MARCH, 1954

FRONT COVER: NATIONAL IRE CONVENTION—For the many thousands of engineers who will come to New York City for the annual IRE Convention, March 22-25, the map should be a helpful guide. The detailed subway stations are of particular interest this year because the exhibition is being held in the Kingsbridge Armory for the first time. For a preview of the convention, see page 72.

TELE-TECH'S CIRCULATION, 21,000

Because of increases in circulation which obviously cannot be shown in current audited statements, advertisers should disregard any comparison based on a previous period or any that fails to show TELE-TECH's guaranteed circulation of 21,000.

A New Level in Engineering is Achieved in the Functional Design of Toroidal Decades*

This unique development permitting precision toroids to be combined in decade steps of inductance will appeal to all engineers who are familiar with the disadvantages of the ordinary type of inductance decade box.

All the decade units in the plug-in decade series are higher Q toroids such as are employed in the Burnell attenuation filters. They are guaranteed to a tolerance of 1% of the marked inductance and have extremely good stability of inductance vs. voltage and temperature.

PLUG-IN DECADE COILS CAN ALSO BE DESIGNED WITH SPECIAL CHARACTERISTICS FOR SLIGHT EXTRA CHARGE. UNITS GENERALLY AVAILABLE FROM STOCK ARE AS FOLLOWS:

OTHER RECENT *Burnell* ACHIEVEMENTS IN TOROIDS AND FILTER NETWORKS

SIDE BAND FILTERS

Our most recent engineering development in communications filters has already stirred the interest of the leading receiver manufacturers in the country.

The new side band filters which eliminate, for most applications, the necessity for expensive crystal filters are expected to accelerate the advancement of single side band communications.

MINIATURE TELEMETERING FILTERS

In recognizing the need for miniaturization of the presently bulky telemetering equipment, our engineering staff has succeeded in reducing the size of telemetering filters to as little as 25 to 50% of the original volume.

SUB MINIATURE TOROIDS

Toroids for intermediate frequencies of 100KC to 1 megacycle. A wide variety of coils ranging in size from $\frac{5}{8}$ inch provides high Q in the frequency range between audio and RF.

The tiny toroid about the size of a dime has been welcomed by designers of sub miniature electronic equipment for the transistor, guided missile and printed circuit field.

FILL ALL YOUR COLOR-TV TUBE NEEDS!

New G-E Receiving Tubes for Color!

Your first aim in designing your new color-TV chassis is quality reception. Your second aim is economy, so that the selling price may be—and remain—competitive. General Electric helps you reach both objectives by bringing you five new receiving tubes specially designed for color. Each of them does a particular job in a color receiver *better* . . . or, it replaces two or more standard tubes, saving you money.

G-E tube engineers at the I.R.E. Show will be glad to explain fully the circuit functions of the five new tubes. Still other types are on their way. Keep constantly in touch with General Electric for new, advanced tubes for color TV!

G-E TUBE SERVICE includes (1) special design and application help with your tube problems, (2) coast-to-coast tube warehousing for fast deliveries to your plant, (3) same-day processing of your tube orders, (4) local-laboratory help in checking your circuit performance. Top service to manufacturer-users is an important chapter of the General Electric tube story!

1 Time delay relay with

**430
variations!**

Here is the Edison Time Delay Relay, Model 501. There are now 430 different variations of this standard model—half of which are in stock and available for immediate delivery!

The reason there are so many variations of the Edison Time Delay Relay is because of Edison's policy to give customers the *exact* kind of relay to meet each application.

The experience and know-how of eight years in the design and manufacture of time delay relays makes this Edison policy possible.

Investigate Edison's ability to meet your requirements. Select to your certain satisfaction the *exact* time delay relay from the widest range presently available. Profit

from the resulting reduction of engineering time.

CHECK THESE ADVANTAGES:

- Time Delays from 2 seconds to 300 seconds.
- Ambient compensated from -60 to $+85^{\circ}$ C.
- Heater Voltages from 2.5 to 130 V. AC or DC.
- Meets aircraft vibration and shock requirements.
- Timing is calibrated after sealing for greatest accuracy and production uniformity.

TELE TECH & ELECTRONIC INDUSTRIES is edited for top-level engineers and executives throughout the electronic industries. It gives the busy engineering executive authoritative information and interpretation of the latest developments and new products, with emphasis on subjects of engineering import and timeliness. Special attention is given to:

MANUFACTURING

- Electronic equipment, communications, broadcasting, microwave relay, instrumentation, telemetering, computing.
- Military equipment including radar, sonar, guided missiles, fire controls.
- TV FM-AM receivers, phonographs, recorders, reproducers.

OPERATION

- Fixed, mobile and airborne communications in commercial, municipal, aviation and government services.
- Broadcasting, video and audio recording, records, audio and sound systems, motion picture production.
- Military, civilian and scientific electronic computing and control systems.

Midland

FREQUENCY CONTROL CRYSTALS

for **COLO**R television

Color television brings a new set of critical demands for precision frequency control. Accuracy, stability and uniformity of crystals used in this application must be as nearly perfect as materials, methods, and quality controls can make them.

Midland meets this demand not only with a crystal of complete reliability in this new field, but also with a solid background of pioneering in the development of frequency control crystals and circuits for this and many other exacting applications.

Midland is prepared NOW to supply you in quantity with Color TV Crystals to meet your exact specifications, and to counsel on all matters concerned with this subject.

SEE OUR EXHIBIT in Booth No. 143
Radio Engineering Show, March 22-25.
Kingsbridge Armory, New York City.

WORLD'S LARGEST PRODUCER OF QUARTZ CRYSTALS

ARNOLD MAGNETIC MATERIALS

TYPES "C" AND "E" CUT CORES

Arnold "C" and "E" Cores are made from precision rolled Silectron strip (highly oriented silicon steel) in 1, 2, 4 or 12-mil thicknesses and a wide variety of window sizes and core areas, for high and low-frequency applications. Sizes range up to 10 lbs. in 12-mil strip, and from fractions of an ounce to hundreds of pounds in the thinner gauges. Cores wound from ultra-thin strip (down to 1/4 mil or less) can also be supplied.

Insulated strip of the proper width is wound

on a mandrel, then heat treated, bonded and cut into halves. Careful control results in accurately dimensioned and matched core halves whose effective air gap at the butt joint is very small.

In 3-phase applications, the use of "E" Cores provides weight and size reduction, as well as higher efficiency and possible cost savings. Rigid standard tests are employed for both "C" and "E" types of cores, and special tests where required.

TAPE WOUND CORES

Depending upon the specific properties required, Arnold Tape Wound Cores are available made of Deltamax, 4-79 Mo-Permalloy, Supermalloy, Mumetal, 4750 Electrical Metal, or Silectron . . . in standard tape thicknesses of 1, 2, 4 or 12-mils, and in ultra-thin gauges of 1/2 and 1/4-mil where required.

Practically any size core can be supplied, from a fraction of a gram to hundreds of pounds. Toroidal cores are made in 22 stand-

ard sizes with protective nylon cases. Special sizes of toroidal cores, and all square or rectangular Tape Wound Cores, are manufactured to meet individual requirements.

Used for magnetic amplifiers, pulse transformers, current transformers, wide-band transformers, non-linear retard coils, peaking strips, reactors, etc., this gapless type of core construction results in maximum effective working permeability with minimum flux leakage.

MOLY-PERMALLOY POWDER CORES

For use in loading coils, filters, broadband carrier systems and networks, for frequencies up to 200 kc, these Toroids provide high Q in a small volume, and are characterized by low eddy current and hysteresis losses.

Arnold Powder Cores are supplied in four standard permeabilities: 125, 60, 26 and 14 Mu. They provide constant permeability over a wide range of flux density. The 125 Mu cores are recommended for use up to 15 kc; the 60 Mu at 10 to 50 kc; the 26 Mu at 30 to

75 kc; and the 14 Mu at 50 to 200 kc. Many of these cores may be furnished stabilized to provide constant permeability ($\pm 0.1\%$) over a specific temperature range.

These Moly Permalloy Powder Toroids are available in a wide range of sizes, to obtain nominal inductances as high as 281 mh/1000 turns. They are given various types of enamel and varnish finishes, some of which permit winding with heavy Formex insulated wire without supplementary insulation over the core.

ALNICO MAGNETS

Arnold manufactures permanent magnets from all grades of Alnico, although Alnico V is usually the preferred type due to the high value of energy product of that alloy. Alnico Magnets are quite hard and somewhat brittle and may be machined only by grinding. Most sizes and shapes are manufactured as sand

castings and are made to the customer's drawings and specifications. Some types and shapes of Alnico Magnets are carried as stock items.

Some small sizes of magnets may be furnished in sintered Alnico, but special shapes made in this way require rather expensive dies.

Stock sizes of all the products above are listed in Catalog GC-106. Write for your copy . . . but if you're attending the IRE show this year, see us at Booth 148.

THE
AMPHENOL *Qwik*
MICROPHONE CONNECTORS

AMPHENOL proudly presents the new QWIK microphone connectors! Designed by one of America's leading industrial designers in cooperation with the skilled engineers of AMPHENOL, here at last are microphone connectors with the beauty and the efficiency to complement every microphone, in any setting!

In both mechanical and aesthetic considerations the new QWIKs are unique. They have an ingenious release device which is both extremely easy to operate and very efficient. Disconnection for either male or female connectors is made by simply sliding a button forward with a slight pressure of the thumb. For insertion, the QWIK is gently clicked in.

**MODERN
DESIGN**
MICROPHONE CONNECTORS

The finish of the new QWIKs is an attractive corrosion-resistant satin nickel—the body is a sturdy zinc alloy. They incorporate the famous 1-501 blue dielectric material, the same used on all AMPHENOL AN connectors. Contacts are gold-plated over a silver finished high conductivity bronze.

QWIKs are available, either male or female, with three or four contacts. The possibilities of their applications are such that you will want to see and study them as soon as possible.

fastest connect and disconnect with Blue Ribbon Connectors

PRECISION MADE COMPONENTS FOR THE ELECTRONICS INDUSTRY

AMPHENOL makes over 11,000 separate cataloged components that are used and relied upon by the electronics industry the free world over. These components include the famous AN connectors, RF connectors, cables and many special types of sockets, plugs and connectors. Their applications vary, but the distinguishing feature of all AMPHENOL components is present in each: *quality*.

The quality that is the mark of AMPHENOL components is the product of both precision engineering and precision manufacturing. Neither of these would result in quality alone. But the teamwork of the two produces the finest components available—the electronics industry has learned to rely upon AMPHENOL quality.

Not only the components on this page but thousands more are listed in the new AMPHENOL Catalog B-3. From the B-3 you will be able to fill the majority of your component needs. Where more specialized information is desired, the B-3 also lists the special AMPHENOL catalogs, A, C and D, as well as other product literature.

Mallory Capacitors

for printed

circuit

applications

Mallory FP Electrolytic Capacitors are now available in a construction that is specifically designed for printed electronic circuits. Their mounting prongs and terminals have been adapted for quick, fool-proof production line assembly.

- 1 Prongs and terminals are smaller . . . take less space . . . hold securely with a small amount of solder. No need for large copper areas in the printed chassis.
- 2 Self-positioning. One mounting prong is wider. The capacitor can fit only in its correct position.
- 3 Shoulders on prongs hold capacitor clear of chassis, permitting use of printed circuitry on both sides.
- 4 Prongs can be automatically spread on insertion by simple jig, insuring strong mechanical mounting prior to soldering.
- 5 Positive soldering. Aluminum risers do not extend through chassis. No danger of contaminating solder.

These refinements of design are one more step in the capacitor developments which Mallory has pioneered, and which have made Mallory FP Capacitors the leader in their field. Write or call us for detailed literature, or for engineering service on your capacitor problems by one of our field specialists.

Expect more . . . Get more from **MALLORY**

★ Parts distributors in all major cities stock Mallory standard components for your convenience.

Serving Industry with These Products:

Electromechanical—Resistors • Switches • Television Tuners • Vibrators

STACKPOLE Fixed RESISTORS

... dependable, easy-to-solder molded composition types

Stackpole 1/2-, 1- and 2-watt resistors not only meet exacting performance standards, but save assembly time thanks to their highly-tinned, easily-soldered leads.

JAN-R-11 TYPES—in styles RC10, RC20, RC21, RC30, RC31, RC41, and RC42 available.
Write for JAN Resistor Bulletin J-2.

STACKPOLE Variable RESISTORS

with versatile switching

Single, ganged and concentric shaft dual types in smallest sizes consistent with real dependability offer long, and trouble-free performance for today's requirements. Gold plated "ring spring" contactors assure low noise level. A complete array of unique midget line switches offers practically any desired switching arrangement, with types for both civilian and military use.

New!

Cost-saver bushingless controls

Similar to standard Stackpole LR-2 controls except that a plate with sturdy mounting lugs replaces the conventional threaded brass bushing for easier assembly.

... A dependable source of reliable components for over 30 years

STACKPOLE Composition CAPACITORS

Cost-saving, low-value, fixed types

Originated by Stackpole, these tiny units not only represent the simplest, most inexpensive capacitor design yet produced—but likewise have characteristics that make them more desirable than larger, more costly capacitors for many uses. 47 standard types, 0.1 to 10.0 mmf. Write for Stackpole GA Capacitor Bulletin.

STACKPOLE Iron CORES

... to match any electrical or mechanical specification
Pioneers in modern iron core development, Stackpole offers practically any desired style and with assured uniformity of both electrical and mechanical characteristics.
Write for Iron Core Bulletin.

STACKPOLE
Ceramag® **CORES**
(Ferromagnetic)

for real uniformity! Wherever ferromagnetic cores are used, Stackpole Ceramag Cores have set the quality standards. But proved superiority in essential characteristics is only part of the story. Even more important is the fact that Stackpole Ceramag core characteristics are maintained with remarkable uniformity regardless of size, shape or production quantity. *The sample matches your specification "on the nose"—and each production unit is exactly like the sample!* Write for Ceramag Bulletin RC-9A including details on available grades and latest characteristic curves.

STACKPOLE
Molded **COIL FORMS**

Cut Assembly Costs!

You can reduce coil sizes and cut assembly costs with simplified point-to-point wiring and fewer soldered connections with these Stackpole molded coil forms. Types available with iron core sections. Axial or "hairpin" leads. Write for Catalog RC-9.

STACKPOLE
Slide **SWITCHES**

... the economy switches of 1001 uses!

Over 20 types of these inexpensive little Stackpole slide switches cover just about every mechanical and electrical switching requirement for radio and television equipment, small motors, appliances, electrical toys, instruments, etc. For complete details, write for Stackpole Switch Bulletin RC-9B.

Engineering Samples are proof of the pudding!

Engineering samples of standard Stackpole components are available to quantity users. Send details of your requirement for recommendation by Stackpole engineers.

ELECTRONIC COMPONENTS DIVISION
STACKPOLE CARBON COMPANY, St. Marys, Pa.

STACKPOLE

MOLDED JACKET IS
 MOISTURE-RESISTANT
 VAPOR-RESISTANT
 AND INERT TO FILM!

FILMITE[®] "B"

DEPENDABLE BORO-CARBON RESISTORS

... IN 1/2, 1, AND 2 WATT RATINGS

Now for the first time you can obtain a superior yet relatively low cost film-type resistor for military electronic gear—resistors that not only meet the severe performance requirements of Military Specification MIL-R-10509A, but are capable of full wattage dissipation at 70°C ambient!

Sprague Type 4E, 5E, and 6E Filmite B resistors are housed in a dense molded jacket which not only provides unexcelled physical protection for the film resistance element but serves as a barrier to moisture and vapor, the twin enemies of all film-type resistors.

Boro-carbon films are unusually sensitive to moisture. Protection against moisture in any form is a primary requirement for successful long term stability of resistance. The low-loss phenolic housings on molded Filmite resistors not only shed water but are vapor resistant and inert to the film material. There

is minimum possibility of field failure through electrolytic action and penetration of moisture or vapor through the dense molded jacket.

Other features of molded Filmite B resistors are special low-contact-resistance, low noise end terminations held rigidly in place on special ceramic cores, extremely low temperature and voltage coefficients of resistance, and excellent load-life and high frequency characteristics.

For complete engineering data, write for Engineering Bulletin No. 130 to:

As We Go To Press...

COLOR TV TEMPO on RISE

While TV receiver manufacturers were busily occupied getting their production lines into shape for moderate color runs (early announced models were close to custom built), the spotlight turned on TV broadcasters and their equipment needs. So far, about 30 big city stations are equipped to rebroadcast color programs fed by the networks. RCA is continuing to push production of color cameras and monitoring equipment.

General Electric has signed a patent license agreement with CBS, granting GE the right to manufacture and sell color TV apparatus developed by CBS. GE is converting standard black-and-white cameras to field-sequential color for \$6,000 each. The Chromacoder, which translates field-sequential to compatible NTSC signals, and can be used with any number of cameras, will sell for about \$40,000. Such changes are reported to exact a saving over three-tube cameras. Total studio conversion necessary to permit rebroadcast of network color shows, and origination of local color slide and film shows, is expected to cost \$82,000.

In addition to a CBS order for GE to deliver four cameras before March 1, CBS has also placed a million dollar order with RCA, and the first two of 12 cameras are to be delivered in

Single-tube color TV camera (l) made by GE under CBS license. Three-tube camera at right

All-glass 15-in. color picture tubes undergo beam current checks in life test racks at GE

February, with the remainder shipped by June. The same type of RCA cameras have been ordered by WKY, WPAP, WBEN, WTMJ, WCCO and KTLA. RCA also reports that substantial progress is being made in the development of a single pick-up tube to do the job of the three tubes used in present cameras.

CBS-Hytron is starting to step up production of its three-color tube, and is converting Newburyport, Mass., plant to color. GE and RCA are moving along with 15-inch planar shadow mask types. From several quarters, the need for larger sizes has been voiced. Along these lines, RCA's announcement of a 19-inch tricolor tube was warmly received, but they will not be available

until the latter half of 1954. Secret of the big tube lies in the gradation of hole size in the shadow mask toward the edge of the screen, as well as an improved electron gun assembly and deflection system. RCA is also pressing forward in research work for a brighter 21-inch tube using a focus mask, instead of a shadow mask.

Color "clinics" are springing up all over the country, most of them sponsored by large manufacturers or broadcasters.

Airtronic Research engineer has developed a rotating disc color converter, which he believes can be marketed for \$50 to \$100. At best, it is an interim device. One of its main drawbacks is high flicker.

Experimental Atomic Battery Revealed

An experimental model of a new type of battery which converts atomic energy directly into electrical energy has been revealed by RCA. In it, a radioactive source is coupled to a semiconducting crystal. Technical description is given on page 85.

FCC Rejects Petition for Manufacturers Radio

The FCC has denied the petition of the Committee on Manufacturers Radio Use for a separate radio service and allocation of 4 mc now occupied by the citizen's radio service.

In effect, the ruling rejects the establishment of point-to-point systems by manufacturers on the same basis as other industrial services, such as power and petroleum. The

Commission noted that the broader problem of the extent to which private microwave systems will be permitted is now under study.

Japan Cuts Television Imports

Prohibition of TV receiver import, except for experimental use, is planned for Japan. The move to conserve foreign currency by the Ministry of International Trade and Industry is accompanied by plans to encourage, through tax exemption, mass production of a popular 10-in. set for 50,000 yen (about 360 yen per dollar), which is half of the current price. Domestic industry will also be assisted by loans of 330 million yen, and research subsidies of 43 million yen. To date, some 14,000 foreign made TV sets have been imported.

BELL REPEATERS TESTED

Specialists at Bell Labs test interstage network to go into repeaters of first transatlantic telephone cable. Overall cable diameter is 1.25 in., and repeaters 1.5 in. It will take three years to complete, cost \$35,000,000

As We Go To Press . . . (Continued)

Forerunner of automatic assembly machine for electronic components, punch press controlled by digital computer is extremely versatile. Quick set-ups facilitate small lot production jobs

Computer Controls Punch Press

A punch press based on digital servo control has been developed by General Electric under a project sponsored by the Signal Corps. An opaque vinyl sheet acts as the memory card, and the photoelectric reader directs the computer, which in turn causes the press to position the work automatically. No template is needed, and 30 holes can be punched in one minute. The device is not primarily intended for large mass production runs. Rather, its high flexibility and rapid set-up allow design changes without the cost and excessive time of making a new

template, thus making it ideal for small lot jobs.

This device is part of a program to develop an Automatic Component Assembly System (ACAS). The first phase of ACAS, to be completed by mid-1954, will provide for automatic component placement on terminal boards, printed circuits, etc. The second phase, which should be ready by mid-1955, will perform automatic component preparation, such as bending leads and testing parts. At the present, electronic production techniques depend on manual handling of components.

PRINTED CIRCUIT TV SET TO BE PRODUCED

TV receiver (l) with printed circuit chassis. Note concealment of high voltage circuit. Remote control unit turns set on, adjusts volume, and changes channels. Fred Miller (r), Kaye-Halbert Ch. of Engineer, points to circuit etched on copper-phenolic plate

A mass produced all printed circuit chassis for receivers will soon be manufactured by the Kaye-Halbert

Corp. of Culver City, Calif. The chassis has been divided into nine major sections. Each of these major

sections is separately silk screened and etched on copper phenolic plates. These plates are then punched and proper components and tubes are placed in them. The entire plate is then dip-soldered. When all nine printed circuit sections have been sub-assembled and dip-soldered they can be snapped into a large phenolic frame which acts as the chassis holder. The sections are then connected with each other through a few conventional wire attachments. Ease of servicing is said to be improved. The new chassis will contain 27 tubes instead of the 23 now operating in current chassis.

FCC Proposes Licensing Fees

The FCC has proposed a schedule of fees to cover the cost of licensing and similar activities. All fees collected would be turned over to the U.S. Treasury. Comments will be received on or before April 1, 1954.

The contemplated fees include:

Major broadcast applications	\$ 325
Minor broadcast applications	50
Safety and Special Radio Services applications	10
Except Amateur, Disaster and Radio Amateur Civil Emergency Services applications	3
Experimental services applications	20
Type acceptance of equipment applications	100
Type approval of equipment applications filed under Part 18 of the rules	600
Applications for type approval covered by Parts 3, 8 or 19 of the rules	1,500
Commercial operator license applications (all)	3
Restricted radiotelephone operator permit applications	3
Compulsory ship inspection applications	30
Applications for telephone acquisitions, consolidations, etc.	350
Applications for construction or extension of telephone lines	150
Applications by common carriers for exemptions from Commission jurisdiction under Title II	150
All other common carrier applications (except those covered in fees for the Safety and Special Radio Services)	30

Engineers Study Upper Atmosphere

There are no April showers and no snow falls but there are definite seasonal trends where unceasing winds of super-gale force sweep far above the surface of the earth. Wind velocities as high as 175 miles per hour and temperatures of 80° F below zero have been recorded in the upper atmosphere by Signal Corps meteorological engineers at Fort Monmouth, N. J.

Weather balloons carrying equipment which collects and transmits information back to earth climbed to an altitude of 27 miles while the research was carried on by scientists at Evans Signal Laboratory, near Belmar, N.J. The laboratory is a few miles from the Atlantic shore.

"Tinkertoy" TV Set

The modular design of electronic components, developed in "Project Tinkertoy" (Nov. 1953 TELE-TECH & ELECTRONIC INDUSTRIES, page 70), is being applied to semi-automatic production facilities for

Replacing "rat's nest" wiring with compact modular component sections gives TV new look

radio and TV, as well as military equipment. Sanders Associates of Nashua, N.H., has come up with a TV receiver using these modules under the trade name "Reliacubes."

CAA Approves Selective Calling Equipment

The CAA has approved a newly developed tone-coded selective signaling system developed by Motorola. It is reportedly the first of its type to receive such certification. The system, known as airborne "Quik-Call," relieves pilots and radio operators of the fatiguing task of listening to all ground-to-air

Selective calling equipment for aircraft is demonstrated by Motorola V-P Daniel E. Noble

radio transmissions. Instead, any selected craft equipped with a decoder for each channel to be monitored may be alerted that a call is intended by means of a light or bell actuated by the code.

COMING EVENTS

- Mar. 15-19—NACE Tenth Annual Conference and Exhibition, Kansas City.
- March 22-25—IRE National Convention, Waldorf-Astoria Hotel and Kingsbridge Armory, New York, N. Y.
- March 30-April 8—62nd Royal Netherlands International Industries Fair, Utrecht, Holland
- April 2-3—Biennial Rice Exposition of Engineering Science and Arts, The Rice Institute, Houston, Texas.
- April 5-8—A.M.A. 23rd National Packaging Exposition, Convention Hall, Atlantic City, N.J.
- April 5-10—International Congress Soundtrack Recording, Paris, France.
- April 15-16—RETMA Engineering Department Conference on Reliability of Electrical Connectors, Illinois Institute of Technology, Chicago, Ill.
- April 19-20—Symposium on Automatic Production of Electronic Equipment, sponsored by Stanford Research Institute and U.S. Air Force, Fairmont Hotel, San Francisco, Calif.
- April 22-23—AIEE Conference on Feedback Control, Claridge Hotel, Atlantic City, N.J.
- April 22-23—Joint Meeting of Radio Technical Commission for Aeronautics, Franklin Inst. Labs., and IRE Professional Group on Aeronautical and Navigational Electronics, Franklin Institute, Philadelphia, Pa.
- April 22-28—RTCM Spring Assembly Meeting, St. Francis Hotel, San Francisco, Calif.
- April 26-29—1954 Metal Powder Show. Sponsored by Metal Powder Association, Drake Hotel, Chicago, Ill.
- April 24—Eighth Annual TV Conference, IRE Cincinnati Section, Cincinnati, Ohio.
- April 26-30—Tenth Biennial ASTE Industrial Exposition, Philadelphia Convention Center, Phila., Pa.
- April 27-29—AIEE Electronic Components Conference, Washington, D.C.
- May 3-6—URSI, U.S.A. National Committee and IRE Professional Group on Antennas and Propagation. Joint Spring Technical Meeting. National Bureau of Standards, Washington, D.C.
- May 4-6—1954 Electronics Components Symposium, RETMA and others, U.S. Department of Interior Auditorium, Washington, D.C.
- May 4-7—1954 AWS National Spring Technical Meeting, Hotel Statler, Buffalo, N.Y.
- May 4-9—SMPTE 75th Annual Meeting, Statler Hotel, Washington, D.C.
- May 5-7—Third International Aviation Trade Show, 71st Regiment Armory, New York, N.Y.
- May 5-7—IRE Seventh Region Conference and Electronic Exhibit, Multnomah Hotel, Portland, Ore.
- May 5-7—AIEE Northeastern District Meeting, Schenectady, N.Y.
- May 5-8—1954 Welding and Allied Industry Exposition, Memorial Auditorium, Buffalo, N.Y.
- May 7-8—IRE North Atlantic Region, New England Radio Engineering Meeting, Sheraton Plaza Hotel, Boston, Mass.
- May 7-9—AFCA National Convention, Shoreham Hotel, Washington, D.C.
- May 10-12—IRE National Conference on Airborne Electronics, Dayton Biltmore Hotel, Dayton, Ohio
- May 17-20—Basic Materials Exposition, International Amphitheatre, Chicago.
- May 17-20—1954 Electronic Parts Show, Conrad Hilton Hotel, Chicago, Ill.
- May 17-20—New York Import Show, 34th St. Armory, New York, N.Y.
- May 24-26—IRE, AIEE, IAS, ISA 1954 National Telemetering Conference, Hotel Morrison, Chicago, Ill.
- May 25-27—NARTB Convention Engineering Conference, Palmer House, Chicago, Ill.
- June 13-18—ASTM Annual Meeting, 11th Exhibit of Testing and Scientific Apparatus and Laboratory Supplies and Ninth Technical Photographic Exhibit, Sherman and Morrison Hotels, Chicago, Ill.
- June 15-17—RETMA Convention, Palmer House, Chicago, Ill.
- June 16-18—High Vacuum Symposium, Berkely Carteret Hotel, Asbury Park, N.J.
- June 21-25—AIEE Summer General and Pacific Meeting, Hotel Biltmore, Los Angeles, Calif.
- July 6-9—International Conference on Electron Microscopy, Joint Commission on Electron Microscopy of International Council of Scientific Unions, London, England
- July 8-12—Convention British Institution of Radio Engineers, Christ Church, Oxford, England.
- July 13-15—Plant Maintenance Show, Pan Pacific Auditorium, Los Angeles, Calif.
- Aug. 25-27—Western Electronic Show and Convention. Los Angeles and San Francisco IRE sections and WCEMA sponsored. (Show) Pan-Pacific Auditorium, Los Angeles. (Convention Hq.) Ambassador Hotel, Los Angeles, Calif.
- September—First International Scientific Radio Union, Amsterdam, Holland.
- Sept. 1-16—Golden Jubilee Meeting of the International Electrotechnical Commission, University of Pennsylvania, Philadelphia, Pa.
- Sept. 15-21—ISA First International Instrument Exposition, Convention Hall, Philadelphia, Pa.
- Sept. 30-Oct. 2—High Fidelity Show, International Sight and Sound Exposition, Inc., Palmer House, Chicago.

temperature & low voltage characteristics

N.U. UNION DIODES

FORWARD & REVERSE CHARACTERISTICS OVER CURRENT & VOLTAGE RANGES

FORWARD & REVERSE CHARACTERISTICS UNDER TEMPERATURE CHANGES

ACTUAL SIZE

Your inquiries are invited on the many uses of Union Diodes exclusive with National Union. You will find that Union Diodes have characteristics particularly useful to the circuit designer interested in small signal and pulse applications. For example, the turn-on and turn-off time of the 1N107 is equal or superior to most point-contact diodes.

The accompanying charts show the Union Diode's behavior with temperature variations. Also plotted, over wide ranges of voltage and current, are their forward and reverse characteristics.

Important to you is the fact that Union Diodes are produced by the electronics engineers who helped pioneer the original research and development leading to such devices.

NATIONAL UNION RADIO CORP.

HATBORO, PENNSYLVANIA

BOLTING VOICES TOGETHER

Adjusting casing over splice in polyethylene cable. Edges and ends are sealed with a new Butyl rubber compound that won't harden, dry out or lose adhesion even in extreme heat or cold.

More than ever, light, flexible polyethylene sheathed cable developed by Bell Telephone Laboratories is providing speedy answers to the demand for more telephone service.

But at thousands of splices, the sheath must be thoroughly sealed against moisture. Laboratories engineers developed a protective casing which is quickly and simply bolted in place. The edges and ends of the casing are *permanently* sealed with a new compound developed by Laboratories rubber chemists.

Now, economical polyethylene cable can be installed much faster and at lower cost. Here is another example of how Bell Laboratories continually finds ways to keep telephone service high in quality, while the cost stays low.

BETTER FOCUS

than any other 21" picture tubes

Set manufacturers recognize the inherent advantages of electrostatic picture tubes since they offer lower weight, use fewer components, and sets have lower assembly costs; yet, until now, picture quality was not as good as when electro-magnetic picture tubes were used.

Now Westinghouse offers the 21ALP4 and the 21ALP4A: these 90° deflection electrostatic tubes offer pictures with better focus and higher definition than their electro-magnetic counterparts. In the unretouched pictures above, notice the better corner resolution, higher definition, and better contrast in the electrostatic tube. Photographs were made under identical conditions with voltages as follows: $E_{B2} = 16$ kv; $E_{G2} = 300$ v; $E_F = 6.3$ v.

New Westinghouse 90° picture tubes have an added 13 square inches of picture area, a better aspect ratio, are 3" shorter which allows shorter cabinets or elimination of the hat.

These tubes offer good focus at voltages from 10 to 18 kv without distortion, less shift in focus voltage as beam current varies, and better fringe area reception. They are more stable under conditions where voltage variations are encountered due to home-current variations or to variations in components. These tubes are interchangeable in different receiver circuits due to their inherent stability.

Westinghouse invites your tests! Qualified set manufacturers are requested to write or call for sample tubes which may be tested in their own laboratories as desired. Call your nearest Westinghouse Electronic Tube Sales Office, or write to Dept. B-2034 at the address below.

These tubes offer set manufacturers clear, easily defined sales advantages. Check now for further information.

This chart illustrates the ability of the new Hall gun to maintain sharp definition despite changes in beam current — relating center resolution to beam current over a range of anode voltages.

**C-A-C
MOLDED TOROIDS**

Stocked in Standard Inductances
for immediate delivery...

With the new molded toroid simplifying mounting problems and with the resultant demand increasing daily, C-A-C now offers an added convenience to buyers by stocking standard types for immediate delivery.

Write for file of complete specifications and listing of stocked inductances. C-A-C molded toroids meet the performance requirements of Military specifications.

Why is it?...

From a modest beginning five years ago, Communication Accessories Company has grown to one of the largest exclusive toroid coil winding producers in the U. S. today. Why?

We like to think that this growth is due to the thorough, careful handling we apply to each coil . . . and because of the particular skill of our people. Whatever the reason, we'll continue — doing the best we know how — thankful for the trust that important companies have placed in us.

Multiplier phototubes are employed as pickups. Tube designed by Du Mont, provides extreme stability, long life and high signal-to-noise ratio. Cost of tube \$55. Tube has practically infinite life, barring breakage.

Signal amplifiers are flat within 8 mc, permitting full amplification of color signals. Circuitry as simple as that encountered in audio equipment. All plug-in units, completely accessible.

Light source is a special cathode-ray tube designed and built only by Du Mont. Face plate is optically corrected, of medium density and is non-browning. Tube is operated at 45,000 volts on accelerating ring.

...Surpassing all

for film pick-up

Finest reproduction of 16mm films — either new or old. Film moves through carrier silently, smoothly, minimizing chances of film breakage and wear.

opaque pick-up

Automatic carriers provide for 4" x 5" glossy or matte finish prints. Dual unit permits one carrier to be loaded while other is used in pickup.

2x2 glass slides

Automatic slide changer carries standard 2" x 2" glass slides. Dual pickup feature permits blending, or simultaneous pickup of two signals at once when operating from film, slides or opaques.

KOOL-TV

KWWL-TV

MULTI-SCANNER

The advanced method of film, opaque or slide pickup—**ready now!**—ready for you to use in your television broadcasting operations today!

The Du Mont Multi-Scanner offers a far more simple, more reliable and better method of electronic reproduction than ever available before. Film reproduction assumes studio pickup quality with all the original gray tones and elimination of edge flare inherent in other film pickup systems. The same true pickup is attained when the Multi-Scanner is used on slides or opaques.

Performance is only one of the many outstanding advantages of the Multi-Scanner. Simplicity of operation is such that the system is practically automatic. Thread the film in place, try it out if you wish, reverse the mechanism and you're ready to put the system in operation from a **remote control panel**.

Truly, the Du Mont Multi-Scanner has no equal
—it is the modern pickup system — ready for you **today**.

The complete Multi-Scanner incorporating film, opaque and slide pickup equipment.

OPERATION: No shading adjustments necessary. Picture free from edge flare and shading. Completely automatic operation from a remote panel.

DEPENDABILITY: Simple mechanism carries film at continuous, smooth rate of travel. No tearing, wearing stop and go action.

PERFORMANCE: Gamma-corrected signals from Multi-Scanner brings out all gray tones of film, opaque or slides.

VERSATILITY: Reversing feature permits "dry runs" by operator immediately before going on air, without necessity of complete rewinding of film.

SHRINKAGE COMPENSATOR: Film shrinkage compensator permits complete control of allowances for shrinkage. Pictures frame right with the Multi-Scanner, whether new or old film.

COLOR: The Multi-Scanner is the only film system presently available that may be easily and quickly converted to color pickup.

Expectations!

Production of Multi-Scanner units is now going ahead at full speed to meet the ever-increasing orders for this system of tomorrow, today.

FOR BETTER PERFORMANCE SYLVANIA OFFERS NEW MICROWAVE MIXER CRYSTALS

Sylvania announces the addition of a series of new Microwave Mixer Crystals to the world's foremost line.

These new crystals bring simplicity and dependability to many specialized circuit designs. Matched pairs such as the 1N23B and the 1N155 are specially balanced for low-noise operation.

Sylvania also offers Silicon Video Detector Crystals for use as microwave detectors in receivers of the non-heterodyne type. Other quality Sylvania products, engineered for radar and SHF receivers, include Magnetrons, TR Tubes, ATR Tubes, Hydrogen Thyratrons, and Beacon Reference Cavities.

The unbeatable performance of all Sylvania Crystals, Tubes and other components is the direct result of Sylvania's longer experience and continuing advance in the field of electronic research . . . another reason why it pays to specify SYLVANIA!

Here is amazing

MANEUVERABILITY

never before achieved!

NEW!

for Film and TV Cameras

NEW! CIRCULAR STEERING

Entirely new steering mechanism makes possible easy, smooth, sharp turning on own axis or in any desired arc. Wheels can also be locked parallel for straight tracking in any direction.

VERSATILE WHEEL POSITIONS

STRAIGHT TRACKING

PARALLEL STEERING

CIRCULAR STEERING

PIVOTING

NEW! MANEUVERABILITY

The extreme flexibility of the steering mechanism makes possible fast positioning in small, crowded studios.

NEW! HANDLING EASE

Weights only 500 pounds. Cameramen and grips appreciate easy dollying, turning, raising and lowering boom.

NEW! LOW SLUNG CHASSIS

Cinemobile is built low down for better balance, greater stability and smoother rolling.

NEW! VERSATILITY

Makes possible a wide range of camera effects formerly achieved only with larger, heavier equipment. Priced to fit the budget of smaller studios.

HOUSTON-FEARLESS CINEMOBILE

NEW! HYDRAULIC BOOM LIFT

Camera boom is raised and lowered smoothly, quietly, effortlessly, automatically by hydraulic system. Extreme high and low lens heights are readily achieved even when dolly is in motion.

5 More reasons why FAIRCHILD can meet

TYPE 753 — Sine-cosine potentiometer — Full sine-cosine function without mechanical cams and linkages — can be ganged up to 6 cups. 20,000 ohms per quadrant; linearity, $\pm 0.5\%$ peak-to-peak; 3" diameter, 1 $\frac{1}{4}$ " long from front of servo flange to rear of cup. Also available as straight sine function.

TYPE 745 — 10-turn helical potentiometer — Meets rigid government requirements for humidity, salt spray, altitude, temperature, vibration, shock, sand, dust and fungus resistance. High electrical accuracy (linearity $\pm 0.025\%$); resistance range 100 to 300,000 ohms. 2" diameter, 2 $\frac{3}{4}$ " long from front of servo flange to end of case. Mechanical and electrical rotation, 3600° (+2° -0°).

TYPE 771 — The FilmPot, metallic film potentiometer — Infinite resolution, high temperature operation (225°C). High wattage dissipation and exceedingly wide resistance range (100 to 200,000 ohms). Only $\frac{3}{4}$ " in diameter and $\frac{1}{2}$ " long. Resistance element is precious metal deposited on an inorganic base. Available with servo flange or threaded bushing mounting.

See the complete Fairchild line of pots at the IRE Show, Booth 648, Radio Road and Circuits Avenue.

POTENTIOMETERS

all your precision potentiometer needs

TYPE 754—2" linear potentiometer—Resistance range from 800 ohms to 100,000 ohms. High linearity ($\pm 0.15\%$ standard). Internal clamp rings permit ganging up to 8 cups on single shaft without increasing over-all diameter. AIA standard 2" servo mount. Depth is 1" with .594" added for each cup section ganged. Gold-plated terminals are easier to solder and have better resistance to corrosion.

TYPE 741—1½" linear potentiometer—Internal clamp rings permit ganging up to 5 cups on a single shaft without increasing the over-all diameter. Resistance range 500 to 25,000 ohms; linearity $\pm 0.5\%$ standard. Electrical angle 350°. Only 1½" in diameter and 1½" long; starting torque is 0.25 oz.-in. The simplified slip ring construction and a one-piece paliney wiper give longer life and lower noise.

Available immediately in sample quantities. Look to Fairchild for assistance in solving all your precision potentiometer problems. Fairchild has, or can make, a potentiometer to fit any requirement. For information write: Fairchild Camera & Instrument Corp., Potentiometer Division, 225 Park Avenue, Hicksville, L. I., N. Y., Dept. 140-45E.

FAIRCHILD
PRECISION POTENTIOMETERS

The old Roman god Janus lives today in servo mechanisms, instruments, and controls which take past information and use it to guide the future — much as Janus faced backward and forward in time, to symbolize past and future.

time in your hands

Controlled, predictable flight depends upon data concerning the immediate past of a flight, as well as navigational information for the course ahead. Time is literally in your hands with Kollsman products.

Today our activities encompass four fields:

AIRCRAFT INSTRUMENTS AND CONTROLS

OPTICAL PARTS AND DEVICES

MINIATURE AC MOTORS

RADIO COMMUNICATIONS AND NAVIGATION EQUIPMENT

Our manufacturing and research facilities . . . our skills and talents, are available to those seeking solutions to instrumentation and control problems.

New RCA single-unit Sync Generator takes less than one-third the rack space needed by other sync systems

Smallest, finest Studio Sync Generator ever built!

RCA Type TG-2A

COMPLETELY NEW THROUGHOUT—and incorporating a revolutionary new multivibrator circuit—Type TG-2A is, we believe, the *ultimate in synchronizing generators*. It combines all synchronizing functions into a single chassis (includes a Genlock, a Dot Generator, a grating generator, and a regulated power supply). It takes only 21 inches of rack space (one-third that required by other sync generators)—is so compact you can easily install two of these units (one a stand-by) and an RCA changeover Switch MI-26289 in a single rack. It uses fewer tubes than other sync generators (38 miniatures, 2 rectifiers). And, of course, the TG-2A can be operated in conjunction with a Color Frequency Standard.

RCA Type TG-2A's are now available for all TV stations—VHF and UHF. For technical details and delivery information, talk to your RCA Broadcast Sales Representative.

Only RCA's TG-2A has these features

- In a SINGLE standard chassis it includes:
 - a synchronizing generator,
 - Genlock, dot generator,
 - grating generator,
 - regulated power supply
- Entire unit takes only 21 inches of rack space
- Only 4 operating controls
- Adjustable pulse output voltages
- Pulse outputs have sending end-terminations
- Adjustable "front porch" width
- Operates with Color Frequency Standard
- Can be remotely-switched to Genlock operation
- Provides Dot Convergence Pattern
- Fewest tubes of any sync generator (38 miniatures, 2 rectifiers)
- Test jacks for circuit checking
- Pulse widths and delays STABILIZED against tube aging
- Choice of 5 ways to control basic frequencies
- Characteristics more than meet FCC and RETMA standards

RADIO CORPORATION of AMERICA
ENGINEERING PRODUCTS DEPARTMENT

CAMDEN, N.J.

The
Invention
of Compression-Type
Seals is about as
Old as
Grandma's Phonograph—

but Constantin's
Production Facilities
and Methods are
as New as Tomorrow

The invention of compression-type seals in general is quite old as evidenced by U. S. Letters Patent No. 1,184,813, issued to Wilfred T. Birdsall and assigned to the Westinghouse Electric and Manufacturing Co. on May 30, 1916, for the original compression-type seals, expired in 1933. It is now public domain.

Yes, the idea of high compression glass to metal seals is thirty-seven years old and public domain. The compression principle can be employed by anyone, but Constantin makes the *quality* seal.

The wise buyer now is concentrating on quality of manufacture and materials. For over eight years L. L. Constantin & Company has been operating the most modern machine shop facilities for die construction, stampings, and bending—a glass department capable of compounding, tableting and sintering—latest ovens for fusing—multi-slide machines for pin fabrication. In this way, our completely self-contained plant operating all under one roof, can produce

true compression seals of highest quality, in addition to our regular line of hard glass to KOVAR and RODAR alloy seals.

We at Constantin realize that adding color to the already pure white glass does not add to the strength, and for identification purposes, whether you buy green, gray, blue, brown or other colors, you will find Constantin seals to be consistently uniform and superior in strength.

Constantin can proudly say that it is not selling an idea. Constantin is selling precision engineered high compression glass-to-metal vacuum seals. See them, test them, and compare.

Seals also available in KOVAR and RODAR alloys to hard glass types.

designed for present requirement of 440' and for extension—when needed—to 600'

When WICC-TV in Bridgeport, Connecticut, erected their tower, they went high enough to meet their present need—but also had an eye for the future.

So any time they need greater height for increased coverage, another 160 feet can be added to their present tower height of 440 feet. For the Blaw-Knox Type TG tower purchased by WICC was originally designed for extension to 600 feet—with a third set of guys to be installed at that time.

This is typical of how Blaw-Knox Towers are designed and constructed to meet specific customer requirements—based on some forty years experience in designing and building towers. Blaw-Knox Type TG towers, for example, are designed to support TV and FM antennas—available in standard heights up to 1000 feet and in special designs for higher structures. All have such features as

- pivoted or articulated base to avoid excessive bending stresses
- structural angle bracing (with no adjustable members) in a “tension and compression” system to provide extra strong rigid construction
- guys, with all connections permanently attached, factory pre-stressed and proof tested to load greater than ever required in service
- invar rule to insure accurate and simple tensioning of guys
- convenient support for transmission lines
- hot-dip galvanized to protect against all weather conditions

For more complete information on all types of Blaw-Knox Antenna Towers just write or phone to get your copy of Bulletin No. 2417. Or send us your inquiry for prompt service, specifying height of tower and type of antenna.

