New GPS Series: Tek sets the pace with SmartCursors™ and push-button ease.

Work faster, smarter, with two new general purpose scopes from Tektronix. The four-channel, 100 MHz 2246 and 2245 set the new, fast pace for measurements at the bench or in the field. They’re easy to use and afford, by design.

On top: the 2246 with exclusive integrated push-button measurements. Measurements are accessed through easy, pop-up menus and implemented at the touch of a button. Measure peak volts, peak-to-peak, ± peak, dc volts and gated volts with new hands-off convenience and on-screen readout of values.

SmartCursors™ track voltmeter measurements in the 2246 and visually indicate where ground and trigger levels are located. Or use cursors in the manual mode for immediate, effortless measurement of waveform parameters.

Both scopes build on performance you haven’t seen at the bandwidth or prices. Lab grade features include sweep speeds to 2 ns/div. Vertical sensitivity of 2 mV/div at full bandwidth for low-level signal capture. Plus trigger

Sensitive to 0.25 div at 50 MHz, to 0.5 div at 150 MHz. Accuracy is excellent: 2% at vertical, 2% at horizontal. And four-channel capability includes two channels optimized for logic signals.

Best of all, high performance comes with unmatched convenience. You can see it and feel it — in the responsive controls and simple front-panel design, in extensive on-screen scale factor readouts, and in simplified trigger operation that includes Tek’s Auto Level mode for automatic triggering on any signal. Start to finish, the GPS Series saves steps and simplifies tasks.

Get out in front! Call toll-free today to order, to get more details or a videotape demonstration.

4 What's News
If you watch TV, you’re undoubtedly familiar with the phrase, “Closed-captioned for the hearing impaired.” You may not, however, be familiar with closed-captioning itself, or the technology behind it. So build a decoder yourself and find out what you’ve been missing and what closed-captioning is all about.

You don’t have to be hearing-impaired to use the decoder. Closed captions can be an excellent educational tool. The unit also decodes Line-21 teletext, which offers such information as news updates and sports scores. To find out more about closed-captioning and how to build your own decoder, turn to page 41.

**NEW!** **Lower Price Scanners**

Communications Electronics*, the world's largest distributor of radio scanners, introduces new lower prices to celebrate our 15th anniversary.

**Regency® MX7000-GR**
List price $599.95/CE price $489.95
**10-Band, 20 Channel** Crystalless & AC/DC Frequency range: 25-550 MHz, continuous coverage and 800 MHz, to 1.3 GHz, continuous coverage. This special MX7000 scanner lets you monitor Military, Space Satellites, Government, Railroad, Justice Department, State Department, Fish & Game, Immigration, Marine, Police and Fire Departments, Broadcast Studio Transmitter Links, Aeronautical AM Band, Aero Navigation, Paramedics, Amateur Radio, plus thousands of other radio frequencies most scanners can't pick up. The new Regency MX7000 is the perfect scanner to receive the new PC22-GR Uniden remote mount antenna.

**Regency® Z60-GR**
List price $299.95/CE price $179.95/SPECIAL 8-Band, 60 Channel **No-crystal scanner** $300-80, 108-116, 144-174, 440-512 MHz. This is the world's only the public service scanners plus aircraft, space stations, and buses, aircraft, space stations, and other common carriers, forestry radio. This special Z60 model listed above however does not make the commercial FM broadcast bands. The Z60 is now at a special price during this important anniversary.

**Regency® RH250-B-GR**
List price $659.00/CE price $329.95/SPECIAL 10 Channel **25 Watt Transmitter** & **Priority Channel Access Feature** The Regency RH250 is a ten-channel VHF land mobile scanner with 25 watt transmitter and Priority Channel Access Feature. The world's first non-handheld scanner to have seven full size (1 3/4 inch) channel display with backlight for low/medium light use and 12 band aircraft band coverage at the same time including the AM aircraft band. The LCD display is even better for night use. Includes belt clip, Flex Scan (sequential scanning of up to 12 channels), 1.2 volt rechargeable NiCad batteries (not included). Be sure to order batteries and battery charger from accessory list on this ad.

**NEW!** **Regency® RX1500-GR**
List price $369.95/CE price $239.95
11-Band, 55 Channel **Handheld/Portable Scanner** A70-GR Base station scanner antenna $35.95 A60-GR Magnet mount mobile scanner antenna 535.95

The new handheld Regency RX1500 scanner is fully keyboard programmable for the ultimate in versatility and features 12 band aircraft band coverage at the same time including the AM aircraft band. The LCD display is even better for night use. Includes belt clip, Flex Scan (sequential scanning of up to 12 channels), 1.2 volt rechargeable NiCad batteries (not included). Be sure to order batteries and battery charger from accessory list on this ad.

**NEW!** **Bearcat® 800XL-GR**
List price $499.95/CE price $317.95
12-Band, 20 Channel **No-crystal scanner** Priority control Search Channel AC/DC Bands: 29-54, 118-174, 406-512, 406-512 MHz. The new Bearcat 800XL is an advanced third generation scanner with great new CE price.

**NEW!** **Bearcat® 145XL-GR**
List price $179.95/CE price $102.95/SPECIAL 10 Band, 16 Channel **AC/DC** Instant Weather Access Scanner Frequency range: 29-54, 118-174, 406-512 MHz. The Bearcat 145XL makes a great first scanner. Its low cost and ease of use make it a very attractive purchase with the touch of a key. Order your scanner from CE today.

**TEST ANY SCANNER**
Test any scanner purchased from Communications Electronics, Inc. for free. If for any reason you are not completely satisfied, return it in original condition with all parts in 31 days, for a prompt refund (less shipping/handling charges and rebates credits).

**NEW!** **Bearcat® 50XL-GR**
List price $199.95/CE price $114.95/SPECIAL 10 Band, 10 Channel **Handheld scanner** Bands: 29-54, 136-174, 406-512 MHz. The new Bearcat® 50XL is a ten-channel VHF, UHF, and AM Band handheld scanner with 10 channels covering ten bands. It features a keyboard lock switch to prevent accidental entry to any channel. Also ordered is the $14.95 Bearcat® 50XL as a rechargeable battery pack for $14.95, a plug-in wall charger, part # AD100 for $14.95, a carrying case part # VCH100 for $19.95, and also order optional cigarette lighter cable part # PSS01 for $14.95.

**NEW! Bearcat® 100XL-GR**
List price $239.95/CE price $179.95
11-Band, 55 Channel **Handheld/Portable Scanner**

**NEW!** **Bearcat® 201XW-GR**
List price $339.95/CE price $209.95/SPECIAL 8-Band, 20 Channel **No-crystal scanner** Automatic Weather Search/Search/Scan AC/DC Frequency range: 30-50, 136-174, 406-512 MHz. The new Bearcat 201XW is an advanced third generation scanner with great new CE price.

**NEW!** **Bearcat® 123XL-GR**
List price $179.95/CE price $102.95/SPECIAL 10 Band, 16 Channel **AC/DC** **Weather Scanner** Frequency range: 29-54, 118-174, 406-512 MHz. The Bearcat 123XL makes a great first scanner. Its low cost and ease of use make it a very attractive purchase with the touch of a key. Order your scanner from CE today.

Kodak claims quantum leap in new imaging sensor

Eastman Kodak Co. scientists report development of a solid-state monochrome imaging sensor capable of imaging 1.4 million individual picture elements (pixels.) The picture element size is only 6.8 microns—about one-tenth the width of a human hair. That makes it possible to put the megapixel sensor on a 6 x 9 millimeter chip, which formerly held only about 250,000 conventional pixels. The breakthrough is due to a revolutionary new design—now in the process of being patented—that uses only half as many transistor gates per imaging cell as do present sensors.

A major challenge facing the research team was to achieve the ultra-clean processing techniques necessary in manufacturing so small a chip. In a memory chip of the same size a few spare cells can be added to substitute for defective ones, but each cell in an imaging chip is “part of the picture,” and a microscopic speck of dust shows up like a boulder.

U. S. trade organizations join forces in Japan

The American Electronics Association (AEA) and the Electronic Industries Association (EIA), the two largest American electronics trade associations, merged their Tokyo offices into a single U. S. electronics industry facility as of last July 1. The goal of the new entity, now called the U. S. Electronics Industry Japan Office, is to improve the environment for all U. S. electronics companies doing business in or with Japan.

A “galloping negative trade balance” between the United States and Japan was cited as one of the reasons for the cooperative effort. “In 1980, U.S./Japan trade in electronic products and services resulted in a deficit of $3.9 billion. In 1985, it was $17.6 billion,” reports AEA president J. Richard Iverson.

Zenith gives top award to stereo TV inventor

The Robert Adler Technical Excellence Award of the Zenith Electronics Corp. was awarded to company scientist Carl G. Eilers at Zenith’s annual Inventors’ Banquet. He is a co-inventor of two broadcast industry standards—stereo-TV sound and stereo-FM radio broadcasting technology. Eilers, manager of systems research and development for color television, headed the group that developed Zenith’s MTS (multi-channel TV Sound) stereo-TV transmission system. More than 250 U. S. TV stations have begun using the Zenith system since stereo-TV broadcasting was approved in March 1984. That number is expected to double by the end of next year.

New heart-rate monitor operates like radar

A device for remotely measuring human heart and respiration rates works by reflecting electronic waves off the subject’s chest in a fashion similar to that of radar. The device, just patented by RCA, directs two microwave beams of different frequencies toward the person being examined. Those beams are reflected back and recorded.

Since low-frequency signals penetrate the body to a greater depth than high-frequency ones, signals coming from different depths of the human body can be distinguished. The high-frequency signal is used to measure respiration rate, while the low-frequency one measures heart rate. The strength of the signals is well below the safety limits recommended by the American National Standards Institute.

Since the device is wireless and can operate up to eight feet from the person observed, it requires no attachments to the body. No clothing need be removed and there is no disturbance of the subject’s freedom of movement.

The unit is expected to be useful for checking the heart and lung performance of astronauts, pilots, and other military personnel in training. An early version of the instrument is now being tested by the U. S. Army, which sponsored its development.
HAMEG Oscilloscopes with Component Tester 2-year warranty

HM 203-6 DC to 20MHz $489.00
- Rectangular screen, internal graticule 8x10cm.
- Deflection: 5mV/cm to 20V/cm
- Timebase: 0.5us/cm to 0.2s/cm
- X-Magnification x 10
- Component Tester
  Test voltage: max. 8.5Vrms (open circuit)
  Test current: max. 24mA rms (shorted)

HM 204-2 DC to 20MHz $629.00
- Component Tester
- Deflection: 5mV/cm to 20V/cm
- Y-Magnification x 5
- Timebase: 0.1 us/cm to 0.5s/cm
- X-Magnification x 10
- Sweep delay: 100 ns to 0.1 s.
- Calibrator: square-wave generator, 1 kHz/1MHz switchable, rise time <5ns, for probe compensation, output voltages: 0.2V and 2V ± 1%

HM 605 DC to 60 MHz $899.00
- Component Tester
- Deflection: 5mV/cm to 20V/cm
- Y-Magnification x 5
- Y-Output from Ch.I or Ch.II: ±45 mV/cm into 50 Ohms.
- Timebase: 50ns/cm to 1 s/cm
- X-Magnification x 10
- Sweep delay: 100ns to 0.1 s.

Digital Storage
- Operating modes: Refresh and Single with Reset (incl. LED indication for Ready), Hold Ch.I, Hold Ch.II. 1024 x 8 bit for each chan.
- Sample rate: max. 100kHz. Resolution: vertical 28 pts/cm, horiz. 100 pts/cm.
- Option: Interface for plotter.
- Component Tester

HM 205 $799.00
Real-time - See 203-6 Specifications

HM 208 $2,380.00
HM 208-1 $2,860.00 (with IEEE Interface)
Real-time - See 203-6 Specifications

Digital Storage
- Operating modes: XY, Roll, Refresh, Single (LED ind.), Hold Ch.I, Hold Ch.II, Plot I and Plot II with read-out check on screen, backing storage, Dot Joining button. 2 x 1024 x 8bit for each ch.
- Sample rate: max. 20MHz. Resolution: vert. 28 pts/cm, horiz. 200 or 100 pts/cm.
- Plotter output: vertical 0.1V/cm, horizontal 0.1V/cm.
- Output Imped: 100Ohm each. Penlift: TTL/CMOS compat.
- Output speed rate: 5-10/20/10/20-40 s/cm.
- Option: Lithium battery for memory backup.

More camcorders. This year's hottest product is the camera-recorder combination, or camcorder. It's available in three different formats (8mm, VHS, and VHS-C). Manufacturers are choosing up sides, and it's obvious that the VHS group is engaged in a boycott of the upstart 8mm format. Under pressure from JVC, which invented VHS, most of the group has endorsed VHS-C rather than 8mm as their miniaturized format. But some manufacturers are hedging their bets. Matsushita, which owns both Panasonic and Quasar, is making 8mm equipment for Eastman Kodak as well as a very lightweight 8mm camcorder for Olympus. Hitachi is manufacturing 8mm camcorders for Minolta and Pentax. Neither manufacturer sells 8mm equipment under its own brand name.

The photography marketers are also hedging their bets. Some are selling multiple formats. Pentax is fielding both the full-sized VHS and 8mm camcorders; Minolta went whole hog and is marketing units in all three formats.

The little 8mm camcorder that Matsushita makes for Olympus is quite impressive. It weighs only 3.3 pounds and has autofocus, a solid-state CCD pickup, and all the other goodies. The Hitachi-made versions for Minolta and Pentax also look like winners, weighing just 3.08 pounds for the Minolta and 3.2 pounds for the Pentax; both units feature MOS pickup, autofocus, and more.

The Minolta VHS-C compact unit is the first VHS-C machine to be shown that wasn't completely manufactured by JVC. The recorder section is a JVC product, but the camera portion is made by Minolta. Instead of the solid-state pickup used in the completely JVC-made units, the Minolta camcorder has a Saticon tube and weighs a relatively heavy 4.4 pounds; by comparison, a JVC VHS-C camcorder weighs 2.9 pounds.

Vidiwall. That's the name of the show-stealer in London's hit musical, "Chess." While a musical about a chess championship seems unlikely, its "star" is even more unusual. It's a matrix of 64 large-screen television sets, weighing a total of 3.8 tons. Vidiwall is suspended at center stage, above the actors. In addition, two 32-set banks of televisions are set up at the left and right of the stage. That makes for 128 TV screens in all. The producers were forced to reduce the number of screens to 128 because the video was upstaging the "other" actors.

Programming is provided by six Laserdisc players as well as by six on-stage cameras. Glass Laserdiscs, rather than the familiar plastic ones, are used as the material is continuously updated during the run of the show.

All of the TV screens are perfectly color-matched. That leads to one of the show's major problems. If one of the sets fails, its replacement must be matched to preserve the color harmony.

Vidiwall was built by Philips. There is no word on when or if the show will open in New York, but if it does, it is likely that PAL equipment will still be used due to that system's better color consistency.

VCR prices falling again. Amid all the talk about the rise in the price of the Yen against the Dollar, have you wondered why VCR and color-TV prices haven't risen noticeably? Many people have, but the explanation is relatively simple. In the case of VCR's, the Japanese are building them faster than they can be sold, even in today's booming market, and this summer nearly 3,000,000 unsold units accumulated in U.S. warehouses.

At the same time, the Japanese improved their efficiency and worked mightily to keep costs down. The result was that while the Yen's value against the Dollar increased by about one-third, the factory costs of VCR's were up only about five percent or so. Competition among the more-than-80 VCR brands here also tended to push prices down.

Generally speaking, the same factors have kept the price of color TV-sets depressed. Additionally, many Japanese manufacturers assemble their sets in other countries, including the U.S. The result is that production costs are not as closely tied to fluctuations in the value of the Yen and therefore remained more stable.

LIMIT ONE DMM PER SCOPE. NO LIMIT ON NUMBER OF SCOPE/DMM PACKAGES!

FLUKE 70 AND 20 SERIES ANALOG/DIGITAL MULTIMETERS

On this limited-time super special, you can buy a Fluke 73, 75, 77, 21 or 23 at below rock-bottom pricing!

All units feature: • 3½ digit, 3200 count LCD displays • 31 segment analog bar graph • Single rotary control • Auto ranging and polarity • Tough textured case • Continuity beeper and diode test (except 73) • 2000 hour battery life • Range hold (except 73) The 77 and 23 also feature exclusive Touch Hold™ to lock-in your measurement. 21 and 23 series DMM’s feature protection from high-energy overloads; survives 6kV transients.

Model 73 reg. $85  Model 77 reg 512* $64.50  Model 23 reg. $145 $72.50
Model 75 reg. $90  Model 77 reg 512* $64.50  Model 21 reg. $99 $49.50

Dear Customer,

From: Drew Kaplan

Escort turned down our $10,000 head to head challenge described below. Escort says that Maxon's Radar Detector is "primitive", "bottom-end" and "an off-shore product" and will cost you $245 for Escort or $295 for Passport. We should be based on a head to head test with Maxon, not on perceived retail price points.

FORGET PRICE COMPLETELY!

We've put up our $20,000 challenge to Escort to take on Maxon's new Dual Superheterodyne RD-1 999® radar detector on the road of their choice. We say Escort fails to measure quality, value, or price. Escort's marketing people boast of "sophistication" or "advanced engineering" for a product that costs $245 and $295 for Passport.

Let's cut through the Radar Detector Glut. We challenge Escort to one on one Distance and Falsing duel to the death on the highway of their choice. If they win, they must pay $20,000 (was $10,000) check pictured below is theirs. We've put up our $20,000 (was 10). We challenge Escort to take on Maxon's new Dual Superheterodyne RD-1 999® radar detector on the road of their choice. Escort's marketing people boast of "sophistication" or "advanced engineering" for a product that costs $245 and $295 for Passport.

A $20,000 Challenge To Escort

Let's cut through the Radar Detector Glut. We challenge Escort to a one on one Distance and Falsing 'duel to the death' on the highway of their choice. If they win, the $20,000 (was $10,000) check pictured below is theirs.

Bob Thetford, the president of Maxon Systems Inc., and a friend of mine, was explaining their new RD-1 anti-falsing Dual Superheterodyne Radar detector to me. I said "You know Bob, I think Escort really has the market locked up." He said, "Our new design can beat theirs." So, since I've never been one to be in second place, I said, "Would you bet $20,000 (10) that you can beat Escort?" And, as they say, the rest is history.

By the way, Bob is about 6'9" tall, so if we can't beat Escort, we can then see who you know what out of them. But, Bob and his engineers are deadly serious about this 'duel.' And you can bet that our $20,000 (was $10,000) is serious.
... Challenge Continued

We ask only the following. 1) The public be invited to watch. 2) Maxon’s Engineers as well as Escort's check the radar gun and monitor the test and the results. 3) The same car be used in both tests. 4) We'd like an answer from Escort no later than December 31, 1986 and 60 days notice of the time and place of the conflict. And, 5) We'd like them to come with a $20,000 (was $10,000) check made out to DAK if we win.

into action in just 1/4 of one second. Just imagine the sophistication of a device that can test a signal 4 times in less than 1/4 of one second. Maxon's technology is mind boggling. But, using it isn't. This long range detector has all the bells and whistles. It has separate audible sounds for X and K radar signals because you've only got about 1/3 the time to react with K band. There's a 10 step LED Bar Graph Meter to accurately show the radar signal's strength. And, you won't have to look at a needle in a meter. You can see the Bar Graph Meter with your peripheral vision and keep your eyes on the road and put your foot on the brake.

And you'll have a very high level of protection. Maxon's Dual Conversion Scanning Superheterodyne circuitry combined with its ridge guide wideband horn internal antenna, really ferrets out radar signals.

SO WHAT'S DUAL SUPERHETERODYNE?

Ok, so far we've set up the conflict. Now let me tell you about the new dual superheterodyne technology that lets Maxon leap ahead of the pack.

It's a technology that tests each suspected radar signal 4 separate times before it notifies you, and yet it explodes with the test results.

By the way Escort, we'll be happy to have our test around a bend in the road or over a hill. Maxon's detector really picks up 'ambush type' radar signals. And the key word is 'radar', not trash signals. The 4 test check system that operates in 1/4 second gives you extremely high protection from signals from other detectors, intrusion systems and garage door openers.

So, when the lights and X or K band sounds explode into action, take care, there's very likely police radar nearby. You'll have full volume control, and a City/Highway button reduces the less important X band reception in the city.

Maxon's long range detector comes complete with a visor clip, hook and loop dash board mounting, and the power cord cigarette adaptor.

It's much smaller than Escort at just 3½" wide, 4¾" deep and 1½" high. It's backed by Maxon's standard limited warranty. Note from Drew: 1) Use of radar detectors is illegal in some states.

2) Speeding is dangerous. Use this detector to help keep you safe when you forget, not to get away with speeding.

CHECK OUT RADAR YOURSELF RISK FREE

Put this detector on your visor. When it sounds, look around for the police. There's a good chance you'll be saving money in fines and higher insurance rates. And, if you slow down, you may even save lives.

If you aren't 100% satisfied, simply return it in its original box within 30 days for a courteous refund.

To get your Maxon, Dual Superheterodyne, Anti-Falsing Radar Detector risk free with your credit card, call toll free or send your check for just $99* (S4 P&H). Order No. 4407. CA res add tax.

OK Escort, it's up to you. We've got $20,000 (10) that says you can't beat Maxon on the road. Your answer, please?

Escort and Passport are registered trademarks of Cincinnati Microwave.
LETTERS

As a long-time subscriber, I enjoy Radio-Electronics very much, especially the smaller construction articles.

However, I question whether the construction article dealing with the Stun Gun (September 1986) should have been published. It is dangerous to put such equipment in the hands of persons who might misuse it.

Referring to the schematic for that article: In order to recharge the battery, the STAN button (S1) needs to be closed! I would return the charger input directly to the negative terminal of the battery, rather than to ground.

Keep up the articles—Computer Digest also. I have built the voice synthesizer project using the SPO-156-AL2.

RODNEY B. LEWIS
Seymour, MO

Mr. Lewis is correct; the charger jack's return should connect to the negative terminal of the battery, not to ground. The correct schematic is shown in Fig. 1. In addition, due to a printing error, several components (C1, D7, and J1) were not reproduced in the parts-placement diagram; Fig. 2 shows how those components should be mounted. We apologize for those errors.—Editor

DISTURBED BY OUR COVER

The library where I work just received the September 1986 Radio-Electronics, and I am very much disturbed by the cover article, "Build This Stun Gun." The fact that you would run directions for building the gun bothers me less than the manner in which you present the project.

Considering that this is a powerful and dangerous electronic item, which can cause a significant amount of pain to anyone it is used on, you were quite right to post the warning on page 41. That warning reads, in part: "THIS DEVICE IS NOT A TOY. We present it for educational and experimental purposes only...and you should never, repeat, never use it on another person!" You go on to warn...
INTRODUCING THE REPLACEMENT FOR OUR REPLACEMENT GUIDE.

RCA's new SK Guide gives you fast, accurate solid state replacements.

In the world of semiconductor replacements, no one outperforms RCA's engineering excellence. We're in the business of manufacturing semiconductors, so you can depend on our reliability.

Our new, expanded RCA SK Guide to Reliable Replacement Semiconductors lists more than 2,900 SK and KH types that replace over 214,000 industry types. And, for the first time, QMOS logic devices and an extensive line of RF types are included.

The new RCA SK Replacement Guide (SKG202E). It's the only solid state replacement source you need. For a copy, see your RCA SK Distributor. Or mail a check or money order for $3.25 to RCA Distributor and Special Products Division, Box 597, Woodbury, New Jersey 08096-2088.

RCA SK Replacement Solid State
R220 mounts in the unused pads beneath Q200 and Q201. In the right-channel power amp, power-supply bypass capacitors C238 and C239 mount in the unused pads beneath Q209. Viewing the board from the component side, mount C238 to the right of D207, horizontally, with the + side to the right. Mount C239 to the right of C238, vertically, more or less in line with R255. Use 50-volt devices for C132 and C232.—Editor.

**COMPUTER GRAPHICS CONFERENCE**

The University of Oregon is pleased to announce the Fifth Annual Pacific Northwest Computer Graphics Conference, to be held on Monday and Tuesday, October 27 and 28, in Eugene, Oregon, at the Eugene Conference Center/ Hilton Hotel Complex and the Hult Center for the Performing Arts. This year’s Conference will once again focus on leading-edge computer-graphics applications in a multi-disciplinary context. Artists, engineers, designers, architects, scientists, advertisers, and all others interested in the latest in computer-graphics technologies, are invited to participate in what certainly will be an exciting and informative two-day event.

The Conference program features six General-Session presentations, workshops on specific applications to various fields, an extensive Trade Exposition, and the dynamic Monday evening Film and Video Show. Exhibits of computer art and design imagery, a hands-on microcomputer lab, and provocative panel discussions are open to the public without charge. New this year will be pre-conference Macintosh workshops providing concentrated, hands-on, personalized instruction, and a Vendor debate on the latest technology in computer-graphics hardware and software.

For more information, contact: Conference Manager, Fifth Annual Pacific Northwest Computer Graphics Conference, University of Oregon Continuation Center, 1533 Moss Street, Eugene, OR

---

**68 Testing Problems**

- Allows safe, convenient testing of Plastic Leaded Chip Carrier (PLCC) style ICs.
- All four sides of test clip open simultaneously for fast and easy attachment to PLCC being tested.
- Stays securely clamped to PLCC until removed.
- Helical compression springs and insulating contact combs ensure contact integrity during testing.
- Permits testing of ICs with as little as .200" row to row spacing between devices.
- Probe access points are immediately visible for fast and safe individual lead testing.
- Staggered contact rows on .100" centers facilitate probe attachment and help prevent accidental shorting of adjacent probes.
- Industry standard .025" square contact pins on the .100" centers easily accept single row female socket connectors.

