ultra 5

TRADE MARK REGISTERED

Guaranteed by a Big Old Company 7th Successful Year

Sloping Front Cabinet-Panel-Dials Finished in Walnut

[ULTRA-SELECTIVE LONG DISTANCE SET EASY ON BATTERIES]

Unless convinced—after a good long trial in your home—that the beautiful new high-powered Miraco is the most astonishing bargain offered in big, fine, high-grade radios, don't buy it. Could any offer be fairer? And, remember, this offer is made by a large responsible manufacturing corporation—one of the oldest and most successful set-builders in the industry—a concern which has grown to immense size through the recommendations of satisfied customers who bought after trial.

Testimony of delighted users from coast to coast offers positive proof that the big Miraco actually is unmatched (even at much higher prices) for "razor-edge" selectivity combined with extreme long distance reception, clear natural tone, powerful loud speaker volume and economy in use of battery current.

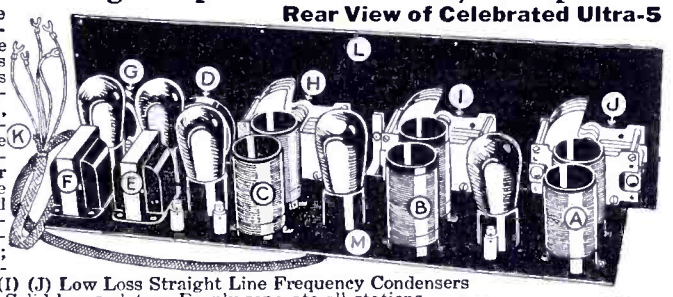
It comes completely built, thoroughly tested and factory guaranteed for one year. A big, beautiful expensive looking radio,—one you'll be proud to have friends see and hear. Has stylish sloping front cabinet, handsomely gold illustrated genuine Bakelite front panel and large Bakelite knobs with "arrow point" indicators for fine tuning—in beautiful walnut finish throughout.

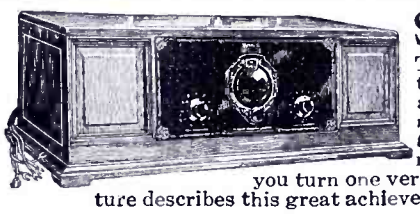
Clip coupon now for literature and Special Offer that will surprise and interest you.

Compare its construction with highest priced sets—study this picture

Note the neat sturdy high-class construction; wide spacings between parts eliminate losses and interference. All wiring concealed under genuine Bakelite base panel (M). Flexible wiring prevents broken or noisy connections. Flush-type sockets for the new tubes. (A) (B) (C)—"Duoformers"—famous exclusive Miraco Ultra low loss, self shielded and matched coils—one of the Miraco secrets of selectivity with powerful volume on long distance stations. (D) "Counter Balancer"—patented feature, NOT a rheostat or potentiometer. Controls oscillations on all wave lengths, reduces "B" battery consumption and further increases selectivity, distance range, clarity, power and volume. (E) (F) Shielded transformers of famous make evenly amplify all notes; beautiful tone quality. (G) Tone Modulator—regulates volume, switches current off or on. (H) (I) (J) Low Loss Straight Line Frequency Condensers—highest grade—equipped with ball bearings. Solid brass plates. Evenly separate all stations. (K) Connect E-Z Cable for attaching batteries. (L) Genuine Bakelite front panel. And many other latest features of costliest sets. Literature describes them fully, send for it!

Rear View of Celebrated Ultra-5





Single Dial Control!

The celebrated Miraco Ultra-5—U.S. Navy type circuit, above described, has also been adapted to Single Dial Tuning—*without sacrifice of selectivity, volume, clearness, power, tone or distance getting qualities!* In the magnificent big Miraco Unitune-5, here shown, you turn one vernier knob for stations everywhere. Literature describes this great achievement. *Also offered on 30 days free trial!*

AGENTS! DEALERS! Write for our latest Miraco proposition. Nation-wide popularity, superior performance of Miraco 5-tube sets, at amazingly lower prices, make them easy to sell. Send coupon today for proof

4. One filter condenser block, Type 392.
5. One input transformer, ratio 1:6, Type 285.
6. One output transformer, Type 367.
7. One resistance unit, Type 393-A.
8. Two vacuum tube sockets, Type 349.
9. One terminal strip.
10. One double snap switch.
11. One attachment plug and cord.

A Four Tube Non-Reradiating Receive

(See Page 153 for diagram)

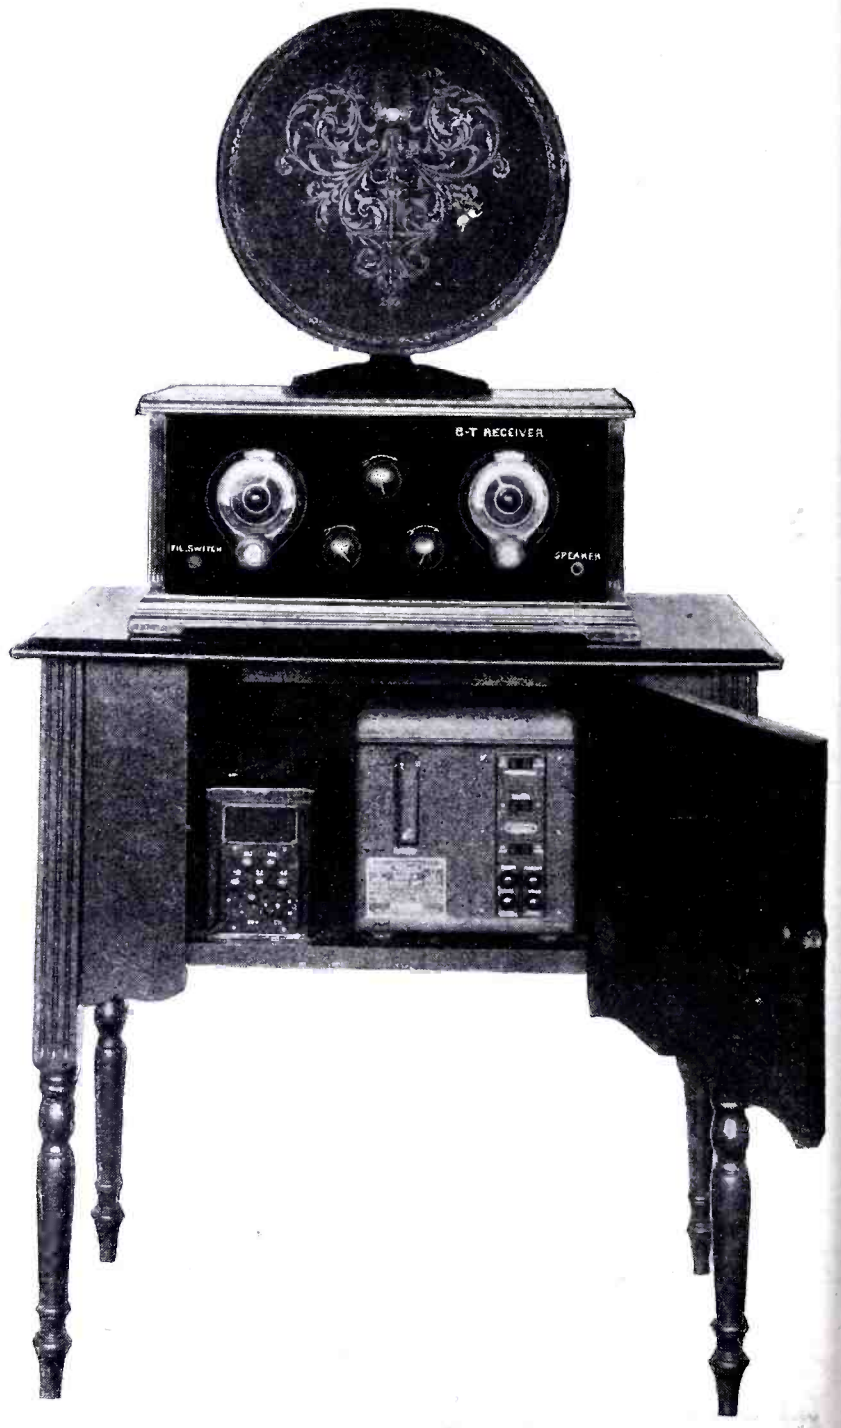
THIS receiver consists of a tuning arrangement of a antenna coupler with an adjustable primary, a three cir cuit tuner consisting of a radio frequency coil used in th plate circuit of the radio frequency tube, a secondar winding and a variable tickler coil used for regeneration in th plate circuit of the detector tube.