TV-RADIO BROADCAST ENGINEERS!

Cut tube cost-per-hour
with G.E.'s **NEW** complete . . .

TUBE INVENTORY CONTROL SYSTEM

A metal box holds your file of tube life cards. These show performance by type and location, from the time a tube is installed until replacement is made. You have an accurate check on operating life which helps you obtain more service hours per tube.

Ask your G-E tube distributor for details!

● In order to reduce tube replacement expense, you must have the full performance record of every tube in your equipment. A failure by any tube—power, rectifier, or other type—to meet life expectancy will then show up clearly. Conversely, those types which are giving better-than-average service will establish their value and economy.

General Electric's new inventory control system gives you the history of *all* your tubes for quick, sure reference. In addition, you have before you an inventory of your spares down to the last 12AT7, including tube prices for cost-control and budgeting. Key performance ratings . . . an interchangeability guide, for tube substitutions . . . make the system complete.

Phone your G-E tube distributor! He will be glad to help you install this aid to lower tube costs. It combines the successful control methods of efficient TV-radio stations from coast to coast. *Tube Department, General Electric Company, Schenectady 5, New York.*

A handsome blue leathette binder, gold-lettered, contains an up-to-date inventory of your tubes in use and held as spares. Prices, essential ratings, and other helpful facts are included. Among them you will find an interchangeability guide.

STONIZED PRODUCTS CO., INC.
900-922 Franklin Street, N.E., Washington 17, D. C.

STEP DOWN! New York City Police Department is installing an industrial-type TV system to telecast the daily line-up of assorted criminals to various detective headquarters around the city. Previously, only a few representative detectives had the opportunity to witness the line-up, and become acquainted with local hoodlums. Through TV and microwaves, the criminal mugs will eventually be studied simultaneously in all city precincts.

SCIENTISTS PREFER BLONDES, report researchers at Minneapolis-Honeywell. At least they do when they are evaluating the best type of hair to be used as reacting element in humidity measuring devices. Swedish blonde hair comes out on top. Brunettes and redheads qualify no better than pig bristles or horse hair.

\$90,000 FOR THE TAKING—The Educational TV Grant established by Emerson in June 1952, which offers \$10,000 to each of the first ten non-commercial stations to start broadcasting with a permanent FCC license, has had only one taker so far—KUHT-TV, Univ. of Houston, Texas. KTHE-TV, Los Angeles, operating under special temporary authorization, also will soon be eligible. Since the grant was established, over 250 new commercial stations have gone on the air.

BY END OF 1954, there will be between 25 and 30 non-commercial TV stations programming regularly, according to estimates by the National Citizens Committee for Educational TV.

WATCH THOSE RATINGS! For the benefit of the uninitiated (and some who should know better), when you buy a piece of equipment, make sure all conditions are specified. As elementary as this may seem, a fellow engineer recently bought a 20-watt audio amplifier rated flat ± 0.2 db from 20 to 20,000 cps. Manufacturer neglected to mention that response would be flat only if output were kept under 1 watt. Same applies for intermodulation distortion (power and frequencies should be specified) and other characteristics.

Announcement to the industry...

WHY TUBE SOCKET STANDARDIZATION?

A message from the E. F. Johnson Company

Standardization means different things to different people. To you—the design engineer or manufacturer specifying or purchasing tube sockets, Johnson's new standardization program offers three definite advantages.

1. Simplified selection of components.
2. Shorter delivery cycles.
3. Superior sockets at the same or lower cost, due to the elimination of special set-up and tooling charges.

In the past, selection of materials for commercial, industrial, and military sockets resulted in anywhere from 15 to 50 variations of each socket. This program permits the maintenance of stock on industrial and military types as well as standard commercial models. Immediate shipment of small quantities is hereby made possible for development or pre-production runs. Small run set-up charges will thus be eliminated, and manufacturers ordering sockets to their specification will receive equal or superior quality sockets, in most cases at a lower cost.

STANDARD—A standard grade commercial socket for all general requirements. Grade L4 steatite bases, Dow Corning 200 impregnated or white glazed porcelain. Phenolic washers are fungus resistant, glass base melamine. Contact materials vary with tube socket types.

INDUSTRIAL—A higher quality socket incorporating such features as DC 200 impregnated glazed steatite bases and .0005 silver plated contacts with phosphor bronze clips and beryllium copper springs. Aluminum shields on shield base types are irridite No. 14 treated to prevent corrosion.

MILITARY—A top quality socket designed to meet all military requirements. Incorporating the finest materials and plating, glazed steatite bases are DC 200 treated—grade L4 or better. Contacts have phosphor bronze clips and beryllium copper springs, both heavily silver plated. Fungus resistant cushion washers are of glass base melamine. All solder terminal ends—hot tin dipped. Bayonet shield base types have brass shells, .0003 nickel plated. Threaded hardware, .0002 nickel plated—unthreaded hardware, .0003 nickel plated. Entire socket fully protected to meet 200 hour salt spray requirements.

PROVEN PERFORMANCE

with *Federal TV*
at KSWs-TV...

A FEDERAL VHF INSTALLATION

KSWs-TV (Channel 8) Roswell, New Mexico . . . on the air since June, 1953 . . . in the rich and rugged Southwest area . . . has been achieving new, high standards of coverage and picture quality with its *all-Federal VHF* installation. Executives of KSWs-TV report "excellent reception from 100 to 186 air-line miles from the transmitter" . . . as well as "one of the best-transmitted pictures from film in the country."

This is the kind of *proof* that counts! And it's coming from areas throughout the U.S. . . . *proof* of the high-quality signals, wide coverage and dependable performance delivered by Federal VHF and UHF installations. Investigate Federal TV equipment for your requirements . . . whether for a small two-man operation or an elaborate multi-studio station. Federal has the equipment and the know-how to do the job.

The KSWs-TV control room features simplicity of layout . . . with maximum operating efficiency. Transmitter Console, Poly-Efex Scanner, Master Monitors and Camera Control units provide complete station control. Film, slides, studio and network program material are handled with a minimum of operating personnel.

J. A. Barnett, owner, and J. C. Porter, general manager of KSWs-TV, inspecting the FTL-19B 7.5 KW Federal VHF transmitter . . . outstanding for excellent picture quality and trouble-free operation since first going on the air.

KSWs-TV uses Federal's remarkably successful 16-bay High-Gain Triangular Loop Antenna . . . mounted atop this 710-foot tower. Exceptionally wide coverage is produced by its gain of 17.1.

Mr. Porter states: "Consistently good reception has been reported in the White Sands area about 150 miles from Roswell . . . despite a 9,000-foot mountain range half-way between the two points."

NEW! FOR PRINTED COMPLETE LINE

- 1 FOR AUTOMATION: EXCLUSIVE NEW Self-Supporting Snap-in Bracket Mounting. (See Type YGC-B45.)
- 2 NEW Twist-ear Mounting. (See Types XP45 and UPM45.)
- 3 PLUG-IN BLADE-TYPE TERMINALS for vertical or horizontal mounting of control to printed circuit panel. (See all photos.)

4 Threaded Bushing Mounting. (See Types XGC-45 GC-U45 and *miniaturized* U70.)

Consultation without obligation available on variable resistors for your printed circuit applications. Write today

VERTICALLY MOUNTED to Printed Circuit Panel. Shaft above panel. (Types YGC-B45, XP45 and XGC-45.)

- NO shaft protection needed during soldering.
- PARALLEL terminals permit *small* round connecting holes instead of *large* elongated slots necessary for fan shaped terminals.
- Terminals available in 7/8" or 1-1/32" lengths from control's center.

Suggested panel piercing.

Type YGC-B45 FOR AUTOMATION: EXCLUSIVE NEW Self-Supporting Snap-in Bracket

- Snaps instantly into place.
- Stays firmly put during soldering. Solder permanently anchors control to circuit panel.
- Terminal connections cannot loosen; bracket prevents mounting or operating strain on control or switch terminals.
- No mounting hardware, no separate supporting panel needed.
- No strain on printed circuit panel. Anchor tabs attach bracket to cabinet.
- Adequate clearance for circuit paths provided by ample spacing between terminals and by design of mounting lugs on bracket.

Suggested panel piercing.

Type XP45

For TV preset control applications using a mounting chassis to support printed circuit panel. Twisting 2 ears holds control rigidly to mounting chassis. Available in finger adjusted shaft lengths of 1/2", 5/8", 11/16", 7/8" and 1" from control's mounting surface. Also available with recessed screw driver slotted shaft (Type XPM45).

Suggested panel piercing.

Type XGC-45

For applications using a mounting chassis to support printed circuit panel. Threaded bushing mounting

All controls illustrated actual size.

D CIRCUITS E OF VARIABLE RESISTORS

HORIZONTALLY MOUNTED

to Printed Circuit Panel. Shaft extends through panel. (Types U70, GC-U45 and UPM45.)

Type GC-U45

Threaded bushing mounting. Terminals extend perpendicularly $7/32"$ from control's mounting surface. Available with or without associated switches.

Type U70

(Miniaturized)

Threaded bushing mounting. Terminals extend perpendicularly $5/32"$ from control's mounting surface.

Type UPM45

For TV preset control applications. Recessed screw-driver slotted shaft remains solder free during panel dipping. Control may be held rigidly to panel before soldering by twisting 2 turns. If ears are left straight, the solder will permanently anchor control to circuit panel. Terminals extend perpendicularly $7/32"$ from control's mounting surface.

3 HOLES FOR $.016" \pm .001"$
X $1/16" \pm .003"$ TERMINALS

HOLES TO RECEIVE $.020"$
X $.094"$ LOCATING LUG

THINGS ARE **NOT** AS THEY SEEM...

Things are not as they seem
 These two fuses look alike ...
 Until you look inside.

LITTELFUSE

DES PLAINES, ILLINOIS

This is not a spiral. It is a series of concentric circles that do not join.

This fuse has a straight element—cannot be made more delicate than 1/16 amp. with normal blowing characteristics.

This fuse has a bridge construction (note short filament between electrodes). This type fuse may be rated as low as 1/500 amp. with precision blowing characteristics required for protection of extremely fine instruments. Without this construction pioneered by Littelfuse—the microscopically fine filament would break in shipment, in normal operating vibration or even from nearby footsteps.

Littelfuse leads all other fuse manufacturers in design patents on fuses.

NATIONAL SAFETY COUNCIL is making available a new series of human relations training films for supervisors, featuring O'Grady, the safety skeptic. The Council is also publishing *Showmanship in Safety*, a book of attention-getting gimmicks. For prices, write to National Safety Council, 425 N. Michigan Ave., Chicago 11, Ill.

FISH STORY—Business of "angling" for classified security information by unauthorized persons is being handled in novel fashion by Minneapolis-Honeywell. In series of card mailings, nine most flagrant security risks are satirically portrayed. For example, there is the three-martini worker (Fried Herring) who volunteers information after imbibing, and the loquacious employee (Large-Mouthed Bass) who discusses classified information over the telephone.

"**RESEARCH** is an organized method of finding out what you are going to do when you can't keep on doing what you are doing now."—Charles F. Kettering.

DOG DAZE—Do not force your dog to look at TV, advises the Gaines Dog Research Center. They believe that the canines are TV blind, and what to the human eye appears as a comprehensible picture may be a jumble of flashing lights to poor Fido.

PAYDAY, in the early days of the airlines was an uncertain time because of the precarious financial condition of many carriers, coupled with the problem of flying weather. When pay checks were actually in a company mail sack aboard a flight, the word would get to the radio operator, who would broadcast the message (in violation of unwritten regulations), "The eagle flies today." Hence the expression currently used on payday throughout American industry.

BOOK REVIEWS

BEGIN ON PAGE 52

New CBS-Colortron

NOW IN MASS PRODUCTION

Unique photographic process, like photoengraving, uses aperture masks as negatives to print consecutively the red, green, and blue phosphor dots (250,000 of each) on CBS-Colortron screens.

After tri-color screens are printed, aperture masks are temporarily removed and face plates move on to critical inspection for screen imperfections.

COLOR TV IS COMING . . . faster than you think. The revolutionary new CBS-Colortron . . . a practical color picture tube hastens the day. Already it is in lower-cost, mass production . . . made possible by its simplified, advanced design.

As in black-and-white tubes, the CBS-Colortron's screen is deposited directly onto the inside of its face plate. A unique photographic technique makes this possible. Because each aperture mask serves as a negative to print its tri-color screen, perfect register of mask and screen is automatically achieved

and maintained. The rugged, simple, light-weight mask sharply reduces assembly and exhaust problems. And the spherical design of mask and screen simplifies convergence circuitry and adjustment.

The CBS-Colortron is now a 15-inch, round tube. But, as soon as tooling is completed, it will be made in larger sizes. Watch for the new CBS-Colortrons. You'll see plenty of them soon. And you'll be sold on sight by their logical simplicity . . . their superior performance . . . their many advantages.

CBS-Colortron OFFERS MANY ADVANTAGES

Cross-section (face plate, aperture mask, funnel, tri-color electron gun) shows simplicity of CBS-Colortron and its adaptability to low-cost, mass production.

Spherical screen and aperture mask of CBS-Colortron simplify convergence and focus. Electron beams remain in focus over entire surface of screen.

Light-weight (6 oz.), rugged, simple aperture mask of CBS-Colortron minimizes problems of exhaust, handling, and assembly.

COMPLETE CBS-Colortron DATA FREE!

Condensed Specifications

Sync Separator

Permits triggering from composite signal.

Delayed Sweeps

Zero to 25 milliseconds from start of field—
triggered at any selected line.

Field Selector

Instant shift to opposite field (easily identified
by vertical block presentation).

Sweep Magnifier

3x or 10x magnification—expands sweep to
left and right of center.

Sweep Range

0.1 $\mu\text{sec}/\text{cm}$ to 0.01 sec/cm continuously
variable, accurate within 5%.

4 kv Accelerating Potential

Flat-faced 5" cathode-ray tube.

60-Cycle Sine-Wave Sweep

Separate phase and amplitude controls.

Vertical Sensitivity

DC to 10 mc —0.15 v/cm to 50 v/cm .
2 cps to 10 mc —0.015 v/cm to 50 v/cm .

Transient Response

Risetime—0.04 μsec .

Signal Delay

—0.25 μsec .

Undistorted Vertical Deflection

More than 6 cm.

Internal Time Mark Generator

Pips spaced 1 μsec , 0.1 μsec , 0.05 μsec ,
or 200 pips per television line.

Amplitude Calibrator

Square wave, zero to 50 v in 7 ranges...
accurate within 3%... duty cycle variable
from 1% to 99%.

Line-Indicating Video Output

Lines being observed on the Type 524-D are
brightened on picture monitor.

DC-Coupled Unblinking

Electronically Regulated Power Supply
10x Attenuator Probe

Here's why:

Variable delayed sweeps at the frame rate let you examine any portion of the television picture—from complete frames to small portions of individual lines. Any one of the picture lines may be located and observed in minute detail. A touch on the Field Shift button provides a quick switch to the interlaced line or lines in the opposite field. Sweep magnifier expands the image 3x or 10x for detailed examination of sync and equalizing pulses. Internal markers are available for checking accuracy of sync timing. All other features meet Tektronix standards for laboratory-type oscilloscopes.

Type 524-D Cathode-Ray
Oscilloscope—\$1180

Type 500 Scope-Mobile—\$97.50

All prices f.o.b.

WHY YOU WILL FIND IT PROFITABLE to STANDARDIZE on **BUSS FUSES**

BUSS OFFERS A COMPLETE LINE OF FUSES

It is easy and economical for you to choose the exact fuse for your requirements. Select from dual-element (slow blowing) renewable and one-time types . . . in sizes from 1/500 ampere up, plus a companion line of fuse clips, blocks and holders.

*For more information mail

A fuse is a small but significant component part — for a faulty fuse that fails to protect — or a fuse that blows needlessly may reflect, in your customer's mind, on your product or service.

Dependable electrical protection is not an accident with BUSS fuses.

The makers of BUSS fuses maintain rigid quality control by testing every fuse in a sensitive electronic device that rejects any fuse not properly calibrated, properly constructed and right in all physical dimensions.

That is why you can be sure that a BUSS fuse will always operate as intended under all service conditions.

"Trouble-free" BUSS fuses can help protect your goodwill, reputation and profits.

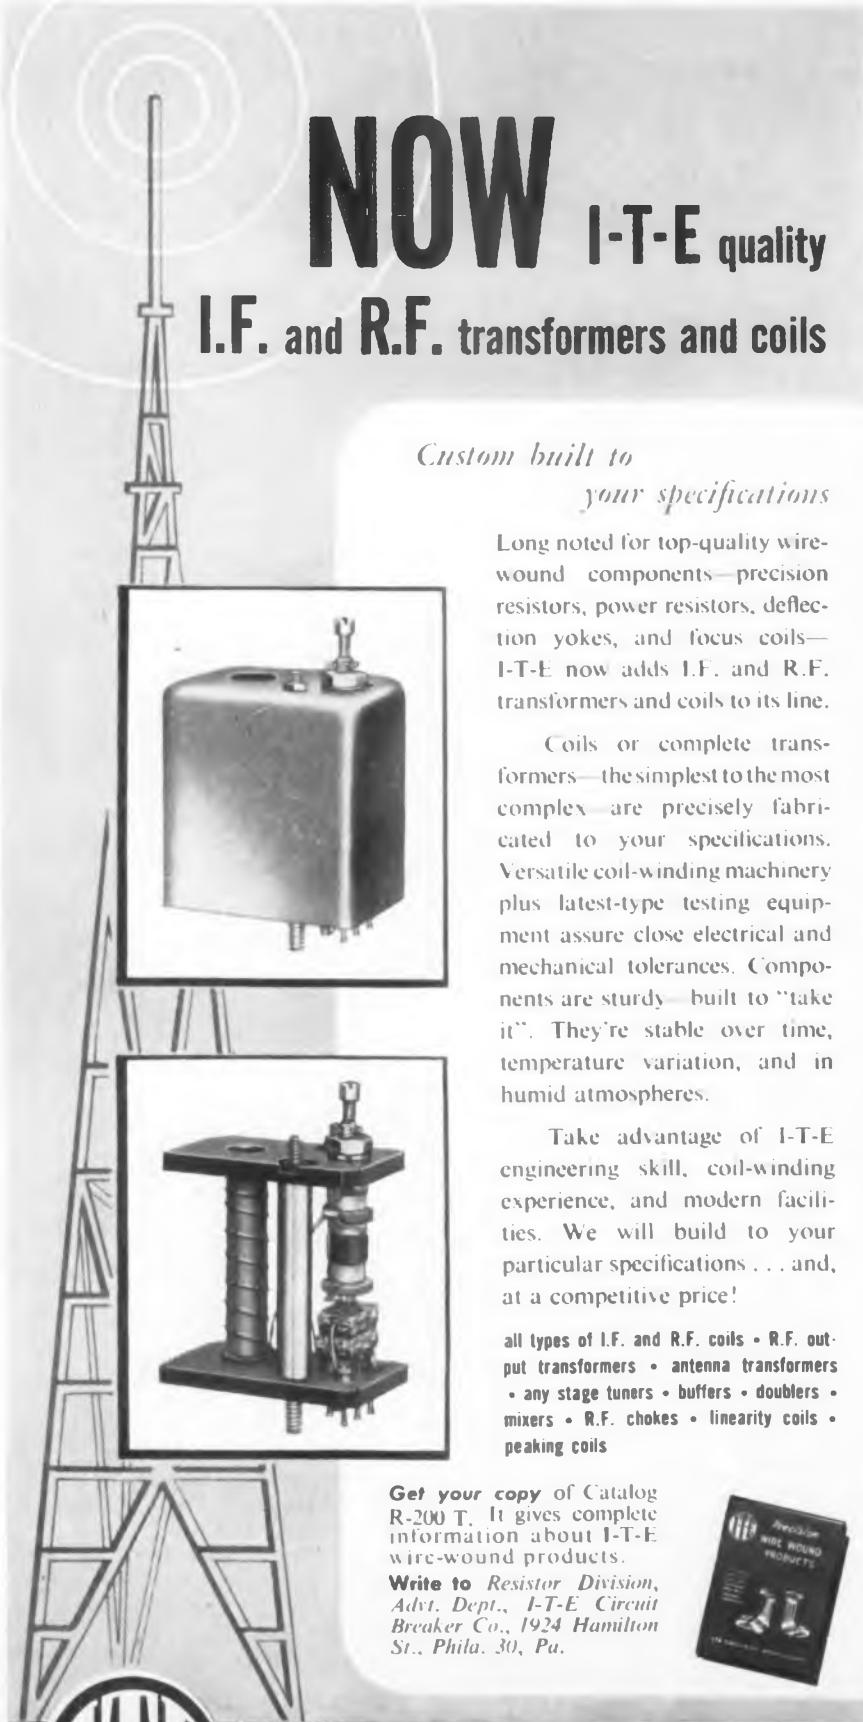

Then be profit wise, change your buying and stock records today — to standardize on genuine BUSS fuses.

Let BUSS save you engineering time.

When selecting or designing a fuse or fuse mounting let BUSS, with the world's largest fuse research laboratory and its staff of engineers, be of service. At least be sure to get the latest BUSS fuse information before final design is crystallized. It's quite possible that the fuse to meet your exact requirements is already available in local wholesaler's stocks.

Makers of a complete line of fuses for home,
farm, commercial, electronic and industrial use

NOW I-T-E quality I.F. and R.F. transformers and coils

*Custom built to
your specifications*

Long noted for top-quality wire-wound components—precision resistors, power resistors, deflection yokes, and focus coils—I-T-E now adds I.F. and R.F. transformers and coils to its line.

Coils or complete transformers—the simplest to the most complex—are precisely fabricated to your specifications. Versatile coil-winding machinery plus latest-type testing equipment assure close electrical and mechanical tolerances. Components are sturdy—built to “take it”. They’re stable over time, temperature variation, and in humid atmospheres.

Take advantage of I-T-E engineering skill, coil-winding experience, and modern facilities. We will build to your particular specifications . . . and, at a competitive price!

- all types of I.F. and R.F. coils • R.F. output transformers • antenna transformers
- any stage tuners • buffers • doublers • mixers • R.F. chokes • linearity coils • peaking coils

Get your copy of Catalog R-200 T. It gives complete information about I-T-E wire-wound products.

WIRE-WOUND PRODUCTS

BOOKS

Soft Magnetic Materials for Telecommunications

Edited by C. E. Richards and A. C. Lynch. Published 1953 by Interscience Publishers Inc., 250 Fifth Ave., New York 1, N. Y. 316 pages. Price \$9.00.

With the use of magnetic material for communications systems continuing its growth, this book may be considered quite timely. Included are 35 collected papers of a symposium held in the British Post Office Engineering Research station in April 1952. It is unfortunate that this volume could not have been made available a year earlier; doubtless it would have been a considerable aid to researchers and designers. Nevertheless, it is most welcome at this time because it is highly informative and rather extensive in its coverage of the subject material. Some of the writing is of basic nature, but, for the most part, it comprises advanced laboratory developments.

To indicate its scope, the following partial list of subjects described in this data-packed book is presented:

- Coercivities in dilute ferromagnetic alloys
- Nonlinearity in core materials
- Frequency dependence of magnetization process
- Hysteresis modulation in directional filters
- Ferromagnetic resonances in ferrites and metals
- Inhomogeneity in high permeability alloys
- Carbonyl iron and silicon iron
- Tests of rectangular loop materials
- Magnetostriction of ferrites

High Fidelity Techniques

By John H. Newitt. Published 1953 by Reinhardt Books, Inc., 232 Madison Ave., New York 16, N. Y. 512 pages. Price \$7.50.

Much of the information primarily aimed at that anomalous creature, the “hi-fi bug,” can be of considerable value to the professional broadcast or audio design engineer. For that reason, this volume crammed full of practical information is to be highly recommended to the engineer. It is clearly and simply written, and liberally illustrated with over 200 drawings and photographs. Although not every facet of audio is covered in extreme detail, the scope of the work is very thorough, and every important topic is quite adequately discussed.

Among the items described are design of various speaker enclosure-circuit features of a large number of commercially available amplifiers, speakers, tuners and pickups, and binaural systems. Other chapters are devoted to receivers, tape recorders, record players, equalizers.

(Continued on page 60)

TI transistors will FIT in Your Future!

THREE MONTHS AGO we ran this "ad" announcing a major reduction in the physical size of TI hermetically sealed junction transistors. At the Radio Engineering Show in March, TI will show transistors only one-third the size of the one illustrated at the right. This is typical of the rapid progress being made in semiconductor device design. For first-hand information on these and other new TI semiconductor products, visit Booth 776. A real southwestern welcome awaits you there.

Choose Your Carbon Controls from this Complete Mallory Line

You can select Mallory Carbon Controls in any construction you may require. This complete line includes single, dual concentric and dual tandem types, with or without switch, in values from 200 ohms to 10 megohms.

Electrically, these controls assure you of the highest performance. They have a unique carbon element, with exceptionally high density and surface smoothness. It has set new standards of low noise level, minimum resistance drift and long life.

Mechanically, Mallory Controls are built to withstand vibration, and production line handling... through such features as welded construction, firmly clinched terminals, and sturdier fastenings. Switches have long-lasting silver contactors and heavy gauge terminals.

Mallory resistor engineers will welcome the opportunity of analyzing your specific circuits to see how engineered selection of resistors can help reduce your manufacturing costs. We will be glad to send you the complete new catalog on Mallory Fixed and Variable Resistors... including both carbon and wire-wound types.

FOR SPECIAL REQUIREMENTS

Get in touch with Mallory any time you need carbon controls with special tapers, non-standard resistance values, insulated shafts or bushingless mountings.

Our flexible manufacturing facilities enable us to produce, at economical cost, special controls which can solve your individual design or manufacturing problems.

Expect more...

insulation at high temperatures,
resistance to heat shock, accuracy,
strength, permanent rigidity and low cost.

ALSiMAG[®]
extruded
CERAMICS

If you will give us details of your requirements our engineers will be glad to submit suggestions without cost or obligation. Try ALSiMag ceramics for best results at low cost.

ALSiMag ceramics can be extruded in uniform cross sections in almost any design. These extruded sections can then be sawed and economically machined before firing. This is the fastest and best way to produce many shapes which seem complex but which are actually quite practical and economical . . . ALSiMag ceramics are not affected by normal operating temperatures of electrical appliances and do not rust, corrode or carbonize. They are uniform physically and dimensionally, are totally and permanently rigid and do not deteriorate with time.

HOW TO TEACH A MISSILE to read a map

**...and FORD
was asked to find
the answer**

Zwish! And off goes a missile. But where? And how to stay on the right track? And how to *find* the target? That's the problem Ford Instrument is helping to solve.

This is typical of the problems that Ford has been given by the Armed Forces since 1915. For from the vast engineering and production facilities of the Ford Instrument Company, come the mechanical, hydraulic, electromechanical, magnetic and electronic instruments that bring us our "tomorrows" today. Control problems of both Industry and the Military are Ford specialties.

VISIT OUR BOOTH 503-505 AT THE NEW YORK IRE CONVENTION

You can see why a job with Ford Instrument offers young engineers a challenge. If you can qualify, there may be a spot for you in automatic control development at Ford. Write for brochure about products or job opportunities. State your preference.

The *Pan Cinor* Zoom -type lens
with a Bolex 16 mm camera
...what a terrific buy!

You can assure your viewers of a front row seat to every sports and news event in your TV area when you zoom in for a take with this precision equipment.

Think of it . . . this Pan Cinor-Bolex combination gives you a camera and zoom-type lens for less than one-half the price of other 16mm zoom-type lenses alone.

Here is a lens that can vary its focal length from wide angle (20mm) to telephoto (60mm), focusing from 5' to infinity. It has its own parallax corrected variable field finder. Its maximum aperture is $f/2.8$. All lens elements are coated.

For TV filming, Bolex has proven itself a natural. Fast supplanting all other 16mm cameras used by TV stations today, its many exclusive features offer so much engineered value — unlimited forward and reverse hand winding . . . automatic film threading . . . time exposure and single frame setting.

Ask your Bolex Franchised Dealer for a demonstration, or write for literature. Pan Cinor lens and Bolex camera as shown in above photo . . . price \$675.00.

Take title to a *Titler*

Still in limited supply, we again offer the Bolex Titler for 16mm filming. No other equipment has the same ruggedness and versatility that is so essential to movie makers. Its rock-steady track and massive camera cradle (with rack-over for perfect focusing and centering even down to 4" x 5") accepts all Bolex, Bell & Howell, and Kodak Cine-Special models.

With this Titler and its accessories, cartoons, animations, flip-flops, zooms, three-planes and a broad range of other tricks are made possible. Price of Titler and accessories, including FET, \$295.50.

Ask your Franchised Dealer or write for Titler booklet.

BOOKS

(Continued from page 52)

tone controls, noise suppressors, volume expanders, needles, turntables—and just about any device that can be connected to an audio system.

Elements of Electrical Engineering (6th Ed.)

By Arthur L. Cook and Clifford C. Carr. Published 1954 by John Wiley & Sons, Inc., 440 Fourth Ave., New York 16, N. Y. 682 pages. Price \$6.75.

Since the first edition was published some 30 years ago, this textbook has gained such widespread acceptance that it is practically a standard reference today. Interesting to note is the fact that the preface to the first edition made no mention of electronics, while the new volume emphasizes the role electronic circuits play in controlling electrical machinery. The thoroughly revised book is intended solely as a basic engineering textbook for a college course in electrical engineering, and it accomplishes its educational aim with extreme competence. From the fundamentals of electric and magnetic circuits, the authors go through the various types of ac and dc machinery. Their explanation of sinusoidal and vector relations in ac circuits is extremely well done. The last 10% of the text covers electron tubes and control systems.

Television Receiver Design—Monograph 2

By P. A. Neeteson. Published 1953 by Elsevier Press Inc., 402 Lovett Boulevard, Houston, Texas. 180 pages. 137 illust.

Book VIII B entitled Flywheel Synchronization of Saw Tooth Receivers provides an analysis of the flywheel action of resonant circuits, a study of automatic phase control and a discussion of partial circuits. As such, it is of particular interest to television receiver designers working with both black and white and with color sets. The book is another in the Phillips Technical Library Series. It will be followed by other volumes on such specialized topics as deflection circuits, front end problems and circuits in the audio part.

BOOKS RECEIVED

Microwave Lenses

By J. Brown. Published in Great Britain 1953. Available through John Wiley & Sons Inc., 440 Fourth Ave. New York 16, N. Y. 125 pages. Price \$2.00. An interesting monograph on the use of artificial dielectrics for microwave lenses.

DESIGNERS—Cut New-Equipment Costs

F-6366 | **F-6367**
7 KW | **12 KW**
MAXIMUM PLATE INPUT

with *Federal's*
2 NEW TRIODES

... incorporating built-in savings and proved design features that increase tube dependability and life and multiply the performance quality of new units

For Electronic Heating, Broadcast and Communications Service

- ① **High-Efficiency Radiator** requires reduced pressure drop ... cuts blower cost for new equipment.
- ② **Grid and Filament Leads Attached** for convenience of designers ... for extra savings.
- ③ **Double Helical Filament** of thoriated tungsten ... for high peak emission ... lower temperature.
- ④ **No Internal Insulators** to expose tubes to danger of arc-over and gassiness.
- ⑤ **Internal Corona Ring** eliminates trouble with hot-spots and glass cracks.
- ⑥ **Kovar Terminal Cups** used throughout for ruggedness required in industrial service.
- ⑦ **Full Voltage** can be safely applied to the cold filament ... no step starting or high reactance transformers necessary.

Federal's F-6366 and F-6367 are the power triodes that new equipment designers have been waiting for ... to boost the efficiency of induction and dielectric heating units, broadcast and communications equipments ... to bring important savings to production lines!

Both tubes not only provide *more ruggedness, longer service life and higher-quality performance*, but they actually cut costs for manufacturers ... saving as much as 80% on blower costs, while factory-attached grid and filament leads eliminate this expense.

Federal's new triodes feature simplified construction ... with fewer potential trouble spots. Wide element spacing gives better protection against filament-grid shorts. Rated filament voltage may be applied to cold filament, eliminating need for step starting or high reactance filament transformers. Both tubes are operable up to 30 Mc/SEC at full ratings ... anode up or anode down.

Equipment manufacturers now using the F-6366 and F-6367 in new designs report they are "extremely well pleased" with their stamina and performance. For prices and technical data, write to Federal, Dept. K-466.

Visit Federal's Exhibit—IRE Show
 885-893 Audio Ave. at Broadcast Way

Federal's 72-page booklet gives complete data on efficient operation of tubes in service. Mail your request to the department listed above.

HIGH VOLTAGE REGULATION AT...

Lower Cost

... Superb regulation at lower cost for color T.V. receivers is assured if you plan now to use Victoreen's type 6353 Corona Regulator Tube in your Models. Designed to be used with high-voltage power supplies in color T.V. sets, the 6353 stabilizes the second anode potential at 20,000 volts regardless of line voltage and intensity setting.

The 6353 positively protects the picture tube against excessive voltage surges. Any failure in the circuit or components results in a drop in the second anode voltage. Safeguarding of the Kinescope from damage due to voltage fluctuation is positive. There's complete safety in failure with a 6353.

No grid voltage or filament power is used. Ultra simple mounting, extremely long life and rugged construction are a few of the many features of this tube.

The RX-Series resistors are an hermetically sealed 10 KV, deposited carbon type which provide maximum stability and uniformity in operation. Specifically designed for color T.V. convergence and focus voltage-divider strings, these extremely stable resistors are available in 20, 25, 50, 55, 80 and 100 megohms. Tolerances are plus or minus 5, 10, 15 or 20 percent. These 10 KV resistors were designed for long operation under extreme conditions of temperature and humidity.

Write to our Components Division for detailed specifications.

...most accurate magnetic tester

**WHEN LEADING FIRMS
WITH LONG EXPERIENCE
MAKE SUPERLATIVE CLAIMS
SUCH AS THESE...**

**ULTRA-STABLE
COILS**

there's a reason!

... when America's best known manufacturers make such claims as these—for their radio, television, radar and similar equipment—they're basing their statements largely upon the cores in their equipment. And they know that these cores are made of G A & F Carbonyl Iron Powders.

Heat, cold, humidity, atmospheric influences, stray fields and similar conditions—any of these can have an adverse effect on the core materials and on the final performance of the equipment.

An iron core made with G A & F Carbonyl Iron

Powders has a high degree of stability—and is thereby protected against these many influences.

We urge you to ask your core maker, your coil winder, your industrial designer, how G A & F Carbonyl Iron Powders can increase the efficiency and performance of the equipment or product you make, while reducing both the cost and the weight.

We also invite inquiries for powders whose performance characteristics are different from those exhibited by any of our existing types.

This 32-page book offers you the most comprehensive treatment yet given to the characteristics and applications of G A & F Carbonyl Iron Powders. 80% of the story is told with photomicrographs, diagrams, performance charts and tables. For your copy—without obligation—kindly address Department 65.

ATTENTION: Mr. F. W. Lemly

Gentlemen,

I would like to bring to your attention the fact that WJMR TV is now employing your "Styroflex" transmission line, with excellent results. As you know, WJMR TV employs the unique installation consisting of two entirely separate antennae --- one for picture and one for sound--- thus eliminating the complex diplexer unit with its consequent transmission losses.

The "Styroflex" line has proved very satisfactory. Besides being easy to install, we have found it to possess very low signal attenuation. We are indeed pleased with the use of this product and are looking forward to further installation of this line in our now-being-constructed transmission tower.

Sincerely yours,

George A. Mayoral
George A. Mayoral

1. BULLETIN 949-A

On hermetically sealed terminals. Discusses cushioned glass construction, thermal shock resistance, preferred types and special terminals. Explains code systems and methods of installation.

2. BULLETIN 950-A

On hermetically sealed multiple headers. Explains vacuum tight feature, cushioned glass construction, strain-free qualities. Tin dipped for easy soldering and silicone treated for highest electrical resistance.

3. BULLETIN 951

With complete information on octal type plug-in and multiple headers. Feature a new principle of hermetic sealing. Solid metal blanks insure maximum mechanical strength and rigidity.

4. BULLETIN 952

Complete information on E-I end seals for hermetic sealing condensers, resistors and other tubular electronic and electrical components. Provide a permanent hermetic seal. Completely strain-free.

5. BULLETIN 953

Individual, color-coded hermetically sealed terminals. Available with glass inserts colored in standard, easily identified RMA color codes. Coloring is in the glass — no lacquers or enamels are used.

6. BULLETIN 960

Compression type multiple headers. Super rugged, absolutely rigid and practically indestructible. An exclusive E-I achievement offers vastly greater resistance to shock and vibration. Guaranteed vacuum-tight.

TV TUBULARS

The Standard By Which Others Are Judged

LOOK at the critical points in any TV set. That's where you'll find Sprague "Black Beauty" Molded Tubular Capacitors. Over 250 million have been made since 1947 and demands are still increasing... thanks to their unprecedented failure-free record.

Sprague's unique patented design and "dry assembly" processing make these the first tubulars made just like more expensive metal-encased oil capacitors. Every "Black Beauty" from 200 to 12,500 volts is molded *dry* in non-flammable phenolic. After molding it is impregnated thru an eyelet under high vacuum; the lead is then inserted and the capacitor solder sealed.

Every major TV manufacturer uses "Black Beauties" in critical circuits. He can depend on *extra high insulation resistance; minimum capacitance change with temperature variations; and absence of drift with repeated heating and cooling.*

A letterhead request will bring you sizes, ratings, and performance data. Write for Engineering Bulletins 210C and 214A to the Sprague Electric Company, 233 Marshall Street, North Adams, Massachusetts.

TELE-TECH

& Electronic Industries

D. H. CALDWELL, Editorial Director ★ M. CLEMENTS, Publisher ★ 480 Lexington Ave., New York (17) N. Y.

Let's Solve Our Own Problems!

Last month the editors of TELE-TECH & ELECTRONIC INDUSTRIES proudly saluted the achievements of NTSC in developing an industry-wide compatible color television system. It was noted too that Dr. W. R. G. Baker, who headed this splendid group of engineers, announced the dissolution of the National Television Systems Committee, since its work has apparently been completed. The fine performance of this committee suggests the desirability of another all-industry committee for the purpose of resolving other pressing industry-wide problems.

All-Industry Committee Needed

The need for such a committee is quite evident. We have at the present time two very active organizations in the form of the Institute of Radio Engineers and the Radio Electronic Television Manufacturers Association, who develop engineering standards for the benefit of the industry. Essentially the standards developed by the IRE define theoretical test and measurement standards while those of the RETMA establish practical specifications for the construction of components and equipment. There are, however, the more general industry problems that arise from time to time which are not in the scope of either of the aforementioned organizations, and for which no steering or handling committee exists today.

Usually these industry problems start out as small ones. But they keep growing constantly and ultimately assume monumental proportions. As a problem grows, confusion starts within the industry. Both individuals and organizations concerned join cliques or groups to press more effectively for their own individual points of view. And as the problem grows larger, parts of the industry upheaval spill over into the minds of the public and into the hands of the legislators. The result in either of the latter cases serves only to harm the industry! A confused public will reflect its displeasure with less buying dollars, and legislation all too frequently enhances rather than reduces the immediate problem.

Types of Problems

High Fidelity

What types of problems are there? Well a good one to start off on might be the current High Fidelity (Hi-Fi) fiasco. For many years the industry has been saddled with this general term, and many groups have wrestled with this problem in vain. The difficulties of arriving at a

definition are of course apparent. The desirable frequency responses of either the individual or overall input, amplifying, and reproducing elements; the intermodulation distortion; the directivity of microphones and speakers etc., are in effect system engineering problems. An all-industry committee could, by mutual agreement, settle the issue with dispatch because it is of mutual advantage to do so.

Printed Circuits

Printed circuits represent another area of rapidly growing dispute within the industry. In the booklet "Printed Circuit Techniques" published through the government printing office in Washington, there is the statement that circuits are defined as printed when they are produced on an insulated surface by any means. Painting, spraying, chemical deposition, vacuum processes, die stamping, and dusting are listed as the methods now in use. In discussing the subject with many of the manufacturers, however, it becomes quite apparent that each considers his product to be the only "true" printed circuit! And so again there is needless confusion and upset in our industry which works only to the disadvantage of all concerned.

Antennas

The advertised technical specifications of television receiving antennas, especially the performance curves, in many instances look more like the advertising manager's dream than they do engineering actuality. Apparently, in our industry, antennas are somewhat like cigarettes. Each brand is better and all perform to a degree. With cigarettes, the tobacco at least is the common denominator. Certainly there should be some common denominator for all the claims and counterclaims that tell what antenna to use and what the array will do electrically.

Permanent Policing

Policing the industry to establish a code of ethics that will prevent direct or indirect consumer purchases of substandard products through fraudulent advertising is best done by the industry itself. Note too that the self-policing in our industry before (1938—when Caldwell-Clements exposed the counterfeit radio sets faked with dummy tubes) has not been permanent. We definitely need a permanent, all-industry, engineering committee to spell out the technical framework so as to avoid government intervention and undesirable trade barriers.

RADARSCOPE

Revealing important developments and trends throughout the spectrum for radio, TV and electronic research, manufacturing and operation

TRAVELING-WAVE TUBES will be taken out of the laboratory and introduced in commercial microwave relay systems during the fall of this year. Such systems have favorably withstood the test of time in European installations.

COLOR TV BROADCAST equipment has been installed in over 30 big-city stations, now geared to rebroadcast network color programs.

MAGNETIC TAPE BOOKS are in the wind again. Idea of having library on reels was discussed in 1930's, and may burst into fruition within a year or two. Low-cost recorder, comparable to ac-dc radio, is needed for mass acceptance.

SILICON TRANSISTORS have been announced by Philco and Raytheon. Units can operate up to 350°F,

HEAT TRANSFER COMPUTER

Miniature element (top) used for analog computing by heat transfer employs heater wires wound on two rods. In thermal, but not electrical, contact with heater, are sensing wires. Input signals are converted into heat, and differences between sensor resistance changes perform integration and other analog functions. Unit developed by Arma Corp. can replace much larger geared assembly (bottom) in servo system. Among many potential uses are controls and instrumentation. For complete technical details, see page 101 in Feb. 1954 TELE-TECH & ELECTRONIC INDUSTRIES

and possibly several hundred degrees higher, according to reports. They are not yet available for production.

INTERESTING LEGAL-TECHNICAL question being asked behind closed doors is: "Do transistors made by surface-barrier method come under scope of Bell patent claims?"

AUTOMATIC CHROMA CONTROLS will be incorporated in color TV sets coming off production line within one year, according to Dr. George Brown of RCA.

INGENIOUS TEST TAPE for magnetic recorders is scheduled for introduction in month or so. It will include methods for checking frequency response, tape speed, wow and flutter, signal-to-noise ratio, and new way of measuring head azimuth alignment.

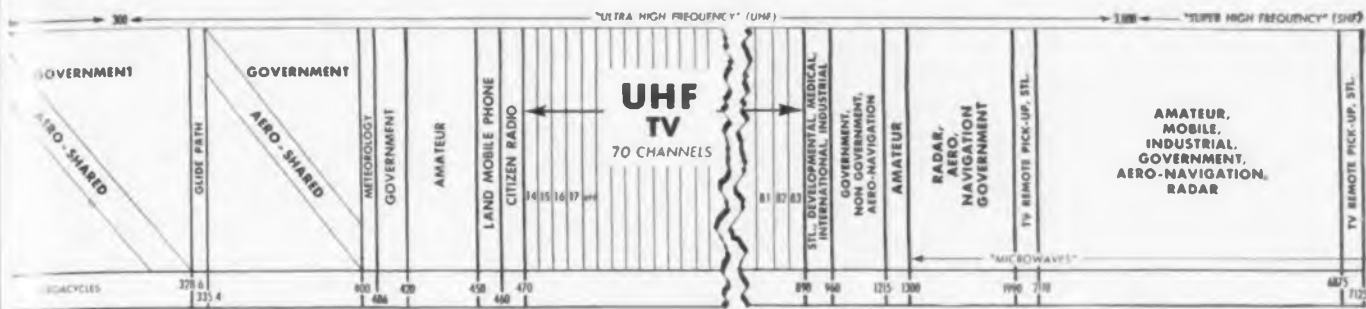

ENGINEERING GRADUATES will decline in number this year. Some 17,000 will receive baccalaureates in June 1954, a drop of about 4500 from previous year. Heartening sign is expected rise of master and Ph. D. degrees over 1953's 4200.

AIRCRAFT CONTROL system which automatically lands planes on rolling and pitching decks of aircraft carriers has been developed by Minneapolis-Honeywell in cooperation with Bureau of Ships.

STRICTER FCC MONITORING of frequencies is likely for 1954-1955. Eisenhower's budget request for fiscal 1955 asked for almost \$1 million for frequency surveillance in the 10 to 27,500 KC range. It will aid more efficient spectrum allocation and bolster national security.

MILITARY

RADAR can be a decisive element in winning—or even preventing—wars. As has been done since science began, as offensive tactics were evolved, defensive ones have been developed to cope with them. Nowhere is this more manifest than in the closely guarded radar race. First countermeasures are developed, then counter-countermeasures, then counter-counter-countermeasures, and so on. This is typified in the war on submarines, where search radar is made increasingly sensitive, and snorkels are made increasingly reflective. The latest thing in the works is a system which may become a keystone in our continental defense. It can jam enemy airborne radar on any frequency, up to several hundred miles away. And the race goes on, at each step pointing up the need for a large pool of highly trained electronic engineers.