**One Solution**

- Available with tin plated leads and gold plated leads.

For information contact a local authorized A P Products Prototype & Test Devices distributor. For immediate response telephone 800-321-9668 or (216) 354-2101 in Ohio.

OBJECTION

I believe that it is a bad choice to run ads unrelated to electronics in Radio-Electronics. I am referring to the Nutri-Wheat ad on page 14 of the August 1986 issue. Independent of the merits of the specific product, I buy Radio-Electronics for its area of specialization, not for general-product ads, with which I’m inundated in all other publications.

ARTHUR WRIGHT
Address Withheld

NEGATIVE FEEDBACK

I enjoy the articles on the early days of radio; they bring back many memories. But I would like to point out that I have not seen any mention of negative feedback, which was introduced by FAD Andrea. The FADA tuned-radio-frequency receivers used negative feedback to overcome oscillation. To adjust the feedback caps, you had to use a tube with one filament prong cut off in the stage you were working on. Then, by using a modulated signal generator, you adjusted for minimum output. I believe that the FADA came out in 1926, and other manufacturers were licensed to use that feature.

One article mentioned the several types of variable capacitors, but failed to mention the one used by some early Crosley radios. It was like two pages in a book. As you turned the dial, a cam pressed the two pages together. A piece of mica supplied the insulation between the pages. Using that cap, Crosley was able to produce some of the cheapest radios at the time.

I remember very well the first dynamic loudspeaker that I heard, about 1926. That was a 110-volt AC-powered set, one of the first. It was made by GE and housed in a Brunswick cabinet. The radio was a superheterodyne with an IF of 90 kHz. There were two tuning dials,

$389.00
MODEL 2000 20MHz
DUAL TRACE

$549.00
MODEL 3500 35MHz
DUAL TRACE DELAYED SWEEP

...AT A DOWN TO EARTH PRICE

At last! Truly affordable test equipment with no compromise in design, and features you would expect to find only on oscilloscopes costing hundreds of dollars more! JDR Instruments presents two, new, high-performance models backed by a two year warranty and technical support which is only a phone call away. Perfect for the technician or advanced hobbyist, both models feature Dual Trace capability and a variety of operating and triggering modes, including CH-B Subtract and X-Y operation.

MODEL 2000 has a 20 MHz bandwidth and 20 calibrated sweeps ranging from .2s to .2μs. A convenient built-in component tester provides additional diagnostic power.

MODEL 3500 features a 35 MHz bandwidth and exceptional 1mV/DIV sensitivity. Delayed sweep and variable holdoff allow stable viewing of complex waveforms.

Today's world is the world of electronics. To be part of it, you need the right kind of training, the kind you get from Cleveland Institute of Electronics, the kind that can take you to a fast growing career in business, aerospace, medicine, science, government, communications, and more.

Specialized training.
You learn best from a specialist, and that's CIE. We're the leader in teaching electronics through independent study, we teach only electronics and we've been doing it for over 50 years. You can put that experience to work for you just like more than 25,000 CIE students are currently doing all around the world.

Practical training.
You learn best with practical training, so CIE's Auto-Programmed lessons are designed to take you step-by-step, principle-by-principle. You also get valuable hands-on experience at every stage with sophisticated electronics tools CIE-designed for teaching. Our 4K RAM Microprocessor Training Laboratory, for example, trains you to work with a broad range of computers in a way that working with a single, stock computer simply can't.

Personalized training.
You learn best with flexible training, so we let you choose from a broad range of courses. You start with what you know, a little or a lot, and you go wherever you want, as far as you want. With CIE, you can even earn your Associate in Applied Science Degree in Electronics Engineering Technology. Of course, you set your own pace, and, if you ever have questions or problems, our instructors are only a toll-free phone call away.

The first step is yours.
To find out more, mail in the coupon below. Or, if you prefer, call toll-free 1-800-321-2155 (in Ohio, 1-800-523-9109). We'll send a copy of CIE's school catalog and a complete package of enrollment information. For your convenience, we'll try to have a representative contact you to answer your questions.
with only parts of their edges showing. One tuned the loop antenna and the RF stage; the other was the oscillator. You normally adjusted both dials together, but you could adjust the oscillator to a different spot about 180 kHz away and pick up the same station. That set had several interesting features: It used 8 UV-199 tubes with their 2-volt filaments in series, supplied with DC. The tube sockets and IF transformers were housed in a brass metal can. That can or trough was potted to keep construction details secret. The troughs were called catacombs.

The loudspeaker had a huge electromagnet, about 4 inches in diameter and 6 inches long. The cone was 10 inches in diameter. That set also contained a record player with a magnetic pickup. It only played one record at a time, but the sound was wonderful. The turntable was driven directly by disk like that in a kilowatt meter. There was a flyball governor to control speed. That set cost about $600.00, which was a lot of money at that time.

You may be interested in the following story: Because long-distance reception was the main attraction of radio in the early days, it happened that all of the stations in the US were to be off the air for one hour during the winter of 1926. That was to allow people in the US to try to pick up some signals from Europe. I conceived the idea of helping out by building a small transmitter in my basement. I built an oscillator with three 201A's in parallel; they were excited by all the 8 batteries that I could borrow from friends. That let them in on the prank, too. For a microphone, we used a carbon telephone mouthpiece. It was connected through 40 feet of twisted pair between oscillator and ground. The telephone mouthpiece was pushed into the horn of a phonograph in our front room to pick up music.

We picked out some call letters of a station in France. I did the announcing and stated that this was a special English broadcast to the USA. When the time came, we started broadcasting music such as "My Old Kentucky Home." We did that very seriously until the hour was up. Of course, we had no idea whether we were being heard or not.

So the next day at high school, we were tickled to find out that a loud station in France had been heard. We kept quiet for about a week, but couldn't keep our secret any longer. The local newspaper ran an article stating that certain young men had violated the law and were liable to go to prison for such pranks—but what a kick we got! All that happened in Lebanon, a small town in Kentucky.

DONALD K. McCAMMON
Louisville, KY

KUDOS FOR MARTIN CLIFFORD

To Martin Clfford for his "The Early Days of Radio," (Radio-Electronics, July 1986) a Thank You!

Your article brought back fond memories of the late twenties when I first became interested in radio. The cat whisker that never
stayed put and the peanut tube created a desire that led to a lifetime career. That career covered the early days of commercial radio, when most equipment was home made, to the design and development of computers—and, in retirement, robotics.

Please retain the present format of Radio-Electronics. Leave the long-winded computer articles to others. Radio-Electronics is. I am sure, the starting point for many of tomorrow's designers and scientists.

ROBERT E. SCHULTZ
Lawrenceville, NJ

SPEECH SYNTHESIS

Ricardo Jimenez and Adrian Valle are to be commended for their article in Computer Digest section the August 1986 Radio-Electronics on speech synthesis for the Commodore 64. That is the only such article that I have seen, which is surprising when we consider how easy and interesting it is to give a 64 a voice.

Radio Shack has another neat trick up its sleeve, in addition to the SP0256-AL2. It is called the CTS256A-AL2, and it makes things even better for the speech hobbyist. “CTS” stands for Code-To-Speech, and it is a digital signal-processing IC that "reads" English words as input, and produces the right allophones as output. You hook it up to the SP0256-AL2, and your computer can actually read and speak English text.

Radio Shack provides a data sheet on how to wire up the circuit, which is quite simple. I was not able to get the parallel interface (of the Commodore's expansion port) to work very well, but there is an RS232 interface that worked perfectly for me—first try.

Figure 5 in the article was a fairly laborious encoding of a BASIC program to make the SP0256 say, "I am a talking computer." The cable from the C54 constituted a pretty tedious piece of work, too, using 9 signal wires plus 2 more for power supply and ground. The equivalent using the CTS256, in addition to the SP0256, is a 3-wire RS-232 cable, 2 lines for power supply and ground, and the following program:

10 OPEN 2,2,3,CHR$(3 + 32 + 128)
20 PRINT #2"I am a talking computer."

The CTS256 figures out the weird allophones required by the SP0256—we don't have to worry about such details. Pronunciation is 85% accurate, according to Radio Shack, and I found it trivial to substitute phonetic spellings in those cases where the CTS256 errs. For example, it pronounces the word "shine" as "sheen," so I just spell it in "shyne," which, for some reason, works great. You could build a "pronouncing gazetteer" for your own application if you wanted to do some fancy dictionary software, instead of remembering to fake out the tricky words yourself with phonetic spellings.

In one major respect, I found the SP0256 to be a huge failure—it sounds like a stupid robot speaking in a monotone. There is no way to vary the inflection, or pitch, of the voice. Even TI's Speak 'n Spell sounds more natural. You should probably have mentioned that in your article, to prevent reader disappointment.

JIM CRAIG
Leander, TX

SPEECH SYNTHESIZER

I was very interested in your article "Speech Synthesizer," by Ricardo Jimenez & Adrian Valle, in the ComputerDigest section of the August 1986 issue of Radio-Electronics.

I'd like to point out that a 2" × 3" circuit board, with the circuit shown in of Fig. 3 of that article is available through Celtic Industries, Inc., 14654 Keswick St., Van Nuys, CA 91405 (818) 787-3615.

The above mentioned circuit board is universally usable on the SP0256-AL2 Voice Synthesizer, and the SP0156 Narrator Speech Processor, and can be an integral part of Radio Shack's Text to Speech Controller CTS256A-AL2. It can also be used with a Commodore VIC-20 or 64 computer.

JACOB LOOSLI

HAMEG Instruments

HM 205

an outstanding Oscilloscope with digital storage

This scope offers all the features of a 20MHz real-time instrument. In addition it provides digital storage capability for signals between 50s and 0.3 ms duration, with a max. sampling rate of 100 kHz. When working with slow phenomenae, the HM205 can easily replace considerably more expensive digital storage scopes.

HM 208

the high tech Storage Scope with 20MHz sampling rate

The HM208's sampling rate of max. 20MHz facilitates storing of fast single events. Max. memory is 4096x8 bit, conveniently divided into two independent blocks. XY-storage capability enables easy viewing and record ng of characteristic curves and Lissajous figures. An XY-recorder output and the optional IEEE-488 Interface allow full integration in automatic measurement systems.
SORTING ZENER DIODES

I purchased a grab-bag of dozens of unmarked Zener diodes. Is there a circuit that I can use to measure their Zener voltages safely?—C. W. L., Bradenton, Fl.

Yes. But let's take a step back and review the basic characteristics of Zener diodes first.

Shown in Fig. 1 is the voltage-current characteristic curve of a Zener diode. When the diode is forward-biased past the 0.6-volt barrier potential, it has a low resistance, so a considerable amount of current can flow.

However, when the applied voltage is reversed, the junction's reverse resistance is very high initially, so current is very low—in the microampere range. As the voltage across the diode increases to a specific and critical value, $V_z$, the normally high junction resistance drops to a very low value, and diode current increases considerably. The Zener voltage, $V_z$, remains constant as the applied voltage increases; it is the latter characteristic that makes the Zener diode useful as a voltage regulator.

The knee in the negative-going portion of the curve is the point where a small current flows just before the onset of avalanche current. That holding current, $I_{zh}$, is considered the minimum current that must be maintained when a Zener diode is being used as a voltage regulator. The maximum Zener current, $I_{zm}$, is limited by junction temperature and by the maximum power that the device can dissipate. Both $I_{zh}$ and $I_{zm}$ are given in manufacturers' data sheets. When current is maintained between those two points, $V_z$ is constant. The value of $I_{zh}$ is low; it's typically 0.25 mA for 1-watt diodes, 1.0 mA for 10-watt diodes, and 5 mA for 50-watt devices.

You can get Zener diodes that are rated from about 2 volts to 200 volts. The power-handling capacity of Zener diodes ranges from 1/4 watt to 50 watts. With those ideas in mind, let's see how we can measure $V_z$ of an unknown diode without exceeding $I_{zm}$ and possibly destroying the diode.

Figure 2 shows the basic scheme for determining $V_z$. The test circuit is powered by a variable DC source whose output is equal to or greater than the highest Zener voltage you expect to encounter. Resistor $R_1$ should be selected to limit current to about ten mA at the highest voltage delivered by the power supply. The diode to be tested is connected across the DC source with its cathode connected to the positive terminal. The two meters allow you to monitor both voltage and current.

To find $V_z$, start with the output of the power supply at zero volts. Gradually increase the voltage while monitoring the voltmeter. As the test voltage increases, the current meter will show little or no
current flow. But when the voltage approaches the avalanche level, current will increase, and voltage will stabilize. After that point, current will increase drastically, and voltage will remain constant. The constant voltage is \( V \).

A more versatile circuit is shown in Fig. 3. That circuit works only with Zener diodes rated at less than about 25 volts. The circuit works by using a 2N2905 PNP transistor as a constant-current generator whose output impedance is determined by feedback current through the emitter resistor selected by switch S1. That current flows through the diode under test; the voltmeter indicates \( V \).

**DUAL AUTO BATTERY**

I am a member of a very active RE-AC-T (Radio Emergency Associated Citizen Teams) unit. With emergency lights, monitor, and CB radios going for hours on end, we often have to make a choice. Leave the engine running to keep the battery charged and risk not having enough gas to return to base. Or else we can turn the engine off and risk letting the battery discharge too low to restart the engine. I’ve heard that some REACT groups use two batteries in their emergency vans and in their cars. How does that work? — G. McC., Palmetto, SC.

Figure 4 shows how to use one battery for the normal circuits (ignition, horn, heater, etc.), and the other battery for your CB radio, siren, emergency lights, etc.

The diodes (D1 and D2) isolates the two batteries and their loads so that neither can be discharged by the other accidentally.

---

**SAFE 'N SURE UNIVERSAL TEST LEAD KIT**

- **PRACTICAL**
- **ECONOMICAL**
- **HANDY**
- **TIME SAVING**
- **MAXIMUM FLEXIBILITY**

This Versatile Modular Kit with 1001 uses allows you to make: TEST LEADS, PATCH CORDS, CLIP LEADS, JUMPER-CABLES, TEST HOOK LEADS compatible with instruments manufactured by: Beckman, Triplet, Simpson, Fluke, B&K, Keithley, Amprobe and other leading brands.

- Accessories screw on for positive, reliable connection. Supplied in pairs (red & black) with 48" long wire leads.
- Packaged complete in neat and handy vinyl organizer carry pouch.
- Custom Leads on special order.
- Made in the U.S.A.

**Kit Includes The Following:**

**SCREW-ON ACCESSORIES**

- Test Hooks
- Spade Lugs
- Alligator Clips
- Banana Plugs

## INSTANT REBATES
### ON B&K-PRECISION SCOPES
Limited time offer—expires November 30, 1986

### $100 INSTANT REBATE
#### 100 MHz, Quad Input Oscilloscope
**Model 1590A**
- 1 mV/div sensitivity — Full Bandwidth
- 2% Vertical and Horizontal Sweep Accuracy
- Dual Independent Time Base
- Calibrated Delayed Sweep
- 20 kV Accelerating Voltage
- V Mode — Displays Four Signals Unrelated in Frequency
- And Much More

**$1865 Price less $100.00 Rebate**
**$1786 FINAL PRICE**

### $90 INSTANT REBATE
#### Digital Storage/Analog Oscilloscope
**Model 2520**
- 20 MHz Real Time Bandwidth 20 MHz Storage Bandwidth
- 2 Megasample/Second Sampling Rate
- 1 K Memory Per Channel
- Equivalent Time Sampling
- Pre-Trigger Capture
- And Much More

**$1895 Price less $90.00 Rebate**
**$1805 FINAL PRICE**

### $80 INSTANT REBATE
#### 80 MHz, Quad Input Oscilloscope
**Model 1570A**
- 1 mV/div sensitivity — Full Bandwidth
- 2% Vertical and Horizontal Sweep Accuracy
- Dual Time Base/Calibrated Delayed Sweep
- 12 kV Accelerating Voltage
- V Mode — Displays Four Signals Unrelated in Frequency
- And Much More

**$1464 Price less $80.00 Rebate**
**$1384 FINAL PRICE**

### $60 INSTANT REBATE
#### 60 MHz, Triple Input Oscilloscope
**Model 1564**
- 1 mV/div sensitivity
- 3% Vertical and Horizontal Sweep Accuracy
- Dual Time Base/Calibrated Delayed Sweep
- 12 kV Accelerating Voltage
- V Mode — Displays Three Signals Unrelated in Frequency
- And Much More

**$1267 Price less $60.00 Rebate**
**$1207 FINAL PRICE**

### $40 INSTANT REBATE
#### 40 MHz, Dual Input Oscilloscope
**Model 1541**
- 1 mV/div sensitivity
- 3% Vertical and Horizontal Sweep Accuracy
- Single Time Base
- 20 Calibrated Sweeps
- 6 kV Accelerating Voltage
- V Mode — Displays Two Signals Unrelated in Frequency
- And Much More

**$847 Price less $40.00 Rebate**
**$807 FINAL PRICE**

### $20 INSTANT REBATE
#### 25 MHz, Dual Input Oscilloscope
**Model 1524**
- 1 mV/div sensitivity
- 3% Vertical and Horizontal Sweep Accuracy
- Single Time Base
- 20 Calibrated Sweeps
- 6 kV Accelerating Voltage
- V Mode — Displays Two Signals Unrelated in Frequency
- And Much More

**$767 Price less $20.00 Rebate**
**$747 FINAL PRICE**

B&K-Precision is offering these instant factory rebates on selected B&K-Precision Oscilloscopes to you through Participating Distributors.

### HERE'S HOW IT WORKS!!!
1. Call 1-800-654-7256 for the name of your Participating B&K-PRECISION Distributor.
2. Select the B&K-PRECISION Oscilloscope that meets your needs from the Participating Distributor's stock.
3. The Participating Distributor will deduct the "INSTANT REBATE" for that model directly from the invoice price. You save instantly!

CIRCLE 7: ON FREE INFORMATION CARD

---

**PLEASE NOTE:** This offer is available only at Participating B&K-PRECISION Distributors. Only B&K-PRECISION Models 2520, 1590A, 1570A, 1564, 1541 and 1524 are eligible for INSTANT REBATES. Sorry, no substitutions are allowed. INSTANT REBATES apply to purchases from October 1, 1986 through November 30, 1986 only.

Multiply your video signal

CIRCLE 9 ON FREE INFORMATION CARD

If you have ever tangled with A/B switches, signal splitters, and coax cables in an effort to route video signals to different TV sets in a multiple-set installation, you’ll fall in love with the VCR Rabbit (Rabbit Systems, Inc., 233 Wilshire Blvd., Santa Monica, CA 90401).

The VCR Rabbit, which consists of a receiver, a transmitter, an infrared transmitter, cabling, and connectors, allows you to input a Channel 3 or 4 TV signal from a VCR, cable-system converter, satellite receiver, computer, videocamera, or other RF-modulated video source and send it to as many as four remotely located TV receivers. The sets may be located up to 150 feet away from the trans-
Where's Your ELECTRONICS Career Headed?

The Move You Make Today Can Shape Your Future

Yes it's your move. Whether on a chess board or in your career, you should plan each move carefully. In **electronics**, you can *move ahead* faster and further with a **B. S. DEGREE**

Put professional knowledge and a COLLEGE DEGREE in your electronics career. Earn your degree through independent study at home, with Grantham College of Engineering. No commuting to class. Study at your own pace, while continuing your present job.

The accredited Grantham non-traditional degree program is intended for mature, fully employed workers who want to upgrade their careers . . . and who can successfully study electronics and supporting subjects through **INDEPENDENT STUDY, AT HOME**

Free Details Available from:

Grantham College of Engineering  
10570 Humboldt Street  
Los Alamitos, California 90720

---

**Independent Home Study Can Prepare You**

Study materials, carefully written by the Grantham staff for independent study at home, are supplied by the College, and your technical questions related to those materials and the lesson tests are promptly answered by the Grantham teaching staff.

**Recognition and Quality Assurance**

Grantham College of Engineering is accredited by the Accrediting Commission of the National Home Study Council.

All lessons and other study materials, as well as communications between the college and students, are in the English language. However, we have students in many foreign countries; about 80% of our students live in the United States of America.

mitter. If the video source is equipped for infrared remote control, each connected receiver can control that source.

Focus on flexibility

The VCR Rabbit affords the user a high degree of flexibility. For instance, suppose you have a remote-control VCR in your family room, but would like to watch video tapes in the master bedroom. You could buy a second VCR, or you could drag your family-room VCR to the bedroom, connect the cables, and watch there. But then no one would be able to watch in the family room. And what if someone wanted to watch TV at another location?

The conventional approach to allow multiple viewing would be to use A/B switches, signal splitters, and coax cable. But each component inserted into the fine takes its toll on signal strength and therefore picture quality. They also can generate a rat’s nest of wiring and switches.

The VCR Rabbit system eliminates most of the bother. The transmitter unit, which can directly feed two receivers, includes a power supply, two splitters, an A/B switch, an RF amplifier, and an infrared amplifier, all housed in a 6½ by 4 by 1¾-inch black and silver plastic cabinet. The receiver, which can feed another receiver, contains an A/B switch, an RF amplifier, and an infrared amplifier in the same-size cabinet. Hooking up the receiver to a TV set or a transmitter to a video source is easy using the color-coded three-tooth cables supplied.

The VCR Rabbit presently being sold is not the wireless TV-transmitter of a couple of years ago. Devices like that, which radiate a Channel 3 or 4 TV signal over a distance of about 200 feet, have been banned by the FCC. Those can easily interfere with your neighbors’ TV reception; and sellers or users of such devices could be subject to heavy fines.

Instead, the VCR Rabbit uses very thin two-conductor “micro-wire” (only 1/4 in. in diameter) for the link between the transmitter and the receiver. Those cables are used to carry the amplified Channel-3 or -4 TV video and sound, 12-volt DC power, and amplified infrared remote-control signals. The system is completely legal; it complies with all FCC rules and regulations.

Using the Rabbit

Installation is a snap. Assuming that there is a TV set located at the signal source, the transmitter is installed between the source and the set using the supplied color-coded cable. If there is no set at the source, the source’s output is
Super Disk Diskettes

Now...Diskettes you can swear by, not swear at.

Lucky for you, the diskette buyer, there are many diskette brands to choose from. Some brands are good, some not as good, and some you wouldn’t think of trusting with even one byte of your valuable data. Sadly, some manufacturers have put their profit motive ahead of creating quality products. This has resulted in an abundance of low quality but rather expensive diskettes in the marketplace.

A NEW COMPANY WAS NEEDED AND STARTED

Fortunately, other people in the diskette industry recognized that making ultra-high quality diskettes required the best and newest manufacturing equipment as well as the best people to operate this equipment. Since most manufacturers seemed satisfied to give you only the everyday quality now available, an assemblage of quality conscious individuals decided to start a new company to give you a new and better diskette. They called this product the Super Disk diskette, and you’re going to love them. Now you have a product you can swear by, not swear at.

HOW THEY MADE THE BEST DISKETTES EVEN BETTER

The management of Super Disk diskettes then hired all the top brains in the diskette industry to make the Super Disk product. Then these top bananas (sometimes called floppy freaks) created a new standard of diskette quality and reliability. To learn the “manufacturing secrets” of the top diskette makers, they’ve also hired the remaining “magnetic media mulls” from top competitors throughout the world. They have chosen the world class, top-dollar engineers, physicists, research scientists and production experts (if they’ve missed you, send in your resume to Super Disk) were given one directive...to pool all their manufacturing know-how and create a new, better diskette.

HOW SUPER DISK DISKETTES ARE MANUFACTURED

The Super Disk crew then assembled the newest, totally quality monitored, automated production line in the industry. Since all diskette manufacturing equipment at Super Disk is new, it’s easy for Super Disk to consistently make better diskettes. You can always be assured of ultra-tight tolerances and super dependability when you use Super Disk diskettes. If all this manufacturing mumbo-jumbo doesn’t impress you, we’re sure that at least one of these other benefits from using Super Disk diskettes will:

1. TOTAL SURFACE TESTING - For maximum reliability, and to lessen the likelihood of disk errors, all diskettes must be totally surface tested. At Super Disk, each diskette is 100% surface tested. Super Disk is so picky in their testing, they even test the tracks that are in between the regular tracks.
2. COMPLETE LINE OF PRODUCTS - For a diskette to be useful to you and your computer, it must be compatible physically. Super Disk has an entire line of 5¼ inch and 3¼ inch diskettes for your computer.
3. SPECIALY LUBRICATED DISK - Super Disk uses a special lubricate which is added to the base media in the production of their diskettes. This gives you a better disk drive head-to-media contact and longer head life.
4. HIGH TEMPERATURE/LOW-MARRING JACKET - A unique high temperature and low-marring vinyl jacket allows more of their product to be available for use in the diskette. This special jacket is more rugged than other diskettes and helps eliminate dust on the jacket.
5. REINFORCING HUB RINGS - Standard on all 48 TP Super Disk mini-disks, to strengthen the center hub hole. This increases the life of the disk to save you money and increase overall diskette reliability.
6. DISK DURABILITY - Super Disk diskettes will beat all industry standards for reliability since they will give you more than 75% of the original signal amplitude remaining even after 500 million disk reads (Weibull B of 30 million disk reads). They are compatible with all industry specifications as established by ANSI, ECMA, ISO, IBM and JIS.
7. CUSTOM-ORIENTED PACKAGING - All Super Disk diskettes are packaged in 10 diskettes a box: 10 cartons and 10 cartons to a case. The economy bulk pack is packaged 100 or 500 disks to a case without envelopes or labels.
8. LIFETIME WARRANTY - We guarantee all diskettes made by Super Disk Inc., to have a lifetime warranty. If any Super Disk diskette fails, write to Super Disk Inc. and we will replace the diskette under the terms of the warranty.
9. SUPER DISK - With Super Disk's automated production line, high quality, error-free disks are yours without the high cost.