The secondaries of each coil are tuned with a .00025 variabl condenser. A variable resistance of 200,000 ohms is used in th plate circuit of the radio frequency tube to control oscillation

Various setting of this unit will increase the amount of volum and sensitivity when tuning in distant stations.

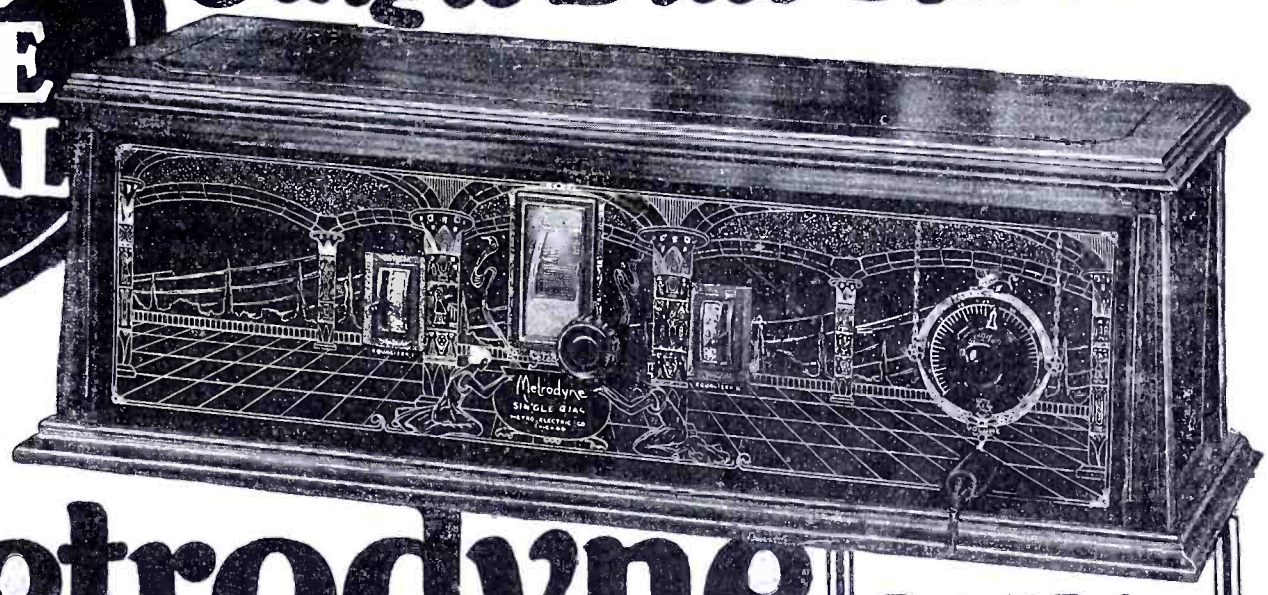
The radio frequency coil is variable and once adjusted for maxi mum selectivity and sensitivity, it needs no further adjustment.

The amplifier consists of two stages of audio transformer wired in the usual manner as illustrated in the graphic drawing.



7 Tube Set
Single Dial Radio

30 DAYS FREE TRIAL



The Metrodyne

ONLY ONE DIAL TO TUNE

Retail Price
$75
Completely Assembled
Big Discounts to Agents and Dealers

Wonderful offer direct from the factory! The world's greatest radio.
A perfect working, single dial control, 7 tube receiver. And just to prove our claims, we will ship it to your home for **30 days' free trial.** Test it under all conditions. Test it for distance, volume and tonal quality — and if you are not convinced that it is the best single dial set you ever heard, return it to the factory. We don't want your money unless you are completely satisfied.

BIG PROFITS TO AGENTS AND DEALERS
Our Agents and Dealers make big money selling Metrodyne Sets. You can work all or part time. Demonstrate the superiority of Metrodynes right in your home. Metrodyne Radios have no competition. Lowest wholesale prices. Demonstrating set on 30 days' free trial. Greatest money-making opportunity. Send coupon below—or a letter—for our agent's proposition.

Metrodyne Super-Seven Radio

A single dial control, 7 tube, tuned radio frequency set. Approved by America's leading radio engineers. Designed and built by radio experts. Only the highest quality low loss parts are used. Magnificent, two-tone walnut cabinet. Artistically gilded genuine Bakelite panel, nickeled piano hinge and cover support. All exposed metal parts are beautifully finished in 24-k gold.

Easiest set to operate. Only one small knob tunes in all stations. The dial is electrically lighted so that you can log stations in the dark. The volume control regulates the reception from a faint whisper to thunderous volume, 1,000 to 3,000 miles on loud speaker! The Metrodyne Super-Seven is a beautiful and efficient receiver, and we are so sure that you will be delighted with it, that we make this liberal **30 days' free trial offer.** You to be the judge.

RETAIL PRICE
Completely Assembled

Metrodyne Super-Six

Another triumph in radio. Here's the new 1927 model Metrodyne 6 tube long distance tuned radio frequency receiving set. Approved by leading radio engineers of America. Highest grade low loss parts, completely assembled in a beautiful walnut cabinet. Easy to operate. Dials easily logged. Tune in your favorite station instantly on same dial readings every time. No guessing.

Mr. Howard, of Chicago, said: "While five Chicago broadcasting stations were on the air I tuned in seventeen out-of-town stations, including New York and San Francisco, on my loud speaker horn, very loud and clear, as though they were all in Chicago."

We are one of the pioneers of radio. The success of Metrodyne sets is due to our liberal 30 days' free trial offer, which gives you the opportunity of trying before buying.

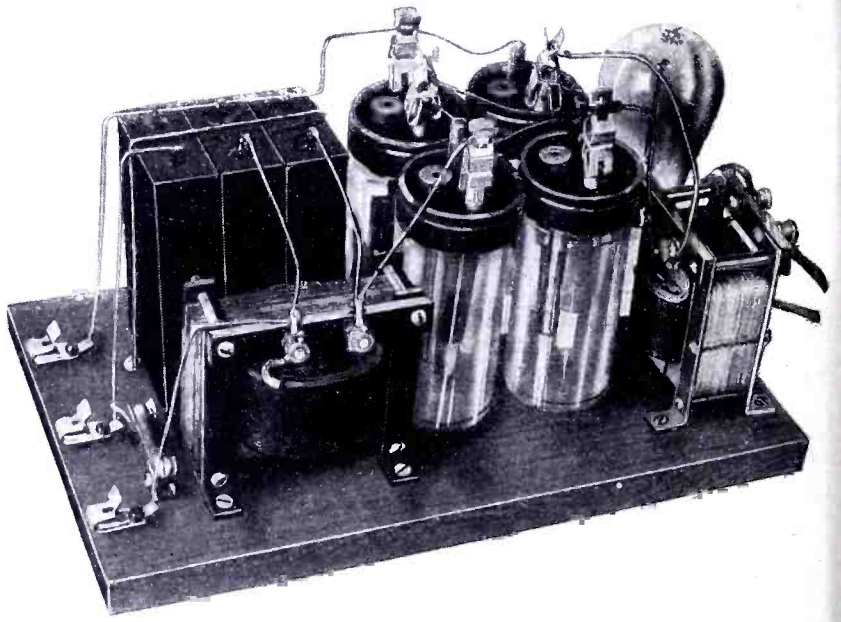
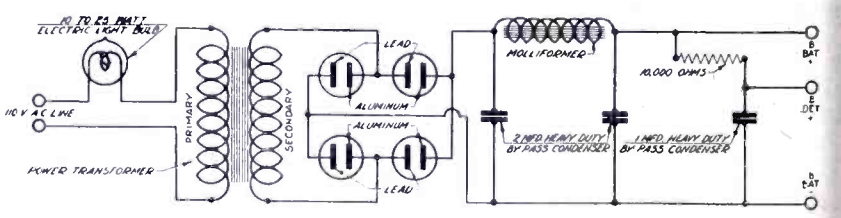
1—Blackburn Ground Clamp
Misc.: Screws, Lugs, Wire, Etc.

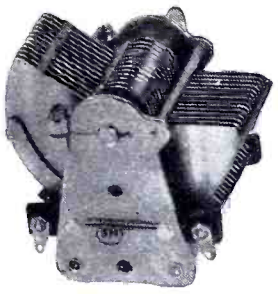
How To Build the Molliformer "B" Unit





(Continued to page 230)

SM



The 316 A, 316 B, and 317 Variable Condensers.

Uniform, interchangeable inductances for all circuits and wavelengths, to fit standard sockets.