BROADCASTING

COMPUTATION OF DEPRECIATION for tax purposes appears to rest on an optimistic long life expectation, according to the existing Bureau of Internal Revenue schedule. A recent DuMont proposal filed with the Bureau presents a more realistic depreciation rate for TV equipment. It can affect station income for many years to come. Excluding building and towers, DuMont proposes that the overall life of TV station equipment be set at six years for VHF and five years for UHF, instead of the present interim rate of 15 years for audio and 10 years for video equipment. Suggested life span for specific equipment involved follows similar pattern.

EMPLOYMENT

ENGINEERING PERSONNEL REQUIREMENTS for 1954 are about on par with the previous year. According to the Engineering Manpower Commission, out of 106 companies seeking technical college graduates in 1954, 52 have same requirements as a year ago, 30 want more, and 24 want fewer. In 1953, 56 wanted the same, 33 wanted more, and 10 wanted less than the year before.

COMMUNICATIONS

EXTREMELY LONG DISTANCES are being covered by transmissions from VHF and UHF communication and TV transmitters. Multi-channel telephone carriers are spanning the Mediterranean with 300-mile jumps. Experiments at 400 mc indicate reliable operation with medium power over 100 to 200 mile links. Several TV stations in Texas and Mexico report clear reception from 250 to 330 miles away. With the development of high-power transmitters and very-high-gain antennas especially designed for point-to-point communications at frequencies below 1000 mc, we can look forward to greater utilization of the spectrum for long distance communications, both within countries and between continents.

INTERNATIONAL

A NEW LANGUAGE for scientists and engineers, Interlingua, is very slowly but surely starting to gain acceptance. It is based on the fact that the languages of the West fall into one pattern, called Standard Average European. Since science is a kind of supranational language, scientists understanding Interlingua would be able to follow developments in other countries without spending much time learning several other languages. Interlingua, which is not intended to be a single world language for all people, was started in 1923 by a group

of technical men. Now, a 27,000-word Interlingua-English dictionary, including 17,000 technical terms, is in preparation. The new medium can often be read with little reference to the dictionary. For example, "Energia es necessari pro toto que occorre in le mundo," means "Energy is necessary for all that occurs in the world."

COLOR TV PICTURE TUBES

One of the big limitations on the growth of color TV has been the small size of most of the picture tubes available. This obstacle is starting to disappear, and one of the most welcome indications is the announcement of a 19-inch tricolor tube, which RCA plans to make available in limited quantities during the latter half of 1954. Dr. D. Joseph Donahue is shown comparing the 15-inch shadow mask tube with the new model. RCA reports that it is also working on a focus-mask type rectangular tube, 21 inches and very bright, for production next year.

1954 IRE National Convention

Kingsbridge Armory will house 3 meeting halls and 600 manufacturers' exhibits

MARCH 22nd will mark the beginning of another record-breaking four-day IRE National Convention. New York City's Waldorf-Astoria and Shelton Hotels will provide four session halls this year for the presentation of the majority of the 243 scheduled technical papers. Additional facilities for the presentation of three simultaneous technical sessions will be provided at the Kingsbridge Armory in the Bronx. A total of 51 sessions, topping last year's figure of 43, will be held in the seven meeting halls between March 22 and 25.

Exhibits of the Radio Engineering Show, formerly located at Grand Central Palace, will also be housed at the armory. Attendance is expected to surpass 1953's record of 35,642 and it is reported that 600 exhibits, better than a 40% increase over last year, will be erected on the four-acre floor of the armory.

The convention's social program will be initiated by a "get-together" cocktail party on March 22 in the Grand Ballroom of the Waldorf-Astoria. Two evenings later, the Grand Ballroom will be the scene of the Annual Banquet, at which Dr. Alfred N. Goldsmith, Editor Emeritus and co-founder of the IRE will deliver the major address on the topic: "IRE—Past and Future." (Dr. John R. Pierce, of the Bell Telephone Laboratories has been named Editor of the Proceedings of IRE for 1954.)

William R. Hewlett will formally

assume the presidency of the Institute at the Convention's opening meeting on March 22nd at 10:30 A.M., also to be held in the Waldorf's Grand Ballroom. Professor John D. Ryder will be the principal speaker at this meeting.

The technical program includes the following papers:

Monday, March 22

SYMPOSIUM: ADVANCES IN MOBILE COMMUNICATIONS

- "Transient Response of Selective Networks and Impulse Noise in Narrow Band FM Receivers," by S. P. Lapin and J. J. Suran
- "Advances in Petroleum Mobile Communications," by L. A. M. Barnette
- "A New Approach to 450-470 Mc Communications Equipment," by R. W. Tuttle
- "Operation and Planning on a Utility System," by A. B. Buchanan

INFORMATION THEORY I—APPLICATION OF INFORMATION THEORY TO COMMUNICATION SYSTEMS

- "Information Theory—Past, Present, and Future," by R. M. Fano
- "Optical Filters—Their Equivalence To and Difference From Electrical Networks," by T. P. Cheatham, Jr.
- "Theoretical Improvement in Signal to Noise of Television Signals by Equivalent Comb Filter Technique," by M. B. Ritterman and M. J. Stateman
- "Information Losses in Regenerative Pulse Code Systems," by W. D. White
- "A Gaussian Noise Generator for Frequencies Down to 0.001 Cycles Per Second," by D. F. Winter

AERONAUTICAL AND NAVIGATIONAL ELECTRONICS I

- "An Impulse Generator for Receiver Performance Measurement," by J. H. Vogelmann
- "Aerial Methods in Microwave Survey," by M. Sheldon and L. Dickerson
- "The Development of a Production Radome Tester," by R. P. Walcutt
- "A Correlation Direction Finder for Guided

- Missile Range Instrumentation," by M. S. Friedland and N. Marchand
- "Present Status of Microwave Radiometric Receiver Development," by R. M. Ringo

QUALITY CONTROL AND RELIABILITY

- "Improving Reliability of Electronic Equipment by Effective Analysis of Field Performance," by R. R. Landers
- "A Survey of Electronic Failure Prediction Techniques," by J. H. Muncy
- "A New Approach to the Attainment of Reliability in the Production of Airborne Electronic Systems," by A. Warsher and F. Hanusek
- "A Method of Testing and Evaluation of Complex Missile Systems," by E. J. Althaus, S. C. Morrison, and W. R. Tate

RADIO TELEMETRY AND REMOTE CONTROL I—SYSTEMS AND ELEMENTS

- "Guided Missile Range Instrumentation—A New Electronic Art," by M. S. Friedland
- "Interpretation of Sequential Samples from Commutated Data," by L. L. Rauch
- "Comparison of Required Radio Frequency Power in Different Methods of Multiplexing and Modulation," by M. H. Nichols
- "Flight Testing of an Airborne Digital Computer," by E. M. Grabbe and D. W. Burbeck
- "Evaluation of Magnetic Tape Equipments for Telemetering Instrumentation," by R. E. Rawlins

ELECTRONIC COMPONENTS I—TECHNIQUES

- "The Effect of Maintenance on Reliability of Complex Military Electronic Equipment," by J. B. Arnold

William R. Hewlett
President of the IRE for 1954

- "Miniaturized Computer Applications of the Hughes Diode," by S. G. Lutz
- "Subminiaturization Techniques for UHF Communication Equipment," by G. Shapiro
- "Synthetic Quartz Crystals for the Electronic Industry," by D. R. Hale and W. H. Charbonnet
- "Application of Precise Components in Permeability Tuned Oscillators," by D. M. Hodgkin

RADIO COMMUNICATIONS I—SYMPOSIUM: FACSIMILE

- "Facsimile Systems," by A. S. Hill
- "Operation of International Commercial Radiophoto Circuits," by M. P. Rehm
- "Applications of Facsimile in the USAF," by H. R. Johnson
- "Application of Cathode-Ray Tubes in Facsimile Systems," by W. H. Bliss

Preview

Latest electronic engineering developments to be covered by 243 technical papers in 51 sessions. Kingsbridge Armory houses 600 manufacturers' exhibits on single floor

Wednesday, March 23

AERONAUTICAL AND NAVIGATIONAL ELECTRONICS II

- "The Digital Airborne Digital Computer," by E. Bolles
- "New Fixed-Beam Instrument Approach System for Aircraft," by R. A. Hampshire
- "The Role of Flight Directors in Present-Day Aircraft," by N. L. Graham
- "The Navaglobe Long Distance Navigation System," by C. T. Clark, R. I. Colin, M. Disha, I. Gordy, and M. Rogoff
- "The N-I Compass," by R. C. Rosaler

ENGINEERING MANAGEMENT I

- "The Engineer and Return on Investment," by S. C. Peek

Inside armory exhibitors will occupy 4 1/2 acres of floor space

- "Technical Information: Communication for Research," by C. De Vore
- "A Working Philosophy for Engineering Management," by T. G. Slattery
- "Organization for Operations Research," by F. Weldon
- "Training for Operations Research Groups," by T. Page

RADIO TELEMETRY AND REMOTE CONTROL II—TELEMETRY

- "A 227 Mc Pulse Position Modulation Telemetry System," by D. G. Mazur

- "Crystal Control Low Distortion FM Telemetry Transmitter," by R. E. Rawlins
- "A Crystal Controlled FM Telemetry Transmitter," by F. N. Reynolds
- "A New Subcarrier Oscillator," by J. W. Wynn

AUDIO I—HIGH FIDELITY

- "Large Area Microphones for Distant Pickup Use," by T. Aamodt and F. K. Harvey
- "The Enhancement of Music by Reverberation," by D. W. Martin

(Continued on page 134)

New Products at

Previews of new equipment and what

Booth 7 Capacitors

"Centrathene" insulated molded disc ceramics are said to have high breakdown to ground, lead strength, and resistance to mechanical damage. The units can be placed directly against a chassis or adjacent to high voltage

leads without danger of flashover or breakdown. Voltage ratings are 1,000 VDCW to 4,000 μf , 600 VDCW to over 4,000 μf . Tolerance is $\pm 10\%$ 5 μf through 680 μf , $\pm 20\%$ 750 μf through 3,300 μf . Guaranteed minimum value, 4,000 μf through 10,000 μf . **Centralab, Div. Union-Globe Inc., 900 East Keefe Ave., Milwaukee 1, Wis.**

Booth 123 Capacitor

The piston type variable trimmer capacitor shown in the illustration is a

new development with a dust-proof metal cap with an extruded lead-in rather than the old wire wound pigtail lead-in. Another new feature soon to go into production, is a piston capacitor with an invar band and an invar sheet lead-in without soldering or other metals which will eliminate loss due to metals and add stability to capacitance. **JFD Manufacturing Co., 6101 Sixteenth Ave., Brooklyn 4, N.Y.**

Booth 129 L,C Meter

Designed for the development engineer, type 130 L,C meter enables quick readings of inductance and capacitance values while circuit changes are being made. It is also suitable for testing sorting, and color code checking on a pro-

duction basis. The unit has coarse and fine zero adjustment controls and an illuminated 4-inch meter. Five ranges, 0-3, 0-10, 0-30, 0-100, and 0-300 μh or μf are accurate within 5% full scale. Weight, 9 lbs. **Tektronix, Inc., P.O. Box 831, Portland 7, Ore.**

Booth 261 TV Camera System

The "Kay-Lab" TV Camera System comprises three basic units: camera; camera control; and synchronizer monitor. The system enables the installation of additional cameras and controls without equipment duplication. Use of an accessory modulator unit enables

distribution of the composite TV signal at video level or at the frequency of any of the standard commercial broadcast channels. Scanning lines, 525; Interlace, 2 to 1; Field repetition rate, 60/sec.; Frame repetition rate 30/sec.; line repetition rate 15,750/sec.; Synchronization, AFC power line frequency; Camera band width, 8 MC.; Video line amplifier band width, 8 MC. **Kalbfell Laboratories, Inc., P.O. Box 1578, 1090 Morena Blvd., San Diego 10, Calif.**

Booth 281 Power Supplies

The series "RP" 41, 42, 43, and 44 regulated dc power supplies are dynamically compensated to provide zero or slightly negative internal impedance to compensate line voltage between the power supply and the consumer. Sup-

plies are rated nominally as follows: RP-41, 250 v. 0-50 ma.; RP-42, 250 v. 0-100 ma.; RP-43, 400 v. 0-50 ma.; RP-44, 400 v. 0-100 ma. All regulators have a stability of 0.5% at rated voltage over the full load range with line voltage variations between 10% above and 10% below rated value of 117 v., 60 cps. **Millivac Instrument Corp., P.O. Box 997, Schenectady, N.Y.**

Booth 330 Delay Lines

Compact delay lines designed to satisfy a specific need are now available and can be obtained in a tubular shape or a package with a wide range of

mountings. The delay line for color TV shown has the following specifications: Delay, 1 μsec , nominal; Impedance, 1,000 ohms $\pm 10\%$; Voltage rating, 500 v.; Frequency response, phase, linearity within 1% over 6 MC's; amplitude, flat within 0.5 db to 3.5 MC., down 1.5 db at 5 MC., down 3 db at 8 MC., down 6 db at 10 MC. Leads 2 in., No. 20 tinned copper. **Technitrol Engineering Co., 2751 North 4th St., Philadelphia 33, Pa.**

The IRE Show

Exhibits will display at the convention

Booth 386 Measuring Set

The "Universal" measuring test set for direct current consists of three identical instruments having a full scale sensitivity of 5 ma and 100 mv, and a galvanometer. Each instrument will measure ma., amps., mv., and

v. As they are interchangeable, the user can combine those he needs to perform desired measurements. The galvanometer has a basic sensitivity of 50-0-50 μ a with multiplying factors of 1.3/10/30/100. Accuracy ± 0.5 %. Ranges, 1 μ a to 60 amps. Voltage, 1 mv. to over 750 v. Scale length 4 in., each instrument. **Sensitive Research Instrument Corp., 9-11 Elm Ave., Mount Vernon, N. Y.**

Booth 711 Reflection Coefficient Meter

Model 136A, a reflection coefficient meter, is designed for the rapid measurement of reflection coefficient or VSWR. The unit includes a local oscil-

lator that is continuously tunable from 92 to 355 MC and an i-f amplifier centered at 60 ± 2 MC. The oscillator produces a harmonic in the range 184 to 710 MC, and a third at 276 to 1,065 MC. Any harmonic can be used to mix with the incoming signal to produce the 60 MC i-f signal. **Sierra Electronic Corp., San Carlos 2, Calif.**

Booth 786 Oscillator-Wavemeter

Model U-4, a new type grid-dip oscillator-wavemeter, is designed specifically for UHF-TV band use. It covers the 450 to 900 MC range in excess of the allocation for UHF video transmission. Tuning element uses low-loss cav-

ity resonated to desired frequency by a split-stator type capacitor. The resonant cavity is coupled by a small external loop that is not part of the tuned circuit. The unit is designed to enable ready access to other cavities, transmission lines, or virtually any type of UHF tuned circuit. **Linear Equipment Laboratories, Brightwater Place, Massapequa, L. I., N. Y.**

Booth 533 Tubechecker

Model 981 type 2, proportional mutual conductance tubechecker, consists of a vacuum tube and voltage regulator tester mounted in one assembly. Protection against obsolescence is obtained by use of nine single-circuit,

twelve-position, selector switches which make possible more combinations of tube connections. Three toggle switches enable checking and comparing the sections of twin section tubes at one selector switch setting. Sockets are provided for conventional type tube bases as well as for acorn, and 7 and 8 pin subminiatures. **Weston Electrical Instrument Corp., Newark 5, N. J.**

Booth 776 Milliammeter

A new design ink-writing, dual-recording milliammeter uses standard curvilinear chart paper and features two independent channels and four selective chart speeds. The speeds range from 12 in./hr. to 12 in./min. allowing

continuous recording up to 100 hrs. Frequency response ranges through 15 cps with an accuracy of ± 5 % from dc through 6 cps. Sensitivity is 0.45 in./100 μ amps. with a linear recording range to 500 μ amps. Unidirectional recording is possible to 1 ma.—**Texas Instruments, Inc., 6000 Lemmon Ave., Dallas 9, Texas.**

Booth 810 Code Sender

Smaller and lighter than a typewriter, the Model EBC2, is a new, simplified device for automatically sending Morse code. Leads are clipped across a hand key or to a transmitter and a touch of the letter buttons of the unit

forms the code message electronically at any speed from 10 to 75 wpm. Designed for ac or dc operation, the unit contains only 12 miniature tubes, and has a continuously variable speed control. It also incorporates encapsulated unit cells, a self-contained monitor, a keying relay output, and an internal power supply. **Codetyper Laboratories, 530 Fifth Ave., New York 19, N. Y.**

IRE Show Exhibits

Previews of the latest electronic equipment that

Booth 823 Color TV Conversion

A new color conversion package converts any monochrome synchronizing generator for color, generates standard color bars, and encodes output of color bar generator, color camera chain, or

color slide scanner to produce composite color video signal. The equipment consists of model ISG-1 interlace signal generator, model CBG-1 color bar generator, model CC-1 color coder, and power supplies. Interlace signal generator produces 3.579545 MC reference signal. Oscillator output is available at 75-ohm termination, and at output of three isolation and distribution amplifiers. Wickes Engineering and Construction Co., 12 St. and Ferry Ave., Camden 4, N. J.

Booth 520 Electronic Counter

Pulse or sync wave signals of 10 mv or greater at frequencies up to 1000 cps are counted by model 21 electronic totalizer. Two decade counting tubes are used with a six-digit mechanical register. Decade-counting tubes are rated at 10,000 hours and the 5000 hour

industrial type electronic tubes are operated at a fraction of their normal load for comparable long life. A remote start-stop connection is provided in addition to the manual switch to facilitate counting over controlled time intervals. Potter Aeronautical Co., Route 22, Union, N. J.

Booth 409 Power Supply

The 6/12 v. Duovolt Genemotor incorporates two 6 v. input windings, each having its own field, for the operation of mobile radio equipment requiring a dual-voltage power supply. Duovolt powered radio equipment may be transferred from one car to another,

regardless of battery voltage, without impairment of transmitting or receiving quality, without replacement of the Genemotor, and without modification of the wiring hookup. The Duovolt is the same size as standard Carter Genemotors except for $\frac{7}{8}$ in long length. End brackets with removable cover plates permit easy commutator inspection. Carter Motor Co., 2644 N. Maplewood Ave., Chicago 47, Ill.

Booth 390 Connectors

Series SM and MX subminiature and miniature connectors, produced in England, are highly specialized. The Type MX, are small, lightweight, non-military plugs and sockets with a matched impedance of 63 ohms. Teflon insulated, the units have spring loaded quick con-

nect-disconnect action. The type SM are fractional size and weight constant-impedance connectors. Frequency limit is 2,000 MC/S. Maximum voltage 500 v. peak; 50 to 70 ohms. Units are heavily silver plated. Transradio Ltd., 138A Cromwell Road, London, S.W.7, England.

Booth 715 Capacitors

A representative line of polystyrene capacitors, in standard and extended temperature stabilized ranges in values from 0.01 to 10 rf at tolerances from 0.1 to 1.0%, features a 1 mfd. ultra precision capacitor that enables setting to 1 part in 10,000 with long time stability in

the order of 0.03%. These units also exhibit temperature coefficients of 100 P.P. M./°C. to 140° F. Conservatively rated at 200 v. dc, the units show no trace of voltage coefficient. Inherent noise is not measureable. The capacitor is hermetically sealed, and has all the advantages of high insulation resistance, low power factor and soakage. Southern Electronics Co., 239 W. Orange Grove Ave., Burbank, Calif.

Booth 387 Amplifier

The FXR Type B810A standing wave amplifier is designed to provide full utilization of the latest precision slotted sections and probes when measuring the impedance or VSWR in a coaxial or wave guide transmission line. VSWR range is to 100. Noise level is less than

0.03 μ v. Variable 3.5 to 9 ma. constant current-metered bolometer bias. Automatic bolometer protective circuit. Narrow and wide band operation. F. J. Machine Works, Inc., 44-14 Astoria Blvd., Long Island City 3, N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES

ts and New Products

will be on display during forthcoming convention.

Booth 817 Time Delay Generator

Model 221A time delay and gate generator gives a high-resolution, accurate time delay from an external trigger source. It also generates both positive and negative gate pulses whose width corresponds to the delay for

which the instrument is set. Five ranges of pulse delay are available with upper limits as follows: 1.0, 10, 100, 1,000, and 10,000 μ secs. Positive and negative delayed outputs from a blocking oscillator through a cathode follower and from the plate, respectively, are available. **Electro-Pulse, Inc.**, 11811 Major St., Culver City, Calif.

Booth 869 Surface Indicator

The Model BL-110 is designed accurately to measure surface finish roughness ranging from 1 to 1,000 microinches. It can be calibrated to read directly in arithmetic average or RMS microinch deviation from the mean surface. A variable cut-off switch permits the separation of waviness and roughness characteristics of surfaces by filtering out wavelengths exceeding

0.03, 0.010, or 0.030 inch. The instrument case contains the indicating meter, amplifier, power supply, contacts. The hinged cover houses the pickup and precision reference specimens which comply with the American Standards Association, Standard B 46.2 and the Society of Automotive Engineers' requirements. **Brush Electronics Co.** 3405 Perkin Ave., Cleveland 14, Ohio.

IRE Exhibit Summaries

Booth 106-108 Inverters

Several models of inverters, emphasizing new type of control and shock mount. Demonstration of vibration isolating mechanism. **Le-land Electric Co.**

Booth 141 Packaging

New approach to packaging electron tubes and delicate instruments. Methods of reducing shipping costs. **Cargo Packers, Inc.**

Booth 155 Broadcast Equipment

New 1-kw UHF-TV transmitter, system for AM remote control, and portable remote equipment for AM and TV. Also, consoles, plug-in amplifiers and standby transmitter. **Gates Radio Co.**

Booth 214 Control Panels

Illuminated control panels, dials, knobs, and switch assemblies. Test equipment for organic coatings. **Universal Aviation Equipment, Inc.**

Booth 350 Metal Strip

Very close tolerance strip metals, tin gages, foils and clad metals. Coil metals, silver brazing material, and thermostatic bimetals. **American Silver Co.**

Booth 424 Signal Generators

New time-delay generators, pulse generator, pulse train calibrator, range sweep generator, and other test instruments. **Rutherford Electronics Co.**

Booth 465 Wire & Cable

Fine wire, ground rods and clamps, guy strand, antenna wire, grounding wire, hook-up wire, twin-lead, and coaxial cables. **Copperweld Steel Co.**

Booth 488 Fuses

Small dimension fuses of various types. Dual-element, slow-blowing fuses, and fast acting fuses for circuit protection. Fuse blocks, clips and holders. **Bussmann Mfg. Co.**

Booth 490 Capacitors

Mica capacitors, paper capacitors, and electrolytic capacitors. Engineering consultation. **Sangamo Electric Co.**

Booth 489, 493, 496 Color TV Equipment

Color film and slide equipment,

color TV test devices for manufacturers and broadcasters, color TV microwave. New surface-barrier transistor. **Philco Corp.**

Booth 501 Solder

New line of solders and fluxes for printed circuits, and low melting alloys for use with diodes and transistors. General purpose rosin-filled solder. **Alpha Metals, Inc.**

Booth 511-513 Phototransistors

Compact transistorized automatic headlight dimmer for cars features phototransistors and junction transistors. Also, hermetically sealed power diodes. **Radio Receptor Co.**

Booth 523 Magnets

New type of permanent magnet, TV focusing units, polarized relays, high frequency mechanical oscillators, and loudspeaker magnets. **Indiana Steel Products Co.**

Booth 692 Engineering Study

Home study engineering courses in radio broadcasting, TV, communications and servicing. **Capitol Radio Engineering Institute.**

Booth 705, 802 Winding Machines

Automatic and semi-automatic toroidal coil winders, new winder for subminiature coils, new tape winding machine, and new shuttle head assembly for winding stacked coils. **Boesch Mfg. Co.**

Booth 725, 727 Resistors

Standard and special power resistors, miniature resistors, resistor decade box, and screw-base resistors. **Clarostat Mfg. Co.**

Booth 744 Rectifiers

Rectifier used in magnetic amplifier circuit, and selenium rectifiers. **Kotron Rectifier Corp.**

Booth 756, 758 Potentiometers

Precision potentiometers employing spot-welded taps. **Helipot Corp.**

Booth 814 Microwave Lens

New reflectionless lens for microwave relays, design of free space antenna test rooms and radomes. Low-loss dielectrics and gas tubes. **McMillan Laboratory.**

Booth 835, 837 Printed Circuits

Various new grades of materials for printed circuitry. **Formica Co.**

Capacity Commutator Eliminates

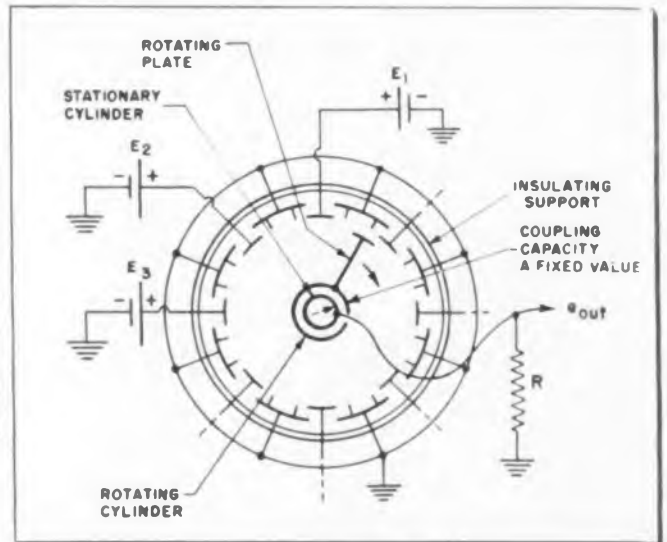

Fig. 1: (l) Crude capacity commutator would induce spurious voltages, crosstalk and be subject to friction. Fig. 2: (r) Improved design eliminates rotary joint by using coaxial cylinders. Ground plates between input plates provide shielding of static charge and decoupling

By DR. ANGELO MONTANI
Fairchild Guided Missiles Div.,
Wyandanch, N.Y.

THE drawbacks of mechanical commutators are too well known for a detailed description. These drawbacks originate from the inherent destructive frictional effect between the sliding contacts. After a few hours of operation, chatter increases beyond tolerance and the imbedding of metal particles between the adjacent contacts introduces objectionable interchannel crosstalk. As a result, the life of any conventional type commutator is always too short, even when the operating speeds are limited to only a few revolutions per second.

Mechanical commutators have already taxed the ingenuity of designers for quite a long time, and it is best to consider whether sequential electrical contacts could be practically established by avoiding at the same time any mechanical contact. Hence, if a solution exists, it will be found by exploiting a phenomenon entering the "action at a distance."

Sequential Coupling

Eliminating, because of practical considerations, the effect of magnetic induction, the only remaining alternative is the investigation of the forces between electrical charges. That is, a variable-capacity type of sequential coupling.

The expression for the current across a variable capacitor is first

determined. The electrical charge on a capacitor is

$$q = CE \quad (1)$$

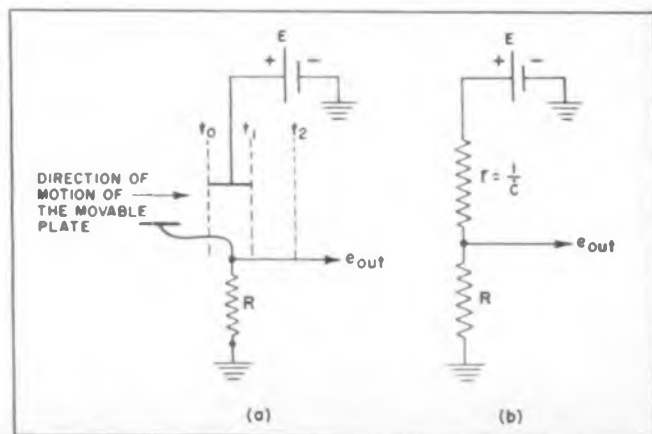

where:
 q = charge
 C = capacity
 E = volts

Assuming that the capacity increases linearly with time, as in the case of a rectangular parallel plate capacitor gradually meshing along one of the sides,

$$i = EC \quad (2)$$

In the above equation C has the dimensions of a conductance. That it is an actual conductance can be verified by differentiating with respect to time the dimensional formula for capacitance. This conductance may then be employed for sequentially connecting several inputs to a common output on a time sharing basis. A first mechanical

Fig. 3: (l) Circuit configuration of commutator element. For simplification, fringing effect is ignored by assuming zero capacitance before t_0 . Fig. 4: (r) Output voltage curve for complete cycle from t_0 to t_2

Frictional Contacts

Fig. 5: (l) Circuit for analyzing unmeshing using ground plate. Fig. 6: (r) Output curve

Inherent drawbacks of conventional rotary contact commutators are overcome with new design. Outputs of several circuits are sampled on a time-sharing basis

interpretation of this conclusion is sketched in Fig. 1.

The crude capacity commutator of Fig. 1 would give very poor results. As a matter of fact it would not work at all and it is here mentioned only because it directly points out the need for an improved design. Referring again to Fig. 1, it is easily seen how any static charge on the inner surface of the insulating support would induce spurious voltages in the output circuit. Furthermore, the stray capacity between the adjacent output plates would introduce intolerable crosstalk between the sampled channels. Last, but not least, the rotary joint between the rotating plate and the stationary

output lead is still subject to the effect of mechanical friction.

In Fig. 2, the above shortcomings have been eliminated. First of all, there is no longer a rotary joint but a coupling capacitor of fixed capacity which is realized by means of two coaxial cylinders, insulated from each other. The inner cylinder being stationary and electrically connected to the output, while the outer one, carrying the sampling plate, is supplied with the motor torque. Interlaced with the input plates are located additional ground plates, which because of their sectional appearance may be referred to as π plates. They have a twofold purpose: Shielding the view of any

eventual static charge on the insulating support from the rotating plate, and affording the static decoupling between sequential input plates, thus eliminating crosstalk. Their surfaces are kept as far as possible from the surface of the rotating plate because the capacity between the π plates and the rotating plate appears periodically in parallel to the resistance R thus shunting the output voltage. Constant angular velocity rather than constant torque is postulated in the present investigation. In practice, a constant velocity system is always encountered because of "flywheel effect."

Circuit Configurations

A sequence of circuit configurations is here analyzed, each following configuration representing a closer approximation to any one of the individual channels of the commutator.

Referring to Fig. 3a the simplifying assumption is made that zero capacitance is experienced before t_0 and after t_1 (the fringing effect is ignored). The represented times refer to the instantaneous positions of the leading edge of the sampling or movable plate, which has the same relative dimensions as any one of the stationary plates.

After t_0 , the current equation is

$$i = (E - Ri)\dot{C} \quad (3)$$

Because of (2) which conveys knowledge of the variation of i with C when the restriction

$$\dot{C} = 0 \text{ is also introduced,}$$

the output voltage across R can be written down immediately.

$$e_{out} = ER\dot{C}/(1 + RC) \quad (4)$$

Between t_0 and t_1 , the circuit of Fig. 3b is equivalent to that of Fig. 3a. Hence e_{out} is a step at t_0 .

Another way of getting to the result would have been to solve for the equation

$$Rq + [q/(C + at)] \quad (5)$$

where: $C + at = C(t)$
for $t_0 < t < t_1$.

Then letting C tend to zero and entering the initial condition of zero charge

$$e_{out} = ERa/(1 + Ra) \quad (6)$$

which is the same as (4) because

$$\dot{C} = a \text{ if } \dot{C} = 0$$

Also, for the unmeshing portion of the cycle, (5) becomes

(Continued on page 181)

Ultrasonic Metal Delay Lines

NBS investigation discloses materials which yield thermally stable delay lines. Finding should lead to improved computer and radar devices

THE National Bureau of Standards recently completed an investigation of metal ultrasonic delay lines for application in electronic computers, radar and ordnance devices. The study disclosed that use of isoelastic alloys containing combinations of iron, nickel, chromium, and other minor elements may solve one of the primary problems in this field—finding materials that yield a thermally stable delay line with respect to time delay. The investigation was conducted by R. W. Mebs, J. H. Darr, and J. D. Grimsley of the NBS thermal metallurgy laboratory.

A delay line is a device for slowing down or storing a signal in an electric circuit. At radio frequencies this can be done by transforming the electric signal into a much slower sound signal and propagating it through an appropriate medium. After a given length of time the sound signal is converted to an electric signal again.

The use of isoelastic alloys for delay lines is apparently new, although such materials have been known and used in other applications for over 50 years. Isoelastic

alloys are ones which have a constant modulus of elasticity with respect to temperature changes. Their primary use to date has been in watch springs and similar applications. Since one of the requirements for ordnance delay lines is ability to give constant signal delay regardless of temperature changes, only the isoelastic alloys and relatively few other materials can be considered for such a use.

Use of Quartz and Mercury

Up to the present time quartz, mercury, water, and certain magnesium alloys have exhibited some of the qualities needed for use in ultrasonic delay lines. Quartz and mercury have been used fairly extensively in certain applications, but both have drawbacks. Quartz is expensive and hard to shape or machine while mercury is thermally unstable and is susceptible to mechanical shock, leakage, aging, and contamination. Mercury has been used, however, in the long delay lines of the NBS Eastern Automatic Computer (SEAC). In some devices

Fig. 1: Buffer technique for tests in which crystals were cemented to short lengths of magnesium alloy rods. (A) Specimen; (B) clamp holder; (C) magnesium alloy buffer with cement-attached crystal; (D) Electrical connector. Special clamp holds buffers against delay lines under test

Fig. 3: Block diagram of equipment used to measure ultrasonic delay lines

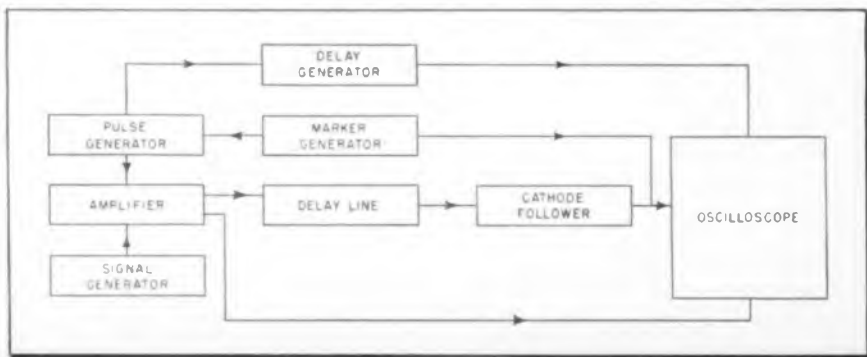

Fig. 2: Thermal stability of metal materials studied by NBS. FS-1 is for magnesium alloy

it is desirable to use a material that will transmit 10-mc pulses, without appreciable attenuation or distortion of the signal, and give a 50 μ sec time delay. At the same time the material must be thermally stable and be easily shaped into specific dimensions. No delay lines developed so far have all these qualities.

Before the delay lines could be investigated, certain problems relating to the transducers used to transform the signal had to be solved. Quartz-crystal transducers were found to be the most efficient elements. The crystals were cut so that they transmitted only shear waves. Careful acoustical matching between delay line and crystal was required. The Bureau adopted a buffer technique (Fig. 1) for preliminary tests in which crystals were cemented to short lengths of magnesium alloy rods. A special clamp was devised to hold the unmounted ends of these buffers against the delay lines under test. In the second method for attaching crystals to delay lines, the one which was used in the final investigations, crystals were cemented directly to the delay lines as they would have to be in potential service use. Best signal characteristics were obtained using epoxy type cement and overcuring it.

Various Lengths Studied

Although the principal objective was to obtain a line of a length which would produce a delay of 20 μ sec, specimens of various lengths were studied. This was done to determine the attenuation per unit length and the transducer or buffer loss associated with the various materials. Delay line length varied (Continued on page 178)

Fig. 1: Computing equipment in Project Cyclone Simulation Lab. Power supplies and voltage regulators are located in room behind laboratory

"REAC" Computer Reliability

Data gained from experience of large analog installation in Project Cyclone Simulation Lab points up design features and operating procedures for enhancing reliability

By **BERNARD LOVEMAN**
Reeves Instrument Corp.
215 E. 91 St., New York 28, N.Y.

PROJECT Cyclone at the Reeves Instrument Corp. is under the cognizance of the Bureau of Aeronautics of the Dept. of the Navy. The primary function of Project Cyclone is the development and operation of a Guided Missile Simulator and the establishment and operation of a Simulation Lab. Problems in aeroelasticity, engine control, aircraft stability, dynamics, and navigation have also been studied with the aid of these computing facilities.

Early in Oct. 1952, a new large simulation laboratory was put into operation and subsequently subjected to exhaustive acceptance tests. Fig. 1 shows an overall picture of the computing equipment of this laboratory. The power supplies and voltage regulators are located in a room behind the computer laboratory. The essential elements of this analog installation are the Reeves Electronic Analog Computer (REAC®) and the Reeves Computing Servomechanism.¹

In June 1953, Project Cyclone acquired a medium-sized, medium speed digital computer with magnetic drum storage, the Elecom 100. This computer is being used primarily to obtain checks on the analog computer solutions.

The problem of maintenance and reliability becomes more and more serious as the complexity and size of a computing facility increases. The size of an analog computing installation may be evaluated in a variety of ways. Criteria useful in this evaluation are

- a) the number of computing amplifiers,
- b) the number of vacuum tubes and crystals, and
- c) the power consumed.

The new REAC Simulation Lab. contains 404 dc. amplifiers, 2950

vacuum tubes, 392 crystals and consumes about 35 kw. A detailed breakdown of the components in the laboratory is given in Table 1.

From the users' point of view, the most significant criterion of size is expressed in terms of the problems that can be solved. At Project Cyclone problems involving the equivalent of as many as 91 first order ordinary differential equations, linear or nonlinear, can be solved.

Comparison of Computers

At this point a comparison of analog and digital computers is in order. The reliability demanded of parts in digital computers will be appreciably greater than that of corresponding components in their analog cousins. This can be shown

TABLE 1—COMPONENTS IN SIMULATION LABORATORY

Tubes		Components	
Type	Number		Number
6SJ7	1222	Crystals (IN38)	392
6L6	536	Neon Bulbs (NE51)	376

"REAC" COMPUTER (Continued)

by tracing the steps involved in obtaining the solution to a complex problem. For analog computers the first step is to decide on the simulation technique and code the problem accordingly. A similar procedure is followed for digital machines where a numerical method is selected and the problem coded. The second step is to insert the code into the computer. On analog computers, this is accomplished by interconnecting the appropriate components with patch cords; on digital computers, an input device is provided. The third step for both analog and digital computers is trouble-shooting the setup or code checking.

Here the similarity ends; for in a dc analog computer the time for one solution is usually 60 to 90 seconds. On the other hand, for most digital computers, especially where a large number of variables must be printed out, a single solution may take from one to several hundred hours. A component failure results in a significant difference because of this time factor. In the analog computer, a failure invalidates only one minute of computing time. In the digital computer, only error-free, permanently stored results can be salvaged.

A second important difference arises from the manner of detecting intermittent failures. It is well known that because such failures are more difficult to locate, they are far more serious than sudden total failures. In the REAC most voltages are "smooth" functions of time which are plotted on recorders or plotting boards. The presence of intermittent failures will be evidenced by irregularities in these functions and thus can be observed easily. In addition, the true over-

load system detects all sudden surges or pulses. On the other hand, the computing voltages in a digital computer are pulses and the machine output consists of tabulated values. An intermittent failure may be interpreted by the computer as a signal and cause a circuit to function improperly. All subsequent calculations are invalidated. The overflow circuits may detect this failure. However, as a general rule analysis is required in order to insure that results are free of error caused by such spurious signals.

Operating Differences

Two additional differences in operating procedure should be mentioned. The profusion of results from an analog computer facility requires that one or more operators be in attendance to monitor and process the solutions. For example, in one large problem the solution rate reached 200 runs per day. On the other hand, a digital computer may run unattended for many hours. Finally, an important feature of some analog installations, including Project Cyclone, is the flexibility of interconnection. This enables the operator to select the most suitable simulation setup and also the optimum number of components. From the standpoint of reliability, flexibility assures that no extraneous components will be used in the problem. This is in contrast to the digital computer or the prewired analog computer where all elements of the system must be operating to obtain solutions. Furthermore, the Project Cyclone Simulator may be divided into several parts in order to solve smaller problems. As many as four different problems have been on this computer at one time.

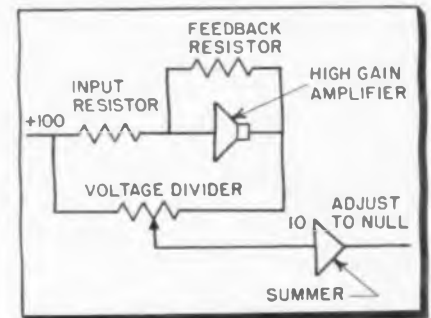

Fig. 2: Bridge circuit employed to measure the input gains of every computing amplifier

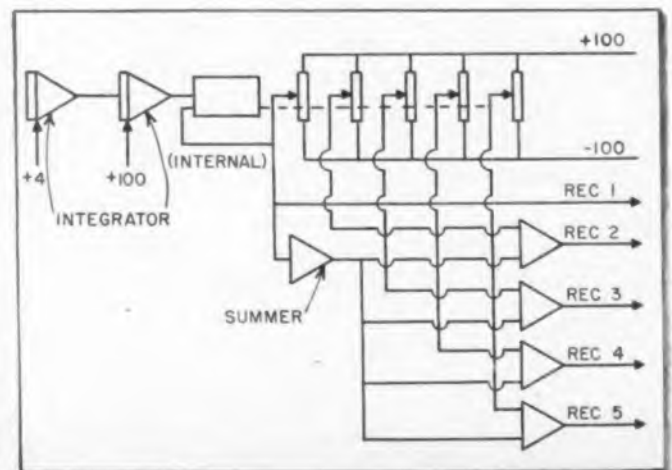

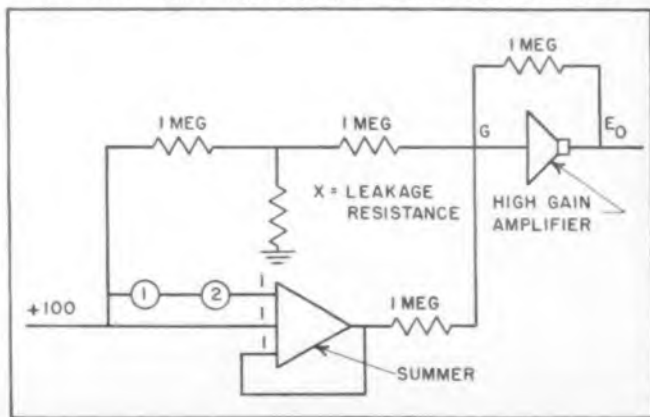

The acceptance test for the new Project Cyclone installation was divided into two phases. The first consisted of equipment checks. Every computing element in the system was performance tested and checked for accuracy. A few of the more interesting tests are described below.

Fig. 2 is a schematic of the bridge circuit used to measure the input gains of every computing amplifier. A Leeds & Northrup 0.001% voltage divider was used as the standard. The maximum permissible error in gain was 0.05%. 94% of the gains were within 0.025% of their nominal value; 70% were within 0.012% of their nominal value. The mean of the absolute values of the errors in gain was 0.01%.

The followup potentiometer of each servo was checked with a similar bridge. The setup used to check the multiplying potentiometers with the followup potentiometer taken as a standard is shown schematically in Fig. 3. The error voltages were plotted on a Brush recorder for the complete excursion of the potentiometer wiper. The maximum acceptable deviation was 0.05%.

The circuit used for measuring the leakage resistance to ground of interconsole leads is shown in Fig.

Fig. 3: (l) Checking servo multiplying pots with follow-up pot as standard. Fig. 4: (r) Measuring interconsole leakage resistance

Potentiometers 1 and 2 are used to null the setup before the inter-console resistance is plugged in. The leakage resistance is calculated from the formula,

$$X \text{ (MEG)} \approx 25/E_0$$

The equation is valid for

$$X > 100 \text{ MEG or } E_0 < 0.25 \text{ volt.}$$

The minimum acceptable leakage resistance was 1,000 megohms.

The second phase of the acceptance test consisted of a computing check. A highly complex nonlinear simulation problem, for which a numerical solution was available, was solved. An indication of the complexity of this problem is given by the fact that a single check solution took 75 hours of computing time on the IBM CPC. The problem required 304 computing amplifiers, 10 multiplying servos, 11 resolvers, 14 diode function generators, and associated equipment.

The REAC plots for 26 variables were checked against corresponding numerical solutions with excellent results. Figs. 5 and 6 show a comparison between the REAC and the numerical solutions for two of the variables.

Reliability

In an analog computer two classes of maintenance service are required, namely, adjustments and repairs.

Adjustments are provided in order to optimize the performance of the equipment as the components change characteristics. Some examples of adjustments are zeroing computing amplifiers, setting gain and damping controls of computing servomechanisms, and balancing limiting amplifiers. These adjustments are made as required, once a week or less frequently.

Repairs are required whenever a failure occurs. Failures arise from three causes,

- a) defective parts,
- b) operator abuse, and
- c) component deterioration.