SAVE MONEY...QUANTITY DISCOUNTS AVAILABLE

Super Disk diskettes are packed 10 diskettes to a carton and 10 cartons to a case. To save you even more, we also offer Super Disk bulk production where 100 or 500 diskettes are packaged in the same box without envelopes or labels. Since we save packaging costs, these savings are passed on to you. For best value, you should order in increments of 100 diskettes. Quantity discounts are also available. Order 200 or more disks at the same time and deduct 1%; 300 or more 2%; 400 or more 3%; 500 or more 4%; 1,000 or more 5%; 2,000 or more 6%; 3,000 or more 7% and 5,000 or more disks earns you an 8% discount off our quantity 100 price. Super strong and tear resistant 5¼ diskette envelopes are available from us for only $0.10 per pack of 100. Use order # CV-5 for a pack of 5¼ diskette envelopes.

39¢ per disk

Quantity One

Almost all diskettes are immediately available from Super Disk. With our large warehouse facilities, your order is normally shipped in less than a day.

NOVEMBER 1986
merely fed to the transmitter. The micro-wire is then connected to the transmitter via spring-loaded terminals and fed along baseboards and door frames to the receiver. Enough micro-wire (150 feet) is supplied with the unit for almost any domestic applications; the cable ends are stripped and tinned for easy connection. The wire is installed by stapling it to the baseboard, etc., and is hardly noticeable. You must be careful, however, not to pierce the wire with the staples. At the receiver, the micro-wire is connected to the unit via spring-loaded terminals. The receiver is connected to the TV set via the supplied cable. That’s all there is to it.

As mentioned, power and infrared signals are sent to the receiver from the transmitter via the micro-wire. That means that the receiver itself is not connected to the house wiring.

More significantly, it means that you can control a signal source from a remote viewing location by using its infrared remote control as you normally use it. Infrared signals from the control are picked up by the receiver, sent to the transmitter via the wire, and emitted by an infrared source at the transmitter. The signals are then picked up by the signal source’s infrared receiver.

The infrared source was originally mounted inside the transmitter, behind a window. However, not all installations allowed for reliable operation using that scheme. Therefore, an external infrared source, or “wand,” was added. That wand is connected to the transmitter via a jack and is placed directly in front of the signal source’s infrared transmitter.

The owner’s manual is excellent as far as it goes, but it only shows the connections for a VCR and a remote TV set. No attempt is made to show other combinations, probably because there are so many possibilities. The unit can be inserted anywhere within the RF signal path.

This reviewer’s major complaint with the unit is that it lacks a main power switch. Although the power consumption of the transmitter is only 14 watts, there is little reason for leaving the unit on all the time, even when the signal source and attached TV sets are off. Further, that omission may lead to shorter device life. Adding the switch, as well as an LED power indicator would not add much to the unit’s cost, or its power consumption; both additions would be worthwhile enhancements.

At a suggested retail price of $99.50, the VCR Rabbit is far less expensive than adding another cable converter, VCR, or satellite receiver, yet offers you much of the convenience of such an addition. Additional receivers, supplied with 150 feet of wire, are available at a suggested retail price of $44.95.

Some might feel that the micro-wire link is unsightly or undesirable, but this reviewer found that the wire was nearly unnoticeable. Further, the video signal supplied by the VCR Rabbit is superior to that supplied by any RF-link system we’ve seen, and without the threat of an FCC fine!
AUTOMATIC IC TEST SYSTEM, the model 560, is designed for testing IC's in and out of circuit. It will test over 90% of the most popular TTL and CMOS IC's.

In-circuit test applications include diagnostic tests on completed circuit boards on a production line, at a quality-control point, in a service depot, or even in a field-service operation. It can be programmed to test all IC's in sequence on a board, or to test large quantities of one IC type. Programming setup time is a minute or less for simple boards.

Tests can be conducted in range dom order or in a pre-determined test sequence. A particular series of IC numbers used on a circuit board can be selected from the model 560's resident library and loaded into RAM, or programmed into EEPROM memory for permanent storage. So rapid is its operation that faulty PC boards that were previously discarded—because of the cost of labor—can now be debugged in minutes by non-technical personnel.

All test results are displayed on a 20-character dot-matrix vacuum fluorescent display. Plain-English user-prompts guide every step of the operation. In addition, front-panel LED indicators display the test mode and device type.

The model 560 is priced at $3500.00.—B&K Precision Product Group, 6640 W. Cortland St., Chicago, IL 60635.

DMM, the Mercer model 9370, offers autoranging and manual selection of voltage and resistance ranges. It measures up to 1000 volts DC (in 5 ranges), 750 volts AC (in 4 ranges), 10 amps AC and DC (in 2 ranges), and 2 megohms (in 5 high- and 4 low-power ranges.)

The memory mode provides up to 99 counts of zero offset. Also included is an audible continuity indication. Basic DC-voltage accuracy is 0.5%. Low and high energy fuses are provided.

The unit is housed in a 5.9" x 2.95" x 1.34" high-impact case, and it weighs ¼ pound. A 9-volt battery, color-coded test leads with screw-on alligator clips, and an operator's manual are also furnished. The model 9370 has a suggested list price of $59.00.—Mercer Electronics, Division of Simpson Electric Company, 853 Dundee Avenue, Elgin, IL 60120.

80 db SIGNAL ELIMINATOR—for removal of undesirable TV FM cable signals. Can be tuned precisely to ANY signal within these ranges: Model 26—Chs. 2-6 plus FM (54-108 Mhz) * Model 1422—Chs. 14(A) - 22(1) (120-174Mhz) * Model 713 - Chs. 7-13 (174-216 Mhz) Highly selective notch adjustable strength. Singles $30. Quantity discounts to 60%. STAR CIRCUITS - P.O. Box 8332 - Pembroke Pines, FL. 33084 CIRCLE 94 ON FREE INFORMATION CARD
Satellite Communications Training from NRI!

Move into commercial satellite communications and home satellite TV with NRI’s latest training breakthrough!

Explore Every Aspect of Satellite Transmission and Reception As You Assemble, Install, and Train With the Complete TVRO System Included in Your Course

Back in 1964, great excitement surrounded the launching of Syncom 2, the true forerunner of today’s satellites. But not even the most hopeful of scientists believed that in less than 25 years, communications satellites would have such a tremendous impact on the professional and personal lives of millions of people around the globe.

Today, thanks to the rapid development of satellite technology, a call to Paris is as clear and as easy to make as a call to your next door neighbor...executives from multi-national corporations and even small businesses use video conferencing to “meet” without leaving their offices...simultaneously a billion people witness a single event (a soccer game, an inauguration, a benefit rock concert)...global weather maps transmitted from satellites allow meteorologists to forecast weather trends weeks in advance...and scientists now explore and investigate the mysteries of outer space without leaving their labs.

And, not surprisingly, these amazing applications of satellite technology have opened up exciting new opportunities for the technician trained to install, maintain, troubleshoot and repair satellite communications equipment.

Home Satellite TV Is Just at the Start of Its Explosive Future

You’ve seen them in suburban backyards and alongside country farmhouses. Home satellite TV systems are springing up all across the country.

Already there are over a million TVRO (Television Receive-Only) systems in place in the U.S. alone, and experts predict that by 1990, a remarkable 60% of U.S. homes will have a satellite dish. Contributing to the field’s phenomenal growth are the support of the FCC and Congress, steady improvement in product quality, the development of smaller dishes, and a growing consumer enthusiasm for satellite TV.
New Jobs, New Careers for the Trained Technician

Now you can take advantage of the exciting opportunities opening up in this service- and support-intensive industry. NRI’s new breakthrough training prepares you to fill the increasing need for technicians to install, adjust, and repair earth station equipment, such as dishes, antennas, receivers, and amplifiers.

As an NRI-trained technician, you can concentrate your efforts on consumer-oriented TVRO equipment. Or you can use your NRI training to build a career servicing larger commercial or military equipment used both to transmit and receive voice, data, and video signals. You’ll also find opportunities in sales and system consulting, a role some expect to increase tenfold within the next five years on both the corporate and consumer levels.

NRI Brings Satellite Technology Down to Earth

Only NRI has the resources and the skills necessary to transform today’s most sophisticated technology into understandable, step-by-step training.

NRI’s new course in Satellite Communications gets you in on the ground floor of this booming technology. You are thoroughly trained in the necessary basic electronics, fundamental communications principles, and television transmission and operation.

Using the remarkable NRI Discovery Lab®, you demonstrate first-hand many important points covered in your lessons. You perform critical tests and measurements with your digital multimeter. And, using your NRI Antenna Applications and Design Lab, you assemble and test various types of antennas and matching sections.

Then you concentrate on both commercial and consumer satellite earth station equipment, putting theory to practice as you assemble and install the 5’ parabolic dish antenna system included in your course.

Your Home Satellite TV System Brings Theory to Life!

The Wilson TVRO system included in your course comes complete with 5’ parabolic dish antenna system, low-noise amplifier (LNA), down converter, receiver, low-loss coaxial cable, and even a permanent polar mount.

By training with an actual TVRO system, you’ll come to understand the function and operation of a satellite earth station—knowledge that you can apply to both consumer and commercial equipment. And once you have completed your TVRO system, you’ll have access to the best television entertainment available—direct from the satellite to your home.

At-Home Training the Uniquely Successful NRI Way

It’s hands-on training, at home... designed around the latest state-of-the-art electronic equipment you work with as part of your training. You start from scratch and “discover by doing” all the way up to the level of a fully qualified professional. You conduct key experiments... perform vital tests... install your own system... and you do it at the pace that suits you best.

But, most important to your success, you don’t do it alone. Built into your NRI training is the enormous experience of our development specialists and instructors, whose long-proven training skills and personal guidance come to you on a one-to-one basis. They are always available for consultation and help.

Make Your Move Into the Future Today! Send for Your FREE NRI Catalog

Only NRI can train you at home for an exciting and rewarding career as a satellite communications technician. The knowledge and know-how you gain from your NRI training provide you with the soundest possible foundation for further growth with the industry. But now is the time to act. Return the post-paid card to us today. You will receive your 100-page catalog free. It’s filled with all the details you’ll want to know about our training methods and materials and our more than 70 years of successful innovation in at-home, hands-on career training—the kind of experience that enables NRI to provide the most effective training possible to prepare you for today’s, and tomorrow’s, high-tech opportunities. (If the card is miss ng, write to us at the address below.)
Light-seeking robot

Here’s a simple circuit for demonstrating some basic principles of robotics. The circuit is light seeking; with careful adjustment it will follow a flashlight around a darkened room. The heart of the circuit is a pair of photocells that determine the direction in which the robot will move. Depending on how light falls on the cells, the robot can be made to move forward, left, or right. Motion is provided by two independent DC motors; a swivel-wheel maintains balance.

How it works

In the circuit shown in Fig. 1, each photocell is connected to an op-amp configured as a comparator. When sufficient light falls on photocell R2, the voltage at the inverting input (pin 6) of ICS-1 will fall below the voltage at the non-inverting input (pin 5), so the output of the comparator will go high, and transistors Q1 and Q2 will turn on. That will enable relays RY1 and RY2, and thereby provide power for the right motor. The robot will then turn left.

Likewise, when light falling on R3 lowers its resistance, Q2 and Q3 will turn on, the left motor will energize, and the robot will turn right.

Notice that diodes D1 and D2 provide an or function: Q2 turns on when either comparator goes high (or when both do). When Q2 turns on, it energizes relay RY2, which provides a path to ground for either motor coil, or both. When there is not enough light falling on the photocells, neither comparator will go high, so RY2 will be off. That is what prevents the robot from moving when neither photocell is lit.

Also note that the photocells and motors are cross-wired—the left photocell controls the right motor, and the right photocell controls the left motor.

Construction

Building this circuit requires more mechanical than electronic skills. In addition to a circuit board, you’ll have to provide a platform for the motors, the swivel wheel, and the batteries. You could generate the five-volt motor relay supply from a six-volt battery or gel-cell in series with a power diode. Make sure to use a diode that can handle about four times the maximum current drain of a single motor. To provide noise immunity, the comparators should...
be powered from a separate low-current nine-volt supply.

The photocells should be mounted on the front of the platform, several inches apart, with a light barrier between them. You'll have to experiment to find the exact dimensions for your application, but try mounting the photocells two inches apart, and make the light barrier about four inches long. Also, it's a good idea to coat the barrier and whatever the photocells are mounted on with flat black paint.

After wiring the circuit, check it over and correct any errors. Then turn off the lights and adjust R4 so that the robot doesn't move when only ambient light is falling on the photocells. Next adjust R1 so that the photocells are equally responsive to your signal light. Last, try leading the robot around the room. —J. A. Tavares

CASSette DEMAGNETIZER, the model SK308, is powered by a 1.5-volt mercury disc dry cell. The unit's electronic circuit generates a large electronic field at the tape head, then slowly breaks the field down. As the field decays, it dissipates the tape-head magnetism is less than one-third of a second.

The battery has an average life of 500 hours, and is readily replaceable. A recessed LED in the cassette informs the user whether the cell requires replacement.

The model SK308 is priced at under $20.00.—Signet, 4701 Hudson Drive, Stow, OH 44224.

Capacitance, logic and more. For less.

Now, a fully-loaded DMM combines a capacitance meter, logic probe, and an hFE meter, all for the price of a DMM.

TTL Logic Probe: 20 MHz
Hi/lo/off indications
Detects 25nS pulse width
Capacitance: 5 ranges (2nF to 20µF)
hFE (NPN or PNP): 1 range (1000)
DMM: DCV - 5 ranges (.2V to 1kV)
ACV - 5 ranges (.2V to 750V)
DCA - 4 ranges (200µA to 10A)
ACA - 3 ranges (20mA to 10A)
Ohms: 7 ranges (200 Ohms to 2000 Megohms)
Continuity beeper
Diode check
Built-in bail
Anti-skid pads

See one now at your local Beckman Industrial distributor.

CIRCLE 109 ON FREE INFORMATION CARD
MORE AND MORE GOOD PROGRAMS ARE APPEARING ON TV LATELY, ESPECIALLY ON THE CABLE CHANNELS. AND MORE AND MORE GOOD FILMS ARE COMING OUT ON VIDEO TAPE. BUT UNTIL RECENTLY NOT EVERYONE COULD FULLY ENJOY THOSE PROGRAMS—ESPECIALLY PEOPLE WITH A HEARING DISABILITY. SINCE 1979, HOWEVER, MANY TV SHOWS HAVE BEEN BROADCAST AND MANY VIDEO TAPE'S BEEN RELEASED THAT USE CLOSED CAPTIONING—A METHOD WHEREBY HEARING-IMPAIRED PERSONS CAN READ DIALOG AND NARRATION ON THE SCREEN IN REAL TIME—WHILE THE ACTOR OR ANNOUNCER IS SPEAKING!

All it takes is our inexpensive adapter to allow a hearing-impaired person to enjoy all the benefits of modern programming. Because most of the circuitry comes on a pre-built module, the decoder can be built easily in an evening or two for under $150.

To use the decoder, feed the audio and video outputs of a VCR, a component-TV tuner, or a satellite receiver to the adapter, and connect its outputs to the corresponding inputs of your receiver device. If your receiver has no audio and video inputs, you can add an RF modulator to provide input directly to your receiver's antenna terminals.

HOW IT WORKS

Closed captioning is the term for the written subtitles that are encoded on a television program or on a videotape. An often-asked question is why the captions are "closed," or normally invisible, instead of "open" and visible all the time. The answer is that, although captions are a boon to the hearing-impaired viewer, they can annoy and distract other viewers.

Normally the subtitles are not visible on the screen, but when a video signal carrying closed-caption data is passed through a decoder, that data can be extracted from the signal and converted into visible captions that can be placed just about anywhere on the screen. The captions usually appear at the bottom of the screen and provide input to the receiver's tuner.

To avoid blocking on-screen action, or to better identify who is speaking when more than one person is visible, the captions can be placed on the screen strategically. Significant sounds that are not apparent from the on-screen action (such as off-camera screams, door slams, and gunshots) can also be captioned, and usually are placed in brackets: [gunshot], [shouts], etc.

There are numerous closed-captioned programs on TV these days. For example, almost half of the network movies, most of the regular prime-time series, and many news and educational programs are currently closed-captioned. The three networks (most notably ABC) and the PBS system carry more than a hundred hours of captioning a week. Many pay-TV services also carry captioned programs (some 30 hours a week), including HBO, Cinemax and Showtime/The Movie Channel.

In addition to broadcast programming, hundreds of popular video-taped movies have also been captioned. The total number of titles that are available at press time should exceed 600; approximately 25 titles are added every month. Captioned movies are identified by a closed-caption symbol on the package.

Closed-captioning provides more than just captions. There are nationwide full-page text services that summarize news, sports scores, special information for the hearing impaired, and even provide a complete list of currently broadcast closed-captioned programs.

As you might suspect, all that information cannot be packed into a single captioning channel. In fact, there are two captioning channels and two text channels, all of which operate simultaneously. Caption channel 1 (C1) is used for regular caption information. Caption channel 2 (C2) is largely unused at the present, but will most likely find use in "alternate-text" captioning. For example, second-language captioning, simplified text for children, and verbatim captions (which move too fast for some viewers to read) are all possible uses for C2.

Both Text channel 1 (T1) and Text channel 2 (T2) are in wide use, however. On ABC, T2 is used more or less continuously to transmit the Program Listing Update Service (PLUS), which is a rolling list of all current broadcast and pay-TV programs that are captioned, including movies.

T1 is used simultaneously to carry other text services such as The News Summary, which is broadcast Monday through Friday during the program "Nightline." Weekend Scoreboard (a list of current sports scores and rankings), broadcast Saturdays between 8 and 11 PM and Sundays between 7 and 11 PM (Eastern time); and the Hearing Impaired News
captioning. In that type of captioning, which is used mostly for news programs and live speeches, a caption programmer listens to the program and enters the words spoken into a computer, using a keyboard similar to that of a court reporter’s. A sophisticated computer program identifies the word groups, and converts them to caption form. The captions thus produced roll upwards on the bottom three lines of the screen at a rate more or less equal to the speed with which they are spoken. Although the captions lag slightly behind the spoken words (due to the time required for entry and translation), they appear very quickly and are, for all practical purposes, instantaneous.

The line-21 system

The text channels and closed captions are variations of a teletext system known as the Line-21 System, so called because data is transmitted on video line 21. A number of experimental teletext systems using the Line-21 format have come and gone in the US, most notably the original INFOTEXT service in Wisconsin. However, most teletext systems use either the WST (World System Teletext) or NAHTS (North American Broadcast Tele-

Text Service (HINTS), a list of news and information of concern to the deaf and hearing impaired, broadcast Mondays and Thursdays between 8 and 9 PM. PLUS and the other services also can be found on some PBS stations.

Both the existence and the widespread use of the closed-caption system in the US are the result of an almost single-handed effort by the National Captioning Institute (5203 Leesburg Pike, Falls Church, VA 22041), a non-profit corporation whose sole purpose is to develop and further closed captioning. From its beginnings in 1979, NC1 has moved closed captioning from the status of a novelty to that of a viable communications medium for a sizable portion of the population. NC1 is responsible for all phases of captioning, from fundraising, to research and development of new equipment and techniques, to the actual production of captions for programs.

Making captions

Program captions are produced by a rather lengthy process in which the program to be captioned is viewed, trial captions are added, the result is reviewed and edited, and so on until a finished set of captions that accurately follows both dialogue and action has been produced. It takes about 30 hours of work to produce captions for a one-hour program, at a cost of about $2,500.

For broadcast programs, the caption data is encoded on a floppy disk and sent to the broadcast center, where it is added to the video signal for transmission with the program. The caption data is added to videotapes during duplication.

Although most captioning is done in advance for pre-recorded programs, a recent development (by NC1) allows instant

Video encoding

A diagram of the signal that encodes the data is shown in Fig. 1. The data is transmitted on video line 21, which is the last line of the normally-invisible vertical blanking interval, and it is the line immediately preceding the video image.

To synchronize the decoder’s data clock, a seven-cycle burst of a 503-kHz
signal is transmitted first. That is followed by a start bit and then two seven-bit bytes of data, each of which has an eighth (parity) bit for error detection. That makes a total of 17 bits per frame. So, at 30 frames per second, the overall data rate is 510 bits per second. Although that may seem slow, (particularly when compared with WST's 5.7-megahaud rate), it is fast enough to carry the limited data needed for captions. In addition, it is the slow speed of the Line-21 system that gives it its sturdiness.

Most of the symbols, upper-case, and lower-case letters conform to the standard seven-bit ASCII format. However, there are some 55 special character and control codes in the Line-21 system. Among them are codes that direct the following data to one of the four display channels, codes to position the captions vertically, and codes to position the captions horizontally.

Among the special symbols is a musical note, which is used to indicate the presence of music. The symbol may be present at the beginning, the end, or both of a caption to indicate that the caption is being sung. (And yes, program theme songs and the like are captioned!)

Although captions are currently composed of white characters on a black background, the Line-21 system can provide different background colors, which could be used, for example, to differentiate between speakers on the screen, or simply to provide a more attractive display—which could be particularly effective in the text mode.

The decoder

A decoder is required at the viewer's end of things to extract the caption or text data from line 21, convert it into displayable characters and backgrounds, and insert those characters into the video signal at the appropriate time.

As you may have guessed, NCI has developed a decoder. The current model, the Telecaption II, is priced at $200, is available from Sears and JCPenney's, and incorporates a cable-ready tuner and an IR remote controller. But if you'd like to save some cash and have the satisfaction of building your own—read on!

Circuit description

Since our decoder does not have a built-in tuner, it requires connection to the video and audio outputs of a VCR or other device with audio and video outputs. The decoder in turn has both direct outputs for connection to a VCR or monitor, and an optional RF modulator output that can deliver a signal to either Channel three or Channel four through your TV's antenna input terminals. A block diagram of the decoder is shown in Fig. 2.

The heart of the device is NCI's Telecaption Decoder Module. The module detects and extracts the caption data, and then converts it for video output. The module is so complete that the only external circuitry required are a power supply, audio and video amplifiers, and the optional RF modulator. The module has only six external connections, and it has no internal adjustments or settings. A simplified block diagram of the module is shown in Fig. 3.

The most important portion of the circuitry is the input section, which is called an adaptive data slicer. That circuit locates and locks onto the video data, extracts it, and sends it to the module's controller in digital form. It is termed an adaptive circuit because it can adapt to varying signal, frequency, and noise conditions to extract the data.

Next the data flows to a 68A03 microprocessor where it is processed by a program stored in ROM. If the data is valid, look-up tables in ROM are used to determine the meaning of the data—i.e., whether it is displayable characters or control codes. Then captions are formed.
and passed on to be re-combined with the original video image.

Although that description makes the job sound easy, a few moments thought about the complexity of extracting a digital signal from a video signal, interpreting it, converting it, and then inserting the result in sync and in phase with the original image will give you an idea of how difficult the job really is. The 68A03 microprocessor requires 2K of RAM, 12K of ROM, and a 2000-element gate array, some logic IC's, and over 200 passive components to do its job.

Although the module does most of the work, additional circuitry is required to combine data with the video signal, to provide power, and to select the desired function. Let's look at that circuitry now, starting with power supply and switching circuits, which are shown in Fig. 4.

The decoder is powered by a 12-volt, 500-milliamp wall transformer. Power is routed from jack J1 to function switch S1-a via diode D1, which protects the decoder from an accidentally reversed power input. Capacitors C1 and C2 filter the 12-volt input, and LED1 lights up when power is on. IC1 provides regulated five volts for the NCI module. Because the module draws more than 400 milliamps of current, a heatsink is required to dissipate heat.

The only portion of the non-NCI circuit that requires five volts is the function-select circuit that is also shown in Fig. 4. The operating mode of the NCI module is determined by the state of the three pins labeled 5B3, 5B4, and 5B6. Incidentally, the module has 6 connectors numbered 5A-5F, and 5D, 5E, and 5F are not used in our decoder.

Pin 5B3 is the CAPTION/TV select input. When that pin is low, the module's decoding functions are inhibited and the video signal is displayed without captions or text. The inputs at the other two pins are also ignored. When that pin is brought high (to +5 volts), the module is placed in decoding mode.

Pin 5B4 is the CAPTION/TEXT select input. When that pin is low, the decoder will seek one of the two text channels; when that input is high, the decoder will seek one of the two caption channels.

Pin 5B6 is the CHANNEL/CHASS select input. It allows you choose between Text Channel 1 and 2, or Caption Channel 1 and 2, depending on the state of pin 5B4. When 5B6 is low, T2 or C2 will be selected. When 5B6 is high, T1 or C1 will be selected. Switch S1-b, in conjunction with resistors R10-R15 and the array of diodes (D4-D9), allows you choose between OFF, C1, C2, T1, T2, or TV.

We have also designed an all-electronic function-select circuit which we'll present next time. That circuit uses several additional IC's, and it provides a more elegant way of choosing which mode the decoder operates in.

Video circuit

Figure 5 shows the bulk of the non-NCI circuit. That circuit has two main functions. First, it provides the module with a clean, buffered composite-video signal from which the caption data can be extracted. Second, it combines the Blanking and Y (character) outputs from the module with the original video signal, thus providing a composite signal composed of both captions and images.