A Step Ahead —and Then Some

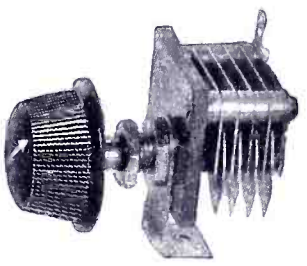
THE name Silver-Marshall has always been associated with progress —S-M parts have always represented something more than devices merely made to fill an existing demand. The part that these products have played in the development of radio reception is fully appreciated by those who know.

A combination of exceptional foresight, a thorough understanding of the field, manufacturing and laboratory equipment that is unequalled, has always resulted in products that have shown a marked advance in efficiency and design—built as well as modern factory methods and laboratory supervision at every step can make them.

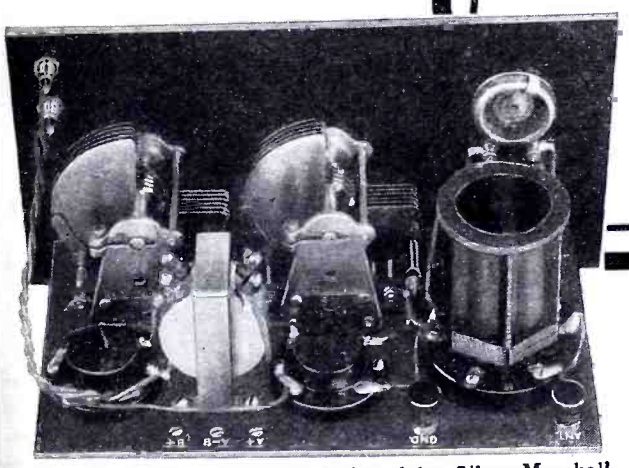
Those illustrated on this page are but a few of the many that are in constant demand where only the best is wanted. Each is a step ahead of the industry—each represents progress—items that experimenters have been waiting for—and are satisfied with.

Behind each S-M part is a guarantee—a guarantee of perfect materials and workmanship. That's why engineers, editors, explorers—seasoned experimenters—use and recommend them.

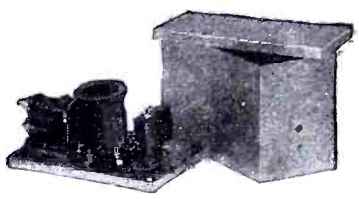
220 Audio and 221 Output Transformer. For power supply sets, 329 and 330 power transformer, 331 Unichoke, and 332 Condenser Bank.



340 Midget Balancing Condenser



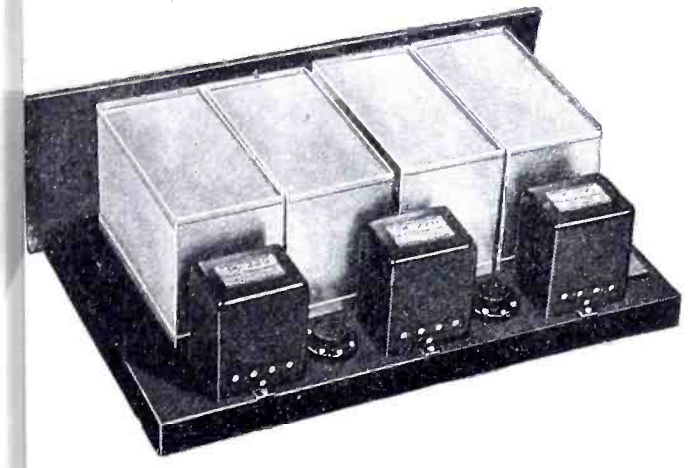
The Short Wave Receiver designed by Silver-Marshall Engineers and carried by Commander Dyott on his South American explorations to keep him in touch with the world—Silver-Marshall parts depended upon and dependable.



Individual 631 Stage Shield

210 and 211 Long Wave Transformers

SM 630 Silver Shielded Six



The assembly is all metal — aluminum shields house each radio frequency circuit and in turn fit on a steel sub-base fastened to a brass panel which is finished in attractive walnut. Not only is the assembly pleasing to the eye—dignified in its quiet richness, but the entire construction is sturdy. The Shielded Six is designed for years to come.

S-M 630 and 633 kits are manufactured by Tresco and licensed under Armstrong U. S. Patent No. 1,113,149, October 6, 1914. Silver-Marshall, Inc., Exclusive Distributing Agents.

The Shielded Six is one of the highest types of broadcast receivers. It embodies complete shielding of all radio frequency and detector circuits. The quality of reproduction is ***real***—true to the ear.

Behind the Shielded Six is competent engineering. It is sensitive. Day in and day out it will give distance—on the speaker. It is selective. Local stations in the most crowded area separate completely—yet there are but two dials to tune.

These features—its all-metal chassis and panel, its ease of assembly, and many others, put it in that small class of ultra-fine factory-built sets, priced at several times the Six's cost.

The S-M 630 Shielded Six Kit—including all specified matched and measured parts to build this remarkable receiver—price $95.00.

The 633 Shielded Six Essential Kit contains four condensers, four radio frequency transformers, four coil sockets, four stage shields and the link motion—all factory matched—price $45.00.

Clear and complete instructions, prepared by S-M engineers, go with each kit—or will be mailed separately for 50c.

220 and 221 AUDIO TRANSFORMERS

S-M 220—the big, husky audio transformer you hear in the finest sets—the only transformer with the ***rising*** low note characteristic that means real quality—not only on paper—but when you hear it. It is a power job—yet this finest of audio amplifying devices is sold, with a guarantee, for but $6.00.

The S-M 221 is an output transformer that will bring out the low notes on your present set. It should be used between the last audio tube and the loud speaker — it eliminates blasting and will increase speaker capacity for handling strong signals without distortion, $6.00.

THE POWER UNITS

These units are particularly designed for all "B" eliminator and power amplifier assemblies.

S-M 330 Power Transformer has 300 volt secondaries, a 110 volt, 60 cycle primary and a 7.5 volt filament lighting winding —$.600.

S-M 331 Unichoke—a two winding high inductance filter choke licensed under Clough Patent Application—$.600.

S-M 332 Condenser Bank—contains 10⅘ mf. of tapped filter condensers—all tested at 700 volts D. C.—$10.00.

S-M 329 Power Transformer is similar to 330, except that it is a low voltage type for Raytheon tubes. Primary, 110 volts A. C., two 220 volt secondaries, and a split 5 volt filament winding.—$6.00.

635 SHORT WAVE KIT

The type 635 Short Wave Receiver Kit contains the carefully designed and matched essentials for a real short wave set. Its range is 18 to 150 meters. The kit contains a set of four plug-in coils, one coil socket, one coupling condenser and two 140 mmf. condensers. These parts are all carefully designed for operation together.

With the four coils supplied, the amateur bands fall well to the center of the tuning scale. "Dead spots" at which the receiver will not oscillate are totally eliminated. The antenna condenser allows coupling adjustment to suit individual conditions. Price $23.00.

Lincoln, Nebr.

Ferbend Electric Co.,
Dear Sirs: I have found your "B" Eliminator to be very satisfactory and the results obtained were even better than the more expensive ——— which I had been using, as it was free from all hum. I also found that it made the reproduction through the loud speaker fully 50% clearer. I am more than satisfied with the machine.
(Signed) H. W. BRADLEY.

COMPLETE
Nothing else to buy
Replaces "B" Batteries. Operates Direct from Electric Light Socket.

$12.50

FERBEND "B" ELIMINATOR

Many careful buyers choose to adopt a policy of "watchful waiting." With the original announcement of the good Ferbend "B" Eliminator and its amazing low price of $12.50, many there were who chose to wait. They wanted to be convinced. True, thousands bought at the start and **they are the ones who now tell you what to expect.** Lack of space alone prevents us from publishing the hundreds of fine testimonials from satisfied users. They are all in our files open to public inspection at any time. A few reproduced here. The Ferbend "B" Eliminator successfully passed the rigid Laboratory tests of Radio News, Popular Radio and Radio Broadcast. It is a **proved** Radio necessity, and a great one.

FERBEND Wave Trap
This company also manufactures the famous Ferbend WAVE TRAP—the instrument which has been widely imitated but never equalled. It is the only **orignal** and **genuine.** $8.50

Ask Your Dealer—or Send Direct

If you prefer, we will make shipment direct to you upon receipt of price, or C. O. D., if desired. Use for 10 days to convince yourself—if unsatisfactory, write us within that time and purchase price will be refunded. Use the coupon now.