In general, the number of failures may be reduced by adequate inspection and testing to eliminate defective components wherever possible before installation in the system. The procedure at Project Cyclone is to inspect and measure all components when they are received and then check them operationally after installation. Occasionally manufacturing defects appear after appreciable operating experience. One example is a potentiometer card that contained a scribe indexing mark under the winding

TABLE 2—SELECTED FAILURE RATES FOR FIRST 12 MONTHS (2527 HOURS) OF OPERATION

Component	Number	% Failure Per 100 Hours
65J7	1,222	0.38
6L6	536	0.19
6SL7	451	0.29
12AU7	200	0.30
5691	91	0.22
Vacuum Tubes of all Types	2,952	0.38
Vibrators	483	0.057
Deposited Film Resistors	1,948	0.026
Servo Motors	40	1.08

which produced a week spot. After 1500 hours of operation, the winding broke. A change of manufacturing procedure has eliminated this type of failure.

Skilled operators are required in order to minimize failures and downtime. Operators may cause failures by carelessly overloading components. The following examples illustrate this point. If the reference computing voltage (± 100 v. in the REAC) is applied to the arm of a potentiometer which is at a low setting, excessive current will flow

used to evaluate the reliability of this analog installation. The first is based on the service-free hours and the second on the number of failures. These ideas are embodied in two coefficients defined below.

The first of these is the *reliability coefficient*,

$$R = 100 [1 - (S/T)]$$

in per cent, where S is the service time and T is the total scheduled operating time.

Service time is the repair time spent on failures arising from both component deterioration and operator abuse. It includes, in addition to equipment downtime, repairs performed in non-operating time. Under non-operating time are subsumed checkout periods, Saturday, and time spent on chassis replaced by spares. Service time does not include operator time spent in locating trouble; nor is the time spent in making adjustments included.

Because this is a flexible simulator, the failure of a component in many cases signifies that only a part of the system is inoperative; other problems will continue uninterrupted. This is not reflected in the factor, T.

The second coefficient is the *failure rate*, defined as the percentage of failures of a specified type per hundred operating hours. The coefficients are evaluated monthly.

Reliability Data

Project Cyclone's weekly operating schedule has been set at 50 hours by the Bureau of Aeronautics. This is achieved in a ten-hour day, five-day week. During its first year, the installation has been in operation 2,527 hours. The data presented in this report have been accumulated during this period.

When the new Simulation Lab. was installed, it was decided that, with the exception of operator checks, only breakdown maintenance would be provided as long as problems were plugged in; upon completion

(Continued on page 146)

Fig. 5: Results of computer acceptance test

through the turns and the winding will open. The operator may also damage the mechanical parts of a computing servomechanism. The servo motor is coupled to the potentiometers through a dry disc clutch with mechanical stops provided to prevent damage to them. If the voltage input to the servo is excessive, it will hit the stops; and if this voltage is maintained, the clutch will slip and be impaired. Finally, the operator must be able to distinguish between malfunction of the equipment and problem errors.

Failures due to deterioration will be reduced by conservative design and operating policy. Operating procedures which contribute to extending the life of computer components are time delay between the application of filament and plate voltage and adequate cooling.

Two complementary concepts are

How to Test NTSC Color with

By **W.B. WHALLEY**
Polytechnic Institute of Brooklyn
Brooklyn 1, N. Y.

THE black-and-white test charts which have been developed by the RETMA Engineering Department over the period 1945-1951 are almost invaluable for the overall and sectional checks of an NTSC color TV system. They were initially developed to test as many as possible of the characteristics of a black-and-white TV system. The fact that the most critical requirement of a

color system is that it reproduce black-and-white pictures accurately, makes these charts extremely important.

Checking Resolution

The first chart, known as the RMA Resolution Chart (of 1946), will be referred to as Chart A, and is shown in Fig. 1. It is designed to check horizontal and vertical resolution, both toward the center and the corners of the picture; some of the phase characteristics, at the higher frequencies by the shape of the reproduced fine structure of the vertical wedges, and at low frequencies by noting the trailing edge of the heavy "bars" at the top and bottom of the pattern: contrast and gamma by checking the output signal produced by the vertical and horizontal gray scales; the uniformity of background level of the camera and the system by observation of the intervening areas of the whole pattern:

and fairly accurate checks of the vertical and horizontal linearities and the aspect ratio.

The second chart, known as the RTMA Linearity Chart (of 1951), will be referred to as Chart B, and is shown in Fig. 2. It was specifically designed for accurate checks of aspect ratio, horizontal and vertical linearity, at the same time checking the horizontal and vertical blanking times.

Both Charts A and B are available as large opacities. Chart A is also available as a 2 x 2 slide transparency for use in flying spot scanners. Chart B could be used as a large transparency for placement over a monitor kinescope for alignment purposes.

In testing an NTSC color system, all of the tests listed above can be made, and, in addition, tests of registration of the camera or the color monitor and similarity of gradation in each of the primary colors can be checked.

Fig. 1: RMA Resolution Chart checks horizontal and vertical resolution, phase, contrast, gamma, background, linearity and aspect ratio

Black-and-White RETMA Charts

Widely used resolution and linearity charts may also be applied to testing registration of color camera or monitor, and similarity of each primary color gradation

In addition to the usual meters available in a studio it is essential that there be a good monitor oscilloscope, a good color picture monitor, and a good black-and-white picture monitor. The oscilloscope should fulfill the specifications of the IRE Television Studio Standards, and should be calibrated in percentage of maximum white and maximum sync amplitude. Associated with the master synchronizing and blanking generator, there should be 315 kc and 900 cycle sources to provide a bar pattern for linearity testing. In addition, it is valuable to have a vectorimeter to check the limits of the primary colors of the system.

After the usual warming-up pe-

riod, the black-and-white monitor should be adjusted for reasonable linearity, both vertical and horizontal, and for the correct aspect ratio, using the bar pattern generator and the transparent form of Chart B. As the linearity adjustments are made, the thin grating on the face of the monitor should closely line up with the centres of the circles of the Chart.

Chrominance Subcarrier

In Fig. 3 is shown a simplified block diagram of a typical NTSC studio, which should be referred to during the following discussion. Before proceeding further, the fre-

quency of the chrominance subcarrier crystal oscillator should be measured by using the beat with the auxiliary high stability temperature controlled master crystal generator, which is periodically checked against WWV.

Then the amplitude, symmetry, and the number of cycles of the burst signal should be checked on the oscilloscope. See Fig. 4.

By both dc and oscilloscope measurement (using test dc and ac voltages inserted at the points marked R₁, then G₁, then B₁), check the resistance ratios of the various sections of the matrices. Set the gains of all of the combining and inversion video amplifiers at their specified values, using test video frequency signals, the monitor oscilloscope and a VTVM.

Now place the opaque Chart B in front of the camera and accurately

Fig. 2: RTMA Linearity Chart is designed to check aspect ratio, horizontal and vertical linearity, and horizontal and vertical blanking times

TESTING NTSC COLOR (Continued)

position the latter so that the Chart image will completely fill the useful area of the pickup tube mosaic. It will be assumed that the dichroic mirror and lens assembly has already been tested and adjusted on an optical bench. Observing the black-and-white picture monitor, the camera line amplifiers should be switched to the various color channels (red, green and blue) to see if each centering control, for both vertical and horizontal, has some latitude for bringing the center of the picture to the same point on the monitor face for each pickup tube.

With the red and blue amplifiers disconnected, the green channel pickup tube should be adjusted for best operation. This includes adjusting the horizontal and vertical linearity so that Chart B appears on the black and white monitor to be superimposed upon the electrical bar pattern.

Replacing Chart B with Chart A, the green channel pickup tube is carefully adjusted for best focus, and, at the same time, the overall background level, high and low frequency phase characteristics are checked.

On the monitor oscilloscope, connected through a line selector, the gradation scale of this green channel may be observed. The gamma amplifier should be adjusted until the steps on the oscilloscope are reasonably uniform.

Next, the red channel should also be switched on so that the black-and-white monitor is receiving signals from both tubes. The vertical and horizontal linearity and centering adjustments must now be made for the red pickup tube, using Chart B in front of the camera. As the adjustments continue, each of the various circles on the Chart will change from a double image to more and more closely approximate a single image, indicating that the two pickup tubes are approaching registration.

Switching off the red channel, the blue channel should be connected and adjustments made in the same way as for the red channel. Throughout, the electron beams of the three tubes should be kept at best focus.

Replacing Chart B with Chart A, the resolution values for each of the

Fig. 4: NTSC waveform, showing color burst

channels, and for the combined three pickup tubes should be noted on the test wedges, and where necessary further trimming of the linearity and centering adjustments be made.

With the line selector connected to the monitor oscilloscope, the horizontal gradation scale of Chart A should be observed for each of the channels and for the three channels combined. Errors can be noted by the width of the horizontal portions of the step on the oscilloscope, and can be corrected by adjustment of the gamma controls on the red and blue channels to agree with the previously set green channel.

With a suitable tricolor monitor, the gradation wedge should appear of the same color throughout. Small differences in gamma adjustment of one channel with respect to another will show as a change in tint of the wedge at one place or another.

Transient Response

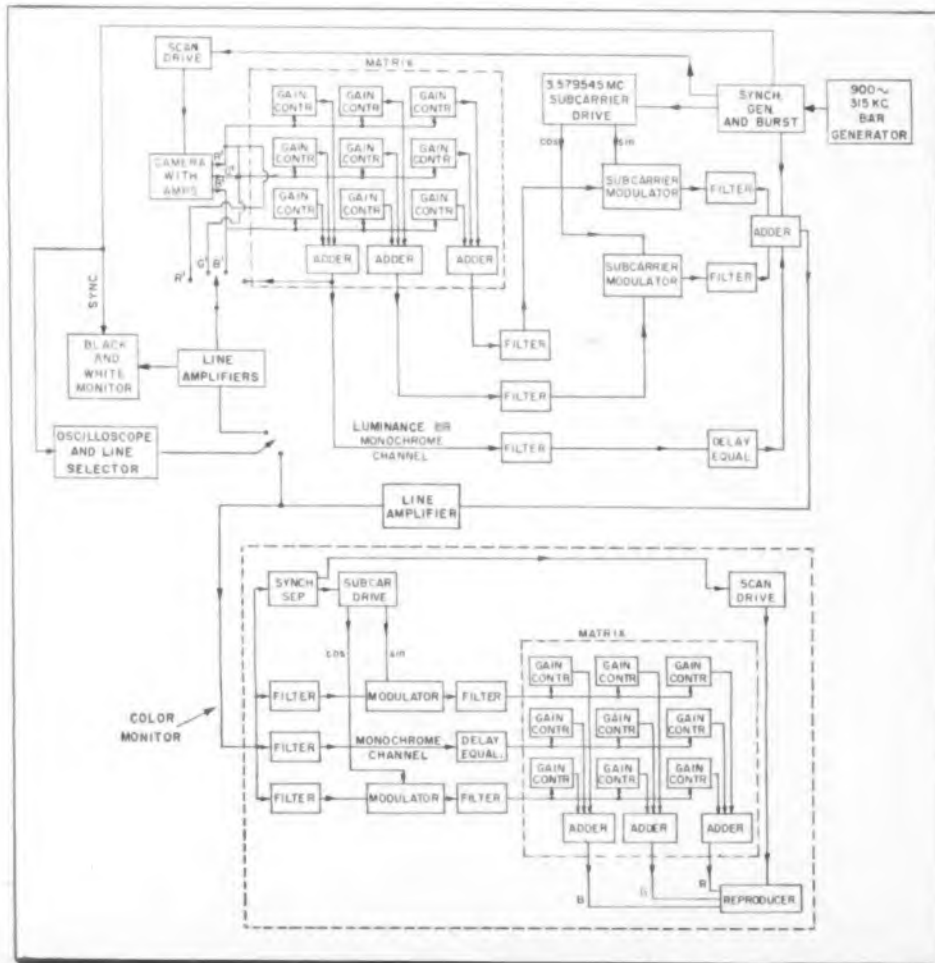

With the tricolor camera still viewing Chart A, any differences in transient response of the three color channels will show as changes in hue from the neutral gray, after the trailing edge of each of the heavy bars at the top and bottom of the pattern.

For adjusting a color flying spot scanner, the 2 x 2 slide of Chart A is most valuable. After adjusting linearity, centering and aspect ratio, each channel can be adjusted for maximum resolution as viewed on the black-and-white picture monitor. A check on equivalent time delay through each of the color channels from the photo tube to the matrix amplifier can be made by viewing on the same black-and-white monitor at the output of the matrices the resolution wedges with two channels connected at a time, and finally with all three channels.

As with the live pickup camera, the adjustment of the separate gamma amplifiers is made by observing the steps on the monitor oscilloscope.

The Atomic Battery

Beta emitter, strontium-90, working into silicon p-n junction generates sufficient power to operate transistor audio oscillator

LAST month at his offices in Radio City, Brig. General David Sarnoff, Chairman of the Board of RCA, demonstrated a thimble-sized atomic battery which for the first time converts atomic energy directly into small but useable quantities of electricity. The battery output was used to operate a transistor oscillator operating at an audio frequency. General Sarnoff interrupted the oscillator with a telegraph key to send the following two messages, "Atoms for peace," and "Man is still the greatest miracle and the greatest problem on this earth."

Present Output Small

The atomic battery was developed at the RCA Princeton Laboratories through the efforts of Dr. Irving Wolf, Dr. Ernest G. Linder, Paul Rappaport and other staff members. In its present form the electrical output is extremely small (1 microwatt—5 μ a @ 0.2v) and not yet such as to be applied with any great practicality. General Sarnoff pointed out, however, that three months ago the output was a billionth of a watt and that this thousandfold increase indicated that the research scientists were on the right track for significant practical developments in the near future. Another important characteristic of the atomic battery is that its half-life is twenty years. This of course would mean that batteries would last as long as the associated electronic equipment, and that as a completely reliable source of power, they would find extensive applications in military communications equipment, aeronautical com-

munications and navigation equipment, etc.

Fig. 1 shows a simplified sketch of the atomic battery. A radioactive source (in this case strontium-90 and yttrium-90—a waste nuclear by-product) as a β or electron emitter emits high velocity electrons (appr. 1 mev). Each of these electrons on striking the silicon produces an effect similar to secondary emission in the ratio of about 200,000 to 1. At the junction of the antimony and silicon an effect similar to the "contact potential" encountered in radio circuits occurs, and by con-

Closeup showing two basic elements of atomic battery. Strontium-90 is at right

necting a load across the silicon and antimony the battery circuit is complete.

Fig. 3: Curves showing current vs voltage of various silicon atomic battery units

necting a load across the silicon and antimony the battery circuit is complete.

Fig. 2 shows the potential distribution curve within a silicon p-n junction unit. Fig. 3 shows current vs voltage curves for various silicon units tested at the Laboratories. When used as a power generator, a large single silicon junction exhibits the following characteristics: From the 50-millicurie radioactive source, which has available about 200 microwatts of radioactive power, 0.8 microwatt of electrical power is de-

livered to a matched load of about 10,000 ohms. This represents a conversion efficiency of about 0.4%. Calculations indicate that a similar wafer of optimum thickness would give an efficiency of 2%.

Referring to Fig. 3, a maximum open circuit voltage of 250 mv. and a short circuit current of 10^{-5} amp have been observed in silicon. From the short circuit current, the multiplication of the beta current (which is 3.2×10^{10} amp) can be computed. A multiplication of 1.5×10^5 is obtained for silicon if corrections for wafer thickness compared to beta depth of penetration and surface recombination are taken into consideration. For germanium, using the same radioactive source, a maximum voltage of 30 mv. and a short circuit current of 2×10^{-5} amp have been observed, giving a corrected multiplication of 1.9×10^5 . Assuming the average energy of a beta particle from the $Sr^{90}-Y^{90}$ source as 0.7 mev, the cost in energy per charge carrier would be 3.7 e.v. for germanium and 4.7 e.v. for silicon.

"Vagabond" Wireless

Subminiature transmitter and self-contained antenna induction system does not require FCC approval. Design

"Vagabond" microphone contains transmitter, antenna and batteries, employs induction system for public address and entertainment work

By **THOMAS W. PHINNEY**
Shure Brothers, Inc.
225 W. Huron St., Chicago 10, Ill.

SINCE the first use of electrically amplified sound, audio engineers have been faced with the problem of minimizing the pickup of extraneous sound by the microphone. The usual approach to the problem is to keep the microphone and the sound source in close proximity. This may be comparatively simple if the sound source to be amplified has a fixed location. If, however, the source is mobile, as is frequently the case, the problem of maintaining this proximity can be a very difficult one. In the case of an individual performer, several approaches to the problem are possible.

A microphone on a fixed stand can be used. In many situations, the enforced immobility of the performer greatly reduces the utility of the system.

Alternatively, a microphone can be mounted on a boom and a trained technician so manipulate the microphone as to follow closely the sound source. This approach is satisfactory for motion picture and television work, but completely unsuitable for general public performance from the standpoint of expense as well as for obvious aesthetic reasons.

A method, frequently used in public address and entertainment work, is to attach the microphone to the user or to have him carry it. The most serious defect in this technique is the encumbrance caused by the microphone cable. The user must move about, dragging the cable after him and avoiding entanglements.

A solution to the problem which eliminates these difficulties is the use of a miniature radio transmitter which can be carried or worn by the performer. It was for this pur-

Fig. 1: Basic circuit of two-tube audio and three-tube r-f sections of mike's transmitter

pose that the Shure "Vagabond" system was designed.

When we set out to design a wireless microphone system, two basic avenues of approach lay before us. The first was to design a high frequency system with a large operating range which would adequately cover Madison Square Garden, or Soldiers Field. Such a system must necessarily be relatively high powered and hence have short battery life. It would definitely require a Federal license which would greatly restrict or even prohibit its use in the very applications which we wished to reach, namely, general public address work, and theater and night club entertainment. Furthermore, those frequency assignments which might be obtained are available on a non-exclusive basis and will be subject to greater and greater interference as time goes on. A final disadvantage of the licensed system was the strict technical requirements imposed by law. These requirements would make the design of a miniature transmitter more difficult and would certainly increase its cost.

Induction System

The second approach which we saw was to design an induction system which would have a relatively restricted operating range but would require no Federal licensing, and hence be available to any and all potential users. If such a system could be developed to give adequate performance, it would offer excellent operating economy through prolonged battery life and it would have to meet only those technical requirements dictated by satisfactory operation. Since it was felt that a practical induction system could be de-

Microphone System

allow operation in areas up to 5000 sq. ft. Roving mike features include printed circuits and resin casting

Fig. 2: (l) Pre-emphasis curve of omnidirectional ceramic microphone cartridge.
Fig. 3: (r) Performance curves of reactance modulator used in microphone transmitter

veloped, that approach was chosen for the "Vagabond" system.

Having decided upon a non-licensed or induction system, other fundamental design decisions had to be made. These were the choice of the physical form of the transmitter, the modulation system to be employed, and the operating frequency of the system.

Principally, two physical forms were considered for the transmitting unit. One form consisted of a pocket-size case, containing the transmitter and batteries, which could be worn concealed about the person of the user, and a separate lapel type microphone attached to the transmitter with a cable.

The second form considered was that of a stick type case which would contain the microphone, antenna, transmitter, and batteries.

Stick Form Adopted

The stick form was adopted, as it offered several advantages. Being completely self-contained, the stick mike could readily be handed from one person to another, or it could be placed in a microphone stand and used conventionally. The performer would not have to "dress" himself in the microphone. Having no interconnecting cables, the self-contained unit would not be subject to wear and tear and would require less maintenance. It was also felt that the stick form, being quite similar to several conventional microphones in appearance and use, would place performers at ease and hence would be more readily accepted. The only manifest disadvantage of the stick form was its inability to be concealed easily on the person. This was felt to be a minor consideration, while the ability of one microphone to be used by several performers in im-

mediate succession represented an economic advantage as it would replace several wearable units.

FM Selected

Two primary considerations led to the choice of frequency modulation for the "Vagabond" system. Since the coupling between the transmitting and receiving antennas in a wireless microphone system will vary greatly, some means of assuring constant overall audio gain is imperative. A FM system was chosen as the simplest means of achieving this goal.

Secondly, the desire to obtain the best possible signal-to-noise performance, with a transmitter of lim-

ited power, again indicated the use of FM. A modulation index of at least five was set as a goal.

The carrier frequency chosen for the "Vagabond" system was a compromise of opposing factors. To obtain reasonable performance from a miniature transmitting antenna and to accommodate the bandwidth required by the FM system, it was desirable to use the highest possible carrier frequency. Furthermore, a study of the literature on the occurrence of noise throughout the radio spectrum indicated that less interference could be expected at the higher frequencies.

On the other hand, the FCC regulation governing unlicensed transmitters limits the radiated field strength in inverse proportion to the carrier frequency, thus dictating the use of the lowest possible frequency.

A final consideration was the minimization of interference from other transmitters operating on the same frequency. This obviated the use of the Broadcast, Amateur, Police, and Loran bands which lie between 0.5 and 2.0 MC. In view of all these factors, a carrier frequency of approximately 2.1 MC was chosen.

Design of Transmitter

Since the feasibility of the entire stick design depended on the development of a satisfactory miniature antenna, the development of such an antenna was undertaken. Calculation and experiment indicated that within practical limits the size

Fig. 4: (l) Chassis assembly includes printed circuit plates which are soldered to component leads and tube socket pins. Fig. 5: (r) After chassis assembly is cast in resin, switch, gain control and battery contact assembly are attached

WIRELESS MIKE (Continued)

of the transmitting antenna would not affect the performance of an induction system. Since any antenna could be reduced to an equivalent magnetic dipole, the only effect of size variation was to change the power required to produce the desired field strength. A satisfactory ferrite core transmitting inductor was developed which was 3 in. long and weighed 2 oz.

Having achieved a practical ferrite antenna, a transmitter circuit was developed to operate from a 30-volt hearing aid battery and a 1.3-volt mercury cell. Five subminiature tubes were used (Fig. 1). The transmitter circuit is divided into two sections: a two tube audio section and a three tube radio frequency section.

Eliminating Motorboating

Two tetrode voltage amplifiers are cascaded in the audio section to obtain a gain of 55 db at 1000 cycles. A miniature volume control between the two stages allows the gain to be adjusted for the desired degree of modulation. While the two-stage audio amplifier alone showed no tendency toward regeneration without any decoupling networks, motorboating at low frequencies occurred when it was connected to the reactance modulator, due to modulation of the plate supply voltage. To eliminate this motorboating, it was necessary to add a decoupling filter in the first audio stage and to restrict the low frequency response of the audio amplifier as well.

In order to obtain the best possible signal-to-noise ratio in the over-all system, an 80 μ sec pre-em-

phasis was used in the transmitter and a corresponding de-emphasis in the receiver. The problem of obtaining sufficient audio gain together with the necessary pre-emphasis was solved by providing a microphone cartridge of special design, with a response which very closely approximated the desired pre-emphasis curve (Fig. 2). An omnidirectional ceramic microphone cartridge was used. The choice of such a unit was in conformity with present day trends in stick microphone design.

The r-f section of the transmitter consists of a self-controlled oscillator, a reactance modulator, and a r-f amplifier (Fig. 1).

After trying many circuit arrangements utilizing only two tubes, the r-f power amplifier stage was added. When only the two tubes were used, the oscillator necessarily had to operate at a higher power level, as its plate load was the high Q antenna circuit. This arrangement had a serious weakness. It required excessive modulator plate current to produce the 2% frequency deviation required.

Reactive Current

In order for a reactance modulator to cause a frequency shift of 1%, it must produce a reactive current which is approximately 2% of the magnitude of the circulating current in the oscillator tank circuit. If the oscillator tank circuit has a Q of 50, a typical value in this application, the reactance modulator must draw an average ac current equal to that of the oscillator and must be capable of 100% modulation of that

current without distortion. This means that the modulator must draw three or four times as much plate current as the oscillator. This was obviously impractical, and the use of a low power oscillator followed by a power amplifier was necessary. A further advantage of such an arrangement was the elimination of carrier frequency shift because of antenna detuning caused by hand capacity.

A second circuit feature worthy of attention is the method of feeding signal and bias to the reactance modulator grid. Two operational difficulties are substantially reduced by this circuit arrangement. They are, first, the amplitude modulation of the oscillator due to variable loading by the reactance modulator, which produces distortion, and second, the carrier frequency shift which occurs as the batteries run down.

Single RC Phase Shift

By obtaining the ac grid voltage for the reactance modulator from the secondary of the oscillator plate transformer, which is connected out of phase with the primary, it is possible to use a single RC phase shifting network and obtain a phase difference between the modulator grid and plate voltages which exceeds 90°. The use of a modulator grid voltage which is more than 90° out of phase with the plate voltage causes the reactance modulator to appear as a reactance in parallel with a negative resistance. This negative resistance will vary as the voltage on the modulator grid varies, and, with proper circuit adjustment, can be made to compensate for the variable loading of the oscillator by

No. 25 — Reactance Nomograph

Easily used graphical structure eliminates maze of crossing scales for solving reactance formulas. Expanded split-scale technique allows high accuracy in frequency range of 0.01 cps to 1000 megamegacycles. Extremely wide limits of L and C provided

By JOSEPH F. SODARO, Registered Engineer, 2924 Selby Ave., Los Angeles 64, Calif.

GRAPHICAL calculators and sliderules which solve the reactance formulas are generally limited in range or are an overly complex maze of crossing scales. In some cases folded scales or multiple charts are used to obtain extended scale limits. As a result these charts have scale discontinuities which are inconvenient to the user. Such shortcomings are overcome in the reactance nomograph described in this article by the expanded scale technique which provides the coverage of extreme scale limits without the loss of significant figures.

The nomograph is shown in Fig. 1. All scales increase in value in the upward direction with the exception of X_c . The scale stems are split to facilitate reading. On the left-side stems are the overall ranges for each scale which are useful for rough calculations and for the determination of magnitude or decimal point location. The right-side scale stems are expanded cycles which give a detailed answer and thus yield the significant figures. On these scales the inductance (L) limits are from 0.1 μ h to 10,000 henrys, capacitance (C) from 0.1 μ mf to 10,000 μ f and frequency (f) from 0.01 cps to 1000 MMC.

Frequency Scale

The frequency scale is common to the L and C scales. Thus, the left side of the chart is for inductive reactance calculations and the right side is for capacitive reactance calculations. Since many different problems can be solved on this nomograph, the problem is designated, formulas set forth, and graphical construction briefly outlined in Table I. The graphical construction is shown by the indicator line with circles and squares at the scale intersections. These symbols indicate the entry scales by the intersections enclosed in circles and the answer scale by the intersection

enclosed in a square. While these are the usual procedures, entry can be on any two of the three designated scales and the answer read on the third.

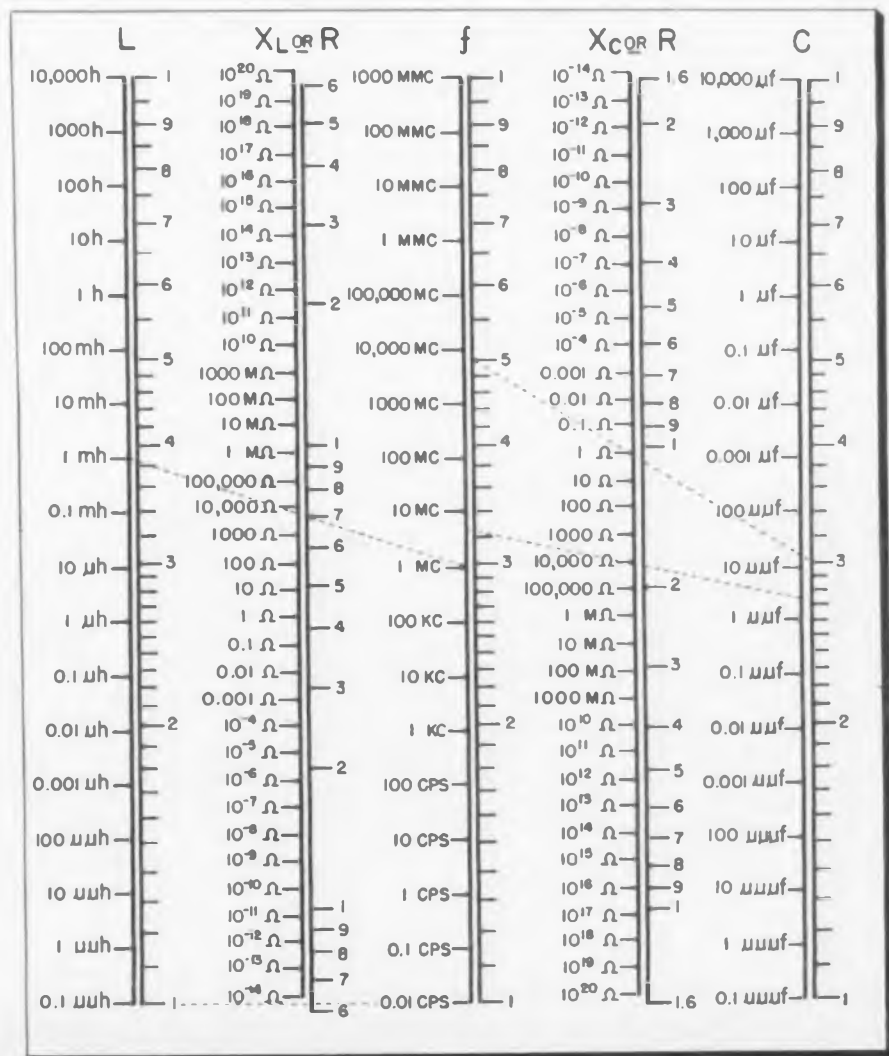

Single Setting

Of course, only magnitude (left-side) or expanded (right-side) scales may be used for one indicator setting. Thus, although the graphical construction in Table I does not

show the split scale stems, it implies that similar constructions are required for magnitude and significant figure determinations. The following examples are given to better understand these procedures:

Inductive Reactance: Approximate the value of inductance on the left-side of the L scale and the value of frequency on the left-side of the f scale. Construct a straight line between these points and read approximate inductive reactance on the left-

Fig. 1: Left stems of nomograph's split scales are overall ranges; right stems for exact figures

REACTANCE NOMOGRAPH (Continued)

side of the X_L scale. Repeat on the right-side scale stems to obtain additional significant figures, if required. For example, determine the inductive reactance for a 1 mh coil at 1 mc. On left-side scale stems locate 1 mh on L and 1 mc on f. Join these points with a straight line and estimate 6000 ohms at the intersection of this line with X_L . (Remember that these are logarithmic scales. Thus, three is slightly below the midpoint between

Fig. 2: Simple RL filter networks provide 3 db attenuation at determined cut-off frequency

division lines.) On right-side scale stems locate one on L, one on f and join these points with a straight line. Read 6.3 at the intersection with the X_L scale. Thus, the answer is 6300 ohms. By comparing the second answer with the first and finding that these are similar, we can be assured that the correct construction was made on the right-side scale stems.

Capacitive Reactance: First, on left-side scale stems, locate the value of capacitance on C and frequency on f. Join these points with a straight line and read capacitive reactance at the intersection of this line with X_C . Repeat using right-side scale stems if a more accurate answer is needed. As an example determine the capacitive reactance of a 3 μ f capacitor at 5 mc. Estimate 3 μ f on C and 5 mc on f and connect these points with a straight line. At the intersection of this line with the X_C scale estimate slightly more than 10,000 ohms. Repeat this procedure on right-side scales and read 1.06. Thus, the reactance is 10,600 ohms.

Inductance-Resistance Filter Cut-off: The simple filter networks shown in Fig. 2 present a voltage attenuation of 3 db (0.707) at the cut-off frequency. To determine this frequency locate the value of resistance on the R (or X_L) scale and inductance on the L scale. Extend the straight line drawn through these points until it intersects f. Read the 3 db attenuation frequency at this intersection.

Capacitance-Resistance Filter Cut-off: The 3 db attenuation frequency for the networks shown in Fig. 3 can be determined in a similar manner.

Locate the capacitance value on C and the resistance value on R (or X_C) and extend a straight line through these points to f. Read the 3 db attenuation frequency at this intersection.

Resonance: If the resonance frequency and either inductive or

Fig. 3: Simple RC filter networks provide 3 db attenuation at determined cut-off frequency

capacitive reactance (which are considered to be equal at resonance) are given, inductance and capacitance can be determined. On the other hand, if Fig. 1 is entered with resonance frequency reactance and either inductance or capacitance, the resonance frequency can be determined. These procedures will be briefly described.

Resonant Inductance and Frequency: To determine the inductance required to resonant a tuned circuit, locate the resonant frequency value on the f scale and the inductive reactance or capacitive reactance at resonance on X_L . Connect these points and extend the joining straight line until it intersects L. Read the required inductance at this intersection. To determine the resonance frequency enter on L with inductance and on X_L with resonant reactance. Read resonance frequency at the intersection of the indicator line with f.

Resonant Capacitance and Frequency: Use the same procedures as the case above. Enter on X_C and f scales. Read on the C scale. Enter on X_C and C and read on the f scale.

Many other problems can be solved on this chart. Those who are interested can superimpose time constant scales which are simply reciprocal frequency scales. Thus, 1 mc becomes 1 usec, etc. Also, the reciprocal of the reactance scales are susceptance scales and reciprocal of resistance are conductance scales.

Among the other problems which can be solved are equivalent shunt and series resistance determination of tuned circuits, tuned circuit band-pass analysis, high and low-pass filter design, bandpass filter design, transmission line characteristic impedance and time delay calculations.

Wheeler, Harold A., "Reactance Chart," *Proc. IRE*, Dec. 1950.

Transistorized Magnetic Microphone

BY using transistors to make a diminutive pre-amplifier coupled with a high quality magnetic microphone, Remler Co. Ltd., San Francisco, has developed a new combination unit yielding improved speech intelligibility and reduced noise in radio and aircraft public address applications through eliminating the hazard of misunderstood orders in air-to-ground communications.

The transistors are built into the microphone unit in both straight microphone and handset applications. Units plug directly into existing equipment previously using carbon button microphones. The reliability of the transistor amplifier, plastic seal-coated, has been proved by thousands of hours of life tests, humidity, hot and cold, and high altitude tests. It has also been flight-tested by a major airline. The microphone itself is the Remler ruggedized unit formerly supplied only to the U. S. Navy and merchant marine service. This new microphone is now in production at Remler's San Francisco plant.

Designed to combine the advantages of the magnetic and carbon

Transistor amplifier being held in hand fits into mouthpiece of a handset or a microphone

microphones, the transistor-magnetic microphone overcomes the disadvantages of both. The noise-free fidelity of the rugged magnetic type variable-reluctance microphone combined with an efficient high gain transistor preamplifier permits direct interchangeability in carbon microphone circuits.

Specifications: Output*—0.778 vrms at 100 dynes/sq.cm.; Matched Impedance—150 ohms, ± 1 db 50 to 500 ohms; DC Supply Load—1000 ohms between 5 & 35 volts dc; Frequency Response— ± 6 db 500 to 6000 cps, 6 db per octave fall off from 500 cps.

Performance of the transistor microphone compared with performance of carbon button type

Tests: A life test, continuous operation at room environment, has been in progress for sixteen weeks with no depreciation in performance. Performance of a test unit was not affected after exposure to the following environment: -60° F for 5 hrs; $+160^{\circ}$ F for 3 hrs; $+125^{\circ}$ F for 3 hrs; simulated altitude of 50,000 ft. and relative humidity of 95-100% at $+122^{\circ}$ F for 96 hrs. In addition, approximately 1,000 hrs. on regular service with a major airline.

* At nominal supply voltage of 27.5 vdc. Output down 2db at 15 volts, 4db at 10 volts, 11db at 5 volts.

Electro-Optical Image Processing System

THE National Bureau of Standards has recently constructed an experimental optico-electronic system that will facilitate the study of visual perception and recognition of patterns and also promises to have a number of useful engineering applications, including TV, radar and computers. The device was developed by H. M. Joseph of the Bureau's electronic instrumentation laboratory in consultation with Dr. L. S. G. Kovaszny, Johns Hopkins Univ. This device can clarify blurred images or produce outline pictures and line drawings from half tone photographs.

Negative Picture

In operation (Fig. 1), moving spot on the cathode-ray tube scanner is focussed on the transparency. The light through the transparency impinges on the phototube which converts the changes in light intensity into electrical signals. These video signals are amplified and applied to the scanning tube intensity grid, thus reducing the light intensity of the spot and producing a negative picture on the scanning tube screen.

The negative feedback obtained in

Light from scanner spot passes through transparency and impinges on phototube. Resulting video signals are amplified and applied to scanning grid to produce negative picture on screen

this way improves the tonal rendition of the picture. The same signals are also applied to another amplifier and the resulting signal is used to control a monitor cathode-ray tube which reproduces the same picture. Altering the monitor for the image processing is accomplished by intro-

ducing modifying circuits between the phototube and the monitor. This freedom to modify the picture on the monitor is the essence of the system.

Any scanning pattern may be used, but it greatly simplifies the (Continued on page 187)

CUES for BROADCASTERS

Practical ways of improving station operation and efficiency

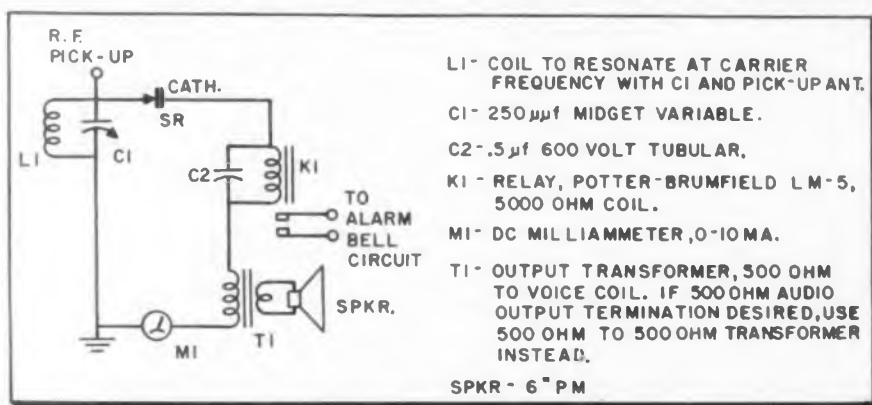

Transmitter Failure Alarm and Monitor

CHARLES M. SPARKS, Chief Engineer, WCRS, Greenwood, S.C.

AN easily-built and fool-proof unit for sounding an alarm when the transmitter carrier fails for any reason, also drives a speaker for monitoring purposes in the transmitter room or shop, and although its volume is limited, it is entirely adequate for the average room. By using a suitable matching transformer at T1 this unit will supply a 500-ohm audio output which is of proper level to feed into a telephone line and thus back to the studio, where it may be fed into the studio monitor amplifiers. Thus a transmitter failure will instantly kill the studio monitor speakers, a very desirable feature especially if remote control operation is used.

L1, C1, and the pick-up antenna resonate at the carrier frequency, the r-f is detected by the 1N34, and the resulting voltage operates the plate relay K1 and flows through the primary of the output transformer T1, driving a 6-in. PM speaker. If a 500-ohm audio output is desired instead of a speaker, a 500-ohm to 500-ohm matching transformer should be used at T1. An output level of approximately plus ten VU will be available, which if desired may be fed through a ten db pad before connecting to a telephone line. The relay used is a Potter Brumfield LM-5, 5000-ohm coil with SPDT contacts, which are connected to operate as a normally closed relay. Thus the rectified carrier voltage holds the contacts open until the carrier fails, then the contacts close, sounding an alarm bell or buzzer.

The pick-up antenna requirements will depend on the strength of the r-f field. All that is needed is enough r-f to register about 5 ma. on the meter, M1 when the tuned circuit is resonated. The entire unit is so small that it could be mounted inside the transmitter or antenna tuning unit, in which case no pick-up antenna should be required. A more sensitive relay could be used, which would of course reduce the amount of r-f required, but the speaker volume would also be reduced. C2 increases speaker volume and improves relay operation.

Simple and foolproof monitor and transmitter failure alarm also kills studio speakers

The primary impedance of T1 is 500 ohms, the secondary being 4-ohm for the speaker voice coil or 500 ohms for other purposes. The meter M1 is a dc milliammeter having a scale of 0-10. In locations where the transmitter and studios are combined in one building, this meter may be mounted in the control room in order to give the operator additional visual indication of the presence of the transmitter carrier. It will also indicate if the operating power is approximately correct.

Harmonic Suppression

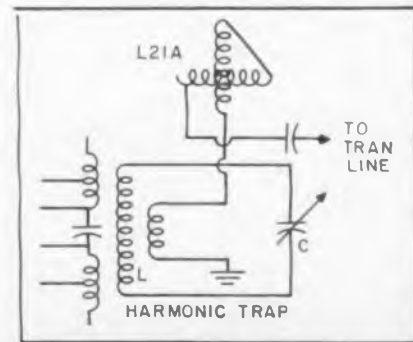

EDWARD J. WHITE, 136 Woodlawn St., Chicopee Falls, Mass.

AFTER many years of proper operation, the Western Electric 310B transmitter at Radio Station WMAS developed strong second harmonic radiation, and was promptly reported by an FCC monitoring station. Several tests and inspections confirmed the fact that no component transmitter part was defective and the transmission line/antenna circuit was operating properly. The 310B transmitter had

a harmonic suppression filter. (Variocoupler L21A) Additional filters installed in the final plate leads suppressed the harmonic but the normal plate circuit loading was affected. After several trap insertions it was finally decided that an absorption wave trap coupled tightly to the final tank was effective. Size and adjustment of the coil are critical. No difference was noted in performance when the trap was grounded. An absorption wave meter was used to determine the effectiveness of experimental trap placements. Use of this meter was misleading, since it indicated harmonic suppression when used in the transmitter room but an additional check with a selective receiver at a point three miles distant proved the wave meter to be incorrect.

Before correction, the second harmonic signal strength at the three mile check point was 30db over S9 in the early morning (6 AM), dropping into the noise level of approximately S3, by 9 AM on an SX24 receiver. The trap condenser is a Barker and Williamson JCX100E, the inductance wound with 12 turns #14 wire.

12 turns of No. 14 wire around final tank and tuned provide efficient 2nd, harmonic trap

Heat Pays Off

ERNEST G. UNDERWOOD, Chief Engineer, KFRC, San Francisco 9, Calif.

DURING the war, when vacuum tubes were hard to procure, high voltage mercury vapor rectifier tubes posed a problem. KFRC accumulated many 12 KV mercury vapor rectifier tubes that were removed from service due to repeated arc-backs.

The problem was, what to do with many apparently usable rectifier tubes? Apparently the problem was tied to the fact that when the station was shut down at midnight, the transmitting equipment cooled down to such an extent, that by 5:30 a.m., when the transmitter was started for warm-up, they were uncomfortably cold. This condition had caused no difficulty with pre-war mercury vapor tubes, but was presumed to be causing the difficulties with tubes of war time and post-war manufacture.

A 1500 watt electric heater was installed in the transmitting, rectifier and generator rooms. These heaters were turned on at midnight when the station was shut down. Use of these heaters resulted in the temperature of the three rooms staying between 68 and 72° F. throughout the night.

Since the installation of the heaters the accumulated stock of wartime 12 KV mercury vapor rectifiers has been exhausted. Normal life was obtained from tubes considered "questionable." Arc-backs in the 12 KV rectifier are now exceedingly rare. The smaller mercury vapor rectifiers give more satisfactory service as well.

Component failure in the transmitter is practically non-existent. The constant temperature maintained during "off the air" hours prevents the equipment from cooling down completely.

Clock Synchronization

FRANCIS J. BOCK, Chief Engineer, WJVA, South Bend, Ind.

BECAUSE our clocks did not maintain accurate time, we decided to install five IBM clocks, operating from 110 v. ac with an automatic reset arrangement built into them. This means that if clocks are fast or slow, they can be adjusted to correct time by using a reset switch. Then we incorporated a short wave receiver into the system with the proper antenna to tune in WWV on 2.5, 5, and 10 MC. Now we can set all our clocks the moment we receive the WWV time signal.

Multiple Echo Effects

BOB CROSTHWAITE, Chief Engineer, KWYO, Sheridan, Wyo.

SOME interesting multiple echo effects can be produced by using a tape recorder with an added, adjustable playback head and an amplifier.

The amplified, delayed output of the adjustable pickup head is fed back in parallel with the input to the tape recorder amplifier to produce the echo. Various results can

Delayed output from tape recorder produces variable echo effect by use of extra head

be obtained by changing the spacing of the adjustable head and the gain of its amplifier. It was found necessary to operate a Magnecorder PT6-AH recorder at a speed of 15 in./sec. because of the mechanical difficulty of obtaining the close spacing required at a speed of 7½ in./sec. A Brush Soundmirror record-reproduce head was used as the adjustable pickup. Its flat base is easy to clamp to a supporting metal strip.

When a Magnecorder PT6 recorder-amplifier combination is used simultaneous use of the echo effect can be obtained by feeding the output of the monitoring jack into a bridging amplifier. Since the delayed output is in parallel with the re-

order input, the program source has to be isolated to prevent continuous echoes.

In the case of a rack-mounted PT6 unit, the adjustable head may be mounted rather easily by using two 1" metal strips. The horizontal strip is fastened with screws and suitable spacers into the holes normally occupied by the two top thumb-screws. The vertical support is bolted to this strip and the head clamped in place.