The composite-video signal from J5 is fed to the video buffer composed of transistors Q2-Q5. That signal is then routed via R25, R26, and C13 to a sync separator.
and DC clamp composed of transistors Q10 and Q11. The output of that circuit is then coupled, along with the original signal, to the base of buffer transistor Q6. The output of Q6 drives both blanking transistor Q7 and the output buffer tran-
sistor Q9; it is the latter which drives the video input (pin 5C1) of the N11 decoder module.

Between Q6 and Q9 is a noise-cancel
cellation circuit composed of Q8 and the components around Q8. That circuit helps remove impulse noise from the video signal and therefore reduces the module’s error rate.

The blanking signal provides the black background for the captions and text. It is produced at pin 5A4 of the module. That signal is buffered and amplified by Q12. The output of Q12 is coupled, along with the original video signal, to the base of blanking buffer Q7. The combined signals are then applied to the base of the video output buffer, Q14.

The blanking “blackness” level is set by components D11 and R47-R49. The level which is stabilized by C20. can be adjusted by means of rear-panel trimmer potentiometer R50.

The Y (character) output comes through pin 5A1 of the module. It is then buffered and amplified by Q13. The output of Q13 is added to the video and blanking signals at the base of transistor Q14.

Diode D13 prevents any Y level below the blanking level from reaching the output and perhaps disturbing the picture sync.

Diode D12 and resistors R54-R56 are used to clip the upper portion of the Y signal and limit the brightness of the characters. The clipping level is set by R55, another rear-panel trimmer.

Output transistor Q14 combines the original video image with the blanked-out boxes and the white captions. That transistor delivers a signal to video output jack J6 and it drives the video input of the RF modulator.

The final portion of the decoder’s cir-
cuity is shown in Fig. 6. Since the audio signal plays no part in the caption decoding process, it is merely buffered by Q1 and routed to audio output jack J4 and the audio input of the RF modulator. The latter delivers a standard video signal on either Channel three or Channel four; a switch is provided that allows you to choose the desired channel.

The RF modulator requires a six-volt supply, which is derived from the 12-volt rail by R8 and D3, and which is smoothed and stabilized by C9.

That completes the circuit description of our closed-caption decoder for the hearing impaired. Unfortunately, we have run out of room for this month. When we continue next time we will present complete instructions for building the unit. We will also present the details for the electronic function-select circuit we mentioned earlier. Finally, we’ll show how to hook up and use the unit. In the meantime, you may want to get a head start by gathering the required parts.
Part 5 MOST OF THE SYSTEMS that we’ve looked at so far share a common problem. That problem is security. As we’ve seen, although the systems appear formidable at first glance, the circuitry required for descrambling is not very sophisticated, especially because most of it is built around commonly available IC’s. As a result, it is a relatively simple task to assemble an unauthorized descrambler. Further, “black-market” units are readily available from several sources.

To many programming distributors that is an intolerable situation. In response, sophisticated scrambling techniques that use dynamic scrambling algorithms and/or digital techniques have been developed.

One such system is the Scrambled Sync And Video Inversion (SSAVI) system. SSAVI has four modes of operation. Those are: suppressed sync and inverted video, suppressed sync and normal video, normal sync and inverted video, and normal sync and normal video (not scrambled). We touched on that system briefly in the September issue. This month, we’ll look at SSAVI in detail.

The SSAVI system

In the SSAVI system lines 27 to 260 are scrambled. All of the other lines of a 262-line field are sent normally. That means that the vertical-blanking interval is not scrambled. But that doesn’t mean that there’s nothing of interest there. In fact, the vertical-blanking interval, or rather the information that is placed on the video waveform during that period, is the key to descrambling the signal.

The vertical-blanking interval of an SSAVI-encoded video waveform is shown in Fig. 1. The first nine lines of that interval are normal. That is, the sequence of six horizontal-equalizing pulses, followed by six vertical-sync pulses, followed by six more horizontal-equalizing pulses is not altered.

Starting with line 10, however, some interesting things begin to happen. Lines 10, 11, and 12 are used to transmit a subscriber code number. Unless the code number matches one that is stored on a prom that is within a subscriber’s descrambler, no decoding takes place.

The main purpose of the subscriber code number is security. As each cable system would use its own code numbers, a decoder stolen from one system would be useless for descrambling another system’s signals. Additionally, the code number allows for a pay-per-view or tiered system. In such systems, premium programs or levels (tiers) of programs could be ordered by individual subscribers. During times when premium programs are broadcast (or cablecast), the decoders of those who have not ordered the programs are shut off via the code. Another advantage that pay programmers like is that the code gives the programmer a way to remotely disconnect the service of those that have fallen behind in their payments.

Over the next few months, Radio-Electronics will be presenting a series of articles describing the techniques used by pay-TV and cable companies to scramble their signals. While specific circuits for specific scrambling systems will be discussed, there are presented for informational and experimental purposes only. Therefore, parts lists, parts suppliers, and additional technical support will not be available for those circuits. The authors are currently preparing a book with a working title of Descrambling and Scrambling TV and Video Signals, with Projects (Catalog number 22499) to be published by Tab Books (Blue Ridge Summit, PA 17214). It will cover many of the scrambling systems discussed in this series.

We will not discuss the subscriber code any further as it is not needed to descramble a signal. An SSAVI decoder can be operated without the subscriber-code security feature simply by bypassing it.

The other important line is line 20. It is used by the decoder to determine whether or not a frame will have its video polarity inverted. If the frame is to be sent with normal polarity, the first half of the line will be a white level, while the second half of the line will be a black level. If the frame is to be sent with inverted polarity, the entire line will be a white level. Line 20 is also used to establish the black and white reference-levels for the frame, regardless of the polarity of the video.

Decoding SSAVI

A block diagram of an SSAVI decoder is shown in Fig. 2. Scrambled video is fed to the noninverting input of the video amplifier. Horizontal blanking pulses are fed to the inverting input; we’ll see how those pulses are developed in a moment. Those signals are combined and the result is a composite video signal, with one major exception: The polarity of the video signal may or may not be inverted.

Proper polarity is restored using a video-inverter stage and two gates. Part of the output of the video amplifier is sent to a video inverter stage and part bypasses it. If the transmitted video has the proper polarity, no further processing is needed and the bypass signal is fed to the output. Otherwise, the gates are switched in such
FIG. 1—THE VERTICAL BLANKING INTERVAL of an SSAMI-encoded signal. Line 20 is used by the decoder to establish the black and white reference levels for the frame, and to determine the polarity of the transmitted video.

FIG. 2—IN THE SSAMI SYSTEM, four different scrambling modes are used. Here, a block diagram of an SSAMI descrambler is shown.

FIG. 3—PART OF THE VIDEO AMPLIFIER'S OUTPUT is picked off and fed to a sync separator, which is similar to the ones found in standard TV sets. The output of the separator is used to recover the video sync via a vertical integrator. Typical versions of those two circuits are shown here. The vertical integrator is shown in a; the sync separator is shown in b.

a manner that the output signal consists of the re-inverted video from the inverter stage and the sync pulses from the signal that bypasses the inverter. Operation of the gates is controlled by the invert logic.

Also, part of the video amp's output is picked off and led to a sync separator. That circuit is identical to the one found in any standard TV receiver. The output of the separator is a composite sync signal. Part of that signal is used to recover the video sync via a vertical integrator. Typical versions of those circuits are shown in Fig. 3. The integrator in Fig. 3-a, the separator is shown in Fig. 3-b.

The rest of the composite sync signal is used as a reference for a Phase Locked Loop (PLL). That PLL is set up to provide a 504-kHz (nominal) signal that is phase locked to the horizontal signal. (Remember that the horizontal frequency is 15.75 kHz, which is 9/2 of 504 kHz.) We'll look at how that's done in a moment, but first let's see how the 504-kHz signal is used to derive the horizontal blanking pulses.

A 504-kHz signal has a period of 1.98 µs. If that signal is used to clock a + 32 counter, by using 5 consecutive count states a 9.92-µs pulse can be formed. That is very close to the nominal 10-µs period of a normal blanking pulse. Therefore, all that's needed to derive the blanking pulses is a counter as described, along with a handful of gates to decode the counter's output. That circuit can take many forms, but one simple design is shown in Fig. 4. Note that only the first 5 stages of the 12-stage (r + 4096) 4040 counter are used. If you wish, the + 32 counter could also be implemented using a + 2 and a + 16 counter or by cascading 5 flip-flops.

Getting back to the PLL, a + 32 counter is also needed there if the circuit is to output a 504-kHz signal as required. One of the characteristics of a PLL is that if a + n counter is placed between the VCO (Voltage Controlled Oscillator) or the phase comparator, the output is equal to n x the input frequency. Therefore, with a + 32 counter and a 15.7-kHz input, the output is 504 kHz.

The PLL could of course be built using
A phase comparator IC, such as a MC4044, and a VCO, but it is easier to use one of the PLL IC's currently on the market, such as the NE565 or the CD4046B. Figure 5 shows a PLL circuit built around the 4046. The output of the horizontal-blanking pulse, a 2-μs sample of that pulse's back porch is taken by the descrambler. That sample is used to establish the black level for the remainder of the frame. About 4 microseconds after the end of the horizontal-blanking pulse, the circuitry takes an 8-μs sample of the "video." That video level is used to establish the white reference for the remainder of the frame.

The rest of line 20 is used to inform the descrambler of the video polarity for the frame. If the frame is to have normal polarity, the video level drops to black. If the polarity is to be inverted, the level remains white. The video level is sampled and used to control the operation of the invert logic.

**Restoring sync**

The horizontal blanking pulses are available to synchronize the PLL during the first 26 lines of the frame. But what happens after that? In the last part of this series (Radio-Electronics, September 1986), we saw that a PLL can lock onto a signal that is present only occasionally. Therefore, when line 27 comes along, with its suppressed or missing pulses, the sync separator is applied to pin 14 of the PLL. A 50-200-pF trimmer, C1, is used to adjust the VCO's center frequency. The +32 counter is inserted between pins 3 and 4. The output of the PLL stage is also taken from pin 4. Under locked-loop conditions, the output from the +32 counter, which should be set up to output on the zero count, should be in phase with the sync signal. The values of the components in the loop filter, R3 and C2, should be chosen for proper loop stability and lock-up time.

As mentioned previously, line 20 is critical in the SSAVI system. About 7 μs after the leading edge of the line-20 horizontal-blanking pulse, a 10-μs sample of that pulse's back porch is taken by the descrambler. That sample is used to establish the black level for the remainder of the frame. About 4 microseconds after the end of the horizontal-blanking pulse, the circuitry takes an 8-μs sample of the "video." That video level is used to establish the white reference for the remainder of the frame.

The rest of line 20 is used to inform the descrambler of the video polarity for the frame. If the frame is to have normal polarity, the video level drops to black. If the polarity is to be inverted, the level remains white. The video level is sampled and used to control the operation of the invert logic.

**Restoring sync**

The horizontal blanking pulses are available to synchronize the PLL during the first 26 lines of the frame. But what happens after that? In the last part of this series (Radio-Electronics, September 1986), we saw that a PLL can lock onto a signal that is present only occasionally. Therefore, when line 27 comes along, with its suppressed or missing pulses, the VCO outputs a pulse anyway. At the same time, a gate controlled by the scramble on-off logic is enabled and the VCO's pulse is summed with the incoming video signal in the video amp. The output of that amp is a video signal with an artificially created blanking pulse.

That artificially created pulse fools the PLL since the sync separator treats that pulse the same as it would the normal pulse. Therefore, in a rough sense the VCO locks into the previously established reference. As long as the VCO's stability is good, it will continue to generate pulses at the proper rate (or close enough that it makes no practical difference).

But just how stable must the VCO be to be stable "enough?" For example, let's say that after the 233 suppressed-sync lines we want the sync to be off by no more than 0.1 μs. For a frame, which is 1/60 second long, that represents a drift of 0.16%. But 233 lines is only a part of a frame, so the allowable drift is closer to 0.1%. For a frequency of 504 kHz, that is a drift of 5.04 kHz-per-second. An oscillator with that much drift is pretty lousy. Therefore the lack of a reference signal for about 15 milliseconds should present no problem for a PLL.

At line 260, the incoming video once again has normal sync. Since the decoder's internally generated pulses are no longer needed, the scramble on-off logic disables the gate that supplies those pulses to the video amp. At line 7 of the next frame all counters are reset to zero by the vertical blanking pulse.

Let's backtrack for a moment. We've mentioned the scramble on-off logic, but we haven't examined that circuit. It consists of a 9-stage counter and decoding circuitry for states 27 and 260. Its function is to enable and disable the gate that feeds the decoder's internally generated sync pulses to the video amp. A block diagram of a typical scramble on-off circuit is shown in Fig. 6.

The video amplifier's output now has its sync restored, but what about the polarity of the video? It may or may not be inverted. Further, if the video is inverted, the chorma signal will also be inverted and thus be 180° out of phase with the color burst. Remember that the color burst rides on the back porch of the sync, and the sync is never inverted in the SSAVI system. To restore proper color balance, the polarity of the video (only) must be switched as appropriate. Further, the DC reference levels on the inverted and non-inverted frames must be made identical. Otherwise, an annoying flicker will be generated as the video polarity switches.

The polarity of the frame's video is detected by sampling line 20 as previously mentioned. That information is fed to the invert-logic stage which controls the operation of the two gates as described earlier. That allows a normal composite-video signal to reach the video output. Further, those gates contain clamping circuitry so that the black levels of the normal and recovered video signals are identical, eliminating any flicker that might occur as the signals are switched. Since the video polarity is always normal after line 260, at that line the invert logic circuit is reset.

Audio scrambling is optional, and is left to the discretion of the operator. If the audio is scrambled, it is done by placing it on a 39,335 kHz subcarrier. The technique has been covered previously in this series so we will not repeat it here.

Next time, we will present decoders for use with sinewave, outband, and gated-pulse scrambling systems. Complete construction details, including PC diagrams, will be provided.
A CONTINUITY TESTER IS A MUST on every service bench for testing cables, PC boards, switches, plugs, jacks, motors, relays, and many other kinds of components. But there are times when a simple continuity test doesn’t tell the whole story. For example, vibration-induced problems in automobile wiring can be extremely difficult to detect because a short or open is not maintained long enough for a non-latching continuity tester to respond.

Our latching continuity tester detects intermittent (and steady state) opens and shorts. The tester will detect and latch on an intermittent condition with a duration of less than one microsecond. In addition, it provides both visual and (defeatable) audio indicators, uses only one inexpensive and easy-to-find IC, and can be built from all new parts for about $25, or less if you have a well-stocked junkbox.

Circuit elements

The heart of the circuit is a 4093 quad two-input NAND Schmitt trigger, one gate of which is shown in Fig. 1-a. The gate functions as shown in Fig. 1-b. Nothing happens until the enable input goes high. When that happens, the output responds to the input as follows.

As long as the input voltage stays between V_H and V_L, the output stays high. But when the input goes above V_H, the output goes low. The output will not go high again until the input goes below V_L. That characteristic is what gives the Schmitt trigger its ability to "square up" a slowly changing input signal. The Schmitt trigger is ideally suited for our application because it is not dependent on edge triggering, and because both slow and fast signals trigger it when either threshold is exceeded.

We use two gates of the 4093 as a combination detector and latch. The gates are cross-connected to form an SR (Set-Reset) flip-flop. When pin 12 goes low, pin 11 will go high. That high may be used to enable an LED or other indicator. Switch S1 is used to select whether the tester will provide output when it detects an open or a short. In the open position, pin 12 is held low, so the output of the gate is normally high. When the test leads are connected across a short, pin 12 is pulled high, so the output drops low. The circuit works in the converse manner when S1 is in the closed position.

As shown in Fig. 2-a, we use another Schmitt trigger to build a gated astable oscillator. A gated astable oscillator produces output as long as the gate input is high. Figure 2-b shows the waveforms that are present at various points in the circuit. When the pin-8 input goes high, pin 10 goes low, and C1 starts discharging through R1. When V_C falls below V_T, the output of the gate goes high, so C1 starts charging through R1. When V_C exceeds V_T, the output again drops low. Oscillation continues in that way as long as the gate input remains high. The frequency of oscillation is given by a fairly complex equation that can be simplified, for purposes of approximation, as f = 1/RC1.

Putting it all together

The complete circuit is shown in Fig. 3. In that circuit, IC1-a and IC1-b function as the flip-flop/detector. The output of IC1-a is routed through S4, AUDIO. When that switch is closed, IC1-d is enabled, and an audio tone will be output by B21. The frequency of that tone can vary from 1000 Hz to well above the audio range (100 kHz), according to the setting of R4. In addition, R4 varies frequency and volume simultaneously, so you can set it for the combination that pleases you best.

Originally we used a PM (Permanent Magnet) speaker for output, but we switched to a piezoelectric buzzer because the buzzer consumes about one tenth the power of a speaker. When the detector has not been tripped, the full power-supply voltage is across the buzzer, but no current is drawn. The reason is that the piezo element is like a capacitor and does not conduct DC current. When the circuit is oscillating, the buzzer consumes a current of only about 1/2 milliamp.

The output of the flip-flop/detector circuit also drives IC1-c. If S2 is in the AUTO position, the output of IC1-c will automatically reset the flip-flop after a period of two to six seconds, depending on the position of R7. If S2 is in the MANUAL position, the LED will remain lit (and the buzzer will continue buzzing, if S4 is on) until manual RESET switch S3 is pressed.

Construction

The circuit may be built on a small piece of perforated con-
All resistors are 1/8-watt, 5% unless otherwise noted.
R1—10,000 ohms
R2, R2—470,000 ohms
R4—100,000 ohms, trimmer potentiometer (Radio Shack 271-338, Pihier PT10YV 100K, or Mouser ME321-1100-100K)
R5—not used
R6—1800 ohms
R7—1 megohm trimmer potentiometer (Pihier PT-15WD-1 Meg with #2 shaft, or Digi-Key Q1A16, Screwdriver adjust)
R8—10 megohms

Capacitors
C1—0.1 µF ceramic disk
C2, C4—0.01 µF ceramic disk
C3—4.7 µF, 16 volts, electrolytic

Semiconductors
IC1—4093B quad NAND Schmitt trigger
D1, D2—1N914 or 1N4148 switching diode
LED1—standard red

Other components
B21—piezo buzzer (Digi-Key 9924 or Radio Shack 273-069)
S1—DPDT, miniature toggle, PC-mount
S2, S4, S5—SPDT, miniature toggle, PC-mount
S3—SPST, momentary pushbutton, normally open

Miscellaneous: Plastic case (4.75 x 2.5 x 1.4 inches), 14 pin IC socket, battery clip, battery snap, banana jacks (optional), test leads (optional), wire, solder, etc.

Note: The following parts and kits are available from Alltech Associates, Dept. LCT, 1441 W. Colonial Parkway, Roseville, CA 95678: PC board, $5.95 plus $0.55 shipping and handling; complete kit less test leads and battery, $24.95 plus $2.40 S & H; complete assembled and tested unit with battery and test leads, $39.95 plus $2.40 S & H. California residents add 6% sales tax.
Part 2 PRIOR TO JANUARY 1, 1984, IF YOU WISHED to install a telephone, add an extension, or otherwise modify or update your telephone setup, all work had to be performed by the telephone company, for a fee. Since that date, which marked the break up of AT&T you could still have that work performed by your local telephone company, but for a rather substantial fee; or you could do the work yourself. The catch to the second alternative is that you need to know what you are doing. In this article we are going to present a primer on basic telephone installation and maintenance. The information that it contains will allow you to perform many of the most common tasks yourself.

This month we show you how to install and troubleshoot your telephone equipment.

Inside The TELEPHONE
RUDOLF GRAF and CALVIN GRAF

Telephone-system basics
For many years now, all new telephone installations have been made using a modular system. The advantage of the modular system is that it allows for quick, easy, and sure connection of various types of equipment to the telephone system. But prior to that, all connections between telephone equipment and the system were of a permanent nature (hard-wired). Since the connections in your home or office easily could be either modular or hardwired, let's examine both types.

Starting with the older system, the point where the telephone line en-
lers your premises is called the connection point. At that point is a device called a lightning protector. Connected to a cold-water pipe or copper rod driven into the ground, that device provides lightning protection for the equipment.

From the connection point the wiring is brought into the house and terminated at a connecting block. The most common type of connecting block is called a 42A block, as shown in Fig. 12. The telephone is wired directly to the block as shown in Fig. 13. Note that the wires from the telephone are color-coded, allowing for quick, accurate connections. However, that only made things easier for the telephone-company installer; customers were forbidden to install or even relocate their equipment on their own. That meant that once a location for a telephone was chosen, it could not be changed without involving the telephone company.

To satisfy customers who demanded more flexibility, the telephone company developed a jack and plug system that allowed customers to relocate their telephones to a limited extent. If the customer wished, the telephone company would install a number of four-prong jacks (see Fig. 14) throughout the premises. These jacks were wired in parallel so that all had equal access to the telephone line. The customer’s phone cord was terminated in a matching four-prong plug.

### The modular system

As you know, the modular system allows for even greater customer flexibility. However it also offers some benefits for the telephone company. It has greatly sim-

However, you are responsible for that servicing. That leaves you with two alternatives: You can hire someone else to do the servicing, such as the telephone company or an independent contractor, or you can do the servicing yourself.

So where does the telephone company's responsibility end? Since 1982 the telephone company has been including a network interface as part of its standard wiring installation. Located near the point where the wiring enters your premises, its function is to isolate the telephone system from the premises wiring and to serve as the demarcation point between the two.

Older telephone installations do not have a network interface. For those, the demarcation point is the lightning protector. The telephone company is responsible for all wiring up to and including that protector; you are responsible for everything that comes after it.

In a typical installation, a modular cable connects the network interface to a junction box (see Fig. 15). From the junction box, one or more two-wire lines run to each modular jack; the modular jack takes the place of the connecting block. The telephone itself connects to one of those jacks.

### Installing telephone equipment

Any telephone or accessory that you install must be compatible with the telephone system. To that end, all equipment must be approved by the FCC.

Further, several pieces of information should be displayed on the outside of the telephone (usually on a surface that normally is not seen). There must be a statement that the device complies with Part 68 of the FCC rules and regulations; and the FCC registration number and the Ringer Equivalence Number (REN) must be shown. Also, the Universal Service Order Code (USOC) designation may be displayed. We discussed the REN and its significance last time. The USOC designation tells you the type of standard jack that the device accepts. A USOC RJ11 designation tells you that the device requires a single-line (four-conductor) jack; a RJ14 designation tells you that the device requires a two-line (eight-conductor) jack. Both types of jacks are shown in Fig. 16. If the USOC designation is not provided, it is safe to assume that it is RJ11.

**FIG. 16—MODULAR PLUGS.** A single-line (four-conductor) plug is shown on the left. A dual-line (eight-conductor) plug is on the right.

Before installing any piece of telephone equipment, FCC rules require that you notify the telephone company of the device's FCC registration number and its REN.

### Practical hints

As with any other task, there's a right way and a wrong way to go about installing telephone equipment. We are going to give you some do's and don'ts that will help you do the job right the first time.

You can install a telephone or telephone equipment almost anywhere, but there are a few locations that should be avoided. Damp locations are unsuitable because of the dangers of electric shock and corrosion. Extremely hot locations should also be avoided because the plastic used could warp. And, as common sense dictates, avoid mounting equipment on temporary structures.

A telephone is an electrical device. That means that unless precautions are taken during installation, dangerous conditions could be present during such installation, or afterwards. Either the 90-
volt, 20-pps ringer signal or the 48-volt DC battery voltage can give the unsuspecting installer or user quite a tingle!

When working on an older telephone installation (one without a network interface), take the telephone off-hook. That will eliminate the danger of an electric shock if the telephone rings. If there is a network interface, simply remove all power to the system by unplugging it from that interface. If you wish to receive or make calls while the system is disconnected, you can do so by simply plugging a telephone directly into the interface.

When routing wires, installing outlets, etc., be sure to follow safe construction practices. Note the locations of gas lines, electrical conduits, and water pipes and plan to place outlet boxes so that there is no danger of cutting into those when installing the boxes. Never route wires through conduits or outlet boxes used for electrical lines. Never route wires so they pass near an object that could attract lightning. Obviously, that includes lightning rods; not so obviously, that also includes TV antennas and their downleads. Before fastening a wire to a metal surface, such as aluminum siding, check to be sure that there are no voltages present. Also, use non-conductive fasteners.

When routing lines between buildings, use underground conduit. That will prolong the life of the cable, and minimize the possibility of its coming in contact with dangerous voltages, such as from a lightning strike. When doing outside wiring, avoid routing the telephone lines anywhere near power lines or transformers.

To prolong the life of the wiring, avoid placing it in hostile environments. That means don't route it near hot-water or steam pipes, or air-conditioning or heating ducts. For best voice quality, keep runs of wire as short as possible and avoid splicing.

As with any other job, it's always wise to be sure that you have the proper tools on hand before you begin. Fortunately, telephone installation work requires nothing in the way of exotic or expensive tools. It is highly likely that you own most, or all of the following: Several sizes of screwdrivers, with insulated handles; diagonal wire-cutters or needle-nose pliers with wire-cutters and with insulated handles; hammer; staple gun; a small keyhole saw (to cut holes in the wall for flushed-mounted jacks); and a drill and bits.

Once you've planned out the installation, and bought whatever components are needed, it's time to get to work. Let's look at some general procedures you should follow to ensure a trouble-free job.

First of all, most components that require installation (junction box, modular converter, wall telephone mount, etc.) will be packaged with complete installation instructions. Read those instructions and be sure to follow all steps.