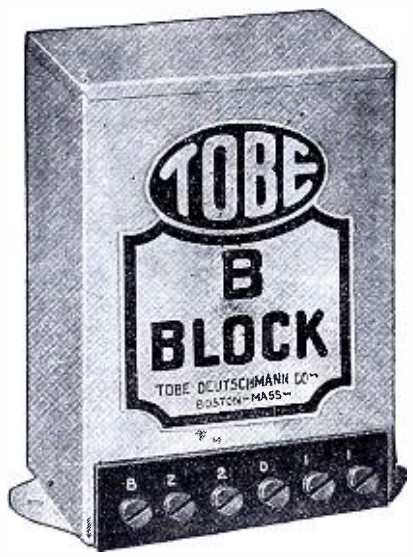
Bi-Pass and Filter Condensers

Hi-Voltage Power Pack Type Condensers for AmerTran Sets

A complete line of Fixed Condensers for set by-passing, for use in filters of Raytheon and Rectron B-Eliminators. and the new TOBE High-Voltage Power Pack Type Condensers, especially designed for use in the AmerTran Power Amplifier.

One quality only,—the best we can make.

In the characteristic silvered, metal cases.



Type 760

The TOBE B-BLOCK contains in one compact metal cased unit, the filter condenser capacities required for the Raytheon B-Eliminator. TOBE Condensers are recommended by the Raytheon Manufacturing Company itself as unsurpassed by any for use with the Raytheon Tube. The TOBE B-BLOCK saves time, saves wiring, saves money. Price $11.00.

(Also made for use with UX-213 Rectron Tube and in other combinations and capacities.)

Vacuum TIPON Loewe-Leak

VERITAS Hi-Current Resistor

The TOBE VACUUM TIPON LOEWE-LEAKS, and the TOBE VERITAS High-Current Resistors, cover the entire Radio requirements for fixed resistances. The vacuum leaks are sealed in a high vacuum and are changeless and noiseless. Adaptable for resistance and impedance-coupled amplifiers and for all grid-leak use in receiving sets. Carry up to 1/10 watt current.

The "VERITAS" Resistors are for use in B-Eliminators and for transmitting grid-leaks and can carry 5 watts continuously. Both types can be soldered into the wiring without damage.

In All Values

We will gladly send you descriptive literature on any or all of these TOBE products, also on TOBE Transmitting Condensers

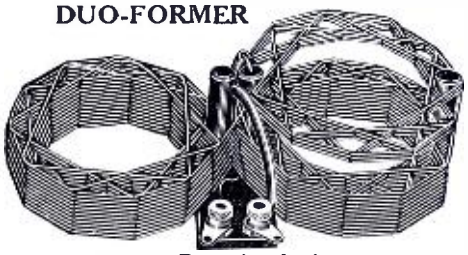
CAMBRIDGE **MASSACHUSETTS**

Gen-Ral Favorites

REGISTERED

Gen-Ral Coils have become a favorite in Chicago, where conditions are most severe, due to their ability to go through local interference and bring in the distant broadcasts.

DUO-FORMER



Pat. Applied

Price $2.50

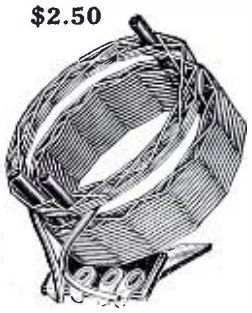
DUO-FORMER

Gen-Ral Duo-Former Coils are built to eclipse past radio performance; to fill the need for higher quality radio reception with an even and undistorted amplification of radio frequency currents; to eliminate the evils of interference between coils and the picking up of outside disturbances; to make possible radio frequency amplification from one to four stages without distortion, producing radio sets combining with distance and selectivity an unparalleled quality of tone.

(Specified in hook-up on page — Other hook-ups sent free on request)

Radio Frequency Transformer

$2.50



The basket-solinoid type of coil of proven ability. The primary winding is adjustable for all conditions. Adaptable for use in sets from 1 to 6 tubes.

Gen-Ral Team

Used in the standard four tube set which is without a doubt, one of the most successful as an eliminator of local interference and as a distance getter. Write for hook-up.

Free Service

Hook-ups and reprints from one to six tube, will be sent on request.

KESTER
Rosin Core
Radio SOLDER

APPROVED by Radio engineers—used by manufacturers of radio and delicate electrical instruments, and yet simple enough for anybody to use. That describes Kester Radio Solder.

Kester is a virgin tin and lead solder of the flat or ribbon type, containing inside itself a pure rosin flux. Just before the solder melts this pure rosin flows to the job in the proper proportion for the amount of solder used.

Kester Radio Solder requires only heat, thereby saving the user the troublesome operation of separate fluxing.

D-X Tube "Rejuvenator"

Makes old tubes new!

Pays for Itself Immediately

Keep your radio tubes like new instead of throwing them away. Do it yourself with the wonderful D-X Tube Rejuvenator and insure for your set satisfactory reception throughout the year. Especially made for home use, to keep radio tubes at top efficiency and to greatly increase their length of useful service.

Weak tubes mar reception just like weak batteries, besides being a drain on the batteries and causing them to run down quickly. Increases the pleasure of radio reception, adds to volume, increases range and selectivity. Brings back the life in old tubes in a few minutes. Just attach to any convenient electric light socket, either A. C. or D. C. 110-120 volts. Used once a month it will add months, even years, to the life of your tubes. It's simple and easy. Anyone can use it.

Costs but little more than a new tube, yet saves all your tubes for months and even years. Pays for itself the first time you use it. You can even use it to rejuvenate tubes for others and make money so doing. Useful for set owners, set builders, dealers and all radio fans.

Complete with simple directions for operation. Each D-X Rejuvenator carries with it an absolute guarantee of satisfaction. Guaranteed to do the work or money cheerfully refunded.

Made in two models for type 201A tubes or 199 tubes. State which you desire. Order direct from this advertisement and save money during this special offer. Why pay $7.50? Order today —NOW—and know the real satisfaction of keeping your tubes lively at all times.

SYD 100 VOLT LIFE LONG STORAGE "B" BATTERY SYD

The Syd Battery pictured above is a storage "B" Battery made of Edison Elements, which have nickel and iron in their construction.

The solution used is a preserver of nickel and iron, thereby giving the battery practically unlimited life.

Radio Fans' unqualified approval of the SYD "B" Battery, product of the SYD Battery Co., is founded solely on merit. Experience is a wise teacher and has taught the need of exact voltage at all times to insure greater volume, clearer reception and better selectivity from any radio set. The unvarying adequate power derived from the SYD "B" Battery explains its great and ever-growing popularity.

Operating on an average of 4 or 5 hours daily the SYD Batteries will last six weeks or more on a single charge. The cost of recharging is less than 5 cents. SYD Batteries do not discharge through idleness. The SYD Battery is assembled in a beautiful polished, chemically treated quarter oak cabinet. The Bakelite front panel has a voltage selector switch and various binding posts, which make it easy to obtain voltage from 16 to 100 volts. The battery unit is 14 inches long, 7½ inches high and 6½ inches wide and weighs less than eighteen pounds.

Laboratory News Notes.

Syd "B" Battery.

The Syd storage "B" battery submitted to The Daily News radio laboratory for a test was found satisfactory. This battery is different from the usual lead sulphuric acid cell type of battery The cells used are commonly known as the Edison cell; the electrodes, or "plates" are of nickel and iron instead of lead, and the electrolite is an alkaline instead of sulphuric acid.

In the hands of the novice the Edison type of cell has the distinct advantage of durability, and ability to withstand neglect and abuse without injury. The battery can be left in a discharged state for any length of time without injuring the plates. Over-charging or heavy loads, even short circuits, have no effect on the life of the battery.

The Syd battery consists of ninety-one Edison cells mounted in a cabinet. Each cell delivers 1.5 volts at full charge. The bakelite front panel has a voltage selector switch and various binding posts which make it easy to obtain voltages from 18 to 100 volts The battery unit is 14 inches long, 7½ inches high and 6½ inches wide. It weighs eighteen pounds

IMPROVE!

YOUR RADIO RECEPTION BY USING

The REDI-MAST FOR AERIALS

FITS ANY ROOF INSTANTLY

A strong hand-turned rock maple pole which gives a quick, convenient method of erecting a dependable antenna. 5 or 8 foot lengths, will fit any roof—single or multiple wire antennas. Will carry the heaviest sleet covered antenna in strong wind without weakening. Neat in appearance. Can be set up or dismantled without danger of causing leaks in roof. Complete set includes three steel guy rods ¼" in diameter, adjustable pulley, neb irons, roof sockets, anchor pins and full instructions; price, 5 foot mast, each $3.50; 8 foot mast, each $4.25. Ask your dealer.