Automatic Remote Amplifier Setup

HENRY C. LOVELL, Chief Engineer, WHIR, Danville, Ky.

MANY stations carry Sunday church broadcasts. The setup described below eliminates the Sunday trip to turn the amplifier on and off. Equipment can be installed on Saturdays. One mike is placed in the church, and the task of riding gain is left to the studio operator.

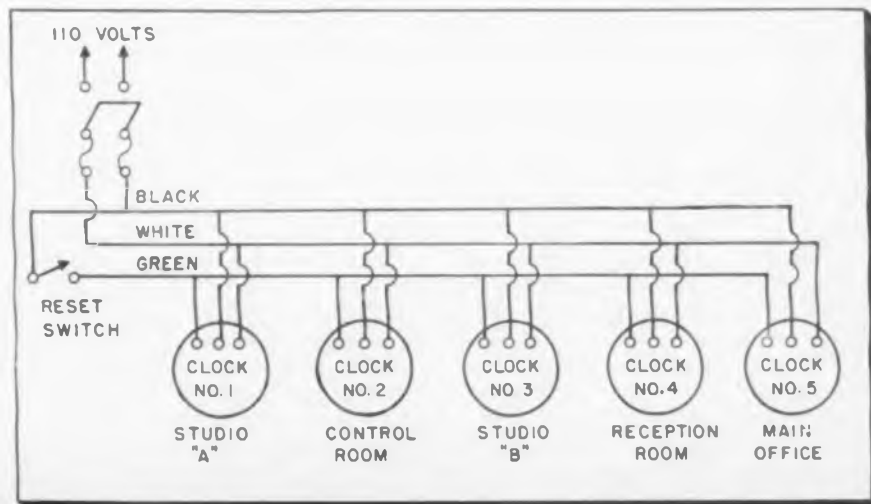

Time switches costing less than ten dollars, will turn equipment on and off once in 24 hours—or many times with addition of trippers. Certain models will skip any days desired. If a check on the line is not

Time switch controls remote amplifier and provides tone source as "OK" signal

desired, the time switch used with the amplifier will suffice. For a constant check on the line, an easily built tone oscillator such as described in TELE-TECH (Mar. '53, p. 87) or (Jan. '51, p. 38) and a DPDT (Continued on page 114)

IBM clock corrector circuit manually controlled by WWV signals provides accuracy

Design Criteria for Transistor

Development of general theory overcomes shortcomings of elementary design principles. Differences between vacuum tubes and junction transistors clarified

By Dr. S. K. GHANDHI, Electronics Laboratory, General Electric Co., Syracuse, N.Y.

THE transistor art has now reached a stage where it is possible to secure any practical value of amplification. It is at this stage that properties such as stability and freedom from nonlinearities begin to assume increasing importance. The use of feedback methods, specifically degenerative feedback methods where amplifier gain is traded for one or more of the other desirable properties, thus becomes a very attractive proposition.

Perhaps the most important difference between transistors and vacuum tubes is that, whereas the maximum available power gain of a transistor is about 40 db, that of a vacuum tube operating over the same frequency range is considerably higher. A consequence of this is that the design of a tube amplifier may be taken up as the design of a voltage amplifier, with all the networks designed on a voltage transfer basis, and the entire burden of power amplification left to the output stage which is designed to transfer power into the load efficiently. With a transistor amplifier, each stage must be designed for power transfer.

Feedback Loops

A second difference is that, whereas a vacuum tube is a voltage actuated element, a transistor is a power actuated device. Thus voltage must be fed back in tube circuits, and power in transistor circuits. This affects the impedance level of the feedback loops. In vacuum tube amplifiers it is usually possible to design a feedback loop at such an impedance level that it neither loads the output circuit appreciably, nor has an appreciable transmission in the forward direction. This is usually not true for transistor amplifiers. Furthermore, the application of feedback around a transistor output stage will reduce the power available to the load; this is usually not the case in vacuum tube amplifiers employing feedback.

In developing an elementary theory of feedback, it is necessary to make use of the fact that a transistor may be approximately represented as a current actuated device. The simple feedback configuration then takes the form of an amplifier with a current ratio A^0 , between the input and output terminals of which is connected a four terminal network, as in Fig. 1.

Let γ = percentage of output current fed back to the network.

β = percentage of output current fed back to the input of the amplifier.

Then,

$$i_o = A^0 i_i (1 - \gamma)$$

$$i_i = i_i + A^0 \beta i_o$$

Whence,

$$\frac{i_o}{i_i} = A_i = \frac{A^0 (1 - \gamma)}{1 - A^0 \beta} \quad (1)$$

In commonly encountered circuits

$$|\gamma/\beta| \geq 1;$$

since the effect of γ is to reduce the gain, it is usual to assume a two terminal network for the feedback.

With such a network, $\beta = \gamma$, and

$$A_i = \frac{A^0 (1 - \beta)}{1 - A^0 \beta} \quad (2)$$

By direct comparison with the well known equation for a vacuum tube feedback amplifier, we note the inclusion of the multiplying factor $(1 - \beta)$. This is due to the loading effect of the β loop on the amplifier.

For amplifiers with large amounts of feedback,

$$|A^0 \beta| \gg 1,$$

whence

$$A_i = -\frac{1 - \beta}{\beta} \quad (3)$$

Thus the current ratio of such an amplifier is determined by the transmission through the β loop.

The effect of feedback on the parameter stability is obtained as follows:

$$\frac{di_o}{i_o} = \frac{A^0 (1 - \beta)}{1 - A^0 \beta}$$

Fig. 1: Simple feedback circuit

Fig. 4: Analysis of feedback amplifier

Fig. 7a: Grounded emitter with feedback

whence

$$\frac{di_o}{i_o} = \left[\frac{1}{1 - A^0 \beta} \right] \frac{dA^0}{A^0} \quad (4)$$

dA^0/A^0 is the relative change in the current ratio without feedback due to a change in the transistor parameters, and di_o/i_o is the relative change with feedback. Thus the application of feedback modifies the variation of the current ratio by the factor $1/(1 - A^0 \beta)$.

A simplified stability criterion follows, by direct analogy with the Nyquist criterion: If a plot of $-A^0 \beta$ is made in the complex $-A^0 \beta$ plane, the system is unstable if the plot encloses the critical point

$$-1 \pm j0.$$

In order to plot the $-A^0 \beta$ locus, it is necessary to know the behavior of the transistor at frequencies inside as well as outside the range of

Feedback Amplifiers

Fig. 2: Plot of alpha in alpha plane

Fig. 7b: Redrawn equivalent circuit

Fig. 8: Cascaded grounded emitter stages

operation of the amplifier. At frequencies where transit time effects become apparent, it becomes exceedingly difficult to define the transistor behavior by simple mathematical expressions. In most cases, it is sufficient to make a stability analysis using approximate formulae for the high frequency effects, and then to make qualitative adjustments to the analysis.

Fig. 2 shows a plot of α in the α -plane. A plot of

$$\alpha_0 / (1 + T_{\alpha} p)$$

is also shown (dashed line) for comparison.

$$\omega_{\alpha 0}$$

is the angular frequency at which α is 3 db down from its low frequency value of

$$\alpha_0, \text{ and } T_{\alpha} \text{ is given by } 1/\omega_{\alpha 0}.$$

Both the collector capacitance and

the collector resistance fall off with frequency. Fig. 3 shows the high frequency behavior of z_c . An approximate representation, $r_c / (1 + T_c p)$ is given in dashed line, and is that formed by a parallel R-C network with time constant T_c .

Theory Assumptions

It is interesting to investigate the assumptions made in the elementary theory.

(a) Loading effect of the feedback loop on A^0 is neglected. As mentioned earlier, the impedance level at which the feedback loop of vacuum tube amplifiers is designed is often such that this loading effect is negligible.

(b) The input impedance of the amplifier is neglected in computing the value of β . Since β is a function of both the load impedance and the

(Continued on page 158)

impedance of the β network seen from the load end, and since this latter is in itself a function of β , an accurate computation of this quantity leads to considerable complication. An approximate value for β may be obtained if the input impedance of the amplifier is neglected in the computation.

(c) Direct transmission through the feedback loop is neglected. If the input impedance of the amplifier without feedback is neglected, this direct transmission is not present. An estimate of the effect of this direct transmission may be made if the input impedance is neglected in the computation of β alone. The loading effect of the feedback loop on A^0 can be taken into consideration by redefining A^0 as the current ratio of the amplifier without feedback, when terminated in a parallel combination of the load and the short circuit impedance of the feedback loop.

Analysis Procedure

The analysis is made as follows. Fig. 4 shows a feedback amplifier. Let the y matrix for the amplifier be

$$\begin{bmatrix} y_{11} & y_{12} \\ y_{21} & y_{22} \end{bmatrix} \quad (5)$$

and let Δ' be the determinant of the array.

For the feedback loop, we have the matrix

$$\begin{bmatrix} Y & -Y \\ -Y & Y \end{bmatrix} \quad (6)$$

$$\begin{bmatrix} y_{11} + Y & y_{12} - Y \\ y_{21} - Y & y_{22} + Y \end{bmatrix} \quad (7)$$

and let Δ be the determinant of the array. Then the current ratio of the combination is given by

$$A_i = -\frac{i_2}{i_1} = -\frac{(y_{11} - Y) y_{21}}{(y_{11} + Y) y_{21}} \quad (8)$$

Current ratio for the amplifier without feedback, but with a load of $y_l + Y$ is given by

$$A^0 = -\frac{y_{21} (Y + y_l)}{\Delta' + y_{11} (Y + y_l)} \quad (9)$$

The feedback factor is given approximately by

$$\beta \cong \frac{Y}{Y + y_l} \quad (10)$$

Whence

$$(11)$$

$$A_i \cong A^0 \frac{1 - \beta \left(1 + \frac{y_l}{y_{21}}\right)}{1 - A^0 \beta \left(1 + \frac{y_l}{y_{21}} + \frac{y_{12} + y_{22}}{y_{21}}\right)}$$

Magnetron

THE magnetron, used in military, industrial and scientific applications, requires special attention in its manufacturing and testing. Among these important requirements are the factors affecting magnetron's stability, which may be tested by means of the Magnetron Stability Tester.

The exterior view of a magnetron stability tester is shown in Fig. 1 and the essential parts are given in Fig. 2. The tester will be used with the same power supply and modulator that is used in the radar set so as to approach as close as possible the actual operational condition of the magnetron. Special attention must be paid to the interconnections between the radar pulser—modulator—amplifier and magnetron stability tester. This requires the practical and constructive investigation of the short interconnections between radar set and magnetron stability tester, investigation of special cable for the high voltage, etc.

The left hand side of the apparatus is occupied by a section with safety interlock for the testing of different

kinds of magnetrons and different bands of frequencies. This section of the magnetron stability tester should be located as close as possible to the radar set. It has the necessary measuring apparatus to measure variable dc and pulsed currents of anodes and filaments of a magnetron and a fluxmeter to measure the magnetic field of the magnetron.

The central and right-hand side of the apparatus is occupied by a slotted line and dummy terminal load with the associated measuring apparatus: standing wave detector, thermistor bridge, frequency meter, spectrum analyzer and output power meter.

The magnetron stability tester, especially this section of the apparatus, permits the different factors, or special criteria, of a magnetron's stability itself and the influence of input

and output circuits on this stability, to be determined.

Magnetron Stability Factors

The stability of a magnetron is determined as a change in magnetron operating characteristics against changes in input and output conditions. It is desirable to attain both high efficiency (or output power) and high frequency stability against changes in load and changes in input conditions.

Frequency Stability

For any given frequency the magnetron's impedance or ratio $\sqrt{L/C}$ determines the efficiency and frequency stability. The efficiency with which a magnetron converts the input power into r-f power at the output is given by

$$\eta = \frac{\text{power input} - \text{losses}}{\text{power input}},$$

where η is the product of $\eta_c \times \eta_e$,

η_c - circuit efficiency

η_e - electronic efficiency

The losses arise from the bombardment of the anode of magnetron by the electrons and from the circulating r-f currents producing r-f losses in the copper and other materials of the magnetron.

The efficiency, especially circuit efficiency η_c , is affected by the impedance of the magnetron. It is highest in a high impedance magnetron, but the electronic efficiency depends on the r-f voltage across the magnetron gap; the maximum η_e occurs at a lowest r-f voltage for a given power output. This reduction of the r-f voltage can be produced by decreasing the magnetron impedance

$$\sqrt{L/C}$$

or by coupling the magnetron tightly to the load. Heavy loading, i.e., closer coupling between the load and magnetron, increases the efficiency but reduces the frequency stability. The high impedance magnetron acts in the same way and has less stability against load changes than a low impedance magnetron.

Overall Efficiencies

These general conditions of stability of a magnetron must apply for a large number of magnetrons, ranging in frequencies from 30 to 30,000 mc and in power output from 30 to 1000 watts CW operation, or from 1 to 3000 kw pulsed power. The working voltage range extends from about 500 to 50,000 v. The overall efficiencies of most existing magnetrons are in the range of 30 to 60% and must

System employs same power supply and modulator as that used in radar set. Tests show how to avoid mode jump, misfiring and sparking

operate for the pulse duration from 0.1 to 10 μ s under a variety of duty ratios.

With the magnetron stability tester may be measured the following stability factors of a magnetron:

The Performance Chart: The relationship among H.V.I.P. and λ (or f_0) for constant load determines the performance chart of a magnetron (see Fig. 3).

The performance chart is the most useful presentation of the operating characteristics of a magnetron and any change in the chart indicates the instability of a magnetron. The study of this chart is especially very useful to determine the causative factor of misfiring. The rate of buildup of oscillations in the magnetron depends not only upon the circuit characteristics, but also upon the electronic behavior with increasing dc and r-f voltage.

An increase in the load results in an increase of circuit conductance (Z_c) and in a decrease of oscillations

buildup, which are inversely proportional to Q and λ .

The correct starting of a magnetron, for example, in the π -mode is possible only for a limited range of voltage near that which provides synchronism between the electron motion and the rotating field pattern of a magnetron. This can be determined from the performance chart using an oscilloscope, whose vertical deflection is proportional to dc voltage and whose horizontal deflection is proportional to dc current. The special device for this observation may be installed also in the magnetron stability tester, as shown in Fig. 4.

Intensity Modulation

The CRT tube plots voltage against current automatically. To make arrangement practical, the CRT tube must be intensity modulated, somewhat as in the synchroscope.

In Fig. 5 are shown:

- (a) the normal starting of a magnetron in the π -mode.
- (b) the "misfiring" of a magnetron.

The "misfiring" also is generally attributable to failure to start in the lower voltage mode and in many cases can be eliminated by sufficiently reducing the rate at which voltage is applied to the magnetron.

The misfiring and instability can be produced also by sparking (c), which is an internal discharge in the magnetron which arises as a consequence of the generation of bursts of gas within the tube. To avoid this, the magnetron must be operated under conditions that do not exceed specifications. Special attention must be paid to avoid overworking of the cathode, operating instructions for reduction of the heater voltage during oscillation should be exactly followed.

The mode shift in a pulsed magnetron or "mode jump," i.e., sudden change from one mode to another, is shown in Fig. 6, and is generally influenced by instability of the power supply. A small increase in supply voltage may cause the shift to lower current oscillation. Very small changes in anode potential produce large changes in anode current. For example, a 4J31 magnetron at H equal 2300 gauss changes its anode voltage from 20 kv to 22.5 kv which causes a change in current from 20 to 50 amps.

The proportion of the number of pulses in the respective modes of oscillation changes with power sup-

Fig. 6: Mode shift in pulsed magnetron may be caused by a small increase in supply voltage

ply voltage and indicated in Fig. 7 for the "mode skip."

To avoid all these phenomena, the control of a power supply must be such that no change occurs in its output. According to all these considerations it should be possible to reduce the tendency toward misfiring by:

- (1) increasing the amplitude of the

(Continued on page 164)

Passive Broadband

By DR. H. M. SCHLICKE
 Consultant Engineer, Allen-Bradley Co.
 136 W. Greenfield, Ave.
 Milwaukee 4, Wis.

THE reduction of the multitude of special methods used for reactive, passive broadband technique to a few basic relations, provides a powerful tool for treating broadband problems systematically.

Fig. 1 signifies the need for wide-band matching by representing the power transfer efficiency as function of the transmission line attenuation and with the load VSWR as parameter. The diagram is premised on input matching equal to Z_0 of the line.²

The bandwidth over which the minimizing of the VSWR can be accomplished, is limited by a certain, yet inevitable property of electrical networks. This intrinsic property can be expressed in several ways that are consequential and wholly equivalent:

For two poles:

- (a) Any non-dissipative, passive reactance X has the fundamental behavior $dX/df > 0$ (except of poles). This is Foster's reactance theorem.
- (b) Another expression for this behavior is that no negative L or C exists as a physical entity.
- (c) In the complex impedance plane, physically realizable two poles describe curvatures that are clockwise progressing for increasing frequency.

For four poles:

- (a) Foster's reactance theorem was extended to n -pair terminals by Cauer.⁴ The special case of four poles is treated by Guillemin.⁵ This extension states that the elements of the impedance matrix are principally similar reactance functions as found for two poles.
- (b) The input impedances of arbitrarily terminated four poles show the same well-known tendency of clockwise progression with increasing frequency as do two poles.

The significance of this restriction

will become particularly clear in the section on anomalous dispersion. Altogether, it will soon become obvious that broadbanding is an "unnatural" correction of a natural behavior; that is, this correction will only be possible within certain limits.

Desirable Load Characteristics

The first prerequisite and the condition for all further procedures of broadband technique is to have a load as "flat" as possible. A load having a low Q will ab initio introduce a low VSWR. In the particular case of antennas, the attenuation exerted by the radiation must be high. High

radiation attenuation, e.g., for dipoles is reached by choosing a low characteristic impedance of the antenna. That means that one must use thick dipoles as illustrated in Fig 2.

Nils E. Lindenblad⁶ went even further in his tendency by a judicious choice of the shape of the antenna. In the equivalent circuit of the dipole he makes the attenuation $R/ZZ = 0.5$ for the inductive branch and 0.5 for the capacitive branch thus providing theoretically a frequency independent dipole impedance (application of Boucherot circuit). Of special importance is the configuration of the antenna in the neighborhood of the feeding point. For

Fig. 1: Power transfer efficiency of lines

Fig. 2: Input impedance of round dipoles of different thickness, equal electrical length

Fig. 3: Influence of configuration in neighborhood of feeding point on input impedance

Fig. 4: Compensated $\lambda/4$ transformers

Fig. 5: Compensation for maximum bandwidth

Design Techniques

Broadband circuit design is facilitated by classification of many methods in use. Reactive and linear elements, and bidirectional fourpoles are analyzed

instance, changing the leaflike antenna 1 to a circular antenna 2 effects an essential shrinking of the impedance curve (Fig. 3).

The anomalous behavior of radiation coupling can be used to contract the input impedance curve of antennas with reflectors to a considerable degree, when the distance of the reflector is properly chosen. A simple rule of thumb, applying to dipoles or dipole pairs in front of plane re-

flectors, is to make the reflector distance $\frac{1}{4}\lambda$ instead of $\frac{1}{2}\lambda$ of the mean wavelength in order to get the best broadbanding effect.

Broadbanding Procedures

Compensation: Series- and anti-resonance circuits have opposite phase characteristics. Hence, in the neighborhood of a series resonance point ($\lambda/4$ antenna) the reactance

can be compensated by parallel connection of an antiresonance circuit of a certain

$$\sqrt{L/C}$$

In the region of an antiresonance point ($\lambda/2$ antenna) compensation is possible by series connection of a series resonance circuit of a certain

$$\sqrt{L/C}$$

The limit of compensation is given by Foster's reactance theorem. With the assumption that the resistive component is constant, the limits of compensation are given by

$$(f_2 - f_1)/f_1 < 2/\pi Q,$$

where Q is the figure of merit of the equivalent circuit of the antenna.

Reactance compensation of $\lambda/2$ dipoles: If X_m is the maximum reactance to be compensated and Z_c the

TABLE 1: COMPENSATION OF SIMPLE $\lambda/4$ TRANSFORMERS

(a) No mismatch at the band mean (b) Compensation for maximum bandwidth

	$Z_1 > Z_2$	$Z_1 < Z_2$
simple compensation at input	$Z_1 = \sqrt{Z_1 Z_2} = Z_2 N_o$ $Z_c = Z_1 (N_o^2 - 1)$	$Z_1 = \sqrt{Z_1 Z_2} = Z_2 / N_o$ $Z_c = Z_1 (N_o^2 - 1)$
simple compensation at output	$Z_1 = \sqrt{Z_1 Z_2} = Z_2 N_o$ $Z_c = Z_1 (N_o^2 - 1)$	$Z_1 = \sqrt{Z_1 Z_2} = Z_2 / N_o$ $Z_c = Z_1 (N_o^2 - 1)$
double compensation	$Z_1 = Z_2 N_o$ $Z_c = Z_1 (N_o^2 - 1) / 2$ $Z_c = Z_2 (N_o^2 - 1) / 2$ $Z_c = \sqrt{Z_1 Z_2} = \sqrt{Z_1 Z_2}$	$Z_1 = Z_2 / N_o$ $Z_c = Z_1 (N_o^2 - 1) / 2$ $Z_c = Z_2 (N_o^2 - 1) / 2$ $Z_c = \sqrt{Z_1 Z_2} = \sqrt{Z_1 Z_2}$
simple compensation	$Z_1 = Z_2 N_o \sqrt{m_o}$ $Z_c = Z_1 N_o^2 (m_o - 1)$ m_o can be calculated from: $q^2 = \tan^2 [(\pi/2) (\Delta f/f_o)] = (m_o - 1) / m_o (N_o^2 - m_o)$	$Z_1 = Z_2 / N_o \sqrt{m_o}$ $Z_c = Z_1 (m_o - 1) / N_o^2$
double compensation	$Z_1 = Z_1 k (N_o^2 m_o - 1) / 2$ input $Z_c = 2 Z_1 (N_o^2 m_o - 1)$ output auxiliary equations: $k = [q(N_o^2 m_o - 1) / 2] / [1 + q^2 + q^2 (N_o^2 m_o - 1)^2 / 4]$ $q^2 = 2 [(m_o - 1) / (N_o^2 m_o - 1)^2] / [1 + \sqrt{1 + (N_o^2 m_o - 1)^2 (m_o^2 - 1)}]$	$Z_1 = Z_2 k (N_o^2 m_o - 1) / 2$ input $Z_c = Z_1 (N_o^2 m_o - 1) / 2$ output

characteristic impedance of the compensating line, the following relations hold:

$X_c = Z_c (\pi/2) \Delta f / f_o$

For an open $\lambda_o/4$ line

$X_c = Z_c \pi \Delta f / f_o$ For a shorted $\lambda_o/2$ line

These equations hold for small detuning Δf ; for large one's tan functions have to be used.

Susceptance compensation of $\lambda/4$ dipoles: Here the compensation has

to be done by parallel connection of a shorted $\lambda_o/4$ or open $\lambda_o/2$ line of the characteristic impedance Z_c . The susceptance to be compensated is

$Y_c = (1/Z_c) (\pi/2) \Delta f / f_o$

For a shorted $\lambda_o/4$ line

$Y_c = (1/Z_c) (\pi) \Delta f / f_o$

For an open $\lambda_o/2$ line

Compensation of simple $\lambda/4$ transformers: The well-known $\lambda/4$ transformers hold only for one frequency.

Broadbanding can easily be achieved by compensation. Two assumptions are made:

- (1) The load Z_2 is a pure resistance R_2 (at least at the mean frequency).
- (2) The transformed ratio N_o (index "o" means mean frequency) is in terms of the voltage. Hence the resistances are transformed by N_o^2 or $1/N_o^2$ respectively. N_o is always chosen in such a way that $N_o^2 > 1$.

The following nomenclature is used:

Z_1 = characteristic impedance of the transforming $\lambda/4$ line.

Z_2 = characteristic impedance of the open compensating $\lambda/4$ line at the end of the higher resistance load of the transformer.

Z_{sh} = characteristic impedance of the shorted $\lambda/4$ line that compensates in parallel connection at the low impedance end of the transformer.

m_o = VSWR for the band mean when maximum bandwidth is tried for.

Z_1 = input impedance.

Z_2 = output impedance.

Fig. 4 explains the arrangement of the compensating elements. For the simple $\lambda/4$ transformer the following equations are applicable:

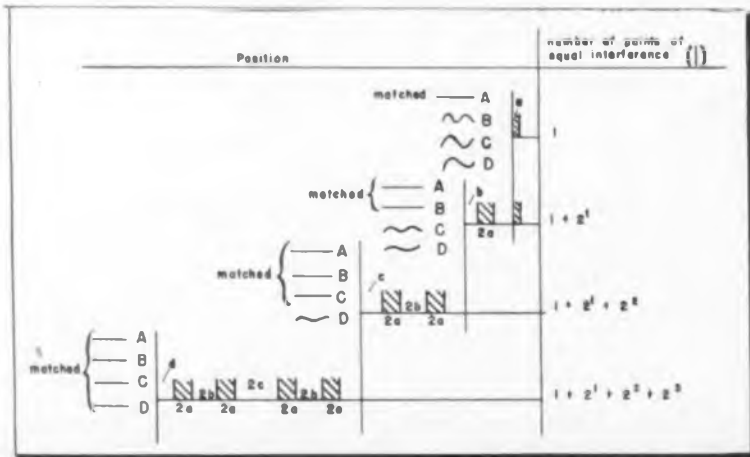

$Z_1 > Z_2 : Z_c = \sqrt{Z_1 Z_2} = Z_2 N_o$

$Z_1 < Z_2 : Z_c = \sqrt{Z_1 Z_2} = Z_2 / N_o$

The possibilities and relations of compensating simple $\lambda/4$ transformers are marshalled in table 1. The upper part of the table refers to cases where no mismatch is introduced at the mean frequency. The lower part of Table I treats the compensation for maximum bandwidth. Fig. 5 explains how this is achieved by allowing the same mismatch m_o for the mean frequency and for the limiting frequencies.

UHF-VHF Printed Circuit Diplexer

Circuit design problems are overcome to provide almost flat response over complete range of TV frequencies. Installation of antenna-receiver combinations facilitated

By ANSEL GERE
Gabriel Laboratories
135 Crescent Rd.
Needham Heights 94, Mass.

In areas where both UHF and VHF TV reception exist, three distinct antenna-receiver combinations will be used. Namely:

1. The use of separate antennas and separate receivers for UHF and VHF.
2. The use of a single antenna for both UHF and VHF, but separate receivers, e.g., a VHF receiver and a UHF converter.
3. The use of separate antennas, but a single receiver.

With both separate antennas and separate receivers, the use of separate transmission lines produces two distinct systems, and no problems arise. However, when either an antenna or a receiver serves for both UHF and VHF, the question arises what is the best method to interconnect the three components used.

A diplexer is defined as any device

Fig. 2: Power loss at matched receiver due to shunting impedance Z across its input

Fig. 1: Shunting unused UHF component across the transmission line causes signal loss due to VSWR from mismatch, and power absorption which would otherwise go to the VHF receiver

intended to connect to a single transmission line two like devices (antennas, receivers or transmitters) operating in different frequency bands. Investigations have demonstrated the need for a diplexer in UHF-VHF TV reception.

Fig. 1 shows the situation where one receives VHF, with the UHF antenna (or receiver, as the case may be) unused, but still connected. The discussion which follows is perfectly general, and the alternative situation of receiving UHF results from reading UHF for VHF everywhere, and vice versa.

In the absence of the unused component the VHF receiver presents a matched load to the transmission line, and absorbs all the power delivered to this line by the antenna (line losses being neglected). The introduction of the unused component into the system results in two types of losses. First, it mismatches the line, introducing a VSWR greater than 1. The resulting loss (in db) is given by

$$L_1 = 10 \log [(S+1)/4S]$$

where S is the resulting VSWR on the transmission line to the VHF antenna. Second, the unused component absorbs power which otherwise would go to the VHF receiver. This loss is

$$L_2 = 10 \log (1 + R_p/Z)$$

where Z is the normalized input impedance at the junction looking toward the VHF antenna.

" S " will be recognized to be a function only of Z , so that the combined loss $L_1 + L_2$ is a function only of Z . All possible values of Z are conveniently shown on a Smith Chart, and if those resulting in identical losses are joined, the result is a set of constant loss contours. These are shown in Fig. 2. One enters Fig. 2 with the complex impedance looking into the unused transmission line, and reads the loss in

db associated with shunting that impedance across a matched transmission line.

Since the unused component is unspecified, one might assume that the reflection coefficient at the junction looking toward the unused component is randomly distributed in both magnitude and phase, or, knowing that the unused component is more likely to be mismatched than not, that the probability of finding a reflection coefficient smaller than a given value is proportional to the square of that value. The last assumption is equivalent to assuming that the fractional number of installations in which the loss exceeds a given level is proportional to the area to the left of that contour in Fig. 2. The arrangement of Fig. 1 is seen to be unsatisfactory a vast majority of the time.

The function of a diplexer may be viewed as transforming in a given band of frequencies any arbitrary impedance Z to an impedance which falls inside the permissible loss contour, while leaving the impedance unchanged at frequencies within the other band.

Simple Diplexer

The circuit of Fig. 3a is the simplest which might reasonably be expected to act as a diplexer in a balanced system. Fig. 3c is the simplified equivalent representation of this circuit when receiving VHF. L is chosen so that it introduces a VSWR of less than 2:1 in an otherwise matched line at 216 mc, and C so that it introduces a VSWR of less than 2:1 at 470 mc.

That is:

$$\begin{aligned} X_L \text{ at } 216 \text{ mc} &= \\ X_C \text{ at } 470 \text{ mc} &= 0.73Z_0 \\ X_L \text{ at } 470 \text{ mc} &= \\ X_C \text{ at } 216 \text{ mc} &= 1.59Z_0 \end{aligned}$$

Fig. 4 shows the approximate loss

PRINTED CIRCUIT DIPLEXER (Continued)

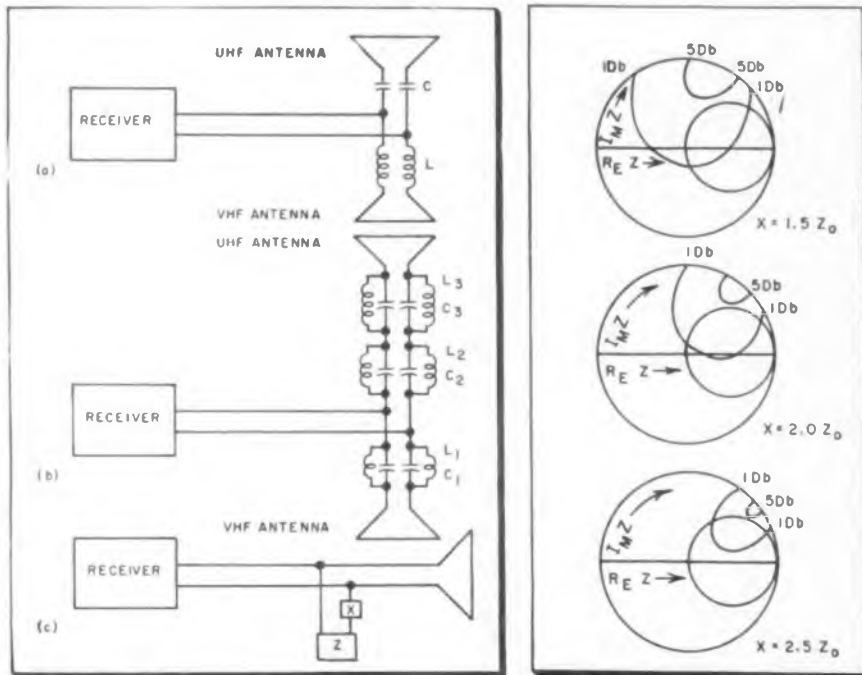

Fig. 3: (l) Simple diplexer (a), and a refinement (b). Simplified equivalent representation (c). Fig. 4: (r) Signal loss at receiver due to shunting impedance of Fig. 3c

associated with various values of X in Fig. 3c. It is shown for X negative (or for VHF operation). For X positive the contours should be reflected in the real axis. Exact values can be obtained from Figure 2. Since $X = 1.5Z_0$ at the edge of the bands, this diplexer is somewhat better than no diplexer at all.

Improved Diplexer

The circuit of Fig. 3b has been suggested as a diplexer. The impedance of the parallel circuits is given by

$$X = \frac{X_L}{1 - \left(\frac{\omega}{\omega_r}\right)^2} = \frac{X_C}{1 - \left(\frac{\omega_r}{\omega}\right)^2}$$

where $X_L = \omega L$, $X_C = -1/\omega C$, $\omega_r = 1/\sqrt{LC}$

The impedance of the parallel combination of an inductance and capacitance is greater than that of the inductance alone below resonance and greater than that of the capacitance alone above resonance, and significantly so for a narrow band of frequencies surrounding ω_r . The diplexer of Fig. 3b is therefore a variation of that of Fig. 3a, with increased action over certain frequency bands.

It may be inferred from Figs. 2 and 4 that if the series impedance is greater than $3Z_0$ at all frequencies in a band, the diplexer will work

"almost all of the time." This requires that the impedance of the parallel combination be twice that of the single component, or that ω differ from ω_r by less than 30%. This is consistent with the variation of frequencies over the widest TV band.

However, for use with $Z_0 = 300$ ohms, the inductances in the resonant circuits are impractically large. This is discussed later. A commercial diplexer utilizing this design must necessarily perform poorly.

Filter theory has been developed to the extent that Tee filters can be designed by straightforward means to approximate any desired stop and passband characteristics. The combination of a high and a low pass filter, both with cut-off in the neighborhood of 350 mc, might be expected to serve as a diplexer for UHF and VHF frequencies. Such a diplexer utilizing so called constant K filter sections is shown in Fig. 5.

Both the high and low pass filters have the property that sufficiently far from cut-off frequency in the stop band they behave like open circuits regardless of their termination, and sufficiently far from cut-off in their pass band they behave like a terminated transmission line with Z_0 determined by the L and C used, and that in the neighborhood of cut-off they behave like reactive elements for most values of termination.

The first two properties are those required for a diplexer, with the

last property serving to determine the extent of the useless frequency band between the two bands in which the diplexer must operate.

A distributed constant diplexer (made with sections of transmission lines) was built using the design equations given by Cohn¹ and ignoring the shunting effect of a filter in its stop bands. Its response curve is shown in Fig. 9a. This curve, and all others in this report, are the measured insertion losses of the diplexer with the unused terminals terminated in 300 ohms. Curves were also measured for short circuit and open circuit terminations, but except for frequencies from 216 to 470 mc were equivalent to those for 300 ohms termination.

The shunting effect of the high pass filter can be seen in the losses of the low pass filter beginning at 210 mc. This effect can be minimized by including the shunting effect of one filter in the design of the other. The procedure is easily done by trial and error and the effect was compensated on subsequent diplexers.

This distributed constant diplexer turns out to be difficult to fabricate, large, and sensitive to its environment. The last property explains the measured results in the UHF band.

In order to eliminate the last two objections it was decided to employ

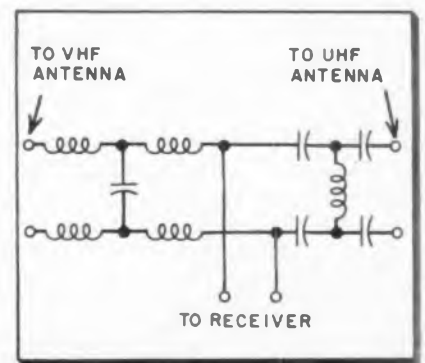

Fig. 5: Diplexer using two constant K sections

a lumped constant diplexer. A conventional lumped constant diplexer roughly equivalent to the distributed constant diplexer, was built. It was difficult to fabricate, and therefore was not investigated further. These two diplexers are shown in Fig. 6

Printed Circuits

It became evident that the only economical way to construct a diplexer was through the use of printed circuit techniques. Fig. 6 shows the first printed diplexer built. Fig. 7 shows the other side of this filter as well as the drawing from which the filter was fabricated by

Fig. 6: (l) First experimental diplexers using printed circuits. Fig. 7: (r) Reverse side of filter and drawing from which filter was made

the photo etch technique.² Schematically, this filter was equivalent to the distributed constant diplexer, except for the small correction to improve response at the upper end of the VHF band.

The diplexer did not perform satisfactorily at UHF and the cause was traced to resonances in the coils. An investigation of spiral coils was conducted and it was found that the reactance of a coil is closely approximated by

$$X = 4f_1 L_0 \tan(\pi f / 2f_1)$$

where L_0 is the low frequency inductance of the coil, and f_1 is the first natural resonant frequency of the coil. " f_1 " was found to be a function of the length of the conductor in the coil, the spacing between

turns, and the material on which the coil was formed. For coils of the geometry used, formed on XXXP phenolic, it was found that f_1 is the frequency for which the length of the wire is $1/5$ of a free-space wavelength. Calculations from these formulas show that any inductance greater than a few tenths of a microhenry will have resonances below 890 mc unless constructed with microscopic conductor widths and spacings. This completely rules out practical construction of the filters of Fig. 3b because of the requirement that either L_2 or L_3 be many fold larger than this in a 300 ohm system.

The required inductances in Tee filters with cut-off frequencies in the neighborhood of 350 MC are not large, however, and by making the

coils small enough the proper value of inductance can be secured from a coil which has no resonances within the television bands.

Dimensions of such coils were computed, and a new diplexer fabricated. This diplexer is shown in Fig.

Fig. 9: Insertion loss of UHF-VHF diplexers with 300 ohms connected to unused terminals

Fig. 8: Second printed circuit diplexer

8. Response curves are shown in Fig. 9b. Abnormal response in the vicinity of 750 mc can be attributed to an increase in the apparent inductance of the shunt coil due to stray shunt capacities in the circuit. An increase in the output condenser is sufficient to transfer this abnormal response to the edge of the band.

The response of this diplexer with the capacitor increase is shown in Fig. 9c. This design is satisfactory for home TV reception in all respects and is taken as the final electrical prototype.

The commercial version of this filter will differ only with respect to arrangement of the terminals, and the inclusion of a weatherproof plastic case.

New Test and

SWEEP OSCILLATOR

The Model Video TTV "Marka-Sweep," is a wide-band sweeping oscillator that covers the 50 KC to 8 MC range in a single sweep. The unit is equipped to provide frequency identification markers throughout the sweep

trace. These can be continuously variable, 50 KC to 8 MC, from the unit's calibrated CW oscillator, or crystal-positioned at 0.2, 0.75, 1.25, 4.0, or 6.0 MC. Other frequencies are available. **Kay Electric Co., 14 Maple Ave., Pine Brook, N. J.—TELE-TECH & ELECTRONIC INDUSTRIES.**

WOBUlator

Intended primarily to align the UHF tuning heads of TV receivers, the Type 1211 UHF wobulator can also be used to determine impedance characteristics of antenna systems, and for proper termination of coaxial cables in the UHF

TV spectrum. The instrument covers the entire spectrum of 450-900 MC on oscillator fundamental frequency. Output is flat within $\pm 10\%$ over the entire spectrum for 50 MC band-width with the exception of a spurious absorption at 650 MC. **Tel-Instrument Co., Inc., 728 Garden St., Carlstadt, N.J.—TELE-TECH & ELECTRONIC INDUSTRIES.**

DISTORTION ANALYZER

Model TDA-1 telegraph distortion analyzer rapidly and accurately measures the bias and distortion of "Teletypewriter" signals, circuits, and equipment. Percent of distortion is read on a scale in front of a cathode ray tube.

No test signals are required. Measurements are made on regular teleprinter traffic. As the self-contained portable instrument measures 7-1/2 x 8 x 12 in. and weighs only 15 lbs., it can be carried to repeater or terminal points in field working circuits. No special skill or technical knowledge is required to operate the unit. **Stelma, Inc., 389 Ludlow St., Stamford, Conn.—TELE-TECH & ELECTRONIC INDUSTRIES.**

FM SIGNAL GENERATOR

The Type ASG-1, FM signal generator comprises a highly stable oscillator coupled inductively to a piston-type attenuator. Frequency range, 20-100 MC in five bands. Calibrated output; 0.05 μv to 100,000 μv in 50 ohms external impedance calibrated to 2 db accuracy. Internal instrument impedance is 50 ohms. Three other test equipment

units announced by the manufacturer are the Model AR-1 FM demodulator and deviation meter, the Type AAM-1 dual channel audio amplifier, and the Model AFR-1 crystal calibrator. **A.R.F. Products, Inc., 7627 Lake St., River Forest, Ill.—TELE-TECH & ELECTRONIC INDUSTRIES.**

POLAR RECORDER

The Model PR polar recorder is designed for recording patterns of antennas and other directional devices. Its chart table is driven by a Selsyn motor that is provided with a gear reduction of 36:1 or 100:1 ratio, or to the customer's order. The chart diameter is 8 1/4 in. Actual recording width is 4 1/8 in. which can be covered from 0-20

db up to 0-80 db. Interchangeable linear, square root, and squaring scales are available. Frequency response is from 20 to 200 k cps. and over. The electronic circuit can be supplied for ac. or ac.-dc. recording. **Sound Apparatus Co., Stirling, N.J.—TELE-TECH & ELECTRONIC INDUSTRIES.**

BALLISTIC METER

The Model S43X dc and ac (rectifier) milliampere and milliampere second meter is one of a group of special 5-inch ballistic meters. Large movement which it has is necessary to achieve the sluggish action required in ballistic-type meters. The most sensitive prac-

tical range is 0-200 μamps , which, due to the long wire-length per ampere turn, has a resistance of 2,500 ohms. A milliammeter of 0-1 has the normal resistance of 2,500 ohms. **The Hickok Electrical Instrument Co., 10606 Dupont Ave., Cleveland 8, Ohio.—TELE-TECH & ELECTRONIC INDUSTRIES.**

Measuring Equipment

VSWR INSTRUMENTATION

Model 620 is a compact, commercial version of the AN/UPM-12 automatic VSWR instrumentation system. The computer-display unit provides automatic VSWR determinations over two ranges covering ratios of 1.02 to 1.2.

and 1.2 to infinity, at any preset power level from five w. to one megawatt and repetition rates from 400 to 4,000 pps. After installation of the matched directional coupler in the waveguide run, VSWR is computed and displayed by the computer display unit. **Cubic Corporation, 2841 Canon St., San Diego 6, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.**

FLUTTER METER

The Gaumont-Kalee flutter meter is designed to measure small frequency variations of a given carrier frequency. The unit consists of a narrow band amplifier, a limiter, a discriminator and detector, and a metering system. The whole is self-contained and has its own power supplies. The input amplifier is

tuned to 3,000 cps. and has a 1,000 cps. bandwidth. For correct operation, an input control adjustment for signal level must not be less than 100 mv. **S.O.S. Cinema Supply Corp., 602 West 52nd St., New York 19, N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES.**

TIME DELAY GENERATOR

The model A-5 time delay generator has the following delay ranges: 1-10 μ secs, 2.5 to 100 μ secs, 5-1,000 μ secs. Incremental delay is limited by the resolution of the helical potentiometer control to 1/9,800 of full scale. Accu-

racy after calibration and long term is $\pm 1\%$. Output pulses, blocking oscillator, width 0.5 μ sec wide between 10% points. Rise time, 0.1 μ sec between 10% and 90% points. Output impedance, 100 ohms 0.01 μ f blocking condenser. Amplitude 50 v. **Rutherford Electronics Co., 3707 Robertson Blvd., Culver City, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.**

COUNTER

The Model 21 electronic totalizer counts pulse or sine wave signals of 10 mv or greater at frequencies up to 1,000 cps./secs. Two decade counting tubes are used with a six-digit mechanical register to give a counting capacity of 99,999,999. Decade-counting tubes are rated at 10,000 hrs. The 5,000 hr. industrial type electronic tubes are operated at a fraction of their normal load for comparable long life. The unit uses only 5 thermionic tubes and draws 22 w. of 95-135 v. 50-60 cps. ac. Each decade-counting tube with one associated electronic tube takes the place of 10 neon bulbs and four electronic tubes employed in conventional counting circuits. Three inches high and six inches deep, the unit mounts in a standard relay rack. Weight is approximately four lbs. **Potter Aeronautical Co., Route No. 22, Union, N.J.—TELE-TECH & ELECTRONIC INDUSTRIES.**

PASSIVE NETWORK

Type 2011 passive network consists of a continuously variable delay line, an input cathode follower, a voltage amplifier, and two output followers. The step variable delay line has a time delay of 10.5 μ secs. in step of

0.5 μ sec. The continuously variable delay line has a total time delay of 0 to 0.5 μ sec. with resolution time less than 5×10^{-10} secs. from 0 to 11 μ secs. **Advance Electronics Co., Inc., P. O. Box 394, Passaic, N.J.—TELE-TECH & ELECTRONIC INDUSTRIES.**

SIGNAL GENERATOR

Type 190 constant-amplitude signal generator generates sine waves in the frequency range of 350 kc to 50 MC. Output amplitude varies less than 2% from 350 kc to 30 MC; less than 4% from 30 MC to 50 MC. Frequency is continuously variable in six ranges. Frequency indication is accurate within 2%. Output amplitude is continuously variable from 4 mv. to 10 v. peak-to-peak in 10 ranges with amplitude in-

dications accurate within 10%. Output impedance is 52 ohms. Weight 24 lbs. **Tektronix, Inc., P. O. Box 831, Portland 7, Ore.—TELE-TECH & ELECTRONIC INDUSTRIES.**

New Audio Accessories

RECORDING TAPE

The newly-developed "Lifetime" magnetic recording tape is unconditionally guaranteed never to break or curl under normal recording and playback conditions; nor will recording machines or ordinary handling break it. Further-

more, neither humidity nor temperature will affect it. The permanent qualities of the new tape are the result of a newly-developed magnetic oxide applied to DuPont "Mylar" polyester film—neither of which contains a plasticizer. **Reeves Soundcraft Corp., 10 East 52nd St., New York 22, N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES.**

REEL

A new 7-inch plastic reel with a 2¼-inch hub provides essentially the same accuracy of timing and tension and stress freedom as the previous 2¾-inch hub, but its additional storage space eliminates outer tape turns slipping off. Holds 1200 ft. of tape with additional capacity for long end leaders and leaders between selections. Flanges provide more space for labels and give greater protection for the rolled tape. Raised edges around the rim and flange openings are said to provide increased

strength and rigidity with minimum weight, and also serve to keep the clear plastic flange surfaces from becoming scratched or marred. **Audio Devices, 444 Madison Ave., New York 22, N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES.**

PLUG-IN AMPLIFIER

Type 5117 miniature plug-in audio amplifier is a two-stage, push-pull, fixed gain unit that is conservatively rated at 8 watts. Gain, 55 db. Input source impedance, 30/150/250/600 ohms—150 and 600 ohms center-tapped. Out-

put load impedance, 150/600 ohms—600 ohms center tapped. Output power as a program amplifier, +26 dbm (0.40 watts) with less than 0.5% rms total harmonic distortion over the range 50 to 15,000 cps. Output noise, unweighted, cps. As a monitor amplifier +39 dbm (8 watts) with less than 1% rms total harmonic distortion over the range 50 to 15,000 cps. Output noise, unweighted, equivalent to an input signal of -110 dbm or less, ±0.5 db, 30 to 1,500 cps., depending on tubes. **Langevin Manufacturing Corp., 37 West 65th St., New York 23, N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES.**

TAPE REEL

An 8/in. reel that can be used on any machine which takes the standard NARTB hub to eliminate tape-stretch, breakage and pitch changes has been announced. The new unit avoids use of

a 10½ in. reel, which causes tension near the end of a small reel, and tension introduced by the smaller hubs of the standard 7 in. plastic reels. **Ampex Corp., 934 Charter St., Redwood, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.**

SPLICER

A splicing device, said to be the first for magnetic tape as employed on tape recorders has been announced. The plastic back of the splicer is provided with an adhesive mounting material for firmly attaching it to the

tape recorder or work table. The splice is made by pressing the tape ends into a groove—overlapping about one-half inch. Held in place by edge friction, the ends are then trimmed by a blade run through a guide slot and a pre-cut tab of splicing tape is then pressed over the joint. **Cousino, Inc., 2326 Madison Ave., Toledo 2, Ohio.—TELE-TECH & ELECTRONIC INDUSTRIES.**

SPEAKER SYSTEM

The IT-1 speaker system is individually tuned. Each enclosure is tuned to its own speaker to secure the optimum 1-f performance from the system. The result is extended bass response without booming effect. The enclosure consists of a critically damped resistance-controlled venting system. All tuning is performed by engineering personnel using laboratory measuring equipment. Cabinets are available in blond birch, walnut and dark mahogany.