The simplest way to determine whether the telephone system or your wiring is at fault is to plug a known-good telephone directly into the system interface. If you can get a dial tone, and can successfully call an outside party, the problem lies in your wiring. Otherwise, call the telephone company.

Once you've determined that the problem is within your system, you need to determine its cause. Often that cause can be found by conducting a simple inspection. Look for telltale signs of trouble such as disconnected modular cords or broken plastic.

If inspection does not reveal the fault, the next step is to check each telephone in your system. That is easy to do with a modular system. Simply attach each instrument to the system interface and verify correct operation.

Once you determine that a telephone is not operating properly, you must determine the source of the problem. Some common problems, their causes, and their cures are shown in Table 4. Many of the problems are easy to clear up. Others are not and may require knowledge of specific telephone circuits. Often, it is easier, and cheaper, to simply replace the phone.

Many telephone-line problems can be diagnosed using a simple line tester. Testers are relatively low-cost and can be obtained from a number of sources (including Radio Shack). If you wish, you could also build a tester. An appropriate schematic for a simple tester is shown in Fig. 18.

The circuit of Fig. 18 simply plugs into a modular jack. The unit's LED's give a quick indication of the telephone line's status. If the green LED lights, the jack is wired properly and the outlet is operational. If the red LED lights, the wiring to the jack is reversed. If neither LED lights, the jack is not connected to the telephone system.

![FIG. 17—STRIPPING MODULAR TELEPHONE cable is made much easier with this simple tool. Similar tools are available from a number of suppliers.](image)

![FIG. 18—A SIMPLE TELEPHONE-LINE TESTER. The LED's indicate whether a line or jack is wired correctly, has reversed polarity, or is disconnected from the telephone system.](image)
This time we discuss the programmer's many modes of operation and hardware options that increase its ease of use.

LUBOMIR SAWKIW

Part 2

WE HAD JUST FINISHED building and testing the programmer when we left off last time. Let's continue now and explain the programmer's four modes of operation. Then we'll discuss adding an optional gang-programming board that allows you to program as many as six EPROM's at once, and a display board that allows you to view addresses and data in hexadecimal on seven-segment LED's.

Manual programming

The programmer's modes of operation, and the switch settings that enable them, are summarized in Table 1. To program a byte manually, place S3 in the STEP position and S4 in the SWITCHES position. Set the data switches in DIP switch S8 to the desired values and then set the address using S5 and S6, as discussed last time. If the byte at that address is properly erased, all eight DATA LED's (LED15–LED22) will light up (indicating a value of FF hex).

<table>
<thead>
<tr>
<th>Mode</th>
<th>Switch Settings</th>
</tr>

</tr>
<tr>
<td>Copy EPROM</td>
<td>Run</td>
</tr>
<tr>
<td>Copy byte</td>
<td>Step</td>
</tr>
<tr>
<td>Repeat program</td>
<td>Run</td>
</tr>
</tbody>
</table>

If that location is erased, you can press program switch S2 to program the new value. The programming occurs in 50 ms, and the new data will be visible for as long as you continue to press S2. If the LED's indicate an incorrect value, the EPROM may not be fully erased, or it may be damaged. Try erasing the EPROM; and if problems persist, try a new one.

When you release S2 after programming a location, the board advances to the next address. You can program that address or use S5 and S6 to go to another.

Copying

To copy an entire EPROM, place S4 in...
the EPROM position and S3 in the run position. Then reset the circuit by pressing S7. Now place your EPROM's in their sockets. The source EPROM goes in SO2, and the blank EPROM in SO1. Don't reverse them!

To start the copying process, press program switch S2. To stop before all locations are programmed, set S3 to the stop position. Doing so will halt the copy cycle and place the programmer in the single-location copy mode. You can now continue to program the EPROM one location at a time. Later you can resume copying automatically, if desired. When the entire EPROM has been copied, the board will reset and await a new command.

It's not a good idea to use the reset switch to halt the copying process because stopping the programmer in the middle of a copying cycle may leave a partially-programmed byte in your EPROM. The proper way to halt the copying procedure is to place S3 in the stop position. Then the programmer will stop after the current byte has been programmed.

Copying bytes
If you want to copy a single location from one EPROM to another, set S3 to stop and S4 to EPROM. The byte-copying mode is very similar to the manual-programming mode except that data is obtained from SO2 rather than DIP switch S8. After setting the desired location using switches S5 and S6, press program switch S2 to copy the contents of the selected location to your program EPROM. As in the manual mode, the contents of the programmed location will be displayed for as long as you hold S2 down. After you release S2, the address counters advance by one. You can then program that location, or move to any other, using S5 and S6.

Switch S1 is handy when you are copying an EPROM one location at a time. Normally, the data LED's (LED15–LED22) display the contents of the program EPROM. But when you press S1, that switch allows you to view the contents of the source EPROM.

Repeat programming
The repeat mode allows you to program successive EPROM locations with the data byte in DIP switch S8. Why would you want to program many locations with the same byte? A delay or timing loop might require one byte to be programmed into a number of locations. You could also repeat programming to erase an EPROM.

To enter the repeat programming mode, set switch S3 to run and set switch S4 to switch. Then set the switches in S8 to the desired value. As usual, to begin programming, press program switch S2. To halt programming, move S3 to the step position. Now you can proceed in the manual programming mode. As mentioned earlier, do not use reset switch S7 to halt the programmer.

To erase a 2815 or 2816 EEPROM, plug the appropriate personality module into SO3. Then set S8 to FF (hex), S3 to run, and S4 to switch. Reset the board and then press S2 to start. In about 2 minutes you will have a blank EEPROM.

2532 limitation
The programmer is capable of copying only the lower half of a 2532 EPROM. That is because pin 20 of the source EPROM socket (SO2) is grounded. The 27xx series of EPROM's uses that pin for chip enable (CE). However, the 2532 uses that pin for address line A11. Since the highest-order address line is held low, only the first half of the EPROM can be read, and, therefore, copied. Pin 20 of SO1 is not grounded, so the upper half of a 2532 may be programmed manually.

External control
As we saw in Fig. 2 last time, there are 7 points labeled A through G on the board. The signals there may be used to control the programmer with an external device. The PC board must be modified slightly, and the switches must be set in certain positions to control the programmer externally.

Remove DIP switch S8 from its socket, and connect your data source at that point. Switch S4 must, of course, be in the switches position. In addition, S3 should be in the stop position, and switches S1, S2, S5, S6, and S7 are not used. S2 should be removed from the board, or the ground trace to its center pole should be cut.

An active-low signal fed to point B presets IC1-a and starts the programming cycle. There must be no noise, glitches, or bouncing at that input. If the input signal isn't clean, you could program ten locations with what you thought was one pulse. After each location is programmed, a low must be fed to point C to clear IC1-a. The circuit shown in Fig. 5 may be used; that circuit can save you the trouble of having to supply a separate clear signal to point C. Just make sure that your input signal stays low for at least 67 ms, or else you will increment the address before the programmer finishes programming the current location.

Point D can be used as both an input and an output. When S3 is in the stop position, point D carries a narrow active-low pulse at the end of a programming cycle when IC3-a reaches the count of nine. That point can be used to indicate when the board has completed programming one location and is ready for another cycle.

When S3 is in the run position, point D carries a narrow low-going pulse when the board has programmed an EPROM's last address. That signal can be used to indicate when a copy operation is complete.

In addition, bringing point D low at any time during the programming cycle will clear IC1-b and will abort the programming operation.

You can increment the current address location by one by delivering a high-going pulse to point F. Point E has the 120-Hz clock signal that drives the timing chain. Your controller can connect that signal to point E for fast address stepping, or you can pulse point F with your own signal.

A high-going pulse at point G will reset the entire programmer. Point A provides a reset output from the programmer; that point goes high after the address counter has incremented past the highest address of the selected EPROM.

Gang-programming option
The programmer can be expanded to program as many as six EPROM's simultaneously: the circuit for doing so is shown in Fig. 6. In order to avoid possible data-bus contention, the board has logic that (optionally) disables the verification capability for sockets two through six. In other words, only the EPROM in SO1 would be read during verification. That feature was included because, if one or more of the EPROM's in SO2–SO6 were defective or did not program properly, both highs and lows could be present on the data bus simultaneously. An EPROM (especially a CMOS type) could be damaged thereby, but, even worse, a bad or misprogrammed EPROM might pass verification and wreak havoc later. To avoid that possibility, if you gang-program EPROM's, we recommend that you verify each one separately at a later time.

Notice the terminals labeled A, B, and C in Fig. 6. With A connected to B, SO2–SO6 will not be read during verification. But if you should wish to read all six sockets simultaneously, connect A to C.

The parts-placement diagram for the gang-programming board is shown in Fig. 7; the foil patterns for the PC board are shown in PC Service. Note that all components except PL1 mount on the compo-
A cable that connects plus PL1 to socket SO2 (on the main PC board) is built using a 28-pin DIP socket header on the end that goes to SO2 on one end and a 34-pin female IDC header on the other end.

Since there will be only 28 wires coming from the DIP end, be sure to leave a gap at the correct end of the female connector. Of course, you could simply solder the wires at both ends of the cable directly to the board but a cable is neater and affords you greater flexibility and we highly recommend that you use one.

There is no difference in operation when using the gang-programming board.

Hexadecimal display option

The circuit for the display board is shown in Fig. 8. The display board’s operation is straightforward. IC2 on the display board replaces IC8 on the main board by means of a 16-conductor cable connected from socket SO1 on the display board to IC8’s socket on the main board. The outputs of the two counters (IC1 and IC2) on the display board drive the display decoder/drivers (IC5–IC8), which in turn drive the address displays (DISP1–DISP4) directly.

You’ll notice that there are no current-limiting resistors connected to any of the displays. Instead, Q1, driven by op-amp IC2b, functions as a dynamic resistor that keeps the voltage across the segments of the display constant, thereby maintaining constant brightness. Any variation in display brightness causes a corresponding change in the brightness of LED2, which changes Q2’s base bias. That varies the voltage at the non-inverting input of IC12-a, which varies Q1’s bias, and thus its effective resistance to ground. Trimmer potentiometer R4 allows you to adjust the brightness of the display.

The transistor used for Q2 can be al-
most any NPN phototransistor that will respond to the LED driving it. Use a good quality, efficient LED for LED2. You can mount it face to face with Q2 inside a short piece of heat-shrink tubing, or you can simply tape them together. Whichever method you use, keep the two parts very close to each other, and keep out all external light.

The data-bus display circuit is even simpler than the address-bus circuit. IC11 on the display board replaces IC13 on the main board via a 16-conductor cable that connects SO2 on the display board to IC13’s socket on the main board. The outputs of IC11 drive a pair of 9368’s, which drive two more seven-segment displays (DISP5 and DISP6).

Mount all components on the display board as shown in Fig. 9. The foil pattern for that board is shown in PC Service.

**DISPLAY BOARD PARTS LIST**

All resistors are 1/4-watt, 5% unless otherwise noted.

- R1—100 ohms
- R2, R3—5000 ohms
- R4—50,000 ohms, trimmer potentiometer, 20 turns, PC mount

**Capacitors**

- C1—C9—0.1 µF disc
- C4—C70 µF, 10 volts, electrolytic

**Semiconductors**

- IC1—4520 dual binary counter
- IC2—4040 12-stage binary counter (from main board)
- IC3, IC4—4050 hex buffer
- IC5—IC10—9368 decoder/display driver
- IC11—74LS244 octal tristate driver (from main board)
- IC12—LM324 op amp
- Q1—2N1305
- Q2—2N3904 or Radio Shack 276-130
- LED1, LED2—Standard red LED
- DISP1—DISP6—FNDS500 common-cathode, 7-segment LED display

**Miscellaneous:** 20-pin DIP-socket jumper cable, 16-pin DIP socket jumper cable.

Note that there are three jumpers on the board. Mount them first, then the re-
sistors, and so on. Its best to use sockets for all IC's; the six LED displays can be mounted in 24-pin 0.6" DIP sockets. A red filter will improve their readability.

To install the display board, remove IC13 from the main board and install it in the space allocated for IC11 on the display board. Then connect a 20-pin DIP jumper cable between socket SO2 on the display board and IC13's socket on the main board.

You could also solder all of connections directly to the appropriate points on the two boards, eliminating the need for a DIP cable or socket. In either case, make absolutely certain that every pin is connected correctly.

Remove IC8 from its socket on the main board and install the IC in the socket provided for IC2 on the display board. Connect a 16-conductor DIP jumper between SO1 on the display board and IC8's socket on the main board. Make sure that the correct pins line up on both ends. Do not plug the jumpers in or remove them (or IC's) while power is applied.

Remove IC9 and IC10 from the main board. Because they drive the 14 address LED's (LED1-LED14), they're no longer necessary. Removing the IC's will conserve some much needed power for the display board.

The voltage regulator (IC14) on the main board can normally run quite warm—as high as 70°C maximum. However, with the display board plugged in we would be pushing the regulator to the limit. So, to let it run a little cooler, solder a 25-ohm, 5-watt power resistor (R57) to the main board in the pads provided near the regulator. If you add that resistor, be sure that you do not run the programmer without the display board connected.

FIG. 9—PHOTOTRANSISTOR Q2 AND LED2 must be mounted so that their receptive and transmissive surfaces receive no ambient light. Heatshrink or tape them together. The foil pattern for this board is shown in PC service.
The Early Days of RADIO

This month we look at the origin of the word “radio,” and pioneers behind the birth of the vacuum tube.

MARTIN CLIFFORD

Part 2 NO ONE KNOWS FOR SURE how the word "radio" was coined. It is very likely that the word is a shortened form of radioactivity, first used by French physicist Antoine Henri Becquerel, or of radiation. In describing the radio effect, the magazine Strand in July 1896 said: "At the solid object the new radiation springs into being and then travels away from it in all directions in very much the same way that ordinary light would do." Dr. Lee de Forest wrote about "radio waves" in his PhD dissertation in 1899.

Whether it was called radio, wireless telegraphy, or something else, there was no denying that the phenomenon captured the public's fancy. In fact, the airways soon became so crowded that it is reported that the U.S. Navy had to plead with the amateurs to shut down so that they could maintain communications with their ships at sea. In 1903, de Forest wrote that "Radio chaos will certainly be the result until...regulation is afforded." The first radio society, The Wireless Association of America, was formed in New York in 1908. With de Forest as its president and Hugo Gernsback as its chairman and business manager, that organization attracted over 3000 members in just its first few months.

The first radios were often simple, home-made, spark-gap units. A schematic diagram of an early "transceiver" made up of a spark-gap transmitter and a crystal receiver is shown in Fig. 1-a; a more detailed view of the spark-gap coil is shown in Fig. 1-b. Note the lack of a tuning mechanism in the transmitter. When our forefathers said that they were "modulating the spectrum," they weren't kidding around. A single low-frequency broadband spark-gap signal would effectively occupy the entire useable spectrum.

The first sound transmission

Let's backtrack for a moment and give some mention to an individual who today is not well known, but deserves to be.
Most students of radio and electronics know of Heurtz, Marconi, Maxwell, and Tesla. But how many know of Nathan B. Stubblefield? Yet it is Mr. Stubblefield who, in 1892, became the first to succeed in transmitting sound via radio. He conducted two public demonstrations of his achievement in 1902.

Crystal-radio specifications

Early crystal sets were judged on two measures of performance. Those were volume and selectivity.

Remember that a simple crystal radio offers no amplification. That made volume the most important criterion. If a crystal set could supply enough volume so that sound could be heard from a pair of headphones lying on a table, the set was considered to be top quality.

Selectivity was next in importance. Figure 2 shows three methods that were used to improve selectivity. One method was to use a tapped antenna-tuning coil, as shown in Fig. 2-a. Another was to use a tapped vario-coupler as an antenna tuning coil, as shown in Fig. 2-b. Vario-couplers were discussed in the first installment of this series (Radio-Electronics, July 1986). A third arrangement was to use multiple tuning capacitors, as shown in Fig. 2-c. Note that those capacitors are not ganged. To tune in a station, each capacitor has to be adjusted separately.

Unfortunately, even with those techniques, or any others for that matter, competing signals could often be heard in the background. Further, all of the methods of improving selectivity did so at the expense of volume.

One of the problems with early crystals is that the most sensitive spot on the crystal had to be found using trial and error. One method of making that task easier is shown in Fig. 3. There, a buzzer circuit is inductively coupled to a radio circuit. As the movable catwhisker is used to probe the crystal surface, the most sensitive spot is detected by monitoring for changes in buzzer volume.

The triode

Problems with volume and selectivity led experimenters to seek some method of signal amplification. They met with success by adding a third element to the diode, creating the triode. The first triode was actually two back-to-back diodes. It was developed by de Forest, and patented in 1907. That device was described as an amplifier, although it is debatable whether

FIG. 2—SELECTIVITY OF EARLY RECEIVERS was improved by using a tapped antenna coil (a), a vario-coupler (b), or multiple tuning capacitors (c).

FIG. 3—A BUZZER CIRCUIT was often used to help find the most sensitive spot on the surface of a crystal. The buzzer was inductively coupled to the radio circuit as shown here.
The first true triode, containing a plate, filament, and grid was patented by de Forest in 1908. That tube was dubbed the Audion by Clifford D. Babcock.

The first triodes were not without their problems. Since the grid was in the electron path between the filament and the plate, electrons would accumulate on the grid, making it increasingly negative. The result was that eventually the flow of electrons would be cut off. That condition is known as a blocked grid. Further, the tube was operated without a bias voltage meaning that it operated over its entire characteristic (not just over the linear portion of that characteristic), creating distortion.

Both problems were solved by applying a negative voltage to the grid. Since that made the grid negative with respect to the filament, operation was limited to the linear portion of the tube's characteristic. Further, the grid now tended to repel electrons. That prevented the occurrence of blocked grid.

With the addition of the bias voltage, the triode required three batteries for proper operation. One was used to supply current to the filament. That current heated the filament and caused electrons to escape. The filament battery was designated the A battery and was a 6-volt lead-acid type.

The B battery was used to supply the plate voltage. Its rating ranged from 22½ to 135 volts. Today, the high-voltage terminal of a circuit is often designated the B+ terminal. That is a carryover from the days of the B battery.

The grid battery was designated the C battery. It was a low-voltage type. A simple triode circuit, showing the battery connections, is shown in Fig. 4.

Later on, the grid's ability to capture and hold electrons was put to work. The captured electrons were allowed to escape the grid via a resistor connected between it and the filament. The resistor is termed a grid-leak resistor. The flow of electrons from the grid was such that a voltage was developed across the resistor, with the grid more negative than the filament. That development eliminated the need for the C battery.

The problem with such an arrangement was that the bias voltage developed in that manner varied with signal strength. That difficulty was sidestepped by shunting the resistor with a capacitor. That kept the voltage across the resistor constant. Two variations of the grid-leak circuit are shown in Fig. 5.

Many of the experimenters that followed de Forest devised variations of his triode design. In one, the grid was mounted outside the tube envelope. In another, devised by J. Scott-Taggart in England, the grid was replaced by a metal rod. There was also an extra plate, called a diversion plate. See Fig. 6. The tube.

continued on page 82
How to Design OSCILLATOR Circuits

JOSEPH J. CARR

Our series continues with a discussion of crystal-controlled sinewave oscillators.

Part 5  There are many ways of generating sinewaves, but the most stable and the most accurate method uses a piezoelectric crystal to control frequency. Some naturally-occurring elements, notably quartz, possess the property of piezoelectricity. Other man-made ceramic materials also possess that property.

A material is said to be piezoelectric if it generates an electrical potential when it is mechanically deformed. Conversely, when we apply a voltage across the faces of a piezoelectric crystal, the crystal will mechanically deform in a precise and predictable way. Associated with each crystal is a resonant frequency that depends on the dimensions of the crystal.

By way of analogy, consider the ordinary tuning fork. When it is struck, it vibrates at its resonant frequency. Mechanical losses in the tuning fork cause the oscillations to die out gradually. Similarly, losses in a crystal cause the amplitude of its mechanical oscillations to die out exponentially. The crystal differs from the tuning fork in that, while it is oscillating, its piezoelectric property causes it to produce an AC voltage with a frequency that is equal to the resonant frequency. It is that signal that is amplified and fed back to sustain oscillation.

Crystals used in electronic circuits are commonly mounted in a “can” as shown in Fig. 1. The can protects the crystal slab from the environment; in addition, electrical contact is made there. The slab is sandwiched between two electrodes. In older crystals, those electrodes maintained contact with spring tension; in modern crystals, contacts are electro-deposited directly onto the surface of the crystal slab. The crystal element is then mounted so that the pins protrude through the header.

Figure 2 shows the equivalent electrical circuit of a piezoelectric crystal. The circuit includes series resistance ($R_s$), series inductance ($L_s$), and series capacitance ($C_s$). There is also parallel capacitance ($C_p$). To understand the following discussion of how those circuit elements interact, see the frequency response curve shown in Fig. 3.

That graph plots reactance vs. frequency. Note that there are two different resonant modes for the crystal: series and parallel. You might have guessed that from the fact that the crystal has both series and parallel internal capacitance.

The series resonant frequency, $f_s$, is that at which the inductive reactance is exactly cancelled by the series capacitance. At that point the total reactance of the crystal is zero, and the series resistance determines the impedance of the crystal. Impedance is minimum in the series resonant mode.

The parallel resonant frequency ($f_p$) of the crystal is usually 1 to 15 kHz higher than the series resonant frequency. A parallel-mode crystal will operate in the series mode if a small capacitor is connected in series with the crystal. The value of the

FIG. 1—THE CONTACTS OF A MODERN CRYSTAL are electro-deposited on opposite faces of the crystal slab.

FIG. 2—EQUIVALENT CIRCUIT of a crystal has inductance, resistance, and both series and parallel capacitance.
capacitor must be equal to the specified load capacitance of the crystal.

**Modes of oscillation**

Crystals can oscillate in two different ways: fundamental and overtone. In the fundamental mode, the crystal oscillates at its natural resonant frequency, i.e., at the mechanical frequency at which the slab oscillates when it is stimulated. The frequency of oscillation in the fundamental mode depends upon factors such as the crystal's mechanical dimensions, the way it has been cut, temperature, and others.

In the overtone mode, the crystal oscillates at a frequency that is approximately an integer multiple of the fundamental frequency. Note, however, that the overtone is not a harmonic of the fundamental. For example, if you divide the frequency of oscillation of a fifth overtone crystal by 5, the result will be a number nearly, but not exactly, equal to the fundamental frequency.

The overtone frequencies are usually (approximately) an odd multiple (3, 5, 7, ...) of the fundamental. However, some circuits use the fourth overtone, which is an even number. The case of an overtone crystal is marked with the intended frequency of oscillation, not the fundamental frequency. An overtone crystal always operates in the series mode.

When ordering crystals for frequency control, you must specify not only the frequency of operation, but also the load capacitance, especially when a crystal will be operated in the parallel mode.

The operating frequency in the fundamental mode is usually less than about 20 MHz because above 20 MHz the crystal slab becomes so thin that it can fracture under normal operating conditions. Fundamental-frequency crystals are usually parallel mode, except below 500 kHz.

The power that a crystal dissipates must be limited in order to avoid fracturing the slab. It is the equivalent series resistance (ESR) of the crystal that determines power dissipation. In a practical crystal oscillator circuit we limit dissipation by controlling the amplitude of the feedback signal. Most fundamental-mode crystals will dissipate as much as 200 µW, although it is considered good design practice to limit dissipation to less than that amount. For example, low-frequency crystals (those that operate below 1 MHz) usually have a maximum dissipation rating of 100 µW, so we usually limit dissipation to 50 µW.

Another reason to limit power dissipation is to improve the frequency stability of the crystal oscillator. That's why it's not good practice to obtain a great deal of RF power directly from the crystal oscillator stage of a transmitter. For example, 25 years ago amateur radio handbooks often carried transmitter circuits that produced as much as 50 watts of power. Modern designs limit the dissipation of the oscillator circuit, and then use a linear amplifier to increase overall output.

**Example circuits**

As we have seen, a crystal is equivalent to a complex LC circuit with both series and parallel sections. Therefore a crystal can be used in many of the same circuits as an actual LC resonant tank circuit. Often the crystal or LC network is the only difference between two circuits.

Figure 4 shows a simple circuit for a low-frequency crystal oscillator. The oscillator operates at a fundamental frequency of 100 kHz, but its harmonics go high enough to make the circuit ideal for use as a high-frequency marker for a communications receiver and for aligning receivers and test equipment.

The active element in the circuit is a bipolar NPN transistor; although a 2N2222 is specified, the actual type is not critical. Almost any transistor with a beta between 50 and 125, and a gain-bandwidth product of at least 50 MHz, will work.

That circuit is similar to the LC Colpitts oscillator discussed in Part Two of this series [in the August issue of *Radio-Electronics*]. Feedback level is a function of the capacitive divider composed of C1 and C2. The ratio of those two capacitors is a trade-off between amplitude, stability, and power dissipation in the crystal.

The operating frequency of almost any crystal can be “pulled” a little bit with a series or parallel capacitor. Capacitor C3 is used to set the actual operating frequency of the circuit.

The output signal is coupled to the load through a low-valued capacitor, C4. The circuit should be lightly loaded in order to minimize changes in frequency due to load variations. If loading will be heavy, follow the oscillator with a buffer stage.

There are several ways to calibrate the operating frequency of the oscillator. You can use a digital frequency counter, or you can use a radio, either a communications receiver or a standard AM radio. If you use the latter, tune it to a station with a frequency that is an even multiple of 100—1500 kHz, for example.

If you have a communications receiver, then tune in station WWV (located in Fort Collins, CO) or WWVH (Hawaii). Those stations transmit accurate signals on 5, 10, 15, and 20 MHz. To reduce error, tune in the highest frequency station that produces a usable signal in your area. It's best to use the 15- or 20-MHz signal.