WAVE-X

The WAVE-X Condensing Antenna is an aerial that can be quickly erected on wall, chimney or roof, anywhere 5 foot square is available. Several on one roof without interference. Provides sharper tuning, increases selectivity and is non-directional. Twelve durable highly conductive, non-corrosive cast-aluminum feelers reach out in all directions. Perfectly insulated to prevent losses. Only one upright to erect, only a hammer and a screwdriver needed. No. 2, with 8 foot pole ready to install with all accessories and full instructions, $12.50. No. 3, for side wall or chimney mounting, $12.50.

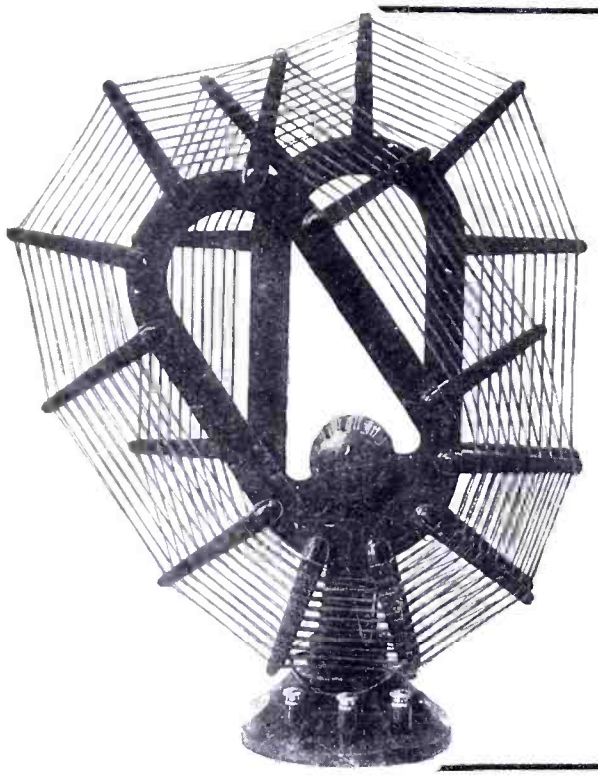
Waukesha, Wis.



— TUN-A-LOOP —

The new antenna that will bring any set to the peak of perfection. Will match all tuning dial settings, regardless of the size of the condenser.

TUN-A-LOOP is made of genuine Bakelite, insuring against dielectric losses and eliminating any possible leakage.

Is spider web wound with silk over phosphor bronze wire.

TUN-A-LOOP can be used on any set which has radio frequency, whether tuned, untuned, reflex or straight radio frequency. Gives amazing results on a regenerative set, and also works on neutrodyne sets which no other loop will operate.

TUN-A-LOOP increases volume by covering entire band of wave lengths, assuring higher selectivity in bringing in distant stations. It can be used with portable or non-portable sets and guaranteed to give complete satisfaction.

There's a golden tinkle in the air–

Does it reach your ears? All you need is a Rectigon to make music sound like money. And to keep your batteries charged up to their ears with pep. Thus you attain best possible reception at lowest possible cost.

Your Rectigon is good for your pocketbook, as well as batteries. It pays dividends quickly in money saved from the service station. And you always have the power to bring in the best your set can get.

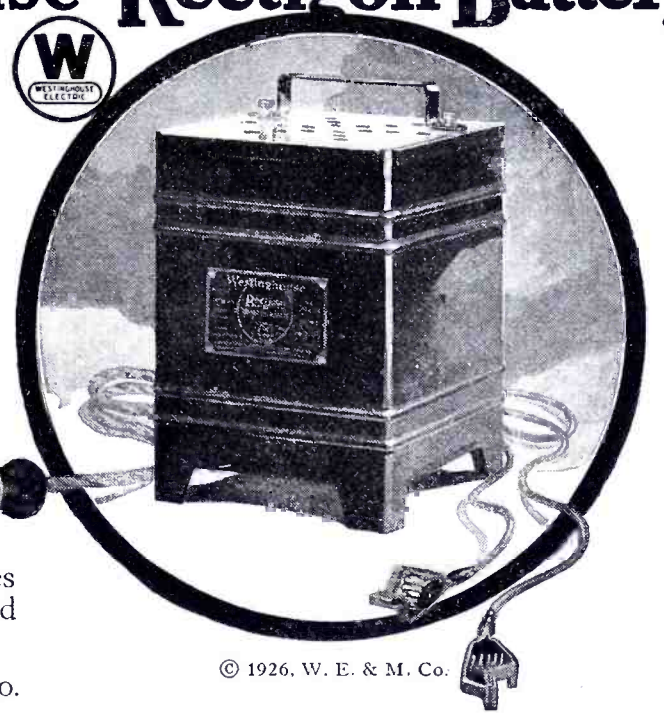
and it comes from charging at home with

The Westinghouse Rectigon Battery Charger

No noise as it charges—not a bit of fuss. You can be sure it will do its work quietly. Not even a murmur from a Rectigon that would disturb the mildest slumber.

No acids, chemicals, no moving parts — nothing to spill or burn. No muss, nor worry, to mar your enjoyment. You'll have no spoiled rugs, ruined clothing.

Snaps on in an instant—just plug into the light socket, snap on the terminals. Saves service station bother. Spares interruptions caused by absent batteries.



Charges both "A" and "B" batteries — keeps both packed with power. Bulb is used for "B" battery charging and it is enclosed, like all other parts, in metal, safe from accident. (Rectigon charges automobile batteries, too.)

Safety for batteries and set—you'll not wake to find your battery discharged—that can't happen with a Rectigon attached. Should you tune in without detaching the Rectigon from the battery, your set is entirely safe from harm.

THE RECTIGON is a superb Westinghouse product. Things you *can't* see, like extra heavy insulation, things you *can* see, like the durably enameled case — all are of highest quality. Westinghouse manufactures also a complete line of radio instruments, and Micarta panels and tubes.

CONSTANT POWER

FOR THE "A" CIRCUIT ON YOUR RADIO

Using **SILITE**
The Wonder Rectifier

PRACTICAL
EFFICIENT
NOISELESS AND
ECONOMICAL
Beyond Belief

Costs only 1/15 cent per hour to operate. No tubes or parts whatever to replace. Fully guaranteed.

Sets requiring 6 volts operating on 110 volt 50-60 cycle house lighting current ..... **$27.00** Other sizes to meet all requirements.

It's remarkable the difference a CONSTANT POWER makes in a radio receiver. It operates your tubes always at their maximum efficiency. Stations roll in with greater power and more volume—a sweetness of tone that was formerly possible only when your battery was at full charge. Positively no hum or distortion and is not affected by variations of line voltage, as the current is actually supplied by a quality storage battery, which in turn is automatically kept at full charge by the marvelous SILITE system of rectifying the house current.

"B" BATTERY ELIMINATOR

Only $7.95

Money-Back Guarantee

Stop being a slave to the "B" Battery nuisance! Throw the old-fashioned cells in the ash can! Hook up a new Roll-O "B" Battery Eliminator in 30 seconds and forget battery troubles forever. This wonderful device means better reception, sharper tuning. Ends that annoying hum. Gives you more real pleasure from your set.

COMPLETELY EQUIPPED—NO "EXTRAS" TO BUY

Operates perfectly on direct or alternating current. Simple directions inclosed—anyone can plug it in to any kind of set. Constant voltage gives your set more power without danger of burning out tubes. Costs no more than a set of good "B" Batteries. Solidly built. Enclosed in beautifully finished metal case.

SEND YOUR ORDER NOW

Make your radio a real pleasure—don't blame the set because run down "B" Batteries won't let it work right. Order your Eliminator NOW. Write your name and address on a piece of paper, pin a dollar bill to it, and mail it TODAY. Pay postman balance ($6.95 plus a few cents postage) when he delivers your eliminator. Use it five days. If not more than satisfied, return it and get your money back.

SPECIAL—Write for facts about combination Roll-O "A" Battery Trickle Charger and "B" Battery Charger—Only $2.95. Also two-ampere Battery Charger, $5.00.

THE ROLL-O RADIO COMPANY, Dept. 2
Third and Sycamore Sts., Cincinnati, Ohio

Hoyt

Universal "Tip-In" Meter
And 2-Range Mounting Block

The HOYT UNIVERSAL "TIP-IN" Voltmeter is a Type 17 moving-coil meter, for use with Radiolas Nos. 20, 25, 26 and 28 and other Radio sets, equipped with tip-jacks in the filament circuit. Marked in red at 3 volts.