All finishes are hand crafted and hand rubbed. Front dimensions are 25 x 30 in. Speaker impedance is 8 ohms. **Laboratory of Electronic Engineering, Inc., 413 L Street, N.W., Washington 1, D.C.—TELE-TECH & ELECTRONIC INDUSTRIES.**

New Electronic Tubes

AMPLIFIER TUBE

The HA-2/4-50/20-1 broadband S-band voltage amplifier was developed to provide voltage amplification from 2 to 4 kmc which does not have to be tracked by tuning voltage or mechanism. The unit finds use in applications

where wideband and high gain are required at a low level, as preamplifiers, untuned r-f receivers, and in microwave measurement techniques. Operating characteristics over this band are 40 db gain, 20 mw. output, and 20 db noise figure. The unit requires a 300 gauss field and a 500 v. regulated power supply. **Huggins Laboratories, 700 Hamilton Ave., Menlo Park, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.**

SHUTTER TUBE

The BL-58 TR shutter tube is said to be the only TR tube with continuous crystal protection—in one complete package. When equipment is not in use, or is in standby condition with the TR keep-alive voltage off, an automatic fall-safe shutter provides a minimum of 40 db insertion loss ahead of crystal. When equipment is in operation with voltage applied, the shutter

action is automatically removed and the TR tube functions normally. **Bomac Laboratories, Inc., Salem Road, Beverly, Mass.—TELE-TECH & ELECTRONIC INDUSTRIES.**

MAGNETRON

The 4-J52 magnetron, used in radar equipment, has been redesigned to replace the oxide-coated cathode with the new Phillips dispenser-type cathode that is fabricated from tungsten impregnated with barium aluminate

enabling the tube to operate over a wider temperature range, and making it practically indestructible, it is said. A bifilar winding heater is used to reduce tube noise. Glass in the tube has been replaced by ceramic, allowing baking at considerably higher temperatures. **Microwave Associates, 22 Cummington St., Boston 15, Mass.—TELE-TECH & ELECTRONIC INDUSTRIES.**

POWER TRIODES

F-6366 and F-6367 are 3 and 6 kw. output power triodes that are improved versions of Federal types F-7C25, F-5680, and F-5996. Although electrically similar, the new tubes differ from current models in characteristics, design, and performance. The F-6366 is a three-electrode industrial oscillator with a 3 kw output and filament characteristics of 11 v., 29 amps. The F-6367 is a three-electrode 6 kw tube designed for use as a modulator, amplifier, or oscil-

lator It has a filament voltage of 13 v. and a filament current of 36 amps. **Federal Telephone and Radio Co., 100 Kingsland Road, Clifton, N.J.—TELE-TECH & ELECTRONIC INDUSTRIES.**

AMPLIFIER TUBE

A new beam power amplifier tube, 5992, is designed to replace the 6V6 and other such tube types. The units have a cathode type structure with an extruded ceramic heater insulator and a coil type heater instead of a filament

structure. This construction, it is said, along with the ruggedized mount structure, virtually eliminates heater failures, shorts, and other adverse effects of shock and vibration. An arc-resistant, compound-filled melamine base with inter-pin barriers enables operation at altitudes up to 80,000 ft. **Bendix Aviation Corp., Red Bank Div., Eatontown, N.J.—TELE-TECH & ELECTRONIC INDUSTRIES.**

MULTIPLIER PHOTOTUBE

RCA-6328 9-stage type short multiplier phototube has instantaneous response to meet the critical timing requirements of headlight-control service. Its high luminous sensitivity allows use of an amplifier with relatively low-impedance input and fewer stages than required by a less sensitive tube. The low electrode dark current of the 6328 makes feasible the use of high-resistance voltage-divider networks to mini-

mize power requirements and to improve operating stability and life. **Radio Corporation of America, Tube Dept., Harrison, N.J.—TELE-TECH & ELECTRONIC INDUSTRIES.**

New Lab and Plant Equipment

CYCLOGRAPH

Model C-1 Cyclograph can be used to sort raw stock, semi-finished, or finished ferrous or non-ferrous parts by metallurgical characteristics such as analysis, hardness, structure, case depth, etc. Comparison with an acceptable known part as a "standard" en-

ables the quick separation of unwanted parts. Used as a "hand" sorter, the operator watches the screen and throws out off-standard parts manually. Used with a type 407 automatic relay unit, operator discrimination is eliminated which makes it possible to sort thousands of parts more per day. The relay unit sends out a reject signal whenever an off-standard part passes the test coil. This signal can be used to operate a solenoid operated reject gate, paint spray marking device, or other reject means. **J. W. Dice Co., 1 Engle St., Englewood, N.J. — TELE-TECH & ELECTRONIC INDUSTRIES.**

WIRE TWISTER

The Model G-6 wire twister is designed for a specific kind of wire, gauge of wire, and length of twist, and has no

treadle-operated jaws. A funnel-type opening guides the loose strands into a special head which holds the strands so that its rotation imparts the proper twist. Each twister is produced to order. **The Eraser Co., Inc., Rush Wire Stripper Div., 1068 S. Clinton St., Syracuse, N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES.**

HARDNESS TESTER

The Model 317 sheet metal hardness tester tests all types of ferrous and non-ferrous sheet metal. Its calibrated microscope and reticle facilitate readings within two points in the Brinnel scale. The microscope has a self-contained battery-type illuminator. Sheet

stock from 0.01 in. to 0.250 in. can be measured. A precision ground spring, which loads a $\frac{1}{8}$ in. ball with 150 KG load, remains in constant calibration. Sheet pressure is applied by parallel jaw pliers, and indentations are measured with the microscope. A limiting pad assures that all indentations are formed with the same load. **Pacific Transducer Corp., 11921 West Pico Blvd., Los Angeles 64, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.**

TEST SET

Type 210 transistor test set is intended for use in the circuit laboratory, inspection department, and on the production line. It measures the equivalent circuit parameters of both junction and point-contact units over a wide range of dc conditions. No accessory

equipment is necessary. The internal generator operates at 1.5 KC, and the ac voltmeter has a sensitivity of 1 mv full scale. The unit gives directly the value of input resistance, output resistance, voltage feed-back ratio, and current amplification factor. **Owen Laboratories, 412 Woodward Blvd., Pasadena 10, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.**

PLATING BARREL

The Gill-Singleton plating barrel has a patented dual V-belt suspension drive that eliminates transmission gears and cylinder bearings. The cylinder is suspended in the tank from the superstructure by two belts that drive shaft pulleys to the grooved circumferences

at the ends of the cylinder. The belts support the cylinder weight while transmitting rotation power. The belts are acid, alkali, and stretch-resistant composition with guaranteed 2,000 lb. capacity, and heat-resistant to well over 200° F. Cathode contact is made by a self-cleaning, 12-in. inverted V-block on each end of the superstructure. **The G. S. Equipment Co., 5317 St. Clair Ave., Cleveland, Ohio—TELE-TECH & ELECTRONIC INDUSTRIES.**

PARTS WASHER

The triple automatic parts washer was developed for cleaning metal parts, paint-stripping, rinsing and similar cleaning and dipping operations. Each compartment is a complete tank with separate controls. Each is equipped with a spare parts rack. Pushing a

switch lowers the rack to the tank bottom and automatically agitates the parts in the solution. A second switch stops agitation and raises it flush with the tank top for unloading and reloading. All electrical switches and connections are explosion proof. The racks are raised and lowered by air under pressure. **D. C. Cooper Co., 1467 South Michigan Ave., Chicago 5, Ill.—TELE-TECH & ELECTRONIC INDUSTRIES.**

Special "miniaturized" strips available, actual size shown.

TERMINAL STRIPS ... BOARDS

The terminal strip, a CINCH engineering "first", is today a Standard electronic component. Something of the scope of the CINCH operation in the design and production of metal plastic assemblies is indicated by the terminal boards fabricated to meet exacting armed forces requirements.

CINCH facilities and engineering experience and ability assure the satisfactory fulfillment of any assignment for a terminal strip, board or electronic component.

WASHINGTON

News Letter

Latest Radio and Communications News Developments Summarized by TELE-TECH's Washington Bureau

PRESIDENT'S RECOGNITION—The outstanding achievements in research in the electronics field as bulwarks for the growth of the nation's economy received full recognition from President Eisenhower in his administration's first Economic Report to Congress. With outlays having doubled in recent years for research, the President stated that "a fundamental condition of economic progress is a growing fund of scientific and technological knowledge" from which "come opportunities for investment and new industries, based upon the development of new materials and products, more efficient processes, and the improvement of old products." The President cited electronics, together with atomic energy, jet engines, helicopters, titanium and heat resistant materials, plastics, synthetic fibers, soil conditioners and hybrid seeds, as notable examples of new industries created by research. He specified as last year's research achievements of new industries, electronic computers and electronic process controls as well as communication equipment.

FCC FEES—What has been in the making for the past few years came to a head recently in the proposed schedule of fees to be charged by the FCC for the filing of applications and licenses for stations and there is no question but that the radio-electronics industry's various segments, even though granting the justification for the Commission's recovery of part of its expenditures in serving the industry, will seek in the filing of comments with the Commission clarification of some of the charges, especially the largest proposed fee of type approval of equipment. The latter is a proposed charge of \$1,500 for type approval of equipment for broadcasting, marine, mobile and citizens radio services. The FCC under its fee program would recoup approximately 45 per cent or \$2.8 million of its current 1953 fiscal year budget of \$6.4 million. Comments are to be filed by April 1.

RANGE OF CHARGES—The first agency to make public its program of charges for its services, the FCC schedule of fees is likely to receive revision in its final form after analysis of the impact of the costs upon the mobile and amateur radio services and upon smaller radio-electronic manufacturers, particularly, because of the potential threat of retarding progress in the art. Clarification of the FCC plan is to be sought by the various elements in the industry through the comments and probably oral arguments before the Commission. The schedule of fees was as follows: \$325 for major broadcasting-television applications such as sale of stations and competitive station proceedings; \$50 for minor broadcast-TV applications; \$10 for processing of all types of applications for the safety and special radio services, includ-

ing modifications of licenses; \$20 for experimental services applications; \$3 for amateur, disaster and RACES (radio amateur civil emergency service) which is a charge likely to be hotly debated by many "hams"; \$600 for type approval of equipment applications for industrial, scientific and medical services; \$100 for type acceptance of equipment applications; and \$30 for compulsory ship radio-electronic equipment inspections by the FCC field staff. The charges of equipment approvals ranging from \$100 to \$1500 have aroused the principal controversy, it is understood.

VIEWS ON UHF-TV—FCC Commissioner George E. Sterling, one of the two "engineer" members of the Commission, gave some significant technical views on how the FCC could help the progress of UHF television. He declared the FCC should look favorably on granting extensions of time for completion of UHF stations which are seeking transmitters of power greater than 1 kw, but he cautioned that possibly stations should not seek such high power. He also felt the FCC could relax or lift the limitations on antenna directionalizing to aid UHF stations in better coverage. The Commissioner who presented his views before the Boston section of the IRE likewise expressed the viewpoint that licensing of satellites and booster stations would help UHF television progress.

MICROWAVE LANDMARK CASE—Proposal of California to establish a state-operated microwave radio system which is before the FCC promises not only a long dispute between the telephone and telegraph systems on the one hand and several state governments and police, fire and forestry conservation departments on the other side but is slated to a landmark case in the development of FCC microwave policy. A virtual flood of comments by supporters and opponents of the California application has been transmitted to the Commission. California has asked to establish its statewide system for its public safety (police, forestry, conservation, etc., services), and to handle traffic for its state agricultural market news service as well as state government administrative traffic in off-peak hours. The telephone and telegraph companies stressed to the FCC that their facilities, already available are entirely adequate and the California move if adopted by other states would provide government competition with private enterprise as well as being a rather costly venture on the part of the state governments. The California plan undoubtedly was a subject of discussion at the Feb. 24 meeting of the central microwave coordinating council in Chicago.

J. Patrick Beacom, president of Beacom Broadcasting Enterprises, specified GPL equipment at WJPB-TV for "top quality plus economy"

**\$117,565 Completely Equips
WJPB-TV...
LOWEST COST EVER FOR
CAMERA CHAIN STATION**

Century-old mansion was restored by radio-television firm, now houses both WJPB and WVVW studios and offices.

● Fairmont, West Virginia, is America's smallest market with a camera chain station for live shows . . . 319,000 persons and 32,101 UHF sets in range of WJPB-TV, Channel 35.

"Keeping costs down," says station president J. Patrick Beacom, "was the only way this community could have a live station." He equipped it for \$117,565, on a GPL plan for a basic package

of camera chain and film chain, projector, transmitter, antenna and accessory units.

"We analyzed *all* equipment," adds Mr. Beacom. "We visited numerous other stations. Then we picked the GPL package plan as best for both our company and our community. Community TV just wasn't possible with other equipment, yet we have top engineering and best picture quality with GPL, plus the economy."

In any market today, costs are important. If your CP is in a highly competitive and densely populated area, you need GPL for quality to get and hold an audience, at a profitable operating rate. If it's in a sparse market, where TV is new, you need it for utmost economy. In short, in any market, big or small, network or independent station, it combines the best quality with operating economy.

Ask for proof! You'll discover how GPL can save you money . . . with the best.

Robert M. Drummond, vice president and general manager of WJPB-TV, directs station operations in Monongahela Valley area.

AEROVOX
high-temperature

**metallized-paper
 CAPACITORS**

Aerolene* does it! This Aerovox-exclusive solid impregnant accounts for the higher temperature ratings and longer life of Aerovox metallized-paper capacitors. The accompanying curve (Operating Voltage vs. Temperature) tells the story. Further gains from permanently-embedded sections in solid Aerolene impregnant are: maximum immunity to vibration and rough handling. And of course minimum size and maximum convenience. Install them—forget them!

Available in a wide variety of case styles including modified molded tubular, and all types of metal-cased hermetically-sealed construction with capacitance ratings from .0005 mfd. to 100. mfd. at voltages up to 600 VDC.

Get the FACTS!

Ask for literature on Aerovox metallized-paper capacitors in both standard and special types. Our metallized-paper specialists will gladly collaborate on your extra-compact-capacitor needs.

WINDING MACHINE

The Type DB automatic core winding machine, produced by Froitzheim & Rudert, Berlin-Reinickendorf-West Germany, is designed to wind toroidal cores, transformers and power rheo-

stats. Uniformly even and firm windings are obtained by means of an infinitely variable wire-feeding arrangement which can be adjusted during operation, and by an automatic brake on the winding magazine. The ring to be wound is inserted in the open winding magazine. Then, the magazine is closed and filled with the required winding material. The ring is wound by the movement of a rotary winding table on which it is mounted, or by the segment table to which it is mounted. Exclusive distributor for U.S.A. and Canada, Rex Rheostat Co., 3 Foxhurst Road, Baldwin, L.I., N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES.

REPEATING FUSE

The Sightmaster patented indicator repeating fuse for home and industrial use has gone into production. When the fuse ceases to function a neon indicator lights which is a signal to switch to the next fuse position. Since there are six positions, the fuse can be used repeatedly by twists of the switch. The fuse will be produced in 15, 20, 25, and 30 amp. ratings. Sightmaster Corp., 111 Cedar St., New Rochelle, N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES.

ELECTROMAGNET

The 6-in. model V-4007 multi-purpose laboratory electromagnet features changeable pole caps for uniform or high field work, an adjustable gap that provides a gap range from 1/2 in. to 6 in., and a dolly mount that gives complete mobility without loss of rigidity. The changeable yoke angle enables use of a variety of positions to provide working access. Varian Associates, 611 Hansen Way, Palo Alto, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.

New! A low-cost

MARKER GENERATOR

**for PRD's VHF-UHF
Sweep Frequency Generator**

▶ **TYPE 909 CRYSTAL MARKER GENERATOR**

GENERATOR: Crystal Oscillator, Harmonic Amplifiers
OUTPUT: 2, 10 or 50 mc/s ($\pm 0.01\%$) markers up to 2000 mc/s
OUTPUT CONTROL: Marker amplitude continuously adjustable
OUTPUT IMPEDANCE: Both high and low
RADIATION: Low

▶ **TYPE 907 SWEEP FREQUENCY GENERATOR**

WIDE RANGE: 40 to 900 mc/s
WIDE SWEEP: At least 40 mc/s for UHF
HIGH OUTPUT: At least 0.3 volts over entire range
OUTPUT IMPEDANCE: 50 or 75 ohms
LOW RADIATION: 10 μ v or less

The Type 909 Marker Generator – precision engineered by PRD – provides frequency markers of crystal accuracy, which are added electronically to the response pattern. This is accomplished by connecting the Marker Generator to a special marker injection circuit in PRD's Type 907 Sweep Frequency Oscillator.

UHF Frequency Meter Type 587 provides a method of accurate absolute frequency measurement in the UHF range.

▶ **TYPE 587 FREQUENCY METER**

CAVITY TYPE METER: May be connected as Reaction or Transmission Type
FREQUENCY RANGE: 400-1000 mc/s
ACCURACY: $\pm 0.2\%$
Q FACTOR: Approx. 1000 (not less than 600)
READING: Direct

Complete data and specifications will be forwarded promptly upon request to Department T-3.

CUES for BROADCASTERS

(Continued from page 93)

relay will round out the setup. Those unwilling to depend upon a normal type relay, can use a locking model, however the tone would not return to the line after the broadcast. With a normal type relay, this setup is convenient for any fixed daily, or weekly broadcast, and gives a constant line check.

Single Channel Transistor Remote Amplifier

ROBERT FLORY, Chief Engineer,
WVBR, Ithaca, N. Y.

THERE are many remote broadcast applications for a compact single channel remote amplifier. Battery operation is often desirable. Fig. 2 shows the circuit diagram of such an amplifier, employing two RCA type 2N34 junction transistors. The

Fig. 1: Rear view of Transistor amplifier chassis

operating condition of transistors are fixed, and any transistor of the 2N34 type can be plugged into either socket. Constructional details are shown in Fig. 1.

The first stage is designed for lowest noise level. This has been found for this type of transistor to be at a collector current of 1 ma or 2 ma and a collector-emitter voltage of 1 v. or 2 v.

The circuit constants for the first stage in Fig. 2 have been chosen to produce these operating conditions. The input impedance of a base input amplifier is about 1000 ohms. A Stancor UM-111 transformer matches a 50 ohm microphone to the base of the transistor. Resistance-capacitance coupling is used between the two stages. If more gain is desired, impedance matching can be used. A Stancor UM-110 transformer would be suitable. Shunt feed should be used to maintain the proper operating conditions on the first transistor. The gain control is of the degenerative type in the output stage. Maximum gain is obtained when the capacitor is connected to the emitter. The output circuit will depend on

the output power required. Output is limited by a 50 mw dissipation limit on the transistor. The amplifier as constructed was designed for 1 mw undistorted output. Collector load impedance for maximum power output is closely approximated by dividing the collector-emitter voltage by the collector current. Hence the load impedance for the output stage is 8000 ohms. The impedance match to the 600 ohm telephone line is accomplished by a UTC A-26 transformer.

Frequency response is limited by the transformers rather than the transistors. Noise level is about 30 to 40 db below average signal level, using a Shure 55S microphone with the announcer about 1 ft. from the microphone. This noise level is low enough that it is almost always obscured by the background noise in a remote location.

Power Requirements

The amplifier requires 4 ma at 20 v. which is obtained from a Burgess XX15 battery, and battery life is about 50 hours with one hour daily operation. To avoid accidental battery drain, the amplifier operates only when it is connected to the telephone line with the proper connector which has a jumper to connect the battery to the amplifier. The entire amplifier, including battery, is contained in an aluminum box measuring 3 x 4 x 5 in.

The operation of the amplifier is extremely simple, the power switch being the only control. The gain control was made a service, or set-up adjustment for simplicity. It is so adjusted that the output never ex-

Fig. 2: Circuit details of remote amplifier unit

ceeds 1 mw with the microphone used. The noise level of telephone lines used is low enough that the average signal level can be 10 to 20 db below 1 mw, without line noise becoming important.

NEW HOT-SLITTING PROCESS

GIVES **audiotape** EXTRA STRENGTH

Newly perfected thermal-slitting technique provides smoother, cleaner edges, resulting in increased break and tear strength of plastic base Audiotape

IN THE manufacture of Audiotape, particular care has always been given to the slitting operation, in which the processed tape is cut into reel-size widths. Precision straight-line slitting has been one of the reasons why Audiotape tracks and winds perfectly flat and has no fuzzy edges to impair frequency response.

Now, however, even this superior slitting operation has been still further improved by precisely controlled heat application. The result, though not visible to the naked eye, is a significant increase in tape *strength*.

For thermal slitting avoids the formation of the microscopic cracks and irregularities which result, in varying degrees, from any cold slitting process. Each such defect is a source of weakness and a potential tape break.

The thermal treatment in no way alters Audiotape's *balanced performance*. Hence Audiotape not only offers you the most faithful reproduction of the original sound, but also assures the highest mechanical strength obtainable with cellulose acetate base material—all at *no extra cost*.

Audiotape is now available on this
NEW 7" PLASTIC REEL

• 2½ inch hub • more area for labeling • less chance of tape spillage • greater protection to tape • rugged, non-warping construction • distinctive, modern design

... and in colors, too!

Audiotape 7" reels can now be obtained, for special applications, in red, blue, green, yellow or clear plastic. And Audiotape is also being offered on either blue or green colored plastic base, in addition to standard red. These distinctively colored tapes offer interesting possibilities for specialized recording and filing applications. Write for further details.

BROADBAND DESIGN TECHNIQUES

(Continued from page 100)

In Fig. 6 the square of the transformer ratio is plotted over $\Delta f/f_0$ for the various compensations. It should be mentioned that the length of the transformers is a bit shorter than $\lambda/4$ to account for capacitive effects of the edges.

The opposite phase relation between series and parallel resonance can also be extended to fourpoles. Fig. 7 exemplifies this point. A load operating in the neighborhood of the $\lambda/2$ is compensated by a cascaded $\lambda/2$ line having an essentially larger characteristic impedance than the load, thus shifting the load in the series resonance range of the impedance diagram.

In this connection reference is made that M. P. Mason and R. A. Sykes' developed unsymmetrical line arrangements working as wideband transformers for large transformer ratios.

Curve Contraction

Several detailed examples are given for empirically derived curve contraction within certain transformation circles. Though no illustration need to be given here, it seems

Fig. 15: Composed line transformer, ratio

worthwhile to extract the intrinsic property that allows this contraction. Fig. 8 helps for a pictorial understanding. By parallel connection of jX_1 , an impedance $R_2 + jX_2$ is converted into $r + jx$.

The normalized r and x are families of orthogonal circles, representing virtually the input impedance of a parallel circuit with damping in one branch only. Of relevant interest are the heavy semicircles constituting loci for constant r/R_2 . The semicircle through $(1, -1)$ designates

$r/R_2 = 1$ and separates the two domains of upward and downward transformation. The inside (where R_2 is small) holds for upward transformation of R_2 and the outside of the circle (where R_2 is predominantly large) for downward transformation.

Thus, by proper selection of the operating range, large R_2 can be converted into small r and vice versa. The optimum center of transformation is the point $(1, -1)$, to which the center of the curve to be contracted has to be shifted by series reactances or sections of transmission lines.

Phase Regression Occurring with Z-Variation

The clockwise phase shifting of transmission lines can partly be compensated by the use of Z-variation. A glance at the simplified Smith diagram, Fig. 9, reveals that a counterclockwise phase regression can be established, if the characteristic impedance of the line is changed at the proper point. At the point of change the phase angle of the input impedance will not change. The impedance will therefore move along the semicircles of constant phase (Fig. 9). The limits of the methods based upon this principle depend on the particular arrangement used; they can, however, not exceed 90° per discontinuity. The broadband short circuit can easily be shown to be a consequence of phase regression.

The principle of phase regression opens new aspects for the understanding of the internal mechanisms of exponential lines. If Z is imagined to vary in little steps, even the need to put a series capacitance at the high impedance end and a shunt inductance at the low impedance end of the exponential line can be visualized with the help of Fig. 9. Exponential lines are broadband transformers, but they are hard to build. A very useful rule, however, is inferred from the theory of exponential lines. If a change of any kind of transmission quality (e.g., characteristic impedance, or mode transition) has to be made for a broad band, a change of 5% of the property in question for a length of $1/20$ of the wavelength (lowest) is permissible, to secure good broadband characteristics.

It is generally simpler to work with discontinuously instead of continuously non-uniform lines. They may consist of a sequence of $\lambda/4$

Fig. 16: Composed line transformer, length

lines with characteristic impedances staggered according to certain patterns to be described. The phase regression is the more complete, the more line sections are used, more being necessary for larger transformer ratios. This procedure is only suitable within the range of $1/8$ to $3/8$ for the line section length in terms of the wavelength.

The equations for the double $\lambda/4$ -quarter transformer shown in Fig. 10 are:

$$Z_1 > Z_2 : Z_1/Z_2 = Z_{12}/Z_2 = \sqrt{N_0}$$

$$Z_1 < Z_2 : Z_2/Z_1 = Z_{12}/Z_1 = \sqrt{N_0}$$

In following up the clear-cut advantage of two $\lambda/4$ transformers in cascade as compared with one (Fig. 6), Daellenbach¹² investigated analytically the possibilities for n $\lambda/4$ transformers in tandem. The input impedance in terms of the output impedance is then:

$$Z_1/Z_2 = N_0^n [1 - j^n (N_0 - (1/N_0))]^{1/n}$$

$$p = \tan [(\pi/2) (\Delta f/f_0) / (1 + \Delta f/f_0)]$$

For $p < 1$ the broadbanding effect increases rapidly with increasing n .

For a triple set of $\lambda/4$ transformers the characteristic impedances are to be:

$$Z_{11} = \sqrt{Z_1 Z_2 / r_3} ; Z_{12} = \sqrt{Z_1 Z_2} ;$$

$$Z_{13} = \sqrt{Z_1 Z_2} \cdot r_3$$

r_3 can be calculated from the following equation or taken directly from Fig. 11.

$$r_3^2 (2 + r_3) / (1 + 2r_3) = N_0^n$$

For a quadruple set of $\lambda/4$ transformers there is no longer a simple

all this and color too!
...with EIMAC UHF TV Klystrons

HIGH GAIN — SIMPLE TRANSMITTER. Eimac klystrons are inherently ideal for the final linear amplifier in UHF color TV transmitters. There is no need for by-pass condensers, rf chokes or feedback loops, and through low driving power and high power gain, the preceding circuits are simplified, and the smallest number of rf stages is required.

LOW NOISE LEVEL. Eimac klystrons operate below the noise level specified by the NTSC color television standards. The low noise level of these klystrons is amply demonstrated in UHF television transmitters now in daily operation.

NO TRANSIT TIME PHASE SHIFT EFFECTS. Regardless of amplitude level, the transit time of electrons in klystrons is substantially constant, and, having excellent linearity, a klystron will provide the amplitude and phase responses necessary for faithful transmission of color values.

WIDE BANDWIDTH. The rf resonant cavities are completed external to the tube, permitting the optimum arrangement of the rf circuits for bandwidths greater than six mc—more than enough for color TV.

RELIABLE — ECONOMICAL. Because of the sheer simplicity of these klystrons, they are light weight, readily mass produced, and give long, reliable life.

ELECTRALAB

PRINTED CIRCUITS

for radio and TV applications

This Electralab printed circuit has already resulted in 40% labor savings for one manufacturer.

The illustration above shows the end result in a search by one manufacturer for a low-cost design for high-speed production. Electralab's engineering staff re-designed the original unit for printed-circuit technique. A trial run of 24 circuits was made. These proved satisfactory, and a sizable production run was then ordered. It is important to note that, even on the original 24-piece order, production costs were actually lower than those for the previous "mass-produced" ordinary assembly method.

This is just one of the many cost-cutting circuits designed and manufactured by Electralab, Incorporated. Others include hearing aids, timing devices, radar, guided missiles, motor controls, etc.

Why don't you take advantage of Electralab's engineering facilities before you design or re-design your circuits? Send for our Engineering Brochure.

Don't forget . . .

Electralab makes printed circuits for the "Project TINKERTOY" modular system, TOO!

geometric progression of the Z_i 's, but rather:

$$Z_{i1} = \sqrt{Z_1 Z_2} / \sqrt{N_0} \sqrt{r_1};$$

$$Z_{i2} = \sqrt{Z_1 Z_2} / \sqrt{r_1};$$

$$Z_{i3} = \sqrt{Z_1 Z_2} \cdot \sqrt{r_1};$$

$$Z_{i4} = \sqrt{Z_1 Z_2} \cdot \sqrt{N_0} \sqrt{r_1};$$

wherein r_1 , determinable from the

Fig. 17: Symmetrical clockwise shifting 4-poles following equation, is given by Fig. 11.

$$r_1 = \sqrt{N_0} [\sqrt{2(1-N_0)} - (1-\sqrt{N_0})] / (1+\sqrt{N_0}).$$

A method in point was developed by W. W. Hansen and communicated by Slater.¹¹

Line Transformer Pairs

If a $\lambda/4$ line of characteristic impedance Z_1 and a $\lambda/4$ line of characteristic impedance Z are cascaded, as shown in Fig. 12a, they form effectively an ideal, real transformer for the frequency for which the $\lambda/4$ relation holds (Fig. 12b). The actual, ideal transformer action is sketched with Smith's diagram in Fig. 12c.

Instead, now, of using a $\lambda/4$ line of characteristic impedance Z_1 , a section of the original Z line can be converted into an equivalent $\lambda/4$ Z_1 -line by inserting a parallel reactance P (as shown in Fig. 12d) or a series reactance S . For the latter the underlying relations are:

$$N_0 = \cotan b_1; \\ 2 \cotan 2b_1 = S/Z.$$

For practical needs Fig. 13 has been prepared allowing the direct reading of the required complementary lengths and of S or P for the transformer ratio N desired.

This simple line transformer alone has no broadband behavior. However, by putting two equal line

BROADBAND DESIGN TECHNIQUES (Continued)

transformers in opposition, the resulting transformer ratio is one. Hence, the pair of opposing transformers may be moved to any place along the transmission line without creating any mismatch for the frequency for which they are designed. This simple fact is utilized to form for other frequencies more complex transformers that will not unmatch previous matchings.

Referring to Fig. 14, it is assumed that a simple transformer is used to match the load for frequency A (straight line stands for VSWR = 1), whereas for frequencies B, C, and D wavy lines symbolize standing waves (top part of Fig. 14). Now two opposing line transformers are used (second step in Fig. 14); they transformer matching the load for leave A matched and form a new a certain frequency B (becomes now straight line). The spacing between the the two points of inserting P (or S) is $2a$, determined by the complementary length a of the original transformer for A. Two pairs of P's, each spaced $2a$ in itself and spaced $2b$ from pair to pair will match for frequency C, but will not unmatch A and B. In order to match also for frequency D four more pairs have to be added as indicated in the bottom row of Fig. 14. In order to match exactly at n frequencies

$$\sum_{n=1}^{n-1} 2^{n-1} \text{ discontinuities P (or S)}$$

have to be inserted into the feeding line. Though these insertions may be simple polystyrene discs in coaxial lines or simple irises in wave guides (or any other series or parallel reactance in the line), the matching at four or five frequencies is usually the practical limit. The experimental adjustment is relatively easy and quick, if the schedule of Fig. 14 is kept in mind and if the matching is done at R_{min} or R_{max} .

Fig. 15 provides the transformer ratio and Fig. 16 the required complementary lengths for pairs of line transformers considered as one. All pertinent information is indicated in the diagrams. The diagrams are based on the following equations:

$$N = \frac{\left[\frac{1 - (1/2)(Z/P^2 - (Z/P) \cotan 2v)}{(Z/P) + \cotan 2v} \right] \pm \sqrt{1 + |z|^2} + \frac{\tan v}{1 + (Z/P) \tan v}}{\left[|z| \pm \sqrt{1 + |z|^2} \right] \frac{\tan v}{1 + (Z/P) \tan v} - 1}$$

$$\tan b = |z| \pm \sqrt{1 + |z|^2}$$

For brevity the contents of the brackets is not repeated.

It should be borne in mind that Fig. 15 and Fig. 16 refer to a simple "pair" of line transformers, not to paired pairs as needed for matching more than two frequencies.

Anomalous Dispersion

For all transmission lines and waveguides being of uniform or simple periodic structure, two correlated features are evident:

(a) Wavelength decreases with increasing frequency.
 (b) Phase shift is clockwise.
 Both relations combined determine the clockwise bending of the input impedance with increasing frequency.

Broadbanding could easily be accomplished, if one of the above properties could be reversed, thus

Fig. 18: Smallband and broadband feeding

providing a counterclockwise bending of the input impedance.

Called superlattice structures by Brioullin¹³ certain biperiodic band-pass structures (as one shown in Fig. 17) can be realized, for which the wavelength increases with frequency (anomalous dispersion) in one or several passing bands. Unfortunately this behavior is by necessity coupled with a counterclockwise phase shifting, since the propagation time or delay $t_{gr} = db/df$ must be positive in any real network (b being the phase constant).

Fig. 17 illustrates this situation.

f_1 , moving to f'_1 by insertion of the anomalous section, is the lower frequency. f_2 and f'_2 refer to the positions at the higher frequency. Though the phase shift is counterclockwise, the phase shift for the lower frequency is larger than for the higher frequency. Hence, again, the progression from f'_1 to f'_2 is clockwise as was the original progression f_1 to f_2 . No counterclockwise curving of the input impedance is possible.

Broadbanding Conditions

The prospects for broadbanding, however, are not completely negative. If the characteristic impedance of the anomalous section decreases rapidly with frequency, as it does, e.g., for the structure shown in Fig. 17, a looping as represented by Fig. 17b will occur, thus providing a result similar to the effect of a half wavelength section.

Since $b = \cos^{-1} A_{11}(f)$, (where the cascade matrix element A_{11} , according to the theory of symmetric fourpoles is the reciprocal of the open-circuit transformer ratio of the inserted section) anomalous dispersion will occur in passing bands wherein

- (1) $dA_{11}/df > 0$ (anomaly).
- (2) $-1 < A_{11} < +1$ (passing band)

The author did not succeed so far in getting theoretically any band width larger than

$$\sqrt{2}$$

1 at most.

Symmetric Pairing: The need for paired feeding of arrays of broadband antennas is self-explanatory by inspection of Fig. 18, since otherwise lobe shifting would take place.

Why buy more instrumentation than you need? The new all-purpose *-hp- 524B* Electronic Counter with Plug-In Units gives you precisely the frequency, time interval or period measuring coverage you want now. Later, you can add other inexpensive plug-in units to double or triple the usefulness of the Counter.

Model 524B offers direct, instantaneous, automatic readings requiring no calculation, interpolation or complex instrument set-up. It has high sensitivity, high impedance, and its operation is so simple and dependable it can be used readily by non-technical personnel. Resolution is 0.1 μ sec, and accuracy is 1/1,000,000 \pm 1 count. Construction throughout is of highest quality components in a compact militarized design.

The new Counter with Plug-In Units gives you more range, more convenience, smaller size and lower cost than any commercial instrument combination ever offered. With this one compact equipment, you readily measure transmitter and crystal oscillator frequencies, time intervals, pulse lengths, repetition rates, frequency drift; make high accuracy ballistics time measurements or high resolution tachometry measurements, or use as a precision frequency standard giving convenience and flexibility not provided in the usual primary standard.

Data subject to change without notice. Prices f.o.b. factory

BASIC COUNTER

The basic *-hp- 524B* Counter unit measures frequency from 10 cps to 10 mc with accuracy of ± 1 count \pm stability, reading direct in kc; or measures period from 0 cps to 10 kc with accuracy of $\pm 0.3\%$ reading direct in seconds, milliseconds or microseconds. Eight-place registration, short term stability 1/1,000,000, display time variable 0.1 to 10 seconds. \$1,890.00

COUNTER WITH PLUG-IN UNITS

- hp- 525A Frequency Converter** extends Counter's range to 100 mc, maintains accuracy, and increases Counter's video sensitivity to 0.1 volts through basic 10 cps to 10 mc range. \$225.00
- hp- 525B Frequency Converter** like 525A but extends Counter's range to 200 mc at 0.25 volts sensitivity. \$225.00
- hp- 526A Video Amplifier** increases Counter sensitivity between 10 cps and 10 mc to 10 millivolts for low level frequency measurements. \$125.00
- hp- 526B Time Interval Unit** measures interval 1.0 μ sec to 100 days with accuracy of 0.1 μ sec \pm 0.001%, reading direct in seconds, milliseconds or microseconds. Start, stop triggering in common or separate channels, through positive or negative going waves. \$150.00 (Plug-in units supplied in aluminum storage case).

Miniature POWER Resistors

Carefully crafted for matchless performance, Dalohm miniature power resistors are made to survive the most severe environmental, shock, and vibration conditions.

Dalohm RH type resistors are completely welded from terminal to terminal. They are silicone sealed in a die-cast, black anodized radiator finned housing and mount on sub-panel for maximum heat dissipation.

Also Available RH-250—250 Watts
RS Types—2, 3, and 10 Watt

ADHESIVE NAMEPLATES

Permanent metal nameplates called "Speedy-Cals" are applied to equipment without use of rivets or screws. They consist of 0.003 in. abrasive resistant metal foil, laminated with bonding material, and may be embossed with cir-

cuit diagrams, trademarks, specification data, and similar patterns. To apply to flat or curved surfaces, they are immersed in water for one minute, blotted, and protective cellophane film removed. These nameplates are then rolled on any clean, smooth surface, such as metal, glass, bakelite and paint. Maximum bond is achieved in 24 hours; considerably less if heat is applied. Available in all shapes and sizes, almost all standard colors, shiny or matte finish. North Shore Nameplate Co., Bank of Manhattan Bldg., Bayside, N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES.

POTENTIOMETER

Type 771 "FilmPot" is a metallic film potentiometer that is only 3/4 in. in diameter and 1/2 in. long. It is available with either a servo-flange or threaded

bushing mountings. The unit has a resistance element of precious metal deposited on an inorganic substrate that is electrically stable up to temperatures of 225° C. that assures a low temperature coefficient of resistance over a range of 100 to 200,000 ohms in the 1 in. case size. The Type 771, said to be the first of its kind to be offered to the commercial market, meets JAN-R-9 specifications for salt spray, vibration, temperature cycling, and low temperature. Fairchild Camera and Instrument Corp., Potentiometer Div., 25 Park Ave., Hicksville, L.I., N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES.

New! All-Nylon! Fungus-Proof!

GUDE-NYLACE

Flat Braided Lacing Tape

Write for samples,

NEWS FROM OUR ADVANCED DEVELOPMENT LABORATORIES

● A four-terminal junction transistor has been developed having a region of negative output impedance. This switching device is unique in that two coincident trigger signals are required to turn it on. Thus two gating functions may be accomplished by a single transistor.

**CUT
DOLLARS
FROM YOUR
COSTS
WITH THE NEW
MODULAR SYSTEM**

TIME-SAVER
MONEY-SAVER
IDEA STIMULATOR

The units of the MODULAR SYSTEM provide a large number of electronic functions at patchcord-selector switch command: amplifiers, pulse-formers, frequency dividers, electronic counters, etc. Thus, you are freed of circuit details, can think and operate on "block diagram" level. Your thinking is stimulated, while time-consuming, costly design and development work is eliminated. The MODULAR SYSTEM allows special devices to be quickly "patched-up" and then just as easily disassembled. Eliminates troublesome delays and the need for acquiring special-function equipment for one-time application. Complex electronic devices are made available and operating within minutes after you have conceived the need. You'll save time and money with Modulares, cut important dollars from your engineering cost.

GENERAL CHARACTERISTICS

System: The Modular System consists of sixteen individual Modular units—providing most of the basic elements used in electronic data handling, storage and transmission, together with a power supply and all the necessary patchcords and connectors.

Operation: Units are assembled on the power supply, locked together mechanically and quickly interconnected by patchcords after the desired functions have been selected by multiposition switches.

Frequency: Maximum useful replate is 120 K pps.

Dimensions: Each Modular unit is 2½ inches high by 4½ inches wide by 9 inches deep. Power supply (300 v, 400 ma) is 18 inches wide by 5½ inches high by 14¾ inches deep.

CONNECTOR RECEPTACLE

A new printed circuit connector receptacle consists of solid one-piece contacts mounted in Alkyd or Melamin. Sockets maintain positive wiping contact on 0.061 boards after 1,000 insertions of 0.071 in. boards. Permanent set

and contact fatigue, even under vibration, have been eliminated by the design and the production processes used. Ample allowance for misalignment of mating boards has been made. The printed circuit connector is presently available in 18 and 22 contact configurations. Dimensional drawings and complete test data are also available. Richardson Co., 5860 Spring Oak Drive, Hollywood 28, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.

COMMUNICATIONS INDICATOR

Radar device developed in cooperation with U.S. Air Force tells whether a radio broadcast is getting through to the listeners. "COZI" (Communications

Zone Indicator) indicates approximately how strong the broadcast signals are at their destination, and whether the enemy is jamming that frequency. In operation, COZI sends out a radar beam which follows the same path as the radio waves, and then returns to show whether a given frequency is being reflected at the proper skip distance. Raytheon Mfg. Co., Waltham 54, Mass.—TELE-TECH & ELECTRONIC INDUSTRIES.

every TV station needs

LOW COST COMMERCIALS

that local sponsors can afford

Here's how the GRAY Telop screens out high production costs

Install a Gray Telop as part of your basic TV broadcast equipment for commercials . . . "screen" out high production costs! Use with any television film camera, including the new Vidicon camera. Projects opaque cards, photographs, artwork, 3 1/4" x 4" transparent glass slides, strip material, even small objects . . . pens, watches, cigarette lighters, pipes, etc., or small models of large products.

A Gray Telop . . . at low initial cost . . . projects these economical materials and small objects with all the professional versatility of major "network" effects . . . without using costly film strips or live talent. Sponsors' copy can be prepared quickly, easily, for a variety of effects that is virtually unlimited. Gray's Telop will help you to sell more revenue producing commercials . . . Increase Your Profits!