Whatever you use for a standard, loosely couple the output of the oscillator into your receiver, perhaps at the antenna terminal. Then adjust C3 for zero beat with the radio station. If you have an S-meter on your receiver, you can tell you're approaching zero beat when the pointer of the meter indicates a null reading.

If you have no meter, you can use your ear. As the signals from the station and the oscillator mix, sum and difference frequencies will be produced. Some of those signals will be in the audio range. As you adjust C3, the pitch of those signals will vary. When the frequencies of the two signals are equal, you'll hear no output.

**Miller oscillator**

The classic Miller oscillator used a crystal resonator in the grid circuit of a vacuum tube, and a parallel-tuned LC tank circuit in the plate circuit. Shown in Fig. 5 is an updated version of that circuit using a junction FET in place of the tube.

The crystal is connected between gate and ground in parallel with a 10-megohm resistor. Bias for the FET is set by source resistor R2, which is bypassed for RF to

PC SERVICE

One of the most difficult tasks in building any construction project featured in Radio-Electronics is making the PC board using just the foil pattern provided with the article. Well, we’re doing something about it.

We’ve moved all the foil patterns to this new section where they’re printed by themselves, full sized, with nothing on the back side of the page. What that means for you is that the printed page can be used directly to produce PC boards!

Note: The patterns provided can be used directly only for direct positive photoresist methods.

In order to produce a board directly from the magazine page, remove the page and carefully inspect it under a strong light and/or on a light table. Look for breaks in the traces, bridges between traces, and in
PC SERVICE
general, all the kinds of things you look for in the final etched board. You can clean up the published artwork the same way you clean up your own artwork. Drafting tape and graphic aids can fix incomplete traces and doughnuts, and you can use a hobby knife to get rid of bridges and dirt.

An optional step, once you're satisfied that the artwork is clean, is to take a little bit of mineral oil and carefully wipe it across the back of the artwork. That helps make the paper translucent. Don't get any on the front side of the paper (the side with the pattern) because you'll contaminate the sensitized surface of the copper blank. After the oil has "dried" a bit—patting with a paper towel will help speed up the process—place the pattern front side down on the sensitized copper blank, and make the exposure. You'll probably have to use a longer exposure time than you are used to.

We can't tell you exactly how long an exposure time you will need as it depends on many factors but, as a starting point, figure that there's a 50 percent increase in exposure time over lithographic film. But you'll have to experiment to find the best method for you. And once you find it, stick with it.

Finally, we would like to hear how you make out using our method. Write and tell us of your successes, and failures, and what techniques work best for you. Address your letters to:

ON THE COVER

If you'll turn to Page 6, you'll find an article on Tape Backup. And that beautiful unit on the cover this month, is ALLOY's FT-60 Streaming ¼-inch Cartridge tape backup. It provides 60 megabytes formatted data capacity and automatic backup.

COMING NEXT MONTH

Check it out! You're going to find a neat way to use your computer for helping to design regulators, and then we're going to run the first of a two-part article on Interfacing that will answer a lot of questions you haven't even thought of yet. And finally (yes, there's more) we'll show you how to use your computer for power control.
EDITORIAL

Systems

People involved in marketing have been using that word "Systems" to bleed the market dry. And it isn't in the computer field alone that we find this. Buy a camera today, and all you're liable to get is a camera body. If you want a lens, film back and all the other accoutrements that are needed to take photos, you want a "camera system."

Likewise, in the computer field, a "computer" consists of a black box that—by itself—can do absolutely nothing. To get any work out of it, you have to add "peripherals" such as a keyboard, and a monitor at the very least. And if you want additional peripherals, such as a modem, a printer, a mouse or a joystick, you're building a "computer system."

It goes a good deal further than that. If you buy a basic computer and open it up, you'll find all sorts of empty card slots so that at a later date, you can plug in those cards that can provide anything from added memory to increased function.

The manufacturers explain that they are unable to predict exactly which cards and peripherals a given buyer will want. What it all comes down to, is that we, the consumers, must know up front exactly what we want, how we want it, and total up all of the costs before spending any of our dollars. There are computers out there that are available at ridiculously low prices, but when you get them home, you find out that they are unsupported by suitable software, are difficult if not impossible to modify, and that frankly, you'd have been far better off to have waited to make a purchase until you could get what you want and need.

In almost every other field, you can buy a basic commodity and learn all about it as you use it. In our field, you have to buy first, before you learn. What it all comes down to, is that you've simply got to take the time to educate yourself thoroughly, before you start to shop.

Power Control
I'd like to get a means of controlling power to my computer, modem, drives, printer, etc. individually, without having to reach behind each unit. I'd also like some indicator lamps to tell me what's on or off. Don't suggest a multiple switched-outlet strip, as I had one of those. TP, Paterson, NJ.

Under separate cover, I'm sending you a schematic of one I built that works like a charm. It's fused, has surge protection, and a latching relay that turns everything off in case of line dropouts. I think you'll like it!

Ann Landers?
In your July Issue, S.D. complains that he bought an expensive computer system and now it's used only for games. He should have written to Ann Landers, not ComputerDigest! If he and his family would take the time and trouble to learn how to program the many fascinating things into their computer they'd get a lot more out of it!—J.J.H., Menasha, WI.

Amen!

Versatility!
I've noticed that in your magazine you often print a story about an add-on circuit that I'd like to have, but it's for a different computer than mine. One that I tried anyway just didn't work. Can't you publish the necessary modifications so that the circuits can be made to work with any computer?—FT, Portland, OR.

Not really. That would require the use of excessive space that we just can't afford. Stick to those projects designed for your computer. We do try to please as many readers as possible each month.

Old Timer
I was going through some old magazines stored in my attic. One of the first of the computer-oriented magazines was called "Data Product News," which I have since its first issue. The Editor's name seemed familiar. Was that you?—S.L., New York, NY.

Yup! Thanks for remembering.

G.E.D.
Do you know of any software that would help make the obtaining of a New York State General Equivalency Diploma an interesting project?—J.A., Farmingdale, NY.

Can anybody help? This sounds like a fine ideal! Write directly to John K. Allison, 25 Elizabeth Street, Farmingdale, NY 11735.

**DISKETTE HOLDER**, the Disk-O-Tier, organizes and protects diskettes close at hand using minimum space. This storage tier helps computer operators avoid "wipe-outs" caused by scratches, coffee spills, and cigarette ashes. The upright design allows diskette titles to be read easily. $15.00 for a twin pack.—ETS Center, 35026-A Turtle Trail, Willoughby, OH 44094

**CONTROL UNITS**, the OASys 66 and the OASys 66/es provide faster performance and permit more PC users to access files and the software library simultaneously. Both systems connect up to 64 PCs in an office network, and up to 48 concurrent sessions may be held on the OASys66 and the OASys66/es at one time. MS-DOS operations, such as spreadsheets, can be updated much faster with the new controller. Both units use an Intel 80286 processor, plus four subprocessors, and come standard with two megabytes of RAM. In addition, the OASys 66/es is available with 76 or 168 megabytes of disk drive in a streamlined tower cabinet design. The model OASys 66 is available with 60 or 120 megabytes of disk storage with an 8-inch disk drive.

Disk-O-Tier is molded of ABS plastic and holds eleven 5½ inch or 8 inch diskettes, in or out of jackets. The suggested retail price is $9.50 each or $15.00 for a twin pack.—ETS Center, 35026-A Turtle Trail, Willoughby, OH 44094

CIRCLE 19 ON FREE INFORMATION CARD

The model OASys 66/es is priced from $27,400 depending on the amount of storage and number of workstations attached. The model OASys 66 is priced from $21,400.—NBI, P.O.Box 9001, Boulder, CO 80301.
Media Master Plus

Media Master Plus is a package of two programs that permits a PC-compatible computer to read and write 72 disk formats, and to directly run generic 8-bit CP/M software on PC-compatible computers.

Most people are not ready to discard software because they upgraded to a PC-compatible. They use their old computers because it's too time-consuming to re-enter the software for the new computer. The ideal solution would be to use the old software on the new computer but this isn't always possible because the disk formats or microprocessors are mutually exclusive—incompatible. Because much CP/M software is similar to, or has the same kind of data files as an MS-DOS version, data can be interchanged if one of the MS-DOS disk drives can function as a "foreign" drive.

An early version of the Media Master program could program an IBM PC so drive A: retains the IBM format, drive B: emulates any of almost 70 CP/M disk formats from Actrix to Zorba. The emulation was so good that the PC-compatible could directly read from or write to the foreign disk: MS-DOS WordStar could edit text (data) on a disk originally written by a Televideo computer using a CP/M version of WordStar.

It is possible to use the MS-DOS computer as a translator to exchange data between normally incompatible 8-bit computers. If you have a mailing list on a Radio Shack Model 4 disk that you need on a Kaypro disk, using Media Master Plus, set the PC-compatible's B: drive for the Model 4 format and copy the data file to an MS-DOS disk in drive A: Then use Media Master Plus to program drive B: to emulate the Kaypro format and copy the data from drive A: to drive B: The result is a copy of the Model 4 data on a Kaypro disk.

But data isn't a program. You can't run a CP/M program on an MS-DOS machine because the microprocessor's op codes are different. While there have been attempts to use CP/M computer moulas in PC-compatibles so the CP/M programs could be used as is, such devices have been expensive.

A better approach is Media Master Plus' utility called ZPEM—ZPEM which creates a CP/M emulator that runs under MS-DOS at an equivalent processor speed of 1 MHz. When you load ZPEM, the screen prompt changes from > to "bracket," indicating that the computer is running the CP/M emulator and will load and run CP/M programs. But the CP/M file must be on an MS-DOS disk, not a foreign CP/M disk. For example, if you wanted to run an Osborne CP/M version of a program called CARDFILE.COM you must first transfer CARDFILE.COM and its data files to an MS-DOS formatted disk. When making the transfer, the extension has to be changed from COM to CP/M so the filename becomes CARDFILE.CPM. The MS-DOS computer's operating system when running the CP/M emulator is MS-DOS which recognizes any program with a .COM extension as being MS-DOS rather than CP/M. The computer becomes confused. By changing the extension to CP/M the extension is recognized only by the CP/M emulation.

That means that you can now run your CP/M programs from an 8-bit computer directly on a PC-compatible. You can run your CP/M programs and work entirely in CP/M using conventional CP/M commands and utilities such as PIP and SUBMIT. As far as you are concerned, the MS-DOS computer functions as an 8-bit CP/M machine.

Media Master Plus provides three versions of ZPEM—the "plain vanilla" ZPEM, ZPEM19 which also emulates the I-eath/Zenith H19 terminal, ZPEMOSB which emulates the Osborne terminal functions, and ZPEMKAY which emulates the Kaypro terminal functions. The special terminal emulations include such things as arrow keys, function keys, screen underline, reverse video, etc.

The CP/M emulation proved excellent. It easily ran generic CP/M programs such as WordStar and Cardfile. Even certain hardware-specific CP/M programs for Heath, Osborne and Kaypro could run using the special ZPEM versions. However, the emulator's speed can be annoying. Since the CP/M program is translated to run on the MS-DOS machine, there is a translation delay. About half speed.

Media Master Plus runs on any PC-compatible computer having at least 192K of RAM. It is $59.95 from Intersecting Concepts, 4573 Heatherglen Ct., Moorpark, CA 93021. CIRCLE 17 ON FREE INFORMATION CARD
Have you thought about streaming tape for backup? Maybe you should!

Marc Stern

Hard disks are natural choices for computer users who have vast amounts of data to store. With capacities ranging from 10 to 60 megabytes, a 5.25-inch hard disk holds as much data as 30 to 180 floppy disks.

The chances of having a problem with the fixed disk are high. At that time, it’s likely you’ll find the data damaged and you realize how important it is to have backed up the platter. A backup copy assures that your program and data files are still usable because copies are stored off-disk.

Floppy alternative

For many, that backup is handled with floppy disks, an expensive solution and not the most convenient one. Even at a cost of $1.50 a disk, you can use over 30 disks to backup a 10 megabyte hard disk, which is a $45 layout. A high-density fixed disk — 20 or 30 megabytes or more — means higher layouts. And, you must shuffle the disks in and out of a floppy disk drive to assure the backup is properly made.

When backups are made, they are done infrequently and only those files which have changed may be backed up at all (the backup option on an IBM PC/XT and compatibles allows this type of selectivity).

Imagine a device which makes backing up a hard disk easy and assures data integrity at a reasonable cost. The streaming tape drive offers efficient backup of up to 60 or more megabytes of data in half an hour.

You simply type one command and the tape drive springs to life. That’s easier than shuffling disks. Such convenience means the job is likely to be done fairly frequently.

Lots of storage

It may seem strange that the storage medium of the early years of microcomputers, discarded when disks became available has regained popularity. A 300-foot tape is capable of storing up to 30 megabytes of data, while a 400-foot tape can store upwards of 45 megabytes.

With streaming tape, data are continuously laid down by the read-write head. To facilitate speed, data compression is used to enable maximum data storage in minimum space.

To ensure data integrity, each major tape storage system uses some form of error-checking and error-correction, such as Cyclic Redundancy Checking (CRC), a form of checksumming.

Tape backup isn’t a recent development, although it may seem so from a microcomputer user’s point of view. Tape backup has been around since the computer explosion of the 1960s. Then, open-reel half-inch tape was the standard for storage. This changed about 1971 when the quarter-inch data cartridge appeared.

That width became standard and is used today in lengths from 300 to 600 feet. As tape formulations get better through the years, data storage capability has increased. A 600-foot tape can be pushed to 134 megabytes of storage.

When you look at data storage cartridges for the first time, you see they aren’t all like the Phillips cassette that you used in a digital tape storage drive, as you may have expected.

A common variety is the DC300 and DC600 series. They are about 4 by 6 by ½ inches. A more recent alternative is the DC1000. It is about 2 by 3 by ⅛-inch. This type of tape is ⅛-inch of an inch wide and can store about 10 megabytes of data on nine tracks.

The DC2000 tape cartridge was only recently introduced, but features high-density ⅛-inch tape that can handle 20 to 40 megabytes of data. Shirt-pocket-sized, the DC2000 uses 12 to 24 separate tracks for information.

There is one tape which looks like audio tape, the real digital cassette. A high-speed unit, it operates at 90 inches per second and is capable of up to 20 megabytes of storage. It uses four recorded tracks.

Little compatibility

You’re probably thinking that like an audio cassette, the tapes generated by one system can be used by another, but, that isn’t true because of differing storage standards.

There are three quarter-inch systems contending for leadership in the storage market: the Quarter-Inch Committee (QIC), a standard called PC/T, which was only recently introduced, and “floppy tape.”

The basic QIC-24 standard calls for the use of nine tracks, recorded in a serpentine pattern. With this data

Fig. 1—STANDARD NINE-TRACK tape cartridge stores backup information by recording front-to-back then beginning at the next track at the back, and recording to the front. It takes nine passes to fill a tape.
encoding scheme, when the end of one recording track is reached, the recording direction is reversed and the read-write head is repositioned. In its new position, the head begins recording the new data track opposite the first. In this manner, the tape doesn’t have to be rewound during the nine recording passes. (See Fig. 1)

The head has separate read and write head elements. Because it has two elements, data written to the tape can be instantly checked and verified, by comparing it against the original data.

Tape erasure is done on a wholesale basis, with Track 0 controlling the entire tape. When Track 0 is erased the whole tape is cleaned in a single pass.

With this system, tapes need not be preformatted before they’re used. Image or file-by-file backups can be made.

The QIC standard defines everything that makes up a tape backup system including interconnections, formats, interfaces and error correction.

Such systems are not compatible across-the-board. Although the QIC system defines nearly every aspect of performance, it doesn’t define data compatibility. A backup tape created with one system can’t be read by another manufacturer’s system. This problem seems much the same as the microcomputer disk world before the advent of PC-DOS. It was true that 5.25-inch floppy disks were the same size and used the same media and their construction was essentially the same. It’s also true that the physical requirements of the disk drive unit itself were nearly universal. What wasn’t universal was the compatibility of data. A 5.25-inch CP/M disk couldn’t be read in an Apple and an Apple couldn’t be used in a Radio Shack disk.

But the advent of PC-DOS (MS-DOS) created a standard that seems to be even more universal than CP/M, which was the former 8-bit standard, and let one system read the media of another. Experts note that software changes will allow this compatibility among QIC systems, but no one has implemented it yet.

A newer standard

The second of the three competing tape backup systems is called PC/T. PC/T stands for Personal Computer/Tape. Its biggest difference from the QIC standard is its method of data verification.

In the QIC system, data is corrected as soon as it is written to tape. Bad data are written and rewritten until they are recorded correctly. Ignoring such issues as tape wear and tear, there is no way to detect future data errors that might be brought on by plain wear and tear or machine problems.

PC/T on the other hand, uses a single head and writes data to tape in two 4K blocks at a time. After the first two blocks are recorded, a third block, using data derived from the first two, is written to the tape. This is the error-checking box and works in an exclusive-or (XOR) fashion.

With the XOR block ready, a tape can be read back and if the data are corrupted, the algorithm polls the XOR box which is then used to correct and reconstruct the corrupted data. The data are reconstructed using XOR techniques.

This technique is more wasteful than the QIC standard. Since error-checking and correcting XOR blocks are written, more space is needed for this function alone. To get around this, manufacturers have increased the number of recording tracks to 11. Also, PC/T tapes must be formatted before use, which can be a lengthy process. This does have an unexpected benefit, since it allows a directory to be set up and the tape controller to use that directory to determine where a file is and then read it off the tape, much as is done with a disk’s random access capability. In this way, specific files can be updated without having to rewrite the whole tape. (See Fig. 2)

Hard disk backup is a function of the IBM PC/XT or compatible world, with an open architecture. All functions of these microcomputers is built into the boards that are inserted on the motherboard. Adding an external drive can be a premium when you’ve populated the motherboard with video, floppy and hard disk controllers, memory and multifunction boards. Still, to use a tape backup system you have to insert a tape controller card, in most cases.

And this brings us to the “floppy tape.” This type of tape backup system uses the floppy disk controller card, rather than a separate tape controller card. A “floppy tape” acts as a floppy disk and is subject to the same requirements. Floppy disks require formatting and so do “floppy tapes.” And, the formatting marks out bad areas and builds a bad-sector table, which keeps those sectors from being used.

Because they run under the constraints for the disk operating system, “floppy tapes” limit to the upper edge of the storage capability of the system. A formatted “floppy tape” in an IBM setting will store about 25 megabytes of data.

In a “floppy tape” system a single read-write head is used. Six tracks are recorded in 16 sector chunks. A 17th is then written which acts as a parity checking sector. This data-protection scheme only covers one bad sector and if two or more are found during a replay, the area is flagged and you are asked whether you want to rewrite the tape.

The error rate for any of these systems isn’t high. It’s on the order of 1 x 10^-11, so these are reliable systems with low error rates.

Of the three systems, QIC still stands to emerge the victor for market share because it is the most widely adhered to. This could change as technology changes.

Whatever standard emerges, hard disks and tape backup go hand-in-hand. It was a marriage everyone was waiting for and one which is a welcomed change.
Schmitt triggers are used to convert sine waves or other shaped signals into square-wave pulses. They compare an incoming signal to upper and lower threshold voltages, then produce a square wave at the same frequency as the input.

This program quickly calculates the standard resistor value for resistors needed in a two-transistor Schmitt trigger circuit. You must enter the upper and lower threshold voltages, the supply voltage (Vcc), the base-to-emitter voltage drop of the transistors, and the load resistance.

Use any computer

The program is written so that it can be run on almost any computer without modification. The only change you should need to make is the HOME command. This clears the screen, and you should substitute the command your machine uses, if it's different.

Because ideal circuits are ideal only on paper, the program calculates theoretical resistor values, and then changes them to the nearest standard value. Since these changes alter the actual threshold voltage values, the actual values are calculated and printed.

No attempt has been made to draw the circuit within the program, because universal ASCII symbols are inadequate, and graphics are unique to each machine. A diagram of the circuit and the four calculated resistors (R1, R2, R3 and R4) are shown in Figure 1. Figure 2 shows a sample run.

FIG. 1—CIRCUIT DIAGRAM and the four calculated resistors is shown above.
Can you build your own modem? Sure you can!

Rodney A. Kreuter

Until recently, a single chip modem meant that a 300 baud Bell 103 compatible modem could be built using about six chips: The answer filter, the originate filter, an RS-232 driver, an RS-232 receiver, the implement hybrid, and the modem. Add a limiter, precision resistors and capacitors, and a one evening project becomes a major engineering and procurement feat.

Thanks to the newer modem chips, that's a thing of the past. Using National Semiconductor's MM74HC942 or MM74HC943, a single chip Bell 103 compatible modem can be built with one chip if a TTL compatible output is acceptable. If you must have the swing of RS-232, the chip count rises to two. Actually, most micros use a 1489 type line receiver which works quite well with a TTL input.

Add to this a 3.58 MHz crystal, a 600 ohm isolation transformer, and a source of 5 volts at 12 milliamps and you're home free. I sprinkle with LEDs—call it 5 volts at 35 milliamps.

Most important is that the only precision part necessary is the 3.58 MHz crystal.

The only difference between the 74HC942 and the 943 is that the 942 requires + and − 5 volt supplies and can drive the phone line to 0 DBm (1 mw into 600 ohms). The 74HC943 requires only +5 volts, but can only drive the line to −9 DBm which is all you're permitted to drive it.

Circuit description

As you can see from Figure 1, the circuit is fairly straightforward. VR1 is more important than it may seem at first glance. National points out that the modem chips are susceptible to noise on the power supply lines and suggests that a three-terminal regulator dedicated to the modem will prevent problems. Unless you have a very clean supply, use the regulator. It also regulates a calculator-type DC supply (9 volts, 100 ma) very well.

The modem is AC coupled to the phone line or data

PARTS LIST

Semiconductors

IC1—MM74HC943
IC2—TIL113 or 4N33 optoisolator (for ±12 volts)
Q1, Q2—2N2222 transistor
VR1—7805 voltage regulator
XTAL1—3.58 MHz colorburst crystal

Resistors

(All resistors %watt unless otherwise specified)
R1, R2, R11—9200 ohms
R3, R5, R6, R7—390 ohms
R4, R10—910 ohms (see text)
R12—620 Ohms, %watt

Capacitors

C1—2μF, 200 volt
C2, C6—100μF, 10 volt
C3, C5, C7, C9—0.1μF
C4—10μF, 16 volt
C8—0.2μF (see text)

Miscellaneous Parts

S1—SPDT toggle switch
S2—SPST toggle switch
T1—600-600 ohm transformer (Radio Shack 273-1375 or equal)
Power supply, PC board, cabinet, wire, solder, Etc.
FIG. 1—SCHEMATIC DIAGRAM reveals that this is about as basic as you can get in a modem. Thanks to the 74HC943, it becomes a one-chip circuit.

Description of pin functions

1. DSI Driver Summing Input. This input may be used to transmit externally generated tones such as dual tone multifrequency (DTMF) dialing tones.

2. ALB Analog Loop Back. A logic high on this pin causes the modulator output to be connected to the demodulator input so that data is looped back through the entire chip. This is used for self test. If ALB and SQT are simultaneously held high, the chip will power down.

3. CD Carrier Detect. This goes to a logic low when a carrier is sensed by the carrier detect circuit.

4. CDT Carrier Detect Timing. A capacitor on this pin sets the time interval that the carrier must be present before CD goes low.

5. RXD Received Data. This is the data output pin.

6. VCC Positive power supply (+5 volts)

7. CDA Carrier Detect Adjust. Used to set the threshold for the carrier detect.

8. XTALD Crystal Drive. XTALD and XTALS connect to a 3.5795 MHz crystal to generate a clock for chip. If an external circuit requires this clock XTALD should be used to drive the external circuit. If a suitable clock is available in the system, XTALD can be driven.

9. XTALS Crystal Sense. Refer to pin 8 for details.

10. FTLC Filter Test/Limiter Capacitor. This is connected to a high impedance output of the receiver filter. It may thus be used to evaluate filter performance. This pin may also be driven to evaluate the demodulator. RXA1 and RXA2 must be grounded during this test. For normal operation FTLC is AC grounded via a 0.1µF bypass capacitor.

11. TXD Transmitted Data. Data input pin.

12. GND Ground

13. O/A Originate/Answer mode. High = Originate

14. SQT Squelch Transmitter. Disables the modulator when held high

15. RXA2 Receive Analog #2. RXA1 and RXA2 are analog inputs. When connected as recommended they produce a 600 ohm hybrid.

16. RXA1 Receive Analog #1. See RXA2 for details.

17. TXA Transmit Analog. This is the output of the line driver.

18. EXI External Input. This is a high impedance input to the line driver. This input may be used to transmit externally generated tones. When not used for this purpose it should be grounded. (To the analog ground pin)

19. GNDA Analog ground reference.

20. TLA Transmit Level Adjust. A resistor from this pin to VCC sets the transmit level.
coupler (see legalities section) through capacitor C1 and transformer T1. Remember, no one said you have to connect this or any other modem to the phone line. In a factory environment any twisted pairs of wires that you supply will do. Resistor R12 provides a DC path for the phone company which maintains the telephone connection after the dialing phone is hung up. National recommends a constant-current sink which is about 3 DB better than a simple resistor at the cost of five diodes and two transistors, which is not in the spirit of a "no frills" modem. If you need the performance, check National's Comparison Report for more details. If you are using your own twisted pair, forget the resistor. Diodes D9-D5 provide protection for the modem during ring which may induce 190 volts on the line. National recommends back-to-back Zeners but 1N914's are fast and cheap. Resistor R9 is the hybrid balance resistor. The National hybrid is balanced for 1200 ohms, so R9 should be 1200 minus the impedance looking into the line. In this case it's R12 in parallel with 600 ohms or 300 ohms. 910 ohms for R9 should be close enough. Since there are 19 op amps in the 74HC943, and the power supply is a single-ended 5 volts, resistors R1 and R2 provide an analog ground reference of 2.5 volts. Capacitors C6 and C7 provide decoupling. Capacitor C8 determines how long the carrier must be present before it is detected by the modem. The time in seconds is equal to the capacitance in microfarads multiplied by 6.4.