With it can be furnished a mahogany table-mounting block, with built-in multiplier, converting the meter into a 2-range general-purpose voltmeter—0-6, 0-180 volts.

Meter only—$7.50
Block only—$2.50

Send for book "HOYT Meters for Radio."

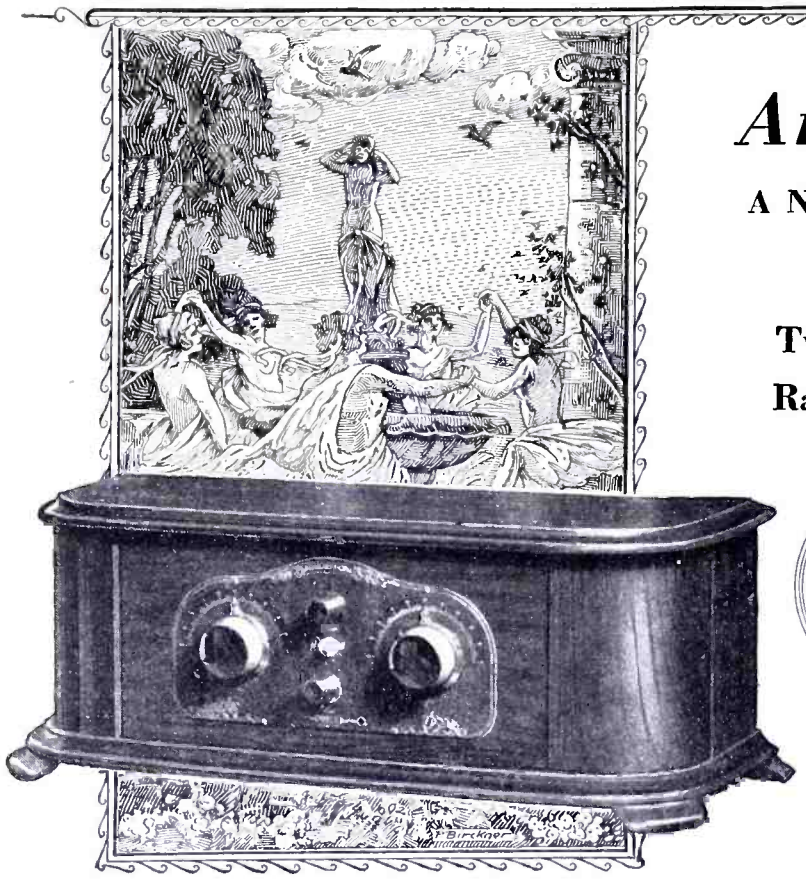
ARBORPHONE



Announces

A NEW AND IMPROVED MODEL

Featuring

Two Dial Control—

Rare Cabinet Beauty

Price $60.00

Add $5.00 in Rocky Mt. and Pacific Coast States

Amazing value features the new ARBORPHONE 5-Tube Receiver. In appearance and in performance the ARBORPHONE matches, yes excels, point by point, sets listing for more than twice its price.

Your first impression—usually the best—is rare beauty of cabinet design and finish. The expensive rounded front is exclusive with ARBORPHONE.

The new model boasts many refinements of the same proved ARBORPHONE circuit now being used by thousands of satisfied owners.

Simplified tuning made possible by special dual condensers and a separate radio frequency control brings improved reception on low wave lengths and greater volume on long wave length stations.

DEALERS

A tremendous market awaits ARBORPHONE Franchised Dealers. Our discounts are as liberal as our exclusive merchandising plan is helpful. Wire or write for this plan of ARBORPHONE distribution. It assures volume business to ARBORPHONE dealers.

Set-Constructors

FOR your convenience, if you are unable to obtain the necessary parts to construct any of the sets described in this issue, we will be pleased to quote you price on complete kit containing all necessary parts.

OUR laboratory tests each piece of apparatus before sending to you, insuring its fullest efficiency — no charge for this service.

IF, however, you merely wish information regarding any of these circuits or articles—before writing to us—consult notice at top of page containing review of circuits.

WE will build, construct, design or repair your set—only high-class laboratory work—moderately priced.

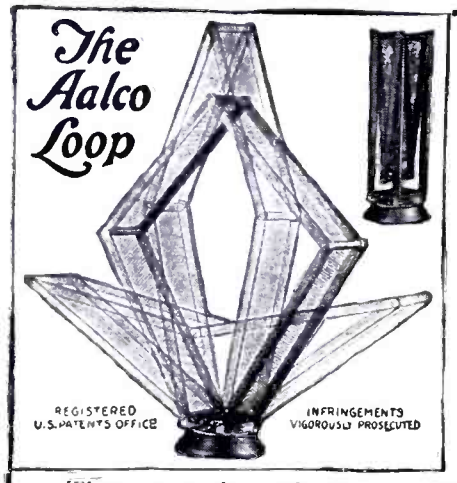
Makers of Burns Loud Speakers

The Famous AALCO Loop



The same excellent workmanship and quality at a new price of **$12.50.**

We also announce our new type 35 loop, which tunes with .00035 variable condenser which makes it possible to **use with all tuned radio frequency, Neutrodyne, Browning Drake, and others.** This information on request. Also at **$12.50.**

These are the only loops which actually collapse without the wire becoming loose and tangled.

Extremely low resistance and fine appearance. Woodwork of genuine walnut with felt bottom to protect furniture. A beautiful addition to any home.

The Aalco Tuned Radio Frequency Coil, Shielded

A new product abreast of the times. **This is to be the shielded year.** Interference and congestion compels the set builder and manufacturer to use shielding as a means to **better selectivity and quality.**

A highly efficient basket weave coil in a non-magnetic shield making it possible for the user to mount in **any position without the crtical angles.**

Highly nickeled, **very compact and the best method** of using T. R. F. This will enable the user to get better efficiency in extremely small space. Price **$2.00.**

I.C.A. PANELS

for the

VICTOREEN, QUALITONE

and all other popular circuits

An I. C. A. Panel of Insuline or Bakelite, drilled and decorated according to standard specifications, gives your set that "factory-built" appearance which is always so desirable in the home-built set. Either of these well known panel materials also insures you the utmost in dielectric strength, durability and beauty.

All panels are drilled ready for mounting. Decoration by our exclusive ETCH-O-GRAVURE Method which brings out the details of the design and lettering in sharp, clean-cut lines, with artistic beauty.

I. C. A. Insuline Panel for 8-Tube Victoreen Super-Heterodyne, 7x24x3/16 in., Black or Mahogany, $4.75. Same for 5-Tube Qualitone, $4.50. In "Frieze" finish for Victoreen, $5.50. "Frieze" finish for Qualitone, $5.25.

I. C. A. Bakelite Panel for 8-Tube Victoreen Super-Heterodyne, 7x24x3/16 in., any finish, $7.00. Same for 5-Tube Qualitone, any finish, $7.00.

I. C. A. Panels can be had for any popular circuit, including the following:

Citizens Call Book 45 Kilocycle Super.—9 Tubes
Citizens Tuned Radio Frequency—5 Tubes
Radio Broadcast Universal—4 Tubes
B. T. Counterphase—6 Tubes
Hammarlund-Roberts—5 Tubes
Browning-Drake—5 Tubes
B. T. Nameless—5 Tubes
Freshman Type T. R. F.—5 Tubes
Madison Moore Super-Heterodyne—8 Tubes
Fenway Super-Heterodyne—9 Tubes
Best Super-Heterodyne—7 Tubes
Silver Six—6 Tubes
Cockaday L. C. 26—5 Tubes
Rasla Reflex—2 and 3 Tubes
Raytheon "B" Eliminator Panel

Sub-Panels Furnished for All of the Above Circuits

FANS! Before building any circuit write for our FREE BOOKLET giving complete list of Insulating Parts, Mounting Brackets, Foundation Units, etc. Also for full particulars of the New I. C. A. Non-Microphonic Socket.

Don't take a substitute for the genuine I. C. A. Products. If your dealer can't supply you, write us direct

Absolutely NOISELESS

Permanently Accurate— Dependable!