Seeing is Believing

- Gray Telop projection of commercials must be seen to be appreciated . . .
- You get dual projection, superposition, lap dissolve, fade-out . . . with a single lens system.
- You can project "cinematic", exciting visual effects for greater audience interest . . .
- Your Gray Telop will pack punch and profit into every minute of your TV commercials . . . at a price that local sponsors can afford!

MINIATURE RELAYS

A new series of telephone type relays, adaptable to low wattage sensitive applications, have been designated as class 22 and are supplied in hermetically-

sealed, dust tight enclosed and open types. They are especially useful in applications where one relay must perform a large number of switching functions with minimum input power. Coil and contact spring terminals at mounting end of relay facilitates concealed wiring of either individually or strip mounted relays. They are available for 60 cps ac, any voltage to 440; and for dc any voltage to 230. They are supplied with a variety of contact combinations; single or twin contacts; snap action contacts; coil resistance from 0.12 to 21,000 ohms; time delay, slow release to 125 millise. **Magnecraft Electric Co., 1442-E West Van Buren St., Chicago 7, Ill.—TELE-TECH & ELECTRONIC INDUSTRIES.**

R-F AMPLIFIER

Utilizing a traveling-wave tube, the model 24 broad band amplifier provides high gain over the 2,000 to 4,000 MC frequency range. The small-signal gain

averages 35 db, and the saturation output power is 30 mw. Maximum noise figure is 20 db or less. Primary supply requirements are 108 to 122 v. at 1 amp., 50-800 cps. The unit is completely self contained in a case with JAN dimensions —4 7/8 x 7 5/8 x 19 1/16 in. **Westlabs, Inc., P.O. Box 1111, Palo, Alto, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.**

FLUTED SET SCREWS

Setko set screws, now available in a complete range, stay more positively on the wrench or key while being started or inserted in a tapped hole, hence save production time. Further, the fluted type is tamper resistant because their application requires a special key or wrench. The strength of the screw is dependent upon its special design

rather than its material, therefore, it can be tightened or loosened repeatedly without distortion nor will it split or round out. Because of its extra strength, the fluted socket screw small-sizes are particularly suitable for small, precision type products. **Set Screw & Mfg. Co., 42 Main St., Bartlett, Ill.—TELE-TECH & ELECTRONIC INDUSTRIES.**

MOTOR

The type PM-47 miniature permanent-magnet motor, rated at 1/400 h.p. with operating speed of 10,500 rpm, is suggested for application to small fans,

blowers, and other light-weight loads. Designed for continuous duty, the unit draws 0.18 amp. at 27 v. dc. and has a total weight of 5 oz. Dimensions: 1 1/16 in. long by 1 1/8 in. diameter. The 1/8 in. diameter shaft has an extension length of 1 1/16 in. Other lengths, and special arrangements, such as splines, keyways, gears, etc., can be provided. A number of electrical-connection arrangements can be provided to suit application requirements. **Dalmotor Co., 1375 Clay St., Santa Clara, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.**

ELECTRIC FURNACE

A new electric, box-type re-circulating furnace for temperatures up to 1,250° F. is built in 9 different sizes and 2 heat ranges, 0-800° F. and 0-1,250° F.

Sizes are 18 x 12 x 18 in. to 24 x 24 x 36 in. The furnace has a new skirt-type cabinet and is furnished with an inf. control, electronic indicating temperature controller, contactor, and switch box. Exterior is baked-on "Hammerloid". **K. H. Huppert Co., 6830-32 Cottage Grove Ave., Chicago 37, Ill.—TELE-TECH & ELECTRONIC INDUSTRIES.**

HICKOK

PERFECTED 250° ARC-ANGLE METER

Doubles Possibilities in Design Field

3½" Round Case

3½" Square Case

- Provides more practical space usefulness than any other electrical indicating instrument.
- New, 2½ times longer scale specifically designed for maximum space economy.
- The result of 8 years of continuously improved HICKOK development.

The pioneering development of this 250 Degree Arc-Angle instrument class has made possible numerous new applications in all fields of electrical-electronic indication. Engineers can now utilize the long-scale readability advantages of a meter with uniform and evenly spaced scale divisions. A full 250° arc on the dial now replaces the conventional 100° arc of other electrical instruments . . . (2½ times longer scale). A 3½" HICKOK 250° meter has a scale length equal to the standard 6" switchboard meter. A 2½" HICKOK 250° meter equals scale length of a conventional 4" meter.

In considering the development of this new line, it was decided to do more than just offer a class of miniature panel meters with accuracies already commercially available . . . but to produce a new instrument equivalent in sturdiness, accuracy and scale length to the larger rectangular switchboard models.

These 250° instruments meet performance requirements of military specifications. Components are exactly machined to provide the highest possible torque to weight ratio. The exacting design of the magnetic circuitry, the high standard of meticulous manufacture and the elaborate laboratory and field testing of this revolutionary achievement has resulted in a new class of 1% panel instruments. Available in 1½ through 5½-inch sizes, round, square, or AN cases, sealed or unsealed, and in all D.C. ranges and A.C. rectifier types.

Your inquiry is invited. Kindly list specification details of your requirements.

See these new meters at the I. R. E. Show,
Booth 458-460 Electronics Ave.

The HICKOK moving coil assembly consists of precision machined components. Carefully designed to insure mechanical stability and dependable electrical accuracy.

Conventional 100 Degree Arc-Angle instrument showing 0—200 microampere range.

HICKOK 250 Degree Arc-Angle instrument showing same range on a scale approximately 2½ times as long in the same size instrument.

Write today for your copy of the new HICKOK Instrument Catalog No. 28.

New Technical Products for the Electronic

SUPER-REGULATOR

The "Kay-Lab" super-regulator converts ordinary power supplies to provide extremely low output impedance and ripple. Stable high gain amplifiers

and pentode series passing tubes make the unit immune to preceding power supply variations. Constant plate current versus plate voltage characteristics of the pentode tube series is maintained by an internal screen voltage source. Amplifier gain of 105 db maintains both the dc and ac output impedance extremely low. There are no electrolytic condensers in the operating circuitry, and the regulator can be used for either positive or negative output voltage. Voltage range, 200-350 v. Current range, 0-450 mas. Load regulation for full load current change 0.01%. Line regulation for 10% line voltage change 0.03%. Voltage stability 0.2%. Provided terminals enable connecting a Model 122 chopper stabilizer affording absolute long time stability to the output voltage. **Kalbfell Laboratories, Inc., P. O. Box 1578, 1090 Morena Blvd., San Diego 10, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.**

REMOTE TV CONTROL

The "Controla-Tone," an inexpensive patented TV and radio set remote volume control now being manufactured and distributed will be available soon in dealers' store. The unit is installed by first disconnecting the set from its electrical outlet. Then, if the set has two voice coil leads, one is cut and the insulation is stripped from the resulting ends. These are then secured to the ends of two "Controla-Tone" wires by furnished wire nuts. To eliminate stress and prevent short circuits, the lead of the device is then attached by an insulated staple to the receiver interior or base board. Thus installed the device can vary volume from a whisper to a shout by a flick of the thumb. **Controla-Tone Co., 111 North Tacoma Ave., Tacoma 2, Wash.—TELE-TECH & ELECTRONIC INDUSTRIES.**

FREQUENCY CONVERTER

The Model 2500 frequency converter delivers 60 va., 2,500 cps power. Its frequency-regulated output is accurately controlled by a tuning fork, and

an output cutoff relay protects against frequency change resulting from component failure. Operating on a 110-120 v., 60 cps voltage at a maximum dissipation of 365 watts, the converter delivers a monitored output that is adjustable between 90 and 115 v., 2,500 cps, at 60 va. maximum. Within the specified input voltage limits, voltage regulation, frequency regulation, and harmonic distortion are independent of the power factor between 0.5 lagging and 0.5 leading. **Avion Instrument Corp., Div. of American Car Foundry Co., 299-30 State Highway No. 17, Paramus, N.J.—TELE-TECH & ELECTRONIC INDUSTRIES.**

HEADSET

The "Earset" is a single-cord, single-phone headset that is held to the ear by a flat, plastic, comma-shaped frame. The center of the "comma" is a sensitive hearing aid type receiver that is held in place by a "tail" which fits over the ear. The other ear is left free to listen to the telephone or conversa-

tion. Frequency response runs from 50 to 4,000 cps. and provides comfortable hearing at 0.3 mw. input. **Telex Inc., Telex Park, St. Paul, Minn.—TELE-TECH & ELECTRONIC INDUSTRIES.**

Industries

COLOR TV COILS KIT

A new color TV coils kit contains 32 items for use with shadow mask tubes. Included are a distributed constant delay line, a horizontal output transformer, a horizontal dynamic convergence and focusing transformer, horizontal dynamic-convergence phase control, and a complete set of i-f., video, and color information circuit coils. The kit is available for immediate delivery in small quantities. **Electrometric, Inc., 6010 N. St., Woodstock, Ill.—TELE-TECH & ELECTRONIC INDUSTRIES.**

POTENTIOMETER

The Model D miniaturized millitorque, single-turn, wire-wound potentiometer, produced by Telepot Instruments, Neuchatel, Switzerland, has the following performance characteristics: linearity, 0.1%; starting torque, 0.003

oz. in.; running torque, 0.0015 oz. in.; resistance range, 100-100,000 ohms; resistance tolerance, 0.2%-3.0%; mechanical rotation, 360°, electrical rotation, 355° ± 5°, power rating, 0.5 watt; temperature, -65° to +85° C.; maximum operating speed, 1,200 rpm; acceleration parallel to shaft, 50 G.; acceleration at right angles to shaft, 15 G. Diameter, 0.87 in., height, 1.05 in., diameter of shaft 0.078 in. **F. H. Paul & Stein Bros., Inc., 100 Gold St., New York 38, N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES.**

TRANSISTOR ANALYZER

All negative resistance curves of N-type and P-type point contact transistors can be traced with the model TA-2 transistor analyzer. Inasmuch as all circuit parameters controlling the negative resistance curves are available as me-

tered variables on the front panel, the unit enables the user to visually design any negative resistance circuit in a matter of minutes. **Polyphase Instrument Co., 705 Haverford Rd., Bryn Mawr, Pa.—TELE-TECH & ELECTRONIC INDUSTRIES.**

The Sigma Relay Manual is frankly patterned after the RCA Tube Hand Book which in our view is one of the best things in the industry. It will be a long time before the Manual, even in its much more limited field of usefulness, achieves anything like the near perfection of its model.

Howsoever, there are here assembled all known facts about each Sigma relay, type, series, and adjustment. Each available combination is tabulated so that it can be selected with foreknowledge of all important attributes, notably including ratings under all test conditions selected for regular proof testing.

Doubly important is the fact that in the Sigma Relay Manual is provided a means whereby—through the regular supplement service—new information can be easily accumulated and disseminated.

The Sigma Manual Service consists of the basic loose leaf manual of approximately 260 pages and additional and replacement pages in groups as issued.

SUBSCRIPTION PRICE IS FIVE DOLLARS, YEARLY RENEWAL, ONE DOLLAR.

For the sake of those who had only one reason for reading the above and who are disappointed we have another book for sale under its title "Sigma Instruments 'nib' (.4ds and selected mail)

Lockheed in California
calling...

ELECTRONICS RESEARCH Engineers

Lockheed's expanding development program in nuclear energy, supersonic fighters, jet transports and other classified projects has created unusual career opportunities for Electronics Research Engineers experienced in any or all of the following fields:

1. Circuit design
2. Airborne radar systems research
3. Airborne antenna design

The positions require a degree or equivalent in electrical engineering or physics.

There are also career openings for Jr. Engineers for Electronic Research. No experience is necessary although a degree is required.

In addition to excellent career opportunities, Lockheed offers you:

1. High salaries, commensurate with your experience
2. Generous travel and moving allowances
3. A chance for you and your family to enjoy life in Southern California.

INTERVIEWS AT I.R.E. SHOW

For those engineers attending the I.R.E. convention, Lockheed Representatives Paul Morgan and Charles Strack will be available at the Hotel Lexington day and night on March 22 and 23.

If you are unable to attend the convention, address inquiries to Paul Morgan, Dept. TT-M-3 at Lockheed's Burbank plant.

New Technical Products for the Electronic

VHF ANTENNA

The A-15 is an inverted "L" antenna that is broad-banded to cover 118-148 MC. Its vertical section is 8 in.; its horizontal section is 13 in. The unit can be single-hole mounted on the belly of the smallest 2-place helicopter, with

sufficient clearance for operation, where it has the best radiation field pattern. Designed to withstand mild icing, the unit can be used on aircraft speeds of 250 mph. VSWR is under 2 from 118-144 MC and rises 2.7 at 148 MC. **Aircraft Radio Corp., Boonton, N.J.**—TELE-TECH & ELECTRONIC INDUSTRIES.

COMBINATION FASTENER

The flat-type combination "Speed Nut" is flanked on both sides with push-on fasteners that bite into integral studs and similar parts. Pressing the one-piece spring-tension fastener by hand over two plastic studs on the rear

face of a TV cabinet, secures the "Speed Nut" in position to receive the screw that holds the glass viewing-window in place. Four of the combination nuts securely attach the window to the cabinet without threading. Their use enables the easy removal of the window for cleaning or replacement. **Tinnerman Products, Inc., P. O. Box 6688, Cleveland, Ohio.**—TELE-TECH & ELECTRONIC INDUSTRIES.

ATTENUATORS

A line of coaxial and turret attenuators with available attenuation steps from 0.1 to 60 db and a frequency range dc to 3,000 MC has been announced. The units may be obtained singly (90500) or in a turret selector

(90506) containing any six values of attenuation which features a "pull-turn-push" selection sequence. The type of resistive elements used is such that with a 1,000 pps at four μ secs duration, the maximum accommodated peak voltage applied to the input connector is about 100 v. **Stoddart Aircraft Radio Co., Inc., 6644 Santa Monica Blvd., Hollywood 38, Calif.**—TELE-TECH & ELECTRONIC INDUSTRIES.

RACK ASSEMBLY

The HQ-140-X communication receiver is now available for standard rack mounting. The rack mounting assembly is a #16 gauge steel frame designed for placement around an HQ-

140-X chassis to make rigid mounting possible in a 19 in. rack. The assembly can be added to an HQ-140-X receiver chassis, or it can be supplied ready-mounted in a new HQ-140-X chassis. Included is a grey panel border trim to cover the standard cabinet mounting holes and rack mounting screws. **Hammarlund Manufacturing Co., 460 West 34th St., New York 1, N.Y.**—TELE-TECH & ELECTRONIC INDUSTRIES.

Industries

TOWER

A new radio and TV tower design enables six sections to nest so compactly that a 100 foot tower occupies warehouse space of less than 2½ sq. ft. The structure and all accessories make a package that is only 90 x 20 x 20 in.

in size. It is made entirely of heavily-coated steel. All bracing is riveted, and there are no welds to rust. No wrenches are necessary to assemble the tower, and rotators can be installed within it without additional accessories. It is said that the package reduces freight charges by 50%. Spaulding Products Co., Tipton, Ind.—TELE-TECH & ELECTRONIC INDUSTRIES.

TV LENS

The 35 mm Angenieux Retrofocus lens features a 64° angle of view. The short focal length, quality lens is supplied in a focusing mount with an iris diaphragm that has f2.5 effective aperture. Complete information is available from the manufacturer. Ponder & Best, Telens Div., 814 North Cole Ave., Hollywood 38, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES.

POWER RECTIFIER

The "Center-Sealed" power rectifier consists of an outside collector, an inside collector, phenolic washer, counter electrode, selenium disc, and base plate. The "outside" collector seals the "inside" or center collector against paint and moisture penetration. This assures a clean contact between the inside collector and plate surface which, it is said, provides a near zero resistance after years of operation. Sarkes Tarzian, Rectifier Div., 415 N. College Ave., Bloomington, Ind.—TELE-TECH & ELECTRONIC INDUSTRIES.

HOW TO AVOID ELECTRONICS

Remote control of radio broadcast transmitters, recently approved by the F.C.C., means that broadcasters can make more money because they don't need to have people wasting their time watching the transmitters — which incidentally can be located where real estate is dirt cheap. All checking, monitoring and adjusting are done at the studio.

As a result, everybody and his brother has jumped into the business of knocking together so-called remote control systems. Following recognized electronic design principles, they start with a couple of black boxes and jam into them as many tubes, wires, resistors and such, as Newton's law will allow (or is it Euclid's fifth axiom?).

We're proud that one of our commercial customers followed a more practical route. He believed that the fewer the components, the more foolproof would be the result. We subscribe to this theory as long as it sells our relays.

So, our friend, The Rust Industrial Company, Manchester, N. H., designed a job that has zero (0) tubes either at transmitter or studio as compared to another system which has thirty-seven (37) in the control and metering circuits, twenty-four (24) of which are at the transmitter. The Rust system has but one control adjustment whereas the competitor has 23. Although nowhere near as electronic, the Rust system works.

Incidentally, Rust has 15 relays (as compared to 16 for the competitor) and the four sensitive ones that Rust calls the heart of the whole system are Sigma (types 5 and 7). The Sigma relays receive the signal over the remote control line and decide which function to initiate at the transmitter. Rust likes these Sigma relays so much that they are replacing other types used in some early Rust models for free. Such is the power of propaganda.

How to Wind Up with a Better Coil!

A precision potentiometer is used as a voltage divider...to translate mechanical motion into voltage change. Essentially, it consists of a resistance element with terminal connections, and a sliding contact. A current is impressed on the element...when the sliding contact is moved, a change in output voltage results. For compactness, the element is usually bent into a circle, and the slider arranged to traverse it when a shaft is turned.

The resistance element may be of

composition, deposited film, or wire-wound type. Each has its advantages...the wire-wound element used in the Helipot* precision potentiometer provides the most satisfactory combination of accuracy, high resolution, and economy.

Resistance wire may be wound on a toroid...or on a card or mandrel which is then bent to shape...and Helipot makes appropriate use of all these cores in various models. In the great majority of Helipots, the resistance wire is wound on a copper mandrel...which has most advantageous heat-dissipating properties...and can be coiled into the space-conserving helical shape which was a Helipot innovation.

The linear potentiometer is designed to change output voltage in direct proportion to change in shaft position. For accurate performance, any given amount of slider travel must effect a precisely corresponding voltage change...no matter which portion of the coil is traversed.

To achieve this, a potentiometer manufacturer must select resistance wire of uniform thickness...and space it as accurately as possible when winding it. Good resistance wire is available from several sources...the critical

phase is the series of operations involved in coil-winding. Sectional dimensions and straightness of the copper mandrel...tensioning of the almost invisible filament of resistance wire...spacing between turns...all must be practically unvarying. The coil must then be pre-heated...coated with just the right amount of insulating varnish...dried...and formed to required shape.

Traditionally, these delicate operations require a variety of equipment and the work of many specialists...to produce a single coil. Helipot Corporation engineers have developed a machine unique in the industry...which performs all these coil-making operations automatically...in continuous sequence and at high speed.

At Helipot's Pasadena plant, a battery of these coil-winding machines permits full-scale production of high-quality coils...the heart of the Helipot precision potentiometer.

WRITE FOR YOURS TODAY! Your Helipot Pocket Slide Rule is waiting for you. Only 6 inches long, this valuable pocket rule contains A, B, C, CI & D scales, plus Ohms Law Formulae. Handy temperature-conversion chart makes it doubly valuable. Write for yours today on your company letterhead, ask for S.R. No. 303.

New Research Firm

Dr. Edward Bentley, former vice president and director of research at Instrument Development Laboratories, 163 Highland St., Needham Heights 94, Mass., has founded a new industrial and research firm which has been named PhoToCorp, Inc. The new group is located at 751 Main St., Waltham, Mass., and is staffed by former associates of Dr. Bentley. Purpose of the organization is to apply extensive engineering knowledge and advanced management principles to problems in instrumentation and subminiaturization.

Index Lists H-P Journal Issues

A four-page index listing all issues of the *Hewlett-Packard Journal* from September, 1949, through August, 1953 is available by writing Hewlett-Packard Co., 395 Page Mill Road, Palo Alto, California.

The Index contains a cross-reference listing of all issues of the technical publication by title of article, by subject, and by model number or type of Hewlett-Packard electronic test instruments mentioned. The Index, as well as previous issues of the *Journal*, is offered free upon written request giving name, business connection and title.

Friction-Free Tape for Magazine Operation

A magnetic tape that is reported to be almost friction-free and will give over 200 hours of excellent performance in loops over 200 ft., has been announced by Cousino, Inc., 2325 Madison Ave., Toledo 2, Ohio. The low friction is achieved by a special coating on the back of mylar base tape. The tape loop is used with the company's "Audio Vendor" continuous play magazine, which may be attached to standard recorders.

American Mica Moves to New Quarters

American Mica Insulation Co. is now established at new and larger facilities at Manasquan, N. J. The company manufactures and fabricates precision insulating materials.

Philadelphia Electronics Buys Atlas Resistor

The Atlas Resistor Co., formerly located at 423 Broome St., New York 13, N. Y., has been bought by the Philadelphia Electronics Corp. of 24 East Coulter St., Philadelphia Pa. It is planned to continue Atlas operations as a wholly owned subsidiary under the direction of Edward Herman.

The Digitester \$1185.00

Telecomputing's new digital instrument

measures resistance, voltage and current with push-button speed

The versatile Digitester serves as a combination digital volt-ohm-milliamperemeter, gives you 0.1% accuracy and .8 second speed. In addition, readout is in decimal numbers instead of analog form.

Wide measuring ranges are an important advantage of the Digitester. You can measure up to 10 megohms, 1000 volts, or 1 ampere. Maximum accuracies (lowest scales) are $\pm .01$ ohms; $\pm .00001$ volts; $\pm .01$ microamperes.

Operation does not involve any manual adjusting or balancing. You simply press a panel button to get decimal readout.

A digital ohm meter called the Digitohm is also available at \$985.00. It measures resistance with the same speed, accuracy and wide range as the Digitester.

Specifications on the Digitester and Digitohm will be sent you upon request. Please address inquiries to Preston W. Simms, Dept. TT-3.

How THE NATION'S LEADING PIPELINES

USE

PHILCO MICROWAVE

Philco Microwave is being used daily by the Nation's leading pipeline companies. These pipeline companies have selected microwave because: (1) it is an economical, reliable and expandable communications system eliminating costly and vulnerable wire lines, and (2) it provides them with private, dependable communications over long distances, cutting maintenance costs to a minimum.

Pipelines stretching over hundreds of miles can be operated and controlled from a single point by microwave. Pressure, rate of flow and tank level readings can be recorded automatically and relayed to headquarters or various points along the route. Philco Microwave carries telephone, teletype, control and telemetering channels... and offers complete tie-in with VHF two-way radio systems and existing wire line facilities.

Shown here are two of the many Philco Microwave systems that provide the nation's leading pipelines with modern and efficient communications.

OTHER INDUSTRIES USING PHILCO MICROWAVE

Communication companies use Philco Microwave for telephone, telegraph and television transmission. Reliability, economy and quality of transmission make Philco Microwave ideal for their use.

Philco Microwave is being used by leading railroads for telephone, telegraph and train dispatching. Microwave is a private system, saves costly wire installations and simplifies right-of-way problems.

Utilities rely on Philco Microwave for the control of power stations, dispatching of repair trucks and communication. Dependable channels, unaffected by adverse weather, are a necessity for utility use.

For complete details, write to Dept. X Today!

From this central console headquarters at Kansas City, Missouri, the entire Platte pipeline and communication system can be controlled and monitored.

Platte Pipe Line Company's microwave system is over 1000 miles long... to provide every communication and control facility: voice channels, remote supervisory control, continuous or selective telemetering, teletype, alarm signaling and VHF radio. This entire microwave system was surveyed, designed and installed by Philco.

Typical Philco Pipeline Installations

El Paso Natural Gas Company has 500 miles of Philco Microwave with an average distance of 50 miles between stations. This New Mexico to Arizona system consists of repeater and terminal stations, multiplexing equipment for system party line and VHF radio channels.

The longest microwave hop in the nation is this 81-mile El Paso hop from Mount Elden to Dilkon, Arizona... typical of the utilization of terrain advantage by Philco.

Your source for 2K50 REFLEX KLYSTRON TUBES

The new Bendix Red Bank 2K50 is the perfect answer for those who want a thermally-tuned Reflex Klystron tube for K-band operation.

The 2K50 has two primary applications—first, as a local oscillator in small, compact, lightweight, high definition radar and, second, as an oscillator in microwave spectrometers, signal generators and spectrum analyzers.

Because of its thermal feature, the 2K50 may be tuned automatically. Thus, it is ideally suited for difficult locations . . . in aircraft, for example . . . where direct or mechanical tuning is not practical.

Perfection of the complex, ultra-precision 2K50 . . . one of the most difficult electron tubes to manufacture . . . is a tribute to the unique talents of our engineers and production men. It demonstrates why you can depend on Bendix Red Bank for the answer to *any* special-purpose electron tube problem you may have.

MAXIMUM RATINGS

Resonator Voltage	330 volts D.C.
Reflector Voltage	—150 volts D.C.
Tuner Grid Voltage	—50 volts D.C.
Filament Voltage	6.3 ± 8% volts
Gun Cathode Current	28 ma. D.C.
Tuner Cathode Current	10 ma. D.C.

ELECTRICAL CHARACTERISTICS

Heater Voltage (A.C. or D.C.)	6.3 volts
Heater Current	755 amps.
Thermal Tuning Range	23216 to 24751 Mc/Sec.
Min. Power Output at 23504 Mc/Sec.	8.5 mW.
Min. Power Output at 23984 Mc/Sec.	10.0 mW.
Min. Power Output at 24464 Mc/Sec.	8.5 mW.
Min. Electronic Tuning at Mid-Band	55 Mc/Sec.

PHYSICAL CHARACTERISTICS

• Dimensions: Maximum seated height 2 1/4" • Base: Small Octal 8-Pin, B8-21, Low Loss Phenolic Wafer • Coupling to Wave Guide: Direct, by means of an insulating fitting • Cooling: Convection • Mounting Position: Any • Cavity: Silver Plated Steel (integral within the bulb) • Bulb: Metal • Output Window: Low loss glass

a Two-Signal Audio Generator

for Complete Audio-Frequency Testing

..... *Harmonic Distortion Determinations*

..... *Gain Measurements*

..... *Intermodulation Tests*

The Type 1303-A Two-Signal Audio Generator has three separate oscillators and three mixers for simultaneously supplying two signals, each separately adjustable in magnitude. These signals enable the complete and reliable testing of recording and reproducing systems, hearing aids, filter networks, noise suppressors, loud-speakers, high-efficiency speech-reproducing systems, recording and other devices.

The Following Signal Combinations Are Available

- ★ A single low-distortion signal whose frequency is adjustable from 20 to 40,000 cycles and to a maximum power of 1 watt.
- ★ One frequency adjustable to any value from 20 to 20,000 cycles, and a second frequency, higher than the first by a fixed amount which may be any value from 0 to 10 kc — one knob varies both frequencies simultaneously, keeping the difference frequency constant.
- ★ Two sinusoidal voltages at the same output terminals, each separately adjustable, one frequency to 20 kc and the other to 10 kc.

Additional features include: As much as 50-volts output, indicated by a panel meter — 120-db attenuation in seven steps — frequency standardization to within 1 cycle at any time; calibration of main 20 to 20,000 cycle frequency dial can then be relied upon to $\pm(1\% + 0.5 \text{ cycle})$ — excellent frequency stability; drift is less than 7 cycles in first hour and essentially complete within two hours.

Type 1303-A Two-Signal Audio Generator . . . \$1450

The Most Accurate, Convenient and Reliable System for Complete Audio-Frequency Testing

the G-R Type 736-A Wave Analyzer in conjunction with the Two-Signal Audio Generator

The Wave Analyzer is tuned to the constant-difference frequency of the generator. The main generator-frequency-control is then slowly turned through its

range and a running record of intermodulation distortion is directly indicated on the panel meter, over the complete audio-frequency range.

MICROWAVE SIGNAL GENERATORS

Complete coverage of
the range 950-10,800 mcs/sec.

with Polarad single dial operation

Four new Microwave Signal Generators covering the range 950-10,800 mcs/sec. All with famous Polarad single dial operation. Each provides the maximum working range possible in one compact signal generator. And, additional Polarad Signal Generators are available to cover 12.8 to 39.7 kmc.

These features on all MSG units assure fast and simple operation: direct reading, single dial frequency control that tracks reflector voltages automatically . . . direct reading attenuator dial . . . conveniently placed controls, in logical sequence . . . high visibility on the face of each instrument.

Polarad Signal Generators are built to the same high standards required for military equipment. They are practical for the factory assembly line—engineered ventilation assures continuous and stable operation of all instrument functions. Components are readily accessible for easy maintenance. And laboratory accuracy is guaranteed under the most rigorous operating conditions.

Write directly to Polarad or your nearest Polarad representative for details.

Visit our Booth 277-279
at the IRE Show
March 22-25.

Defies Humidity

C-D's new BUDROC* tubular

- This is the steatite-cased capacitor rated "tops" by set manufacturers. An ideal unit for critical industrial users, experimenters and researchers.
- Unequaled for its ability to resist humidity.
- You can't pick a better capacitor for hi-fidelity and hi-frequency applications.

Available in all popular capacity and voltage ranges. Engineering samples gladly sent for your inspection. And don't forget our special Technical Advisory Service for your particular capacitor problems. Bulletin NB-154, on request.

NEW TV TRANSMITTER

WOR-TV's new 50 KW transmitter located on the 83rd floor of New York City's Empire State Building, is inspected by representatives from Standard Electronics Corp., a subsidiary of Claude Neon, Inc., manufacturers of the entire transmitter installation. From left to right are Roy Kelley, secretary and treasurer, Harry Smith, Mgr. TV Engineering, and David T. Bonner, president of Standard Electronics.

let 'er go, skip along,
stick with the "K" brand you know

"Maverick" usually spells trouble, on the production line as well as out on the range. Being an unknown quantity or a "Johnny-come-lately," it leaves room for genuine doubt both as to performance and quality. And that's the reason so many experienced buyers — production experts to supervisors — insist on Kester . . . the one "brand" that is synonymous with the best solder and solder products.

Next time, choose one of these famous solder products: "44" Resin, "Resin-Five" and Plastic Rosin — all made only by KESTER . . . Key Name in Flux-Core Solder for More Than 50 Years.

KESTER

Career-chance of a lifetime

ELECTRONIC ENGINEERS AND ELECTRO-MECHANICAL ENGINEERS

for Lockheed's expanding Missile Systems Division

Recently formed from other Lockheed Engineering organizations to prepare for the era of automatic flight, the Missile Systems Division deals exclusively with missiles and their electro-mechanical systems.

Its expansion has created "ground-floor" openings for

Electronics Engineers experienced in any or all of the following fields:

- Micro-wave techniques
- Electronic components
- Circuit design
- Flight instrumentation

Electro-Mechanical Engineers with circuit or servomechanisms experience (aircraft or missile experience preferred)

In addition to outstanding career opportunities, the Lockheed Missile Systems Division offers you high salaries commensurate with your experience, generous travel and moving allowances, and a better life for you and your family in Southern California.

Address inquiries to L. R. Osgood, Dept. TT-M-3, Lockheed Missile Systems Division, 7701 Woodley Avenue, Van Nuys, California.

Really Reliable

Audio Transistors

Read the Reasons

- Stable-surface processed.
- Hermetically sealed.
- Every transistor periodically observed for two weeks on all parameters: alpha, I_{co} , R11, R22, power gain and noise figure.
- Low noise units observed for an hour of operation for any noise drift.
- Only transistors stable within error of measurement are accepted.
- Samples of each lot subjected to JAN 193 humidity and temperature cycling.

RESULT?

- Of thousands of RR_{co} transistors in use in the field for about a year, *over 99%* are giving continuing service.

If you have an application where audio transistors will fit, we'll be glad to discuss it without obligation.

Do You Need This
CAPACITY
 TO PRODUCE FINISHED WIRE LEADS

- measured and cut in 2½ to 45-ft. lengths?
- insulation stripped one or both ends to 8½ in.?
- up to 1800 pieces per hour in 10-ft. lengths?

Completed Automatically on Artos Model CS-10

Now you can get high production of insulated wire leads... accurately measured, cut in lengths up to 45 ft., and stripped at one or both ends. Leads are finished complete and collected in one fast, automatic cycle.

This Artos machine will handle wire, cord and cable up to No. 10 stranded or No. 12 solid. Consistently uniform results are ob-

tained without cutting strands or nicking solid wire. Insulation may be stripped from 2 in. up to 8½ in. at one end and 6½ in. at the other. You can also slit parallel cord or remove the outer jacket on SJ appliance cords.

Inexperienced help can handle an Artos without trouble. Set-ups are quickly changed for different cut lengths and stripped lengths.

Other Artos Machines

The complete line of Artos automatic wire cutting and stripping machines will handle *cut lengths* from 1 in. to 60 ft., *stripped lengths* to 6½ in. at one end and 8½ in. at the other, *wire from* No. 12 to No. 000 gauge, and up to 3600 pieces per hour. Ask for recommendations on your problems.

THIS IS 13 SQUARE INCHES

13_{SQ. IN.} BIGGER PICTURE 3_{IN.} SHORTER CABINET

WITH NEW WESTINGHOUSE 90°, 21-INCH TUBE

The new Westinghouse 90° deflection picture tubes give you a 5 percent larger picture than any other 21-inch tube — 13 square inches more actual picture area than that of the largest 70° tubes.

What's more, the overall length of the tube has been cut at least three inches. Here's the way to reduce TV cabinet depth — or to eliminate the "hat" from the back of the set.

But still more, the new Westinghouse 90° tubes will actually produce a sharper picture than old 70° types. Electrostatic types are equipped with the new Westinghouse electrostatic focus gun which produces sharp, clearly defined pictures because of its smaller spot size. Magnetic focus tubes contain the simply constructed magnetic focus gun which gives crisp pictures in all areas.

New Westinghouse aluminized screens are available, too.

Investigate these Westinghouse 90° deflection 21-inch tubes today. They will make your black-and-white sets sell faster in the months ahead. Call your Westinghouse sales representatives for complete data and sample tubes or write, wire or phone Dept. B2034 at the address below.

21-INCH WESTINGHOUSE 90° DEFLECTION TUBES ARE AVAILABLE WITH:

- Electrostatic Focus
- Electromagnetic Focus
- Aluminized Screens
- Non-Aluminized Screens

WESTINGHOUSE ELECTRIC CORPORATION, ELECTRONIC TUBE DIVISION, ELMIRA, N. Y.

Eimac
QUALITY PRODUCTS
 ...for top performance!

Preformed Contact Finger Stock is an ideal electrical weather stripping around doors of equipment cabinets as well as being excellent for use with VHF and UHF circuitry. Silver plated, it comes in three widths— $\frac{11}{16}$, $\frac{31}{32}$ and $1\frac{7}{8}$ inches.

Variable vacuum capacitors come in three models, are lightweight, compact, eliminate the effects of dust and atmospheric conditions and have low inductance. Also available are eight types of fixed vacuum capacitors.

Air-system sockets, designed for Eimac tube types 4-400A, 4-1000A, 4X150A, and 4X150D, simplify cooling and assure adequate air-flow to various seals. The 4-400A socket can also be used with the 4-125A and 4-250A

radial-beam power tetrodes if desired.

HR heat dissipating connectors provide efficient heat transfer from the tube element and glass seal to the air while making electrical connections to plate and grid terminals. Precision machined from dural rod, HR connectors come in ten sizes to fit most of Eimac's internal anode tubes.

High Vacuum Rectifiers come in eight models, are instant heating, have radiation-cooled pyrovac* plates and can be operated in a variety of rectifying and voltage multiplying circuits. Also available are four types of mercury-vapor rectifiers.

* An Eimac trade name.

“REAC” Computer

(Continued from page 81)

and unpatching of a problem, time would be allocated to check components and repair all defective parts. This course of action was adopted because the extent of a preventive maintenance program for a large analog simulator had not been established.

During the first 12 months, there have been six partial system checkouts. The time between checkouts of any cabinet varied from two months to a year. Operator checking is performed daily. It consists of examining all amplifier outputs with the computer in Balance Check, i.e., with the inputs to the amplifiers disconnected. Typical of amplifier failure is a noisy output or inability to zero the amplifier. Defective amplifiers are repaired immediately or replaced with spares.

The monthly reliability coefficients are plotted in Fig. 7. The average reliability coefficient for the first year exceeded 90%. The total service time was 234 hours. Approximately 75% of this was expended in repairing failures caused by component deterioration; the remainder was due to defective parts or operator abuse.

The failure rates for certain selected components are given in Table 2. The criterion for this selection was a sufficient number of failures from which a significant estimate of the failure rate could be made. It is interesting to note that vacuum tubes constituted 63% of all failures.

The REAC components listed in Table 2 are largely in the 404 computing amplifiers, namely, 69.6% of the vacuum tubes, 81.3% of the vibrators, and 89.7% of the deposited film resistors. Therefore, a careful scrutiny of the failures in these amplifiers is desirable. Three hundred and nine amplifiers (76.6%) have not had a single failure during the first 12 months of operation of the Simulator Laboratory. Conversely, 95 have had one or more failures. These 95 amplifiers had a total of 207 failures of which 164 were vacuum tube failures. The average repair time for a failure was slightly less than 20 minutes.

At least one tube failed in 85 amplifiers. The distribution of vacuum tube failures in these amplifiers was as follows:

- a) 45 had one tube failure;
- b) 23 had two;
- c) nine had three; and
- d) eight had four to seven.

Not one vibrator in a computing amplifier failed during the 2,527

**HUGHES
DIODES**

**A New
Standard of
Reliability**

*Reliability in semiconductor
devices is determined principally
by permanent freedom from the
two major causes of failure—
moisture penetration of the envelope,
and electrical instability under
extreme operating conditions.*

HUGHES SEMICONDUCTOR DEVICES are designed to prevent such failures through two exclusive features:

- 1. Fusion Sealing**—The glass-to-metal seal, proved in billions of vacuum tubes, is incorporated to full advantage in semiconductor devices by the Hughes-developed process of fusion sealing at high temperature. The result is a rigid *one-piece* glass envelope impervious to moisture.
- 2. 100% Testing**—Hughes 100% testing procedures invite instabilities to occur prior to shipment, assuring rejection of defective units. Each standard **HUGHES DIODE** is temperature-cycled in saturated water vapor, JAN shock-tested, and electrically tested under vibration. This testing procedure assures operation of **HUGHES DIODES** under adverse conditions of moisture, temperature, vibration and severe shock.

Reliability of **HUGHES DIODES** has been proved in advanced airborne military radar and fire control systems, and for guided missiles. All Hughes semiconductor devices are designed to the same high standards of reliability.

"REAC" COMPUTER (Cont.)

hours covered by this report. However, seven vibrators located elsewhere failed in this period; five of these were in meter amplifiers and two in servo amplifiers. Five of the vibrator failures occurred within the first three hundred hours of operation.

The deposited film resistors which failed have been traced to a defective lot. The quarterly failure rates for deposited film resistors were 0.15%, 0.046%, 0.033%, and 0.033%. The defective resistors are reflected in the higher failure rate earlier in the year.

The first year of operation re-

Fig. 6: Results of REAC acceptance test

vealed one design weakness. Certain two-phase, 60-cycle servo motors are operated at twice rated voltage in order to drive a greater load with improved dynamic performance. The resulting stress causes a gradual deterioration of the insulation between windings which finally leads to a short circuit between stator field coils. The cure for this is either improved insulation or a larger motor operating at rated voltage.

The effect of component deterioration is mitigated if a wide variation in characteristics can be tolerated. In a dc analog computer this is accomplished by using large amounts of feedback. The dc amplifier, for example, has 90 db feedback with a gain of one.

A second feature that contributes to reliable operation is the introduction of a true overload indicator system, rather than one that indicates overloads at some arbitrary value. Both visual and audible indication of overload is provided. This enables the operator to take remedial action immediately to relieve the arcing across the vibrator contacts and thus extend the life of the chopper. This conclusion is substantiated by the fact that no vibrators in computing amplifiers have failed.

The tubes in a dc analog computer operate in Class A as in normal communication applications.

The eye-opening event of the radio-electronic new year!

For the past 12 months the vast, fast-growing radio-electronic industry has been preparing for 4 great days — March 22-25. This is when the IRE National Convention and Radio Engineering Show — the biggest and best ever — will take place in New York City. Be sure to join the other radio-electronic men — nearly 40,000 are expected — who will come, see and appraise the show at which all that is new will be unveiled.

A practical summary of radio-electronic progress will be unfolded at 54 technical sessions during the four-day period. 243 scientific and engineering papers, grouped by related interests, will be presented during these sessions, more than half of which are organized by IRE professional groups. Actually, you will be attending 21 conventions fused into one. New York's finest meeting facilities are provided — the Waldorf-Astoria Hotel plus 3 huge halls in Kingsbridge Armory. Transportation between the two locations is quick, easy — by subway and bus service.

At the show you will find over 600 firms "spotlighting the new" in their high-interest product exhibits. These will extend over a mile and a half along avenues appropriately named for radio elements: "Instruments," "Components," "Airborne," "Radar," "Transistor," "Audio," "Microwave," etc. These exhibits, an education and revelation in themselves, fill the four-acre space of the great Kingsbridge Armory ... and can be viewed throughout any one or all of the four days.

Admission is by registration only, and serves for the four-day period. For IRE members the cost is only \$1.00. For non-members it is a low \$3.00, covering sessions and exhibits. Social events have been carefully planned. These are priced separately.

March 22-25, 1954

**is the date! New York is the city
where the radio-electronic event
of the year will take place.

"REAC" COMPUTER (Cont.)

The life expectancy should equal or exceed that achieved in these applications, because the tube operating conditions are conservative, e.g., the quiescent plate dissipation of the 6L6 output stage of the computing amplifier is only three watts.

The use of plug-in interchangeable computing amplifiers reduces both service and downtime. The number of spare amplifiers necessary to maintain this installation is less than 3% of the total.

The first year of operation has demonstrated that the simulator has a very high reliability. Therefore, only a limited preventive maintenance program is required. The cost of this program will be carefully evaluated relative to the improvement in system performance.

The present system of patching precludes the possibility of checking permanently wired components when a problem is wired in. This difficulty can be overcome by installing a suitable prepatch system. At the time (1951) the present Project Cyclone Laboratory was designed, no large prepatch facilities were in operation. Since experience with this idea was very limited, the proven telephone jackbay was selected. With a prepatch setup the

Fig. 7: Monthly reliability coefficients for Project Cyclone Simulation Laboratory. The average for the first year is close to 90.6%

problem can be removed readily if a failure is suspected, and a test circuit substituted for it. If the necessary repairs take too much time, the problem board can be plugged into a spare computer. Thus, prepatch adds to installation flexibility and downtime is reduced.

VAC-TITE COMPRESSION SEALS

Hermetic

produces
the greatest
variety of
miniature plugs

- IS THE APPLICATION CRITICAL?
- IS IT AIRBORNE?
- MUST IT HAVE MAINTENANCE-FREE OPERATION?
- DOES IT REQUIRE THE ARC RESISTANCE OF GLASS INSULATION?

If the answer to any of the above questions is yes—then we know from experience that the unit must be sealed in by Hermetic Headers!

HERMETIC has consistently led the rest of its field in the production of miniature plugs, multi-terminal headers, individual terminals, rectangular plugs and connectors of every shape and size... plus condenser seals and crystal bases. All of these are available in VAC-TITE® Compression Seals in addition to conventional cover designs.

Shown is a group of 7 pin miniature plug designs illustrating a variety of terminations. They are also available with exhaust tubulation.

*VAC-TITE is HERMETIC's new vacuum proof compression construction glass to metal seal. In addition to special shapes, many standard sizes such as .800 O.D. and 900 O.D. multi-terminal headers and a large variety of individual terminals are available in VAC-TITE Compression Seals.

Write for samples, data, prices.
We welcome the opportunity to work with you on special problems.

the modulator grid circuit. This minimizes the amplitude modulation of the oscillator and reduces the overall distortion. Using the reactance modulator circuit shown, it has been possible to obtain excellent modulator performance together with adequate r-f amplifier grid driving voltage at a reasonable total plate current (Fig. 3).

Since the use of any sort of automatic frequency control in the transmitter was out of the question and the minute space available, it was necessary to design an oscillator-modulator circuit which would have sufficient frequency stability to meet the requirements of the system. This stability was achieved by means of the modulator grid bias circuit shown. The bias is derived from the self-rectified voltage developed by the oscillator and amplifier grids. As the plate and filament batteries run down in use, the transconductance of the reactance modulator will tend to be reduced and cause the carrier frequency of the transmitter to shift. However, the circuit arrangement used causes the dc grid bias of the modulator to be changed in such a fashion that its transconductance variation is greatly reduced.

Printed Circuit Chassis

The entire transmitter circuitry, excluding the antenna and tubes, occupies a volume of about 1 cu. in. The chassis casting, which contains eight capacitors, eleven resistors, a volume control, five subminiature tube sockets, and a powdered iron core oscillator coil, is a cylinder 1 in. in diameter and 1.3 in. long. To obtain such extreme miniaturization, it was necessary to use rather unorthodox construction.