Transistor Q2 provides level shifting of the TTL or RS-232 input and gives a proper voltage swing for the CMOS modem chip. D8 provides a visual indication of data arriving from the terminal equipment. If this isn't desirable, jumper out D3 and raise R5 to 560 ohms. Q1 level shifts the modem's output to a level required for a TTL compatible device. If this is adequate, jumper out pins 1 and 2 of IC2 and forget the + and - 12 volt power supplies. D9 can be omitted also—raise R6 to 560 ohms and jumper D9.

Omitting D6 is not recommended since it is the carrier detect LED. However, D7 only lets you know if

**FIG. 2—FULL SIZE PATTERN** for the circuit board is shown here. You can easily transfer this from the printed page and make your own circuit board.

**FIG. 3—AND WHEN YOU'RE READY** to start populating the board, here is where all the components should be placed.
you're in the originate or answer mode, so it can also be omitted. Jumper D7 and raise R3.

You gotta have the crystal! It provides all the timing information for both transmitting and receiving data.

Operation

Wire the modem and a standard telephone as shown in Figure 1. Dial the number with $1 in the "voice" position. When you hear the carrier, switch $1 to the "data" position. The carrier detect LED should come on in about 1 second (depending on C8).

Enhancements

Auto dialing can be added by summing dial tones with the output of the modem, but since phones with redial are being given out for opening a checking account, why bother? If worse comes to worse and you have to buy a phone, where else can you get a keypad and a dialer chip for $6.95? If you must have auto dial see National's design guide application note 347.

Is it Hayes compatible? No, but it will talk to a Hayes if one is on the other end.

Does it auto answer? No. Add a ring detector (a capacitor, optoisolator and a diode), a relay with a transistor driver (don't forget the snubbing diode), tie the transmitter squelch to the carrier detect and NAND the carrier detect with the ring detect delayed to drive the transistor driver and relay.

Legalities

This modem, like other telephone line connected equipment should only be connected to the phone line through an FCC approved interface such as the Tele-Path Industries model 381 or other data coupler.
oscillators

Figure 5 — A Miller oscillator uses a FET and a tuned-drain circuit. The latter is tuned to a frequency near the resonant frequency of the crystal.

Make a low-impedance path to ground for the feedback signal. The reactance of the capacitor is usually set at least 1/3 of the resistance that it bypasses.

The drain terminal of the FET in this circuit is connected to the resonant tank circuit. The resonant frequency of the LC circuit is not exactly that of the crystal. Usually the tank circuit is tuned to a frequency below that of the crystal.

On first glance the Miller oscillator doesn't look like an oscillator at all, because there is no apparent feedback network. The circuit depends upon the "hidden" capacitances shown as $C_{GS}$ and $C_{DG}$ in Fig. 5. Those capacitances represent the interelectrode (gate-to-source and drain-to-gate) capacitances of the FET. They form a capacitive voltage divider that feeds some of the output signal back to the input.

If you own older equipment that uses a Miller oscillator, it is possible that the ferrite core in the tank circuit has changed enough to make the oscillator inoperable. For example, we found that to be the problem with two different Heath DX-607B transmitters that were fired up after many years of disuse. The symptom was unreliable keying on CW. Sometimes when the key was closed the oscillator refused to start, and other times it started fine. The oscillator in the DX-607B is a Miller circuit, and its coil had changed inductance.

Another Colpitts oscillator is shown in Fig. 6. That circuit is somewhat different from the previous configuration, but may actually be more popular. The circuit in Fig. 6 operates over the 1- to 20-MHz frequency range, although we have found that that operation may be unreliable above 15 MHz or so.

Feedback is controlled by the $C_2/C_3$ capacitor voltage divider, which is what identifies that circuit as a Colpitts oscillator. As with the previous Colpitts circuit (shown in Fig. 4), almost any NPN transistor can be used for Q1.

Last, shown in Fig. 7 is an overtone oscillator. The crystal is connected between the base of the transistor and ground, and capacitor C1 is used to increase feedback around transistors that have insufficient internal capacitance. In some cases, C1 will not be needed, but if it is used it must be mounted as close as possible to the body of the transistor.

The tank circuit (L1/C3) connected to the collector of the transistor is tuned approximately to the overtone frequency. Bypass capacitor C2 should have a reactance of about 90 ohms at the frequency of operation; values for several frequencies are given in Table 1. You may have to juggle the values of R2 and R3 to get reliable operation.

FIG. 6 — THE COLPITTS OSCILLATOR comes in various forms; the one shown here is probably more widely used than the one shown in Fig. 4.
A budget DBS system

MUCH HAS BEEN WRITTEN ABOUT THE promise of DBS (Direct Broadcast from Satellite). DBS has been assigned the Ku band (11-12 GHz), which is about three times higher in frequency than the C band (4-GHz). Satellite signals for home reception have been broadcast on the C band since the late 1970’s; DBS on the Ku band is the promise of the future.

Originally, the DBS system was to be driven by several high-powered satellites that had as much as 250 watts of transmitter power per transponder. The theory was that, if a great deal of power were beamed down from over the equator, and if carefully shaped antennas were used for the downlink to earth, the size, cost, and complexity of ground-based receiving terminals could be reduced greatly.

That plan has yet to be realized for several reasons that we’ve talked about here in the past (in the January and February issues). However, we now have an interim technology that should be of general interest. It is based on RCA’s pair of satellites called Ku-1 and Ku-2; each satellite has 16 transponders with a nominal power-per-transponder of 50 watts. Recently, New Jersey satellite enthusiast Peter Sutro and I put together a low-cost home-receiving system to see just what might be done with those 50-watt channels.

We used a 32-inch diameter spun-metal dish from DH Satellite, Inc. (P. O. Box 239, Prairie du Chien, WI 53821). DH is the largest-volume manufacturer of satellite antennas in the world today. Their 32-inch dish is the largest that can be packed and accepted for shipment by UPS. The cost of the dish, a simple ring mount, and the feed-support tripod is well under $100 at the dealer price level.

For the electronics, we chose an Echostar LN8 with a 2.2-dB noise figure. The Echostar converts the 12-GHz signals down to a typical 900- or 950-1400 MHz IF. The TVRO receiver is a DX 500 (from DX Communications, Inc., 10 Skyline Drive, Hawthorne, NY 10532) which connects to a stock television receiver tuned to channel 3 for the modulated RF output of the DX 500. The total cost of the antenna and the electronics was less than you might pay for a quality name-brand 15-inch television set.

It took less than five minutes to unpack and set up everything. If we had been in a hurry, the whole exercise might have been completed in half the time. The dish slips onto the ring mount; the whole assembly turns to adjust azimuth. To adjust elevation you use a simple slip-rod system that angles the dish on the circular mount.

You don’t get much gain from a 32-inch dish on Ku band. So you hope that the 50 watts of power from the satellite is enough. On the other hand, by using a small dish, you have the advantage of simple setup. You can locate the satellite and then peak the reception by fine-tuning the azimuth and elevation. If you know which direction is south, and if you remember that the satellite belt is above the southern horizon, you will have close to instant success in obtaining some sort of picture.

The downside of this report is that the signals transmitted by the RCA satellites are not intended for home reception. There are both scrambled signals (from HBO, Cinemax, etc.) and unscrambled signals (from NBC and others) on those two birds. That means that you can watch all the NBC network feeds you want with the system described above—but not much else at the present time. By the way, we’re not encouraging you to intercept NBC’s signals; we’re merely talking about the equipment that might be used to do so.

With the equipment we’ve described and only a few minutes of effort we were able to obtain very good reception. It wasn’t difficult to do so either; the relatively wide beam pattern of the 32-inch dish is really an advantage. In fact, it was about as difficult to find Ku-1 and

Ku-2 with our 32-inch dish as it would be to find a C-band bird with an 8-foot dish. In other words, not difficult at all.

No programming

It's fair to say that low-cost, easy-to-install, and easy-to-use DBS is here. What is missing, however, is effective use of DBS by those would-be programmers who have dreamed of the day when millions of homes would be equipped with those tiny dishes. And things aren't likely to change in the near future.

Part of the problem is that RCA has sold or traded most of the 32 50-watt transponders on Ku-1 and Ku-2 to the large corporate users, including TV networks, ad-hoc TV-oriented programmers, and, of course, cable programmers like HBO, and communications giants like AT&T. Not one of the present or future users of Ku-1 and Ku-2, shown prior to its launch last year in Fig. 2, has made public its plans regarding use of the transponders for DBS. Even the third (and last) RCA Ku bird, Ku-3, which is scheduled for launch some time after the Shuttle failure is sorted out, is pre-sold for non-DBS uses.

The equipment required to create a DBS service is in place and working. But the software for such a service is not in place, and there are indications that that software may not be in place prior to at least 1989.

The technology for small-dish DBS service is here, but small-dish DBS is not. Technical experimenters will find the challenge of receiving low-cost Ku-band signals interesting. But TVRO businessmen will probably have little use for the smaller dishes and the easy Ku-band reception that is now possible.

SEND COOP $20 and HE WILL SEND YOU $63!

NOPE - not a new fangled 'chain letter', TVRO pioneer Bob Cooper, Jr. has put together the most useful 'Data-pack' possible to bring you up to full speed on satellite television scrambling. It will cost you $20 to receive all of the following valuable information:

1) YOU RECEIVE the 3 'current issues' of CSD Magazine; literally, 'the bible' of the home dish industry. The most complete insider look at the new equipment, scrambling strategies, worldwide satellite explosive growth anyplace. You receive 3 issues starting with the now-current issue. A great introduction to TVRO! This is an $18 value.
2) YOU RECEIVE the current plus two recent back issues of SCRAMBLE-FAX, the hot-news 'Newsletter' that details the rapid changes taking place in scrambling, who is scrambling, how, who is breaking scrambling, their progress to date. This is a $30 value.
3) YOU RECEIVE the special 180 page COMMEMORATIVE EDITION OF Coop's Satellite Digest, the full, unabridged history of home satellite television. This is the handiest, one-source reference recording the home dish industry: a $15 value.
4) YOU RECEIVE all of the facts, all of the history, and all of the current, hard-to-find news about TVRO and scrambling. From Coop; the industry's most authoritative information source. Send your check or money order to the address below, or, with your Visa or Mastercharge card handy, call in your order to 305/771-0505 weekdays between 9 AM and 4 PM. Join the Coop team and learn ALL the facts today!

CSD/Coop's Satellite Digest

SCRAMBLE-FAX HOTLINE? Call 305-771-0575 for 3 minute update NOW!

INTERESTED IN TVRO?

For nearly two years Bob Cooper has provided a no-charge kit of printed materials that describes the challenges of and opportunities in selling TVRO systems today. With the present intense interest in scrambling systems, Coop's CSD has made available a new no-charge service.

The SCRAMBLE FAX hotline is a 24-hour-per-day telephone service that provides accurate, detailed, and hard-to-find facts concerning the changeover to scrambling in the satellite communications industry. Information describing satellite receivers tested for scrambling compatibility, sources for authorized descramblers, wholesale rates of scrambling equipment and services—all are provided on the SCRAMBLE FAX hotline. There is no charge for that service, other than your long-distance telephone expenses. Simply dial (305) 771-0575 for a concise and timely three-minute capsule report that covers the latest in scrambling news.
WHERE can you find the components you need? Our local distributors are your wherehouse.

As electronics manufacturers, we serve you better by getting our wares to you through distributors. Our distributor speeds our standard products to you, faster than we could deliver them. He extends our sales, warehouse, and credit capabilities, and thus helps us keep down our costs, and hence your price!

We call him "our distributor", because he handles our product. But he's also "your distributor", because he solves your procurement problems!

WHERE do you have a convenient, nearby source for product? YOUR DISTRIBUTOR

WHERE do you find the important piece you suddenly need? YOUR DISTRIBUTOR

WHERE can you have quantity inventories put into stock, to parallel your production schedules? YOUR DISTRIBUTOR

WHERE do you go when you need those hard-to-find replacement parts? YOUR DISTRIBUTOR

The sponsors of this message believe in the distribution system. Our local warehouse is your local wherehouse. You find what you need, when you need it, where you need it. We are among over 150 member firms of the Electronic Industries Association, Distributor Products Division, all committed to advancing the state of the art of marketing through distributors. Want more information? Contact Herbert Rowe, Senior Vice President, EIA Components Group, 2001 Eye Street, N.W., Washington, D.C. 20006. Telephone (202) 457-4930.

Simple solid-state vision

During the past few years, several manufacturers have introduced relatively inexpensive video-camera interfaces for personal computers. Many of those products are simply analog-to-digital converters that, through the use of special timing circuits, transform standard NTSC video information from the camera into bytes of data that the computer can store, display, and process. The camera interfaces usually come with software that can store and display the digitized images; processing is then up to you. And that's where things get difficult.

It's not terribly difficult to design a robot vision system that can distinguish between different objects. However, there is a difference between distinguishing and recognizing. In fact, recognition is a tremendous task. That's the reason why manufacturers of PC vision interfaces do not provide you with fully functional vision software. Fortunately, it is not difficult to build a vision system that is suitable for experimental and hobbyist purposes.

Many people ask about simple and inexpensive ways to start experimenting in the field of robot vision. The answer we give is that it depends on what you want your robot to "see."

Vision systems may be divided into two categories: high and low resolution. If you're working with a mobile rover, and if vision is to be its primary navigational aid, then a high-resolution system may be appropriate. On the other hand, if you're working with a robot arm that must distinguish between round and square blocks, or other simple shapes, then a low-resolution system may suffice.

The PC-based interfaces are often categorized as high resolution by their manufacturers, but they're really medium resolution (640 x 400 pixels). At the low end of the scale, a very low resolution interface (32 x 32, or even less) can be surprisingly useful, however.

A photocell-based vision system

An extremely-low-resolution (3 x 3) sensor can be built for under $20; it provides surprisingly accurate results. The sensor can distinguish between a multitude of shapes, and it will allow you to carry out a number of useful experiments. Limited character recognition is possible, as are color and pattern recognition.

The sensor uses the same basic technology as a photographic light...
meter: a photocell and some means of measuring voltage. Many light meters use a moving-vane DC meter. The more light that strikes the sensor, the further the meter's needle deflects. That's because the resistance of the photocell varies with the amount of light that is striking its surface. The output of the photocell can be converted to a varying voltage merely by including it in a simple resistive voltage divider, as shown in Fig. 1.

The trick in using the photocell as a robot-vision device is in the way you measure that varying voltage. The DVM updates its display very slowly, so you don't see the minute, rapidly occurring variations in output. A robot needs a method of converting that quickly varying output into discrete values. As you have guessed, an A/D converter performs that task.

Most personal computers (including the IBM-PC) that are used for robot experimentation have eight-bit data buses. Therefore one byte of information in the computer can store any one of 256 \((2^{8})\) values. Therefore it is appropriate to build an eight-bit A/D converter for the sensor. Such a converter will allow the computer to distinguish 256 individual levels of light—and that's quite a few for experimental purposes.

If you require higher resolution, twelve-bit A/D converters are readily available. A 12-bit converter will resolve 4096 \((2^{12})\) levels of light. The disadvantage of a 12-bit converter is that it requires additional circuitry to multiplex the extra four bits onto an eight-bit bus. Is an inexpensive photocell sensitive enough to allow 4096 bits of resolution? The answer is yes, and even more. (Linearity may be a problem, however.—Editor)

Obviously a single photocell is insufficiently accurate as the basis of a robot vision system. Figure 2 depicts an experimental vision sensor array composed of nine photocells in a \(3 \times 3\) matrix.

The mechanical dimensions of the array will depend on the size of the photocells, but by using commonly available cells, you should be able to squeeze the entire array into an area about 0.75" on a side.

One lead of each device is tied to the common voltage source. The other lead of each device will be connected directly to one input of an A/D converter. We'll show the circuit details of the A/D converter next time.

An easy way to mount the photocells is on a solderless breadboard. Four standoffs can support a piece of clear plastic that acts as a dust shield for the photocells. Also, you should isolate the photocells from one another; doing so increases the accuracy with which an object can be scanned. You can cut short plastic or paper tubes to fit over the sensors.

**Pattern recognition**

When the sensor confronts an object, that object should be centered in the array. Centering can be accomplished in a variety of ways, including mechanical and optical limit switches, and others.

Let's consider how we might use the sensor to recognize two different objects, a square and a triangle. Assume that the square has the same outer dimensions as the sensor, and that the triangle is slightly smaller.

The square completely blocks all nine sensors, but the triangle blocks only the center sensor completely, and partially obscures the others. Assuming that the output of each sensor is either high or low, depending upon the light hitting it, it would be easy for a computer to distinguish between the two shapes.

Normally we can't simply lay an object directly on top of a sensor array. So we can direct light from another source, creating shadows. Doing so will result in a similarly easy recognition task.

The program controlling overall operation must have a threshold value that indicates when an opaque surface is detected. You could just perform a daily sensitivity adjustment, but minute changes in the ambient light level can affect the reading tremendously. One way around variable sensitivity is to allow the sensor to carry its own source or light. You could use a photographic flash unit, and trigger it whenever the computer must read the array.

Next time complete details of a vision circuit like that discussed here will be presented.
ANTIQUE RADIOS

Restoring AC-DC radios

IT HAS BEEN YEARS SINCE MANY OF YOU worked on a vacuum-tube radio; perhaps you've never worked on one. And many young antique-radio enthusiasts know a great deal about solid-state circuits and computers, but nothing about troubleshooting a vacuum-tube set. This column is dedicated to all of you who have just come (or have just come back) to antique-radio servicing.

The antique of the month

One of the first things someone new to vacuum-tube servicing must learn is to be careful, because the chassis of an antique may be "hot." In other words, there may be 117-volts AC between the chassis and ground. You can get a dangerous shock if you touch a cold-water pipe or any other grounded metallic object at the same time that you touch the chassis of an antique radio.

The Temple radio shown in Fig. 1 is safer than many other radios because of its wooden cabinet and recessed chassis bolts and set screws. The complement of tubes include: a 35Z5 rectifier, a 12SQ7 2nd detector and 3rd audio amplifier, a 12SK7 IF amplifier, a 12SA7 first detector and oscillator, and a 50L6 for audio output. The Temple is not truly an antique, but it's collectible, and is representative of the type of post-WWII radio that you are likely to run across.

Filament voltages

If you're new to tube servicing, it's helpful to know that the digits preceding the letters in a tube number often indicate the tube's filament voltage. For example, the 50L6 mentioned above has a 50-volt filament. If you add the filament voltages of the Temple's tubes, you'll find that their sum (121 volts) is approximately equal to the line voltage. By wiring all those filaments in series, no dropping resistor or step-down transformer is necessary to connect the filament string directly to the AC power lines.

But in early five-tube AC-DC sets you will find a voltage-dropping resistor in the filament circuit, because the sum of the voltages used by early tubes didn't equal the line voltage. And even though the line voltage might dip as low as 100-volts AC, engineers designed for a peak of 120-volts AC. It was better to underpower a component than to over-power and possibly damage it.

Sometimes, instead of an on-chassis dropping resistor, a resistor was incorporated in the power cord. The line-cord resistor is covered with asbestos and cotton, and the cord looks like the heavy cord that is used with an electric iron. Of course the line-cord resistor generates heat, so it is not recommended that excess cord be tucked inside the cabinet.

Also, that type of line cord shouldn't be shortened, or the resistance may be reduced.

Another method of reducing voltage in some very early AC-DC receivers was to use a ballast tube in the filament circuit. The tube plugged into the chassis, and usually functioned as a pilot lamp.

Tools and test equipment

Newcomers may also appreciate a few hints about the types of tools and test equipment that are necessary to service vacuum-tube sets. Many of the small tools used in servicing modern electronic gear are simply inadequate when working on older radios.

Large screwdrivers, pliers, wire-cutters, and strippers that you wouldn't think of using on 1980's equipment are a must. But most important is a soldering iron or gun. The small pencil-type soldering irons used today are virtually useless on an antique radio chassis—sometimes the heat of a blow torch is needed! Drills and hack saws also come in handy.

As for test equipment, you can often get by with just a multimeter, because most problems can be traced to shorts and opens. Ohm-meter tests must be done on a "cold" (unpowered) set. Even tubes can be tested with an ohm-meter. If you don't measure a short between the prongs of an old radio tube, there's a good chance that it will light up and produce some sort of signal.

Troubleshooting hints

It's a good idea to do as much testing as possible on a cold set, because a cold set is safest for the
service man, for his test instruments, and for the equipment being tested. A cold test should be done only when the set being tested is unplugged. Turning the power switch off never makes a set completely safe for cold testing, or even for handling. With the switch off, even if the chassis is not “hot” with respect to ground, one side of the switch (and anything connected to it) is hot. A good way to remember to unplug a set before testing it is to get into the habit of making a continuity test across the prongs of the power plug first.

To increase safety, some antique radios include a double-pole power switch. But even if your set has that type of switch, it’s much safer to unplug the set before doing any testing.

In the early days of radio, polarized AC power plugs and receptacles were not required. That’s why the chassis could be “hot.” However, there were several ways the radio repairman could prevent shocks and still work on a live set. First, he could buy an expensive isolation transformer. But there was another way. Despite the absence of polarized receptacles, one side of the house wiring was always grounded. However, there was no way to tell (just by looking) which side to insert the plug into the wall socket. So the repairman used to mark the grounded side of the receptacle near his workbench.

Symptoms

A problematic AC-DC radio most often exhibits one of two major symptoms: it’s completely dead, or it has a great deal of hum. A dead radio is usually easier to fix than one with other problems, because the source of the problem is usually easy to find. For example, a simple test with an ohmmeter will show whether the line cord is any good.

Excluding obvious problems like an open power cord or a broken power switch, the most usual source of problems in an AC-DC set occurs in the filament circuit. If a dropping resistor or filament develops an open, the entire set will be disabled. Of course there still may be high voltages present, so be careful!

Analyze defective waveforms faster, more accurately, and more confidently — every time or your money back

with the SC61 Waveform Analyzer
Patented $2,995

If you value your precious time, you will really want to check out what the exclusively patented SC61 Waveform Analyzer can do for you. 10 times faster, 10 times more accurate, with zero chance of error.

End frustrating fiddling with confusing controls. Exclusive ultra solid ECL balanced noise cancelling sync amplifiers, simplified controls, and bright blue dual trace CRT help you measure signals to 100 MHz easier than ever.

Accurately and confidently measure waveforms from a tiny 5 mV all the way to a whopping 3,000 V without hesitation with patented 3,000 VPP input protection — eliminates expensive “front end” repairs and costly equipment downtime.

Make only one circuit connection and push one button for each circuit parameter test: You can instantly read out DC volts, peak-to-peak volts and frequency 100% automatically with digital speed and accuracy. It’s a real troubleshooting confidence builder.

Confidently analyze complex waveforms fast and easily. Exclusive Delta measurements let you intensify any waveform portion. Analyze glitches, interference signals, rise or fall times or voltage equivalents between levels; direct in frequency or micro-seconds.

Speed your digital logic circuit testing. Analyzing troublesome divide and multiply stages is quicker and error free — no time-consuming graticule counting or calculations. Simply connect one test lead to any test point, push a button, for test of your choice, for ERROR FREE results.

To see what the SC61 can do for your troubleshooting personal productivity and analyzing confidence, CALL TODAY. WATS FREE, 1-800-843-3338, for a FREE 15 day Self Demo.

You can often check tubes without removing them from the chassis. You should measure some resistance between the filament pins, and no resistance between any combination of plate, grid(s), and anode. It helps to know which prongs the filament is connected to. Miniature tubes often connect the filament to prongs 3 and 4. The tubes in the temple rod mentioned earlier have filaments on prongs 2 and 7, except the 12SQ7, which uses 7 and 8. Check a tube guide to make sure.

If you must remove tubes from a later model set, it is often easier to remove the chassis before pulling tubes. Newer cabinets are very small so it's almost impossible to get your hand inside to remove the tubes.

After you get some practice, it should take only about one minute to check the continuity of all five tubes, the power switch, the line cord, and a dropping resistor, if present.

The other common problem in AC-DC sets is hum. Since those radios lack many of the hum-causing components of the early AC-only sets, hum is easier to locate. Often it's due to a leaky electrolytic capacitor. The best way to test a suspect capacitor is by bridging it with a good one. Make sure that the voltage rating of the bridging device is at least as high as that of the suspect.

Electrolytics often have two or three sections in a single circuit board tube (or can). You may find that only one section is bad, but it's best to replace the entire component. If you can't find an exact substitute, you can use two or three individual capacitors, as long as both capacitance and voltage ratings are attended to. When replacing an electrolyt, be sure to install the new one with the correct polarity.

Printed-circuit boards

Another source of shorts and opens is the PC board, which was perfected during World War II, although it was conceived of at least twenty years earlier.

As with most innovations, servicemen had problems with the PC board at first. Pushing tiny resistor and capacitor leads through...
small holes and then soldering them to the other side of the board seemed awkward to many of us. It was easy to destroy the fragile copper traces with the large soldering irons that were popular at the time. We then had to repair the damaged board with wire. Weak copper traces can be a nagging problem; a trace can be stripped from the board just by pulling a tube out of a socket. In fact, many sets have notices on the back warning of that problem.