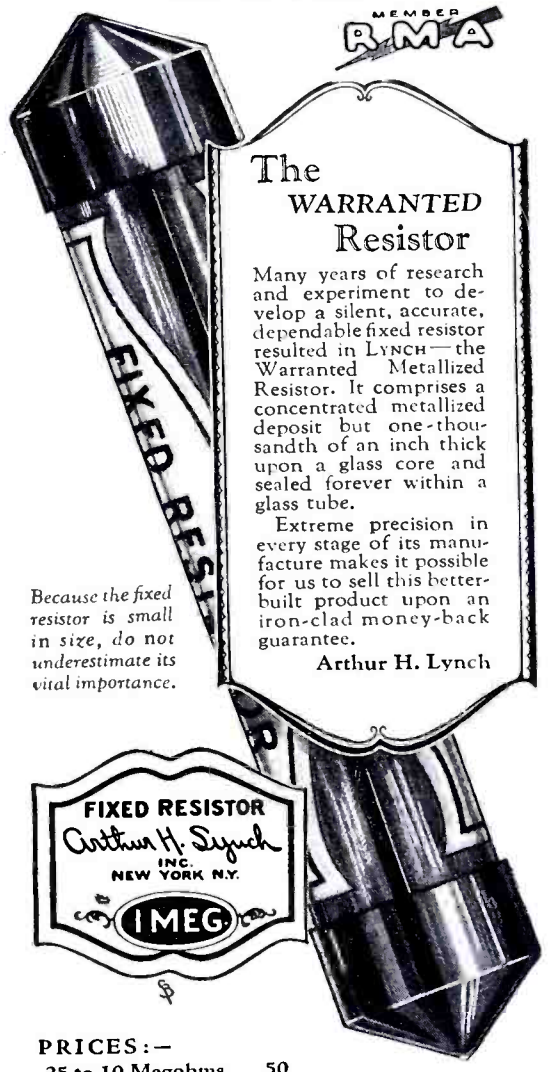
METAL long has been recognized as the best of electrical conductors. The *Lynch* Metallized Resistor gives *conductive, non-arcing* resistance that means absolutely silent operation, permanent accuracy, dependability.

Leading engineers, test laboratories and experimenters have found that this fixed resistor wins in the acid tests of time and service. It marks as great an advance in its field as did the tungsten lamp over the old carbon bulb. If your dealer cannot supply you, we will ship postpaid—same day order is received.

Dealers—Write us!

ARTHUR H. LYNCH, Inc.
Manufacturers of Radio Devices
Fisk Bldg., Broadway & 57th Street
New York, N.Y.

MEMBER RMA



Because the fixed resistor is small in size, do not underestimate its vital importance.

The *WARRANTED* Resistor

Many years of research and experiment to develop a silent, accurate, dependable fixed resistor resulted in LYNCH—the Warranted Metallized Resistor. It comprises a concentrated metallized deposit but one-thousandth of an inch thick upon a glass core and sealed forever within a glass tube.

Extreme precision in every stage of its manufacture makes it possible for us to sell this better-built product upon an iron-clad money-back guarantee.

Arthur H. Lynch

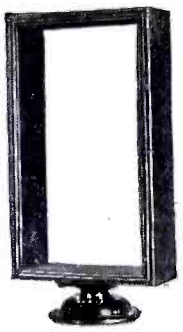
The SIGNAL Spiral Cam Condenser *is still new!*

The Signal Spiral Cam Condenser is still new a year after its introduction to Radio. Nothing has since been developed that offers the selectivity and precision found in the Signal Cam Condenser. The efficiency is all in the patented cam. By means of this cam, wave lengths are distributed evenly over 360 degrees of the dial. The unit is just as compact as the average semi-circular condenser but far more efficient. Resistance losses are very low and the dielectric is entirely out of the condenser field.

It is built in the three standard capacities, .00035, .00025, and .0005, with provision for single or three hole mounting and the attachment of air core transformers directly in the condenser.

SIGNAL Table Type Loop Aerial



Here is a loop aerial that is just about the last word. You will note from the illustration that it presents a beautiful appearance and may well be used with the finest of radio equipment. Made of walnut veneer with a really good-looking antique finish. Height over all 23¾ inches. Has three taps for sets requiring them. There are no wires to get twisted. Positive plug contacts in base. Improves both reception and appearance of your set. Complete at your dealer, $8.50.

The SIGNAL Bracket Type Loop Aerial (not illustrated) is just as fine an aerial as the new table type. It attaches right to cabinet of your set itself and can be turned a complete 360° in a space no greater than the width of the average loop aerial receiver. Built of solid walnut. All metal parts heavily nickel plated. At your dealers, $8.50.

SIGNAL Radio Cabinets

SIGNAL radio cabinets are built of thoroughly seasoned wood, insuring permanent joints and freedom from warping and checking. Workmanship is of the highest grade. Cabinets are hand rubbed to a high piano finish.

Type F

Type "F"

Built of southern willow — mahogany finished. Has hinged top with brace and shaped feet.

Number	Panel	Depth
F1810	7x18"	10"
F2110	7x21"	10"
F2410	7x24"	10"
F2610	7x26"	10"
F2810	7x28"	10"

Type S

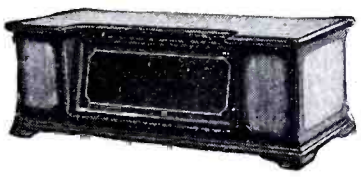
Type "S"

Built of solid walnut with American walnut finish. Has full piano hinge with brace and full shaped base.

Number	Panel	Depth
S1810	7x18"	10"
S2110	7x21"	10"
S2410	7x24"	10"
S2610	7x26"	10"
S2810	7x28"	10"

Type "C"

Made of solid walnut with two tones antique walnut finish. End compartments for batteries or B-Eliminators. Has gracefully curved lines. A delux cabinet beautifully finished. Furnished with Veneer Wood Panel to match.



Type "C"

Number	Panel	Depth	Compartments
C18	7x18"	12"	5 ½ x9x12
C21	7x21"	12"	5 ½ x9x12
C24	7x24"	12"	5 ½ x9x12

Your dealer can get any of these three sizes for you—ask him for prices.

Jobbers and Dealers

YAHR-LANGE, Inc.

National and International Distributor

207-215 East Water St. **Milwaukee, Wis.**

(Continued from page 198)

A complete kit may be purchased containing all parts necessary to build this eliminator. The Molliformer choke has an inductance of 125 henries at 60 cycles and is sufficient to eliminate all AC hum even as low as 25 cycles.

Full wave rectification is accomplished by means of the bridge circuit shown in schematic diagram.

The chemical furnished with kit is self forming and the cells, once they are formed, are ready for service in 10 to 20 seconds.

The amplifier voltage is adjustable by varying the size of the lamp in the primary circuit. The unit delivers from 90 to 125 volts. Its capacity is 90 volts at 35 mills.

Manufactured by C. E. Jacobs, 2802 North Kedzie Avenue, Chicago.

(If any further information is desired regarding this product, write the manufacturer direct.)

The New Crosley Musicone Radio Table

A popular table upon which to place receiver measures 28 inches across and has one of the new Crosley cone type speakers built in. Very neat in appearance and finely finished, has space to accommodate accessories, such as "B" eliminators, 6-volt "A" battery, charger or any other accessories.

Manufactured by Crosley Radio Corp., Cincinnati, Ohio.

(Any additional information will gladly be supplied by the manufacturer direct.)

Stevens Speakers make all the difference in the world—bring you a new realization of radio reception at its best.

You haven't heard radio until you have listened to a Stevens Speaker. All the rich, sonorous tones of the orchestra—all the subtle inflections of the human voice—all that is natural and pleasing to the ear—yours with a Stevens Speaker.

Here Is the Real Test

You can listen to a Stevens Speaker for hour after hour without tiring—there is no feeling of strain, your auditory nerves are not strained by trying to get the full tones, there is no sense of fatigue. This cannot be said of other speakers, as you know.

Try It—Today!

Stevens Speakers are both decorative and superior in performance. The famous Stevens diaphragm—exclusive in form and material—is the ***only seamless diaphragm made*** and is unaffected by atmospheric conditions.

Stevens T. T. Armature Unit operates on an entirely new principle. It is "non-freezable" and its performance resembles the marvelous mechanism of the human voice.

TWO MODELS — EACH THE BEST OF ITS TYPE

MODEL "B" 14½-INCH—Similar to Model "A" but smaller. Ornamental and highly efficient. An exclusive device gives all directional effect if desired—

Adjustable by tilting top as illustrated. Complete, **$16.50**

PATENTS PROTECTED BY AMERICAN PATENT PROTECTION CORPORATION

STEVENS & COMPANY, Inc.

46-48 EAST HOUSTON STREET NEW YORK CITY

Made by the Pioneers in Cone Speakers

Your choice of

SAAL SPEAKERS

ECCENTRIC CONE—No. 1

Entirely new type, no adjustments necessary. Eccentric construction of diaphragm affords more natural reproduction of all tones, as high notes require less space for expression than deep low notes. Satisfactory results with any set using 90 volts "B" battery—135 volts "B" battery recommended.

Height, 22 inches; Diameter of cone, 20 inches; Weight, 15 pounds $25

West of the Rockies $26.50.

JUNIOR MODEL — as above — Height, 16 inches; Cone, 14 inches; Weight, 10 pounds $15

West of the Rockies $16.

PEDESTAL

Can be readily moved from one room to another. The quality of horn reproduction, the beauty of fine walnut furniture. Sound emerges from both front and back—hence non-directional. Stands on its own legs, the top level with your ear when you are seated tuning in. Factory tested with 400 volts "B" battery.

Height, 44 inches: Top Grill Opening, 8x10 inches; Weight, 44 pounds . . $38

West of the Rockies $40.

HORN—No. 5

Latest model of the famous Saal "Soft Speaker." Bell of genuine Bakelite, rich maroon in color. Neck of cast aluminum, porous non-vibrant metal finished in "crackle gold." No tinny ring. Nothing to warp, crack, or deteriorate. No adjustments. Guaranteed not to blast or chatter.

Height, 21½ inches; Bell, 13 inches; Weight, 13 pounds $22.50

West of the Rockies $24.

PHONOGRAPH ATTACHMENT

Easily attached to any standard phonograph, this simple device transforms it into an excellent radio speaker. Price $7

West of the Rockies $8.

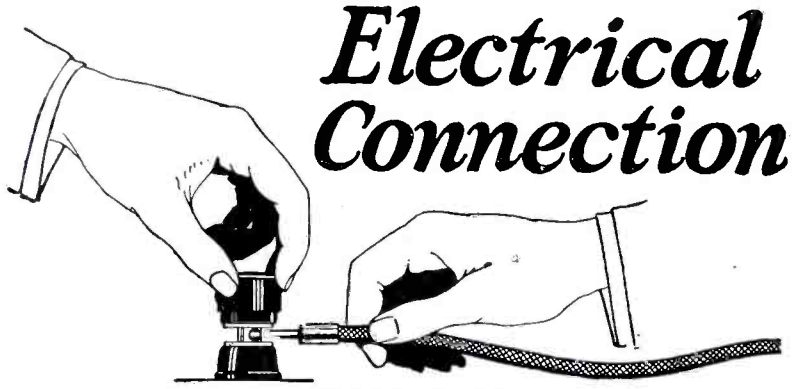
A Good Electrical Connection



CONTACT!

No leaks—no mistakes—if your connections are made with

EBY BINDING POSTS

Eby Marked on every base

The drilled shank and the broad flat contact surfaces of Eby patented binding posts provide a good electrical connection for practically every type of terminal.

The tops don't come off, and the 28 different markings obviate dangerous mistakes.

All good dealers carry them—plain or engraved, 15c.

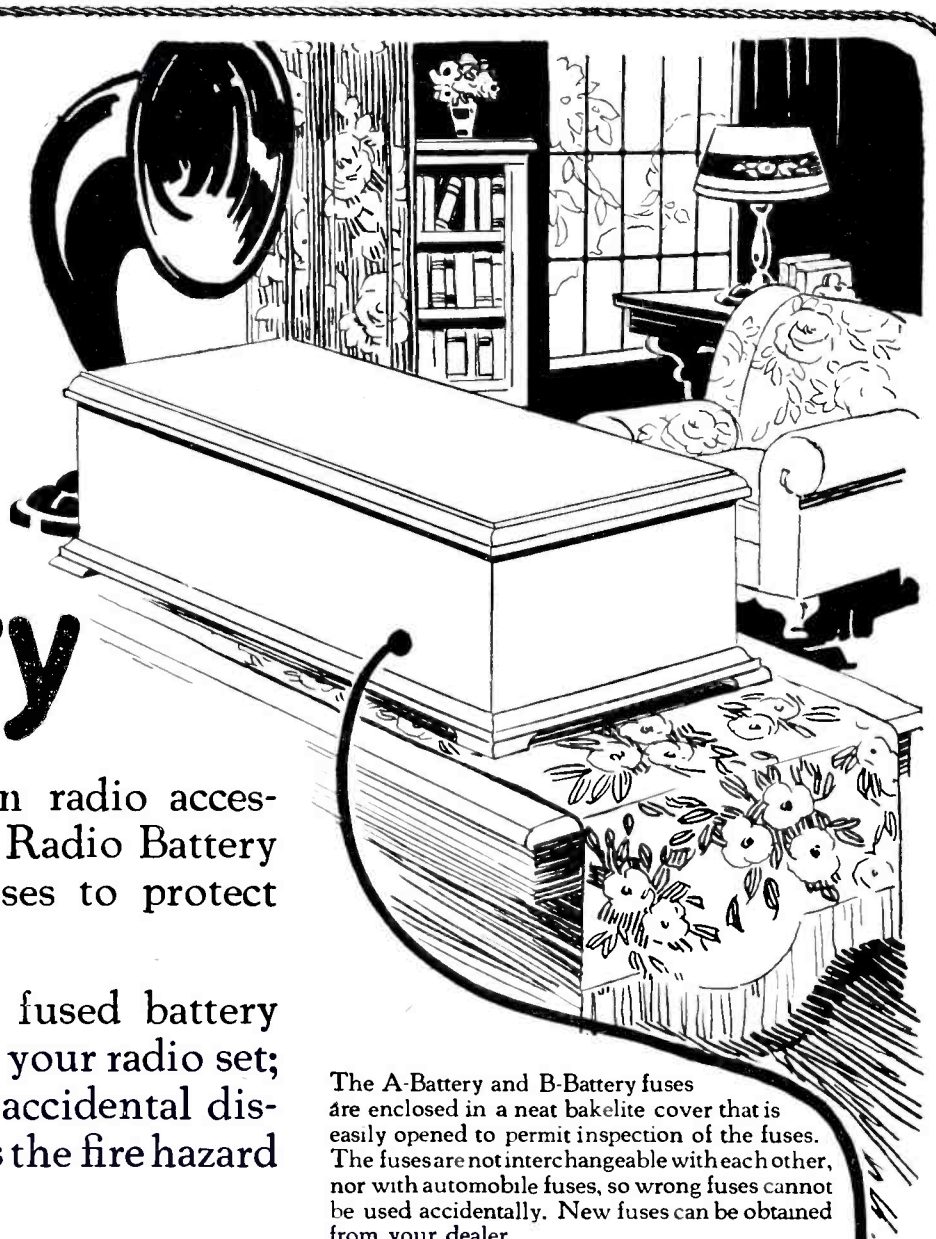
Tell 'Em You Saw It in the Citizens Radio Call Book

A New and Essential Radio Accessory



THE latest development in radio accessories is the Belden Fused Radio Battery Cord, with two enclosed fuses to protect the A and B-Battery circuits.

This remarkable and efficient fused battery cord acts as a safety valve for your radio set; it protects the batteries from accidental discharge, and likewise eliminates the fire hazard from crossed wires.

The Belden Fused Radio Battery Cord makes a neat installation by dispensing with the usual array of loose wires behind the set, and it protects tubes from burn outs.

The A-Battery and B-Battery fuses are enclosed in a neat bakelite cover that is easily opened to permit inspection of the fuses. The fuses are not interchangeable with each other, nor with automobile fuses, so wrong fuses cannot be used accidentally. New fuses can be obtained from your dealer.

Ask your nearest radio dealer today for a Belden Fused Radio Battery Cord, sold only in the Belden striped orange and black carton. Your set is not complete without the protection of this essential battery cord. It is inexpensive insurance against fire hazard and costly short circuits.

Belden Fused Radio Battery Cord

Bradleyohm-E

PERFECT VARIABLE RESISTOR

for B-ELIMINATORS

Bradleyohm-E is a new and enlarged Bradleyohm designed especially for B-Eliminator Voltage Control. The extra long columns of scientifically-treated graphite discs insure perfect voltage control over a wide range. It is made in several ranges for various B-Eliminator circuits.

Bradleyunit-A

PERFECT FIXED RESISTOR

Bradleyunit-A is a solid molded resistor for radio circuits. It is molded and heat-treated under high pressure, making it impervious to moisture. The silver-capped ends can be soldered without affecting the calibration of the Bradleyunit.

Are You Building a B-Eliminator?

IF so, follow the example of leading radio engineers and use the Bradleyohm-E and Bradleyunit-A for your voltage control.

Most of the well-known factory built B-Eliminators are equipped with Bradleyohms as standard equipment. Surely, no better recommendation of the reliability and stability of the Bradleyohm can be asked.

Build permanent performance and high efficiency into your B-Eliminator by asking your dealer for Bradleyohm-E and Bradleyunit-A for your circuit.