But manufacturers soon offered proper instructions and tools for servicing the printed circuit board. The introduction of smaller components went a long way toward preventing damage to the board.

Voltage readings

If you look at the schematics of many early receivers, you’ll see that the voltage readings at corresponding points in various circuits are very similar. Voltage readings take more time to make than continuity tests, and they require some training on the part of the serviceman. A few general rules can be stated, however.

The plates of the converters (12BE6, 12SA7) and IF amplifiers (12BA6, 12SK7) should show under 100 volts. The first audio stages (12AT6, 12SQ7) should show between 30 and 60 volts. The cathodes of the audio output tubes (50C5, 50L6) should show about 6 volts, and the rectifier cathodes (35W, 35Z5) should show over 100 volts. The grid of the first audio tube should show about –1 volt, and the oscillator grid of the converter should show between –6 and –12 volts.

The end of an era

Although few wanted to believe it at the time, the 1950's was the beginning of the end for the tube industry. Tubes were the mainstay of the electronics industry. Wholesaler's walls were covered with shelves of every type of tube imaginable. The radio repairman carried an impressive tube caddy, and kept a rack of popular tubes in his shop. Even more impressive was the repairman's tube tester. No person or piece of equipment did

Exclusive, triple patented dynamic cap and coil analyzing . . . guaranteed to pinpoint your problem every time or your money back

with the all new LC75 “Z METER 2”
Capacitor Inductor Analyzer
Patented $995

The “Z METER” is the only LC tester that enables you to test all capacitors and coils dynamically — plus, it’s now faster, more accurate, and checks Equivalent Series Resistance (ESR) plus small wire high resistance coils.

Eliminate expensive part substitution and time-consuming shotgunning with patented tests that give you results you can trust every time. Test capacitor value, leakage, dielectric absorption, and ESR dynamically; with up to 600 volts applied for guaranteed 100% reliable results — it’s exclusive — it’s triple patented.

Save time and money with the only 100% reliable, in-or-out-of-circuit inductor tester available. Dynamically test inductors for value, shorts, and opens, automatically under “dynamic” circuit conditions.

Reduce costly parts inventory with patented tests you can trust. No more need to stock a large inventory of caps, coils, flyback, and IHVT's. The “Z METER” eliminates time-consuming and expensive parts substituting with 100% reliable LC analyzing.

Turn chaos into cash by quickly locating transmission line distance to opens and shorts to within feet, in any transmission line.

Test troublesome SCR's & TRIAC's easily and automatically without investing in an expensive second tester. The patented "Z METER 2" even tests SCRs, TRIACs, and High-Voltage Diodes dynamically with up to 600 volts applied by adding the new SCR250 SCR and TRIAC Test Accessory for only $148 or FREE OF CHARGE on Kick Off promotion.

To try the world’s only Dynamic LC Tester for yourself, CALL TODAY, WATS FREE, 1-800-843-3338, for a FREE 15 day Self Demo.

Private amateur communications

It is quite likely that ten years ago an amateur radio operator would have responded with utter disbelief if someone had asked whether he could foresee a need for private communications in his radio service.

Of course, private communications is useful—to a degree—for repeater use, particularly where a freebie telephone patch is provided. After all, if someone is going to enjoy expensive communication functions he should be willing to pay "club" dues.

Repeater access is usually made private through the same kind of PL (Private Line) circuits that are used in commercial VHF/UHF gear. Generally, the true PL systems employ a sub-audible tone that is transmitted with the carrier; the tone keeps the receiver's squelch open. In some cases, a tone burst is used to keep squelch open.

But controlled repeater access isn't the only application for private amateur-band communications. For example, you might want your equipment to determine who you'll talk with or listen to. And, although that might be difficult to do using audible or sub-audible tones, it would be convenient to be able to do so just by punching a few numbers on a keypad. Of course, that kind of controlled access can only be done with a transceiver that uses digital-computer circuits.

Digital codes

Thanks to LSI (Large Scale Integration), a single microprocessor and a support chip or two can provide a complete digital encoding and decoding system. With the new-technology controlling squelch, it's now possible to limit access to desired stations only. And a mere five-digit code group provides 100,000 access-code combinations.

What kind of non-commercial communications needs that kind of privacy? Beats me—but Kenwood now builds it into their amateur-band two-meter and 70-centimeter mobile and hand-held transceivers.

Typical microprocessor-controlled communications equipment these days usually has some kind of special readout and controls, or an interface for a personal computer. The Kenwood equipment can work with an optional display, use of which is discussed below.

The access code

The Kenwood DCS (Digital Code Squelch) is triggered by a signal composed as shown in Fig. 1. At the instant the transmitter's PTT switch is pressed, the transmitter sends a digital control signal consisting of a synchronizing signal, a 5-digit access code, several spare bits reserved for future use, and an ASCII representation of the user's call-sign. All that happens in less than 200 ms. The transmitter automatically withholds audio modulation until the control signal has been sent.

At the receiver, the five-digit code is passed on to the digital squelch. If the squelch is programmed to accept that code, it opens; otherwise it remains closed. If the listener wants to wait for transmission from a specific station, he simply punches that station's five-digit code into his keypad.

A flow chart that illustrates how the squelch circuit works is shown in Fig. 2. There's really nothing special about that circuit; what is interesting is that micro-miniaturation makes it commercially viable.

However, the way the transceiver handles the ASCII call-sign is interesting. An optional accessory for the digital squelch transceivers is a device called a "Call Sign Display." It has an LCD readout and 20 memories. What continued on page 83
VHF service channels with the aircraft, performance receiver R-5000. The highest performance receiver here is the Kenwood R-5000. This all-band, all mode receiver has superior interference reduction circuits, and has been designed with the highest performance standards in mind. Listen to foreign music, news, and commentary. Tune in local police, fire, aircraft, weather, and other public service channels with the VC-20 VHF converter. All this excitement and more is yours with a Kenwood R-5000 receiver!

- Covers 100 kHz-30 MHz in 30 bands, with additional coverage from 108-174 MHz (with VC-20 converter installed).
- Superior dynamic range. Exclusive Kenwood DynaMix™ system ensures an honest 102 dB dynamic range (14 MHz, 500 Hz bandwidth, 50 kHz spacing).

R-5000 High performance receiver

THE high performance receiver is here from the leader in communications technology—the Kenwood R-5000. This all-band, all mode receiver has superior interference reduction circuits, and has been designed with the highest performance standards in mind. Listen to foreign music, news, and commentary. Tune in local police, fire, aircraft, weather, and other public service channels with the VC-20 VHF converter. All this excitement and more is yours with a Kenwood R-5000 receiver!

- Covers 100 kHz-30 MHz in 30 bands, with additional coverage from 108-174 MHz (with VC-20 converter installed).

CIRCLE 102 ON FREE INFORMATION CARD
called a Negatron, had a negative resistance characteristic, making it useful as an oscillator.

Early receivers

The first sets that made use of tubes were actually hybrids. One such receiver is shown in Fig. 7. That set uses a crystal detector, but follows it with a tube-amplifier stage. Since that increases the volume at the headphones, more selective tuning schemes can be used.

With amplification, one volume problem was solved, but another was created: too much volume. To control volume, a rheostat is placed in series with the filament and its voltage supply. See Fig. 8.

Another circuit variation was the early heterodyne receiver designed by Fessenden. Shown in Fig. 9, in that receiver the incoming signal was mixed with one generated locally, resulting in a difference or beat frequency that was detected by the diode.

The local signal was generated by an arc connected to the 110-volt lines. The sparking of the arc produced a signal that could be tuned by L4 and C1.

---

**EARLY RADIO**

continued from page 62

---

Fig. 9—An early heterodyne receiver. Designed by Fessenden, it used a tuned electric arc as the local oscillator.

The change to tubes also brought about other changes. Crystal sets were breadboard affairs. But when tubes came along, they brought with them a host of controls.

Variable capacitors, resistors, and inductors needed to be mounted somewhere, so front panels were introduced. Later, the receivers were completely enclosed in cabinets. Before long, the receiver came to resemble the units that are now so familiar.

**HOME SECURITY SYSTEMS**

Deluxe Wireless For Home, Apartment, Offices, Mobile Homes

FEATURES

- Main Module/Receiver is capable of telling what kind of alarm is triggered: Intrusion, fire, maintenance, medical emergency, etc., and where the alarm is originated. 5 zones designated by the user
- This system can only be activated or deactivated by entering a 3 to 10 digit Secret Code selected by the user
- In case of emergency, the built-in siren speaker and the Remote Keen can be triggered instantly by pressing the "EMERGENCY" key
- Adjustable Exit Delay time allows the user to deactivate the system when he/she enters the protected premise
- Built-in Window Reminder LED reminds the user if any or all windows are left open
- Once triggered, the system will emit an ear-piercing sound for five minutes before it resets itself to continue providing protection
- 5 sets of Wireless Magnetic Sensors/Transmitters are included to detect any door or window opening
- When the battery in the Main Module is low, the BATTERY LOW indicator light will light up to remind the user of low battery condition
- The Main Module is DC powered with AC adapter provided and backed up by six 1.5V AA cells
- The Magnetic Sensor/Transmitter is powered by a 9 Volt battery
- System is expandable with the following options:
  - Remote Wireless Siren Speaker to be turned on or off remotely by the Main Module
  - Wireless Panic Switch capable of activating the alarm instantly at the push of a button

- Accuracy +/- 5 percent on dead carrier

We have a national factory warranty service on many brands, and we service all CB, Amateur, and Commercial Equipment.

THE LOWEST PRICES IN THE COUNTRY!
the call-sign of anyone who tried to reach the station. Another option is an internal alarm, which sounds only when a suitably encoded signal has been received.

(for those of you who were pioneers—so to speak—in RTTY using the surplus equipment of the late 1940's and '50's, many of the functions provided by the digital "privatization" of communications sounds very familiar. Back when we were into RTTY using teletypewriters so generously donated to the amateur fraternity, one of the features we all stroved to build and install allowed other RTY'ers to "call in" and leave a message when we weren't home. Back then, getting unattended operation to work was quite an achievement, and even today, it still is.)

As you can see, digital squelch does provide the amateur with full privacy, even more so than many conventional VHF/UHF rigs. The operator can actually limit not only the stations he is willing to "work," but also those he is willing to hear. He need not even know that the world outside his select group exists. But that isn't what amateur radio is all about.

**Communications Corner**

*continued from page 80*

the device does is extract and display the ASCII call-sign from the digital control signal. So even before the user hears the caller's voice he knows the call-sign.

Alternately, the user can leave the receiver on and unattended. The call-sign of any suitably encoded signal that is received will be stored in one of the 20 memories. When the user returns to his shack, he can "flip" through those memories; the display will show
9-volt battery is secured to the side of the case with a metallic battery clip. Your
completed PC board should appear as in Fig. 5.

Usage hints

Set S1 for short or open depending on the condition to be tested. Then connect
the test leads across the circuit to be tested. If an intermittent condition is detected, the LED will illuminate, and the buzzer will sound (if S4 is on). If you don’t remove the test leads (assuming if S2 is set for autorange), the LED will flash and the audio will warble at a rate determined by the reset circuit.

It is very important that the test leads make a positive connection with the circuit to be tested. In fact, clips should be used rather than test probes. The detector circuit is so sensitive that, when it is initially connected across a long length of parallel wires, it may latch due to capacitance between the wires. If that occurs, simply press reset switch S3.

FIG. 5—THE ASSEMBLED PC BOARD reveals the low parts-count and easy assembly of the continuity tester.

70 Series Digital Multimeters

3½ digit multimeters combine a 3200 count LCD display with an analog bar graph for quick visual checks of continuity, peaking, nulling and trends. The unparalleled operating ease, instant autoranging and 2,000 - hour battery life make this a lot of meter for the price. 3 year warranty.

**THE NEW 65/9028 VT ANSI VIDEO TERMINAL BOARD!**

* FROM LINGER ENTERPRISES *

A second generation, low cost, high performance, mini sized, single board for making your own RS232 Video Terminal. Use as a computer console or with a MODEM for hook up to any of the telephone-line computer services.

**FEATURES:**

- Uses the new SMC 9028 Video Controller Chip coupled with a 6502A CPU.
- RS-232 at 16 Baud Rates from 50 to 1200.
- On board printer port!
- 24 X 80 format (50/60 Hz).
- 15.750 Hz (Horizontal) monitors.
- 3 Terminal Modes: H-19, ADMA, and ANSI X-3.64-1979
- Wide and thin-line graphics.
- White characters on black background or reversed.
- Character Attributes: De-inten, Inverse or Underline.
- Low Power: 5VDC @ 7A. 12VDC @ 20mA.
- Mini size: 6.5 X 5 inches.
- Composite or split video.
- Graphical underline or reverse.

DO IT YOURSELF TV REPAIR

NEW...repair any TV...easy. Retired serviceman reveals secrets. Write, RESEARCH, R13, Box 601BR, Colville, WA 99111.
Open up the world of Closed Captions!

Many TV programs carry specially encoded signals to provide captions that allow hearing-impaired people to follow dialogue & narration! Educators find captions improve reading skills!

The DSE Supertext 1C is a low-cost alternative to the more expensive NCI Telecaption II. Using the same decoding technology (under license from NCI), the Supertext 1C offers superior performance (displays crisp white text in a block-back ground box, and easy operation. Cost complexity is minimized by eliminating the tuner & remote control features of the expensive NCI II). The Supertext 1C connects to any video output of newer model TV's or VCR's or component TV tuners (an IF modulator for direct antenna connection is optional) to provide two separate captioning channels as well as full-screen text services. (A fifth "channel" bypasses all captions & text to display the regular TV image without disconnecting the decoder.) All captions & power are controlled by a single front-panel knob. The test channels include program listings of upcoming captioned broadcasts.

**Supertext TC**

**TELETEXT Decoder Kit**

Cat K-6534

$199

**NEW!**

**Teletext Intro-Red Remote Control Upgrade to wireless* remote Cat K-3425**

**Get the latest scores, weather, & stock prices as much as 9 hours before they appear! Easy-to-build kit features pre-adjusted, precision-tuned module & 21-button wired remote. You get: TV, Teletext, Teleast, & T-5250 models. All without user feed.**

**Turn your old TV into an Oscilloscope.**

Don't let that old 8-B-W get gather dust in your attic... with this remarkable kit you can turn it into a 10kHz to 300kHz oscilloscope. Good display for audio applications makes it perfect for 8-B-W applications, and the large screen size provides a dramatic display. The non-technical user can show off fancy displays, promotions, etc. If you can't afford a regular scope, this could be the kit for you.

The kit comes with direct audio-video output connections (Channel 5/6 IF modulator & 6042, $9.95), optional. Power your own scope (on an AC adapter not included). M-9514, $9.95 is ideal or use a 9V battery ($3.289 per, $9.95 also optional).

**What? You can't bend steel in your bare hands?**

Now you can form boxes, covers, trays, & more with this versatile, compact brake. Makes clean, smooth bends up to 90° in metals up to 16 gauge thickness & 14" wide. Adjustments for stock thickness, sharpness of bends, & accuracy are quick & easy. This makes an ideal gift to assure a lifetime of trouble-free service, ideal for one-shot or production runs. Great fun for the do-it-yourselfer or hobbyist.

Shipping weight 4 lbs.

Little Giant Brake

Cat T-5250

$29.95

**NEW!**

**Made In USA**

C clamps not included.

**DSE's RDF rates outstanding technical reviews!**

After spending considerable time playing with the RDF, I have a lot of confidence in it... if you are considering an FM RDF for the lower end, the Dick Smith RDF is certainly worth looking at. When you consider that similar commercial items that cost as much as $500-600, it seems to be a good value at $100.

Bruce Williams, W5B/NV. CST Aug 86

- 12V Operation @ 50-500 MHz
- Internal alignment reference & 170-cd display
- Strobe digital circuitry
- Autorange external monitor switch
- Self aligning commutating filter

**2 Meter Operation?**

Use four whip antennas (D-4205, $16.50 each).

**Radio Direction Finder Kit**

Cat K-6535

$99.95

**Radio at a Base Station?**

Use 12 Volt 1.2A power supply (M-9530, $14.95 each)
**RETURN WITH US NOW TO THOSE THRILLING DAYS OF YESTERYEAR!**

What could be more reminiscent of yesterday's electronics than a 1920's wireless receiver? DSE has an exclusive selection (but limited supply) of genuine antique radio sets for builders & collectors.

DESCRAMBLER PARTS!

We stock the exact parts, PC board and AC adaptor for Radio Electronics February 1984 article on building your own Cable TV Descrambler.

#701 PARTS PACKAGE $29.95
Includes all the original resistors, capacitors, diodes, transistors, integrated circuits, coils, IF transformers (toko BKAN-K5552AXX).

#702 PC BOARD $12.95
Original etched & drilled silk-screened PC board used in the article.

#704 AC ADAPTOR $12.95
Original (14 volts DC @ 285ma) ac adaptor used in the article.

SPECIALS

BOTH #701 & #702 NOW $39

ALL THREE #701, #702 & #704 NOW $49
Add $2.50 shipping and handling — $4.50 for Canadian orders.
We also offer quantity discounts on 5 or more units.

FREE Reprint of Radio Electronics article (February 1984) on Building Your Own CABLE TV DESCRAMBLER with any purchase of above.

60-CHANNEL CABLE CONVERTER WITH INFRARED REMOTE CONTROL $69.95
SC-60R CONVERTER
Thousands of these converters sold nationally for $119.95.
We offer you this same type of converter for only $69.95.
All converters are NEW, with Full manufacturer's WARRANTY.

FEATURES
- Full 60 Channel Capability
- Cordless Infrared remote control
- Ultra-Stable Synthesized tuning
- Microprocessor controlled PLL
- Works on all TV models, channel 3 output
- Standard/HRC Switch for compatibility with all Cable Systems
- Will work with all types of external descramblers
Add $3.50 Shipping and Handling
$4.50 on Canadian Orders

**THE NAME YOU CAN TRUST IN ELECTRONIC TEST EQUIPMENT**

**0-18V 3A Power Supply**
- Regulated outputs — constant volt or constant current, both are continuously variable
- Can be connected in series or parallel for more voltage or current output
- Reverse polarity and overload protected
- Isolated output. For detailed specifications call for a complete Tenma catalog

#72-420
$99.95 (ea.)

**120MHz Frequency Counter**
- Eight digit LED display
- Measurement range: 1Hz-120MHz
- High input sensitivity of 20mV RMS

#72-375
$189.95 (ea.)

**Resistance Selector Box**
- Quickly substitute any resistor in a circuit from 10µh to over 110Mohm, up to 3½ watt
- All resistors are ±3% tolerance
- Dimensions: 4½” (W) x 6” (H) x 1” (D)

#72-405
$28.50 (ea.)

**Digital LCR Meter**
- Measures inductance, capacitance and resistance
- Dimensions: 1½µH-200µH, 1µH-2000µH
- Carrying case included
- For detailed specifications call for a complete Tenma catalog

#72-370
$149.95 (ea.)

**20MHz Dual Trace Oscilloscope**
- Two high quality 10:1 probes included
- For detailed specifications call for a complete Tenma catalog

#72-320
**SPECIAL!**
$349.95 (ea.)

**4½” Digit Multimeter**
- True RMS AC voltage and current functions
- Built-in frequency counter, 20kHz and 200kHz range
- Data hold feature
- Measures AC & DC voltage/current, resistance and frequency
- Carrying case included

#72-430
$169.80 (ea.)

**Be Sure To Call For Your FREE Catalog! Over 6,000 Items!**

We also have a full line of test equipment, computer accessories, telephone accessories, speakers, television parts, flybacks, yokes, switches, fuses, lamps, capacitors, resistors, cartridges, styli, wire, CATV equipment, the largest selection of original Japanese semiconductors in the country and more.

NEW PRODUCTS!

**DISK DRIVE SALE!**

- **MP52S** Double-sided 48P... IBM PC/XT Compatible... $89.95
- **TM100-4** Double-sided 96T... QUAD Drive... $59.95

**ZUCKERBOARD**

- Expansion Memory Half-CARD for IBM PC-XT, Portable, Tandy 1200 and Compatible Computers
- Expand your computer to its full capacity of 64K. In addition to 16K memory chips (4164); 256K memory chips (4146).
- $59.95
- EM-D IBM Disk and Printer Software... $39.95

**IBM COMPATIBLE ACCESSORIES**

- **83-KEY KEYBOARD**
- **SALE** $29.95
- Build an IBM PC/XT Compatible! IBM-64K(2) 64K RAM Chips... $24.95
- KB-83 83-Key Keyboard... $29.95
- IBM-FCC Floppy Controller Card... $49.95
- IBM-Case Case... $49.95
- IBM-MCC Monochrome Card... $79.95
- IBM-PS Power Supply... $79.95
- F05SB Disk Drive... $119.95
- IBM-MON Monochrome Monitor... $99.95
- IBM-MB Multifunction Board... $139.95
- Regular List $674.55
- IBM "Special (incl. 9% sales tax)... $599.95

**Additional Add-Ons Available!**
- IBM-KB 83-Key Keyboard... $69.95
- IBM-ENH Enhanced Keyboard... $99.95
- IBM-KCB Integrated Color Board... $99.95
- IBM-EQA Emily Graphics 256K RAM... $299.95
- IBM-20MBK 20MB Hard Disk Drive... $499.95

**Universal 64K/256K NEW! Printer Buffer**

The BUFFER Universal Printer Buffer is a hi-speed data box, for that supports data at a high rate and passes this data to your printer. You have valuable computer time. The BUFFER can connect to practically any printer or printer. There are four possible combinations: 1) Serial to Serial; 2) Serial to Parallel; 3) Parallel to Parallel; 4) Parallel to Serial. Minimum included sizes: 3.5" x 3.5", 4.4" x 5.5".

- **UBUFFER-64K**... $199.95
- **UBUFFER-256K**... $229.95

**IBM Compatible!**

- **DISK DRIVES** Completely Assembled
- **F55B** Teac 5" DS 1/2 Height... $129.95
- **F5455** Shugart 5" DS 1/2 Height... $199.95
- **T1100-2** Tandon 5" DS Full Height... $109.95

**JMR 5¼" DISK DRIVE ENCLOSEMENTS**

Comes with power cord, fuseholder and connectors.

- **D1-FH** Hynix 1 Full Height 5¼" floppy drive... $69.95
- **D2-HH** Hynix 2 Full Height 5¼" floppy drives... $79.95
- **D2-2HH** Hynix 2 Full Height 5¼" floppy drives... $119.95

**MONO!**

13" Color Composite Monitor for VIC-20 and C-64

- Now also compatible with other computers with composite output (i.e. Apple II, II+, etc.)
- Ideal for color graphics and images
- Resolution: 256 x 160, Interlace: 8 to 16 dots per character...
- $129.95 each or $2/219.95
- RCA-2-DIN (Universal Computer to Monitor Cables for Atari, Commodore, etc.)... $3.49

**MUFFIN/SPIRTE-STYLE FANS**

- MF600 (5060-125-2625)... $9.95
- MF600 (5060-125-2625)... $9.95
- SU27C... $9.95
- Switch 1/3 (18 steps)...

**DATA BOOKS**

- **30003** National Linear Data Book (81)... $14.95
- **30009** Zilog Data Book (56)... $5.95
- **30132** National Linear Supplement (84)... $4.95
- **21083** Intel Memory Handbook (86)... $17.95
- **21084** Intel Microprocessor Data Book (86)... $24.95

For New Ideas In Electronics read Radio-Electronics every month.

During the next 12 months
Radio-Electronics will carry up to the minute articles on:
- Computers
- Video
- Solid-state technology
- Outstanding construction projects
- Satellite TV
- Telephones
- Radio
- Stereo
- Equipment
- Reports
- Test equipment
- VCR's
- Repairing
- Industrial electronics

NEW IDEAS AND INNOVATIONS IN ELECTRONICS APPEAR IN EVERY ISSUE OF RADIO-ELECTRONICS

An electronics revolution is in the making, but you don't have to wait until 2001 to find out how it will change your life in the 21st century. Radio-Electronics will forecast the coming changes and how they will affect you in the May 1987 issue!

Created by a special editorial task force—two years in preparation—20C1, takes you into the research laboratories of Westinghouse, Texas Instruments, Ford and Bell Labs where the future is being invented today!

You'll get an advance look at what's coming in artificial intelligence...new cars and highways (cleaner, quieter and more efficient)...futuristic energy sources like magneto-hydrodynamic and particle-beam generators...personal communications systems that will give you instant access to anyone anywhere...super computers and teaching breakthroughs that will multiply your capacity to learn!

Arthur Clarke introduces 2001. Isaac Asimov explores the marvels of robotics. But it is not science fiction. Rather it is emerging technology with a solid foundation in current research and development.

And its impact will be enormous. It will change the way you work...the way you think...the way you live!

2001 is the kind of special publishing event that can only happen once in any magazine's lifetime and it will happen to Radio-Electronics in May, 1987.

With extra features and extra pages, 2001 will bear a premium cover cost, but you can reserve your copy now at less than the regular cover cost by mailing any one of the subscription orders in this issue.

2001 is coming in May. Make sure now that you don't miss it!
BP Video Processor gives you precision picture control.

You'll get 5 units in one! The BP Video Processor functions as a Stabilizer to end video guard distort...as an Enhancer to provide peak sharpness...as an RF Converter to feed signals from video cameras, computer or VCR in your TV...as a Video Fader for professional fade-in and fade-out effects...and as a Dual Output Distribution Amplifier to send TV signals to other sets.