Two printed circuit plates form the fundamental structure of the transmitter chassis. They are made by a technique which produces a conductive pattern on both sides of a phenolic plate, and on the inside surface of the holes through the plate. It is thus possible to produce cross connections between the two sides of the phenolic plate, automatically, and without the aid of eyelets. Since one printed circuit plate, with an area of less than 1 sq. in., contains 54 holes for tube socket pins and component leads, the use of eyelets for making cross connections would be impossible. This is further emphasized by the fact that the center-to-center spacing of the tube socket pins is only 0.100 in. A very important

NOW Soundcraft
brings you
tape perfection!

the revolutionary new

LIFETIME magnetic recording tape

Here is news of monumental importance to every recording perfectionist. It is the all new Soundcraft LIFETIME Tape. We've called this amazing high-fidelity tape "LIFETIME" because . . .

*It will last, to the best of engineering knowledge, forever!**

Your recording machine will never break it. Neither will careless handling. Because LIFETIME Tape is fully a third as strong as machine steel. It ends tape shrinkage and stretch when your home or studio air is dry or humid. It will never cup or curl. You can forget about storage problems.

All this means that for the first time you can preserve your important recordings, capture and keep those precious moments of music and the spoken word, for generations to come—in all their original fidelity!

LIFETIME Tape owes these new and permanent qualities to its new magnetic oxide coating, and to its base of DuPont "Mylar" polyester film. For both are free of plasticizers whose gradual loss from ordinary tapes limits their useful life.

LIFETIME Tape is indeed the biggest development in tape since the tape recorder itself. Your serious recordings deserve it. Order LIFETIME Tape today.

REEVES

SOUNDCRAFT

CORP.

Dept. N-3

10 East 52nd Street, New York 22, N.Y.

DEFIES HEAT, COLD
500 TIMES THE FLEX LIFE
MANY TIMES STRONGER
ENDS STORAGE WORRIES

Like all Soundcraft magnetic products, LIFETIME Tape is Micro-Polished[®], assuring maximum high-frequency response. It provides uniformity of $\pm 1/4$ db. within a reel, and $\pm 1/2$ db. reel-to-reel. It is splice-free in 600-, 1200- and 2400-foot reels.

*LIFETIME GUARANTEE. Soundcraft unconditionally guarantees that Soundcraft LIFETIME Recording Tape will never break or curl, and that the magnetic oxide will never flake or crack, when the tape is used under normal conditions of recording and playback.

MINIATURIZING YOUR EQUIPMENT?

WIRELESS MICROPHONE (Cont.)

advantage of printed circuits of this type is the fact that it is possible to do all soldering on the upper side of the plate and still make connections to the pattern printed on the under side. In this assembly, the soldering of the 25 tube socket connections could be done in no other way.

Assembly of the chassis is begun by mounting the tube sockets in a phenolic plate which serves to position them and which carries three terminals for connection to the gain control (Fig. 4). The lower printed circuit plate is then placed over the tube socket pins and soldered to them from the top side. Next, the various resistors and condensers are soldered to the top side of the lower plate. Finally, the upper printed circuit plate is fitted over the leads from the components, and the leads are cut off and soldered to the printed circuit. Again, connections are made to the printed pattern on the under side of the top plate by soldering on the upper side.

Setting in Mold

After the printed circuits and components are assembled and inspected, the entire unit is placed in a mold and filled with a casting resin. Upon setting, this resin forms a rigid, moisture-proof mechanical assembly which cannot be damaged by vibration or shock and which is readily attached to the other portions of the transmitter. An additional advantage of such an embedded circuit is the mechanical immobilization of all leads and components which eliminates any possibility of detuning due to mechanical motion.

After the chassis assembly is cast

TUBE TEST SET

A semi-automatic test set, capable of handling up to 1,000 radio and receiving tubes per hour, has recently been designed and developed by Sylvania Electric Products Inc., Emporium, Pa.

SAVE \$300 PER MILE! on each Micro Wave installation

with MICRO POWER

And it's easy to figure too—because "Micro-Power" replaces several units of costly, more complicated equipment. Electric plant—rectifier—battery banks and motor-generator . . . CAN ALL BE ELIMINATED—by the installation of a single "Micro-Power" Unit. Study the following information . . . and see how you can save up to \$300 per mile on your next Micro-Wave installation.

MICRO-POWER . . .

APPROXIMATE SAVINGS

ELIMINATES A STAND-BY ELECTRIC PLANT —

"Micro-Power" performs the functions of a stand-by electric plant during power interruption and power droop. "Micro-Power" is designed for use with equipment that cannot tolerate any interruption of electric power

\$800 to \$1,000

ELIMINATES BATTERIES

"Micro-Power" can eliminate the need for costly battery banks, for "Micro-Power" assures constant power to essential equipment at all times.

\$2,000 to \$6,000

ELIMINATES RECTIFIERS

"Micro-Power" is a motor and/or engine driven electric generator interposed between the source of electric power and essential equipment. "Micro-Power" makes current and voltage conversions.

\$500 to \$1,000

ELIMINATES MOTOR-GENERATOR SETS

"Micro-Power" is a motor generator set with an internal combustion engine stand-by. In operation "Micro-Power" will serve as a voltage regulator

\$900 to \$1,000

\$4,200 to \$9,000
PER INSTALLATION

*a
micro-power
stand-by unit
can save
up to*

The above figures are typical of dozens of complete Micro-Wave installation costs as submitted to United States Motors Corporation for comparison purposes. In many studied cases "Micro-Power" can effect savings in excess of \$7,500 per installation. (\$300 per mile.)

If you are planning a Micro-Wave installation, now or in the future . . . write U. S. Motors Corporation for complete details on "Micro-Power" "Micro-Power" reduces original cost. "Micro-Power" provides continuous, UN-INTERRUPTED SERVICE.

in resin, the gain control, filament circuit microswitch, and battery contact assembly are attached (Fig. 5). The addition of the antenna and microphone completes the transmitter chassis assembly (Fig. 6). A tubular case is attached to the transmitter chassis with three screws after the tubes are installed. The batteries are inserted in the bottom of the case and the battery cap is snapped into place. Connection to the junction between the filament and plate batteries is made automatically by the battery contact assembly.

Casting an entire circuit in plastic is certainly a case of "burning your bridges behind you," as it is virtually impossible to repair such a unit. However, any properly designed assembly which was good before casting, should be good after casting, and should remain good indefinitely. Component failure is very unlikely since the casting resin provides protection from corrosion and mechanical damage which are the chief causes of failure in very low power circuits.

It should be added, however, that a circuit which is to be cast must be designed to make allowance for the increased distributed capacitance caused by the dielectric properties of the casting resin. To simulate this dielectric effect during development work, sample assemblies were immersed in cottonseed oil, which closely duplicated the dielectric constant of the casting resin used. This proved to be an extremely useful experimental technique.

Vagabond Receiver

The high performance superheterodyne receiver designed for the Vagabond system, has a pentode tuned r-f amplifier with a bandwidth of 150 kc. A pentode mixer with a separate triode oscillator is used and automatic frequency control is provided by a pentode reactance modulator. The wideband i-f amplifier employs two pentode amplifier stages, two cascaded triode limiters and a Foster-Seeley discriminator. The output of the discriminator is fed through a gated, cathode follower triode to the audio output terminals of the receiver. A triode detector amplifier is provided in the carrier operated squelch circuit.

To aid in tuning the Vagabond transmitter, the receiver incorporates a double target tuning eye controlled by the outputs of the discriminator and the first limiter. By means of this tuning eye, it is possible to tune both the oscillator and

antenna circuits of the transmitter. A three-position switch on the receiver shifts the frequency of the receiver oscillator in 50 kc steps to provide three operating channels. These may be used when more than one Vagabond system is to be operated simultaneously in the same vicinity or when strong interference is experienced on any one channel. Since the radio frequency amplifier has a 150-kc bandwidth, no retuning of the receiver is required.

Evaluation of Performance

The Vagabond system has been installed in a number of locations and some evaluation of the induction system can be made. It has provided ample quality for general public address and entertainment work with operating areas of 500 to 5000 sq. ft. depending upon local interference conditions and the nature of the particular application. The audio response and signal-to-noise ratio have proved sufficient for radio broadcasting purposes in some studio installations.

The objective of developing a transmitting unit comparable in size and weight to current stick type microphones has been met. The transmitting unit weighs less than 1 lb. and is 1 1/4 in. in diameter and 12 in. long. The life of a set of batteries is 40 operating hours. The battery cost is about five cents an hour.

The author wishes to express his gratitude to his fellow employees for their generous assistance, especially to Mr. John Knox, Assistant Project Engineer, Mr. J. S. Knechtsberger, Project Mechanical Engineer, and Mr. J. W. Medill, who developed the special microphone cartridge. Deep appreciation is also extended to Mr. B. B. Bauer, Vice-President—Engineering, and to Mr. E. V. Carlson, Development Engineer, for their many contributions to the project.

This paper was presented at the National Electronics Conference held in Chicago, Sept. 28-30, 1953.

NEW BROWNING PRESIDENT

Dr. Glenn H. Browning (right), Chairman of the Board of Browning Laboratories, Inc., 750 Main St., Winchester, Mass., congratulates Gardiner G. Greene, new president and principal stockholder of the company as he takes over active management. Mr. Greene will head a new expansion program and Dr. Browning will continue with the company in an advisory capacity.

KLEIN

Quality Pliers

SPECIALLY DESIGNED

FOR THE ELECTRONICS INDUSTRY

Now, Klein quality pliers are available in new compact patterns for precision wiring and cutting in confined space. Note, too, the replaceable leaf spring that keeps the plier in open position,

ready for work. All are hammer forged from high-grade tool steel, individually fitted, tempered, adjusted and tested—made by plier specialists with a reputation for quality "since 1857."

LONG NOSE PLIER

307-5-1/2L—Extremely slim pattern ideal for the really tight spots. Jaws are knurled to insure a positive grip.

OBLIQUE CUTTING PLIER — 210-5L —

For cutting small wires or trimming plastic. Entire length of cutting knives works flush against cutting surface. 5 or 6-inch sizes.

CHAIN NOSE PLIER

317-5L—A full inch smaller than standard pattern. Has a very fine knurl that will not damage soft wire. Also available without knurl.

LIGHTWEIGHT OBLIQUE CUTTING PLIER 209-5—

Smaller than 210-5L with an extremely narrow head. Entire length of cutting knives works flush against cutting surface.

TRANSVERSE END CUTTING PLIER

204-6—Useful in precision work where ordinary oblique or end cutters are too bulky. Gives a clean, flush cut.

PRINTED CIRCUIT PLIER 052-L—

Special knives shear and crimp wire in one operation. Crimped wire holds loose parts in position for dip soldering. Knives face operator for visual inspection. Ask for Bulletin 753.

This Klein Pocket Tool Guide gives full information on all types and sizes of Klein Pliers. A copy will be sent without obligation.

Forging Stronger Links in Microwave Relay

**ONAN
STANDBY
ELECTRIC
PLANTS**

Microwave transmission is only as dependable as each of its relay links. If one repeater station cannot operate, messages do not get through. To assure electric power for transmission, hundreds of microwave relay stations across the country are equipped with Onan Standby Electric Plants. When central station power is interrupted, the Onan plant starts automatically, supplies power for as long as the emergency lasts, then stops automatically. Controls are available to provide a time interval between power interruption and starting. Onan Standby Electric Plants have been proved indispensable in installations serving oil and gas pipelines, utilities, railroads, TV networks, police and other government law enforcement departments. If you have a problem in standby power for microwave radio, or any application, write our sales engineers. Onan Standby Electric Plants range from 1,000 to 50,000 watts.

New 5CW
5,000 watts A.C.
Air-cooled
Gasoline Powered

- **COMPACT**—Take less than one cubic yard of space. Easier to install. Connection box provided for quick hook-up.
- **UNI-DUCT COOLING**—Cooling air is drawn by vacuum through generator and over engine. All heated air is expelled through one small vent which also discharges engine exhaust. Quiet operating. No liquid coolants to freeze or leak.
- **BUILT FOR HEAVY DUTY**—Smooth-running, twin-cylinder, horizontally-opposed, 4-cycle air-cooled engines deliver rated horsepower at moderate speed. Unusually large bearing surfaces for long life.
- **DE LUXE EQUIPMENT**—Nothing extra to buy. Impulse-coupled, high-tension magneto, radio shielded. Oil-bath air cleaner, fuel filter, oil pressure gauge, fuel tank, muffler and exhaust tubing. All heated and moving parts safely enclosed.

Transistor Feedback

(Continued from page 95)

For the grounded base and grounded emitter stages,

$$\frac{y_{12} + y_{22}}{y_{21}} \ll 1 \quad (12)$$

and may therefore be neglected if the analysis is confined to circuits where the last stage around which feedback is taken is one of the above types.

$$\frac{y_l}{y_{21}} = \frac{y_{11}}{y_{21}} \cdot \frac{y_l}{y_{11}} = \frac{z_{i(oc)}}{A_{oc}^0 z_l} \quad (13)$$

where $z_{i(oc)}$ is the short circuit input impedance without feedback, and A_{oc}^0 is the short circuit current gain without feedback. Thus, if

$$\frac{z_{i(oc)}}{A_{oc}^0 z_l} \ll 1 \quad (14)$$

Eq. (11) degenerates to (2). We can say then, that the term $z_{i(oc)}/A_{oc}^0 z_l$ is a measure of the forward transmission through the β loop.

(d) It is assumed that the amplifier has a clearly defined feedback loop. The theory is quite inadequate for the handling of cases where the feedback is not of this form. Thus even the simple case of a grounded

Fig. 9: Redrawn cascaded equivalent circuit

emitter stage with an impedance in the emitter circuit defies analysis by the method.

The above assumptions serve to show some of the weaknesses in the elementary theory. It is clear then, that a more general approach to the problem is desirable.

At present there is in existence a general feedback theory for vacuum tube amplifier circuits. It will be shown that, after making certain redefinitions of some of the basic terms, this theory can be applied to transistor circuits.

Fig. 5 shows the equivalent circuit of any one transistor in a generalized network.

The behavior of this transistor may now be expressed by considering the junction as something remote from the three resistances associated with it. Thus, any current (from Y to X) results in a propor-

1600 BROADWAY JUDSON 6-1420 NEW YORK 19, N. Y.

TRANSISTOR FEEDBACK (Cont.)

onate voltage in the collector circuit. The proportionality factor, W , has the dimensions of impedance.

With the loop currents marked as shown, the impedance matrix for the system may now be set up. Then,

$$\Delta = \Delta^0 + W \Delta_{65} \quad (15)$$

where Δ = determinant of the array
 Δ^0 = determinant of the array with $W = 0$
 Δ_{65} = Cofactor for row 6, column 5

The transistor may be replaced by a T-network of three resistances, with the generator replaced by e_{in} . Since there are no external generators, and since $W = 0$, we have

$$i_5 = e_{in} \Delta_{65} / \Delta^0$$

Thus the current in the junction is Δ_{65} / Δ^0 times the voltage appearing in the collector circuit due to it.

This will also hold for an operative transistor, whose junction is by-

Fig. 10: Circuit for obtaining T_{sc}

passed by a short circuit, as in Fig. 6. (Mathematically, we consider that $X-Y$ has a resistance of $c \rightarrow 0$.) If unit current is forced into $Y \rightarrow X$, a voltage W appears in the collector side, and i_5 is given by

$$i_5 = W \Delta_{65} / \Delta^0$$

The current in the short circuit,

$$1 + i_5 = 1 + W \Delta_{65} / \Delta^0 = \Delta / \Delta^0$$

In order to maintain uniformity with Bode's terminology, the current i_5 is called the return ratio T , and the current in the short circuit is called the return difference F .

Using the new definitions for F and T it is now possible to apply all the theorems already developed for vacuum tube amplifiers. Care must be exercised in their application, however, since an inactive transistor does not provide the complete isolation between stages that an inactive tube does. As an example of the application of Bode's theorems to transistor circuits, the impedance of active networks will be taken up in some detail.

Bode's theorem on active networks may be interpreted as

$$z_n = z_n^0 (F_{sc} / F_{oc}) \text{ where}$$

z_n = impedance of the network as

Cutting and shaping fragile crystals...

... another way the electronics industry uses

THE *S.S. White*

INDUSTRIAL "AIRBRASIVE" UNIT

The S.S. White "Airbrasive" Unit is opening-up vast, new approaches in the development of improved electronic components by providing a practical solution to many of the difficult "problem-jobs" encountered in producing these parts. Cutting spiral bands on film-type resistors, cutting germanium, accurately removing deposited surface coatings, and drilling thin sections of glass and other hard, brittle materials are but a few of the difficult jobs now made practical by this highly versatile, precision machine.

For example, exasperating difficulties had been encountered in cutting and shaping crystals for X-ray and neutron diffraction work. Ordinary cutting and grinding operations were prone to cause fracture. One laboratory applied the S.S. White "Airbrasive" Unit to this task and reported, "There is absolutely no other convenient way to do crystal-shaping for our work than by means of the Unit." The crystals are first manually cut into sections of

roughly correct size with the "Airbrasive" Unit. Then, as illustrated, the rough crystal is mounted on a standard goniometer head and oriented optically or by X-ray. The goniometer head is placed on a small lathe, and the "Airbrasive" tool is mounted on a toolholder. Fragile materials have been successfully shaped into accurate cylinders with diameters to a fraction of a mm and lengths of 1.5 to 2 cm. S.S. White engineers will be glad to conduct tests on any of your parts and will advise you as to the suitability of the "Airbrasive" Unit for your needs.

BULLETIN 5307 has full details on this new precision production method. Send for a copy.

SEE THE "AIRBRASIVE" UNIT at the I.R.E. Show
Kingsbridge Armory, New York, March 22-25. Bring your production
samples along for a demonstration.

TRANSISTOR FEEDBACK (Cont.)

seen by an external source across points x, x'
 z_o^o = impedance of the network when a certain transistor in it is rendered inoperative.
 F_{sc} = return difference for this transistor when x, x' are short circuited.
 F_{oc} = return difference for this transistor when the external source is replaced by an open circuit.

Example 1

Find the input impedance of a grounded emitter transistor with shunt feedback.

Fig. 7a shows the equivalent circuit. Assuming that r_c is larger than

Fig. 11: Two-transistor equivalent circuit

all the other resistances in the network, the circuit may be redrawn as in Fig. 7b.

$$z_o^o = \frac{(r_o + r_b)(r + r_l)}{r_o + r_b + r + r_l}$$

$$T_{sc} \cong - \frac{ar_b}{r_e + r_b}$$

$$F_{sc} = 1 + T_{sc} \cong \frac{r_o + r_b(1-a)}{r_o + r_b}$$

$$T_{oc} \cong - \frac{a(r_b + r)}{r_o + r_b + r + r_l}$$

$$F_{oc} = 1 + T_{oc} \cong \frac{r_o + r_l + (r_b + r)(1-a)}{r_e + r_b + r + r_l}$$

Whence,

$$z_i \cong \frac{(r + r_l)[r_o + r_b(1-a)]}{r_o + r_l + (r_b + r)(1-a)}$$

Example 2

Find the input impedance of two cascaded grounded emitter stages with feedback, as shown in Fig. 8.

Making the approximation that r_c is larger than all other elements of the network, and shorting the junction of the first transistor, we have the equivalent circuit of Fig. 9.

Here,

$$z_i = z_i' + r_b$$

Let,

$$U = [(r_o + r_1)(r_2 + r_l) + r_e r_1]$$

HIGH RESOLUTION LOW DISTORTION...

**TYPE 5AMP—
Cathode-ray Tube**
Low-capacitance deflection
plate connections for high-
frequency applications.
Limited vertical scan.

NEW

MONO-ACCELERATOR Cathode-Ray Tubes by DU MONT

In the new mono-accelerator Types 5AMP— and 5AQP—cathode-ray tubes, Du Mont has utilized modern principles of cathode-ray tube design combined with the Du Mont Tight-tolerance construction, automatic-focus lens and new high-resolution electron gun to provide a cathode-ray tube with the greatest freedom from distortion and best resolution and linearity yet achieved. Primary advantages of mono-accelerator cathode-ray tubes include virtual freedom from field and spot distortions; high deflection uniformity over the entire tube face; uniform resolution from edge to edge; and practically automatic focus. Both tubes have flat face-plates. The Type 5AQP— is intended for low and medium frequency applications, the Type 5AMP— for high-frequency applications.

SPECIFICATIONS (Typical Operating Conditions)

Type	Accelerator Voltage	Deflection Factors		Useful Vertical Scan	Deflection Factor Uniformity
		D1D2	D3D4		
5AMP—	2500	40-50v/in	22.5-27.5v/in	2½"	1% max.
5AQP—	2500	40-50v/in	31.5-38.5v/in	4"	1% max.

An actual unretouched linearity bar pattern of the Type 5AMP—. Not an engraved calibrated scale.

DU MONT

For complete specifications write to:

Technical Sales Department, ALLEN B. DU MONT LABORATORIES, INC., 760 Bloomfield Ave., Clifton, N. J.

TRANSISTOR FEEDBACK

(Continued from page 162)

$$z'_1 = r_o + \frac{r_1 (r_2 + r_l)}{r_1 + r_2 + r_l} \frac{U}{1 + a} = a i$$

$$i = \frac{a}{1 - a}$$

T_{oc} is obtained from the circuit of Fig. 10

$$T_{oc} \cong \frac{a^2 r_l r_1}{U (1 - a)}$$

$$F_{oc} = \frac{a^2 r_l r_1 + (1 - a) U}{(1 - a) U}$$

$$T_{oc} \cong -a$$

$$F_{oc} \cong 1 - a$$

Whence

$$z'_1 = \frac{a^2 r_l r_1 + (1 - a) U}{(r_1 + r_2 + r_l) (1 - a)^2}$$

And

$$z_1 = r_o + \frac{a^2 r_l r_1 + (1 - a) U}{(r_1 + r_2 + r_l) (1 - a)^2}$$

It is interesting to see how the problem may be handled with reference to the second transistor. Fig. 11 shows the equivalent circuit. In this case knowledge of the input impedance of a single stage grounded emitter amplifier is used to compute z'_1 .

$$\text{Thus } z'_1 = \left[r_o + \frac{r_1 (r_2 + r_l)}{r_1 + r_2 + r_l} \right] \frac{1}{U (1 - a)}$$

Let T'_{oc} be due to the first transistor
 T''_{oc} be due to the second transistor
 Then $T'_{oc} \cong a i$

$$\text{But } i = \frac{a r_l r_1}{U}$$

Therefore

$$T'_{oc} \cong \frac{a^2 r_l r_1}{U}$$

$$T''_{oc} \cong -a$$

Whence

$$F_{oc} = 1 + T'_{oc} + T''_{oc}$$

$$\cong \frac{a^2 r_l r_1 + (1 - a) U}{U}$$

Also

$$T_{oc} \cong -a$$

$$F_{oc} \cong 1 - a$$

Whence

$$z_1 = r_o + \frac{a^2 r_l r_1 + (1 - a) U}{(r_1 + r_2 + r_l) (1 - a)^2}$$

as before.

The elementary theory of feedback is a useful tool in the analysis of circuits having clearly defined feedback loops with negligible forward transmission. In either case where the feedback loops are hidden or where appreciable forward transmission occurs through the loop, the general theory finds its use. The general theory is capable of provid-

ing an accurate solution, and is especially valuable when an approximate solution is required, since approximations may be made from the beginning. Direct methods of approach, such as Kirchoff's equations, always end in the evaluation of high order determinants which must be done accurately, the approximation being made at the very end.

This work has been supported by the U. S. A. F. Air Research and Development Command, U. S. A. F. Air Materiel Command, Army Signal Corps and Navy Bureau of Ships under Contract AF 33 (600)-17793.

MAGNETRON STABILITY TESTER

(Continued from page 97)

noise (within compromise)

- (2) increasing the rate of buildup of oscillation of magnetron
- (3) increasing the time interval during which the applied voltage remains within the starting range.

One notes that heavy loads result in a reduction of the current at which misfiring takes place. At the same time the speed of buildup is inversely proportional to the capacitance C of the resonant circuit and changes the amplitude of the noise voltage (inversely proportional to C).

Tendency to Misfire

It is interesting to make C small and adjust the loading for high efficiency, but attention must be paid to the stabilization of frequency and some compromise has to be made. It has also been observed that increasing the diameter of the cathode of the magnetron reduces the tendency toward misfiring, but at the same time reduces the efficiency of a magnetron, so that the magnetron must be based on a compromise. Some experiments indicate that the structure at the end of the cathode has an influence on the tendency to misfire. With some magnetrons the tendency to misfire is correlated with low primary emission of electrons from the cathode. Magnetrons that do not ordinarily skip modes seem generally to function satisfactorily, even when the primary emission of the cathode is very low. Non-uniform and non-axial magnetic field also have an effect on the tendency to misfire.

Fig. 7: Mode skip effect on number of pulses

Between all these factors of misfiring, the important are the following:

- (1) The open circuit voltage of the pulses must be in the starting range, i.e., the quantitative statement of the requirement is to reduce the rate at which voltage is applied to magnetron.
- (2) The magnetron must be operated at a relatively low current.
- (3) The pulses must have a relatively low impedance.
- (4) The starting time of a magnetron must bear a close relation to the maximum rate at which the input voltage can be applied without causing the magnetron to misfire and it is determined by two factors namely, the noise-level from which the buildup of oscillations starts, and the rate of buildup.

Pulling Figure (PF): The Rieko

Diagram is plotted on polar coordinates, the radial coordinate being the reflection coefficient measured on the line joining the magnetron to the load and the angular coordinate being the angular distance of the voltage standing wave minimum from a suitable reference plane on the output terminal (see Fig. 8). Magnetic field, anode, current, pulse duration, repetition frequency and setting of tuner are fixed.

The maximum excursion of frequency (or "pulling figure") which occurs when the load is varied in such a way as to maintain a VSWR of 1.5 while varying the phase over a range of 360°. Rieke diagram is taken by varying the load while keeping the magnetic field and input current constant. The power output, VSWR in the line and the position

Fig. 8: Pulling figure shown on Rieke diagram

of a minimum of the standing wave as referred to the output coupling are measured. The value of the phase and amplitude of the standing wave represent the load. VSWR is defined as the ratio of the maximum voltage to the minimum voltage along the line.

Standing wave equipment of a magnetron stability tester, as is indicated in Fig. 2, may consist of a slotted section with a sliding probe moving over a distance of greater than $\frac{1}{2}\lambda$ together with a suitable detector and measuring instruments.

Power Output: The practice is to measure the output power of a magnetron in terms of average power. The pulsed peak power equals of magnetron

$$P_{\text{peak}} = \frac{P_{\text{average}}}{f \times \tau}$$

$$\text{Duty cycle} = f \times \tau$$

f = frequency of repetition of pulse.
 τ = the duration of pulse.

The average power of magnetron = The pulsed peak power X duty cycle of pulse of magnetron.

A number of devices have been used for measuring average power in the microwave range, such as thermistors or bolometers, platinum wires or thermocouples. In each case

..... With Softer Alloy

Tube Pins resulting from material conservation measures, the wiping action of METHODE laminated miniature socket contacts becomes of even more advantage, permitting uniform withdrawal of tubes without breakage, stress or damage to pins

Seven pin sockets are furnished with $\frac{7}{8}$ ", 1", and 1-5/16" mounting centers; nine pin sockets with 1 1/8" and 1-5/16" mounting centers. Available in production quantities in all standard grades of sheet phenolic and mica filled hard rubber insulation.

METHODE "Spring-Wipe" terminals

feature large gripping and conducting surface bearing on tube pins, insure minimum contact resistance and maximum insertion and retention characteristics. Proved outstanding performance and uniformity in millions of trouble free installations by the industry's leaders.

Geared to produce Plastic and Metal Electronic Components

MAGNETRON STABILITY TESTER

(Continued from page 165)

the r-f power to be measured is absorbed in the measuring element and consists of observing the resistance change. The change in the thermistor or bolometer resistance due to r-f heating current is determined by placing the thermistor in one arm of bridge and by observing a direct power by means of calibrated resistance or other device reading in a balanced bridge. Appropriated attenuator may be used before the thermistor in a slotted line.

Measuring High Level Power

For measuring high level microwave power in more recent practice (the old method, which consisted of terminating the r-f transmission line in a water load is abandoned), is to terminate the r-f slotted line in a solid load, such as polyiron, and to couple a thermistor, bolometer or other devices to the line by means of a directional coupler of known

Fig. 9: Magnetron frequency spectrum

loss. Various power output meters are designed for various band in the frequency range from 500 to 30,000 mc.

It is possible also to measure the power in a waveguide practically without absorbing, by using a Johnson meter which consists of a short section of waveguide of thin constantan. The temperature rise in the constantan is measured by means of a resistance thermometer, and is proportional to the power transmitted through the waveguide. This constantan section of Johnson meter can be installed as a permanent part of the line, and no special matching of this section is necessary.

Frequency: The frequency of a magnetron, as is shown in Fig. 9, may be measured by a frequency meter or spectrum analyzer. The stability of frequency of a magnetron may be increased:

1. by decreasing the load conductance, i.e., by reduction of the coupling between magnetron and load.
2. by increasing the circuit characteristic admittance, i.e., by cou-

pling to magnetron a tuned cavity of high non-loaded Q, called "stabilizing cavity," independent of F as possible. However, the first condition entitles a reduction of output power.

Since in the matched condition, the slotted line is deemed to be terminated in a load match to Z_0 (characteristic impedance), any change in the impedance of the load must cause a change in the reflected energy, and appears as a change in the magnitude and phase of the SWR, which may be measured by means of standing wave detector of the magnetron stability tester. As a result, this changes the Rieke diagram and pulls the frequency f_0 of the magnetron. The input condition, especially the variable impedance of a pulsed modulator of radar also produce a change in frequency f_0 .

Frequency Stability

The best method to increase the stability of frequency is based on the principle of automatic frequency control system. In this system, a frequency discriminator generates an error signal whenever the frequency departs from its proper value. The error signal is amplified and then used to actuate a tuning mechanism of the magnetron. This system may be combined with a stabilizing cavity of a magnetron.

The measurements of frequency stability can be realized by the sensitive and stable receiver of special design with a recording system or a signal relay to determine time shift of frequency, or by a stable and accurate wavemeter with cavity of high "Q," conventionally coupled with the output circuit of magnetron to the recording system or the signal relay. Ordinarily, high absolute accuracy is not required of a frequency meter used in a radar test set. Specifications

Fig. 10: Theoretical frequency spectrum

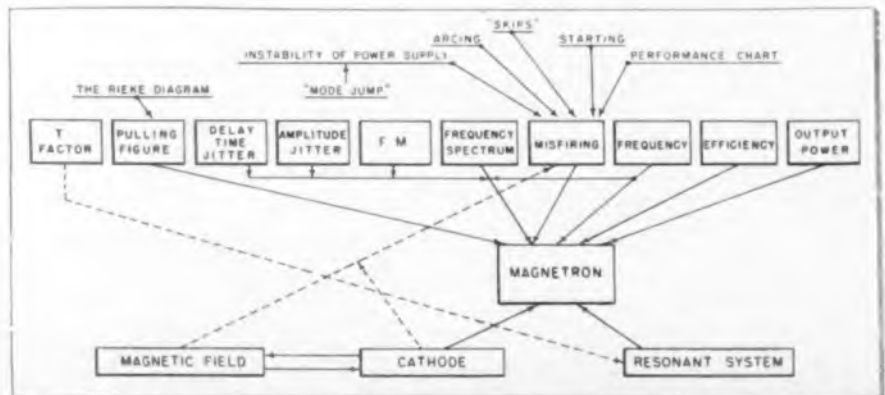

may call for an accuracy of 1 mc at a frequency for beacon operation and an accuracy of 3 mc at about 9000 mc (t° and humidity constant).

Frequency Spectrum: (Fourier analysis of the pulses) The frequency spectrum is displayed on a spectrum analyzer or a synchroscope analyzer. The theoretical form of this spectrum is shown in Fig. 10. It is very important to know the different deviations from this theoretical form to determine different factors of instability of spectrum.

Observe the following deviations from this theoretical form:

- (a) The voltage pulse with rounded top will produce a FM that may broaden the spectrum and marked difference in the heights of the secondary maximum on one side of the spectrum.
- (b) The intermittent disappearance of several vertical lines indicated that the magnetron is misfiring, has "shifted modes" or was arcing.
- (c) For heavily loaded magnetrons (closely coupled) and for a very low magnetron current the spectrum is changed into a noise distribution.
- (d) The frequency shift and frequency stability may be observed on the spectrum analyzer and may be useful for observing the frequency stability of a magnetron.
- (e) Amplitude jitter and pulse delay jitter.

Fig. 11: Relationship of various factors governing stability of a magnetron

The ideal spectrum form from a rectangular pulse is given by the curve of Fig. 9, where F_0 is the carrier frequency and all frequencies are present in amplitude as shown by the envelope. When a stable carrier frequency is pulsed at uniform intervals and in precise phase relation, only harmonics of the repetition frequency are present under the envelope, but in radar practice this condition is not sufficiently stable and produce amplitude jitters and pulse delay jitters.

The limits of these jitters on spectrum display must be determined and evaluated for every kind of magnetron and type of radar.

Temperature Factor (t°): The magnetron operating frequency f_0 can produce shifts by temperature variations of the resonance block of a magnetron, especially when the duty cycle of pulses changes. Since the resonator system is generally constructed of copper, it expands or contracts uniformly with t° . The shift of frequency is roughly proportional to the change in t° , in a 3 cm magnetron. For example, a change of 50°C in the temperature of the copper results in a frequency shift of about 9 mc. Consequently, to increase the stability of frequency of a magnetron, it is necessary to install around the magnetron a special thermostating room (of non-magnetic material) and to measure the temperature instability factor by conventional thermal measuring apparatus. Control of temperature within 5°C is normally adequate.

Stability Factors and Recording Systems

All these factors of magnetron's stability, which have been measured by means of a magnetron stability tester, may be summarized in one general diagram, as shown in Fig. 11, which gives a full picture of investigation of magnetron stability.

These factors may be tested by the different methods of recording systems, such as photographic or writing recording, which permits comparing of these constants simultaneously or periodically all together or separately by recording diagram or curves.

The magnetron may be tested in three phases:

1. Stability magnetron for input and output constant conditions.
2. Stability magnetron for input constant condition, and output variable conditions.
3. Stability magnetron for variable input conditions (tests of different radar sets) and output constant conditions.

newest aids to

AUTOMATION!

Clippard MINIATURE PNEUMATIC CYLINDERS (No. MAC 38), are shown above in a typical test jig set-up activating electrical contacts. Size of cylinders overall is $2\frac{1}{4} \times \frac{7}{8}$ dia., stroke $\frac{1}{8}$ maximum, spring return piston. Operates on as little as 12 pounds air pressure.

Here are three unusual "helping hands" which will enable you to reduce many of your present production and control operations to push-button simplicity. Because of their versatility, they will fire your imagination—suggest challenging new ways to manufacture better products faster, at lower cost.

Clippard Miniature Pneumatic Cylinders, for example, are so small they can be jig mounted on $\frac{7}{16}$ " centers, making them ideal for activating electrical contacts, valves or small work holding or feeding fixtures. In test operations (see jig illustration at right) they actually give an operator extra hands to work with thru use of a foot pedal air valve.

P. R. 5 AUTOMATIC RESISTANCE COMPARATOR permits unskilled operator or automatic set-up to test, grade, sort or match as many resistors a minute as can be touched across two front terminals. Range 100 ohms to 100 megohms. Three scales of deviation from your standard: -5% to +5%, -25% to +30% or -50% to +100%.

If your manufacturing process involves the testing, sorting, grading or matching of resistors, the Clippard P. R. 5 Automatic Resistance Comparator will pay for itself very quickly, permitting you to compare unknown resistors with a standard resistor simply by touching them across two terminals. Work can be handled either by unskilled operator or automatic production set-up.

The Clippard P. C. 4 Automatic Capacitance Comparator is a companion instrument permitting you to accurately check, grade, sort or match up to 8000 condensers of any type (10 mmfd to 1000 mfd) in one day. Either unskilled labor or automatic set-ups can be used.

P. C. 4 AUTOMATIC CAPACITANCE COMPARATOR grades, sorts, checks or matches all types of condensers (10 mmfd to 1000 mfd) at production speeds with laboratory accuracy. Requires no accessories other than the standard capacitor against which unknowns are to be compared.

Write for catalogue sheets describing these versatile new "helping hands" to automation, and literature showing how others are using them to produce higher quality products at lower cost, today!

Transistor Guide Available

The 1954 "Guide to Transistor Literature" has been published by the Presentations Section, Engineering Div., Glenn L. Martin Co., Baltimore 3, Md. A limited supply is available for free distribution to interested engineers. This excellent bibliography covers well over 400 papers. The compilation includes 747 published references, broken down into theory, characteristics, circuits, types, applications, production & testing, and general information.

Powerful Search Radar Being Built

General Electric is producing a powerful airborne search radar, developed under a multi-million dollar contract with the Navy's Bureau of Aeronautics. According to GE, it is twice as powerful as any previous

Bubble-like radomes atop and below aircraft fuselage house antennas of powerful radar

airborne search unit. The radar is being installed in a number of Navy and Air Force aircraft, including new flying radar stations built by Lockheed to carry six tons of electronic equipment. The GE radar and indicator system, which uses printed circuits, weighs about two tons.

Color Transcriptions Report Issued

A technical report on "Color Transcriptions" for TV has been made available by NTSC Panel 11-A, under the chairmanship of Dr. Alfred N. Goldsmith. It points out that color film records of live programs and color release prints for TV can be produced and satisfactorily transmitted by available materials. Copies may be obtained from NTSC Chairman W. R. G. Baker, General Electric Co., Electronics Park, Syracuse 1, N.Y.

Connector Clinic

In conjunction with its participation in the IRE Show, Elco Corp. will hold daily Connector Clinics at New York's Lexington Hotel, March 22-25, from 2 to 5 P.M., for the benefit of visiting engineers.

A modern
dynamic
at an
"old fashioned"
price

**TURNER
ADA 95D**

This is a modern dynamic microphone all right . . . with Alnico V Magnets and moving coils for maximum sensitivity to voice and music. Wide response range and outstanding sound characteristics make it ideal for tape recorder, PA, or commercial broadcasting use. Its design is certainly modern, too . . . trim, handsome, functional.

And about that price. We call it "old-fashioned" because it's so much lower than you would expect to pay in these expensive days. Only \$35.00 list.

Frequency response, 70 to 10,000 cps; output level, -58 db, 20 ft. removable grey plastic cable set; standard 5/8"-27 coupler; high impedance wired single ended (single conductor shielded cable); 50, 200, or 500 ohms wired for balanced line (two conductor shielded cable). About 8 1/2" high.

ADA 95D. List Price.....\$35.00

ADAS 95D. List Price
with slide switch.....\$30.50

TV Set Survey

One of the most extensive nationwide county-by-county surveys of TV set ownership has been conducted by A. C. Nielsen Co. under commission of the CBS-TV network. Among the many interesting statistical results of the CBS survey is the fact that 1,774,690 of the 27,506,500 families owning TV sets are equipped to receive UHF, as of Nov. 1, 1953.

Semi-Portable Television Set

Crosley is concentrating its production effort on a new TV receiver design which utilizes a vertically mounted chassis through which the

New compact TV receiver employs vertically mounted chassis through which tube projects

picture tube neck passes. The compact set, priced at \$139.95, includes a 17-in. picture tube, 13 tubes and one rectifier. Control knobs are on the side. Weight is only 53 lbs., and the overall size is 14-1/2x19x21-5/16 in.

\$1 UHF Station Closes Down

Station KCTY, Kansas City, Mo., which was purchased by DuMont from the Empire Coil Co. at the end of 1953 for \$1, has closed down. The channel 25 station was obtained by DuMont to study the feasibility of broadcasting UHF in that city, already dominated by three VHF stations.

Because of conditions existing in that particular area, including viewers' reluctance to use outdoor antennas, it was concluded that operation is not economically feasible.

Versatile Computer Announced by Bendix

A high-speed, moderately priced digital differential analyzer has been announced by the Bendix Computer Div. of Bendix Aviation Corp., 5630 Arbor Vitae St., Los Angeles 45, Calif.

The computer, characterized by simplicity of operation and mathematical versatility, utilizes the decimal numbering system in programming and calculating. It has the capacity of 60 integrators.

PRECISION TEST INSTRUMENTS

No. 1040 VACUUM TUBE VOLTMETER. Self contained — A.C. operated. High impedance — wide frequency. For use at audio and supersonic frequencies.

No. 1010A COMPARISON BRIDGE. Self contained — A.C. operated. Ideal for laboratory and production testing of resistors, condensers and inductors.

No. 1020B MEGOHM-METER. DIRECT READING. Self contained—A.C. operated. Electronically regulated supply, 1 megohm to 2 million megohms.

No. 1060 VACUUM TUBE VOLTMETER. A 50 megohm input impedance wide frequency range V.M. for use at audio and supersonic frequencies.

No. 1030 LOW FREQUENCY "Q" INDICATOR. DIRECT READING. Measures "Q" factor of coils, also inductances, distributed capacity, impedances and dielectric loss.

No. 1110A INCREMENTAL INDUCTANCE BRIDGE. For accurate testing of communication and television components under load conditions.

TRANSFORMERS & FILTERS

TOROIDAL INDUCTORS. 60 CPS to 1 MC. Also miniature inductors from 1000 CPS to 100 KC.

MILITARY PULSE TRANSFORMERS. Constructed to MIL - T - 27 specifications. Designed for optimum pulse performance.

MINIATURE AUDIO. Hermetically sealed — constructed in accordance with MIL - T - 27 specifications.

HERMETICALLY SEALED COMPONENTS. Constructed in accordance with MIL - T - 27 specifications.

PRECISION FILTERS. 10 CPS to 1 MC.

HIGH FIDELITY. 1/2 DB 20 CPS to 30 KC.

Brooklyn (Ridgewood) 27, N. Y.

ACF Establishes Electronic Division

Charles J. Hardy, Jr., president of American Car and Foundry Company, has announced the establishment of a new company division to be known as ACF Electronics Co. The new division will specialize in engineering development and manufacturing in the field of electronics. J. Gilman Reid, Jr., recently resigned director of the Electronics Div. of the National Bureau of Standards, heads the new company which has established quarters in Alexandria, Va.

Cable Power Rating Increased by 80%

The power handling capacity of Styroflex coaxial cable has been raised 80% by filling the helix space with helium, which has several times the conductivity of air, as well as greater mobility. It is being offered to the Canadian market by the manufacturers, Felten & Guilleaume.

Human Engineering Course Offered

A five-day course dealing with the design of equipment, products, and work stations with emphasis on human limitations and capacities is again being offered by Dunlap and Associates during the week of May 10, 1954, in Stamford, Conn. This year's new institute incorporates not only the suggestions of last year's participants, but also the most recent experience of our human engineering specialists. Specific subject matter includes:

Allocation of jobs to men and equipment

**Control of lighting, air noise, vibration
Design of instruments, warning devices,
handles, pedals, etc.**

Seating, panel design, other workplace aspects

Enrollment will be limited. Lecture-discussions will be conducted for approximately 16 people and laboratory sections for approximately four. Enrollment deadline is April 15, 1954. Tuition of \$30.00 covers texts, materials and two evening activities. For further information contact: Dr. Bernard J. Covner, Director, Human Engineering Institute, 429 Atlantic St., Stamford, Conn. Phone: Stamford 48-9271.

Recording Standard Approved by RIAA

A standard recording and reproducing characteristic has been recommended by the Engineering Committee of the Record Industry Association of America (RIAA). The record equalization curve is identical to that recently adopted by NARTB.

**Want to give your '54
electronic equipment
greater utility at
lower cost?**

HERE ARE TECHNIQUES TO SIMPLIFY YOUR JOB

① To solve problems of hi-voltage and corona suppression

To help you get on a commercial basis, new Alden techniques offer compact connectors that cost only pennies yet actually solve the problems of high voltage and corona suppression better than the bulky, expensive connectors heretofore available. Ask about: A) New Alden 20-pin Picture Tube Connector; B) New Alden Hi-Voltage Disconnects; C) New Alden Hi-Voltage Tube Cap; D) New Alden Hi-Tension Disconnect—all using brand new molding technique providing sealed contacts and long leakage path in ultra-compact economy units.

② To adapt present equipment to Plug-in Construction

Your "Black Box" units mounted in conventional ways can quickly be changed over to plug-ins using Alden's simple Adapter Kits. Ask about: 1) new Alden Back Connectors which unify all in-out connections into an orderly row that makes and breaks as the equipment plugs in or out, yet is beautifully accessible, spread out and color coded for easy tracing and servicing. 2) Alden Quick-Locking and Fastening Devices to pilot, draw in and eject your plug-in equipment with a turn of the wrist.

③ To design from the ground up with 100% Plug-in Unit Advantages

It's beautifully easy, with Alden's complete range of backbone, nerve and sensing elements, to build any equipment on unitized principles so trouble can be spotted instantly, and 30-second plug-in replacements permit operation to be restored on the spot by user's own personnel. Ask about the Alden Plug-in Packages and Basic Chasses for packages, Sensing Devices for tell-tales, and Back Connectors for making all circuitry clearly traceable units with dynamic color coding so simple it reads like a book.

④ To put circuitry in low-cost, compact vertical planes

You may dream about new wrap-arounds and printed circuitry, but if you're really trying to save space and cut production costs NOW, you can put your circuitry in compact, vertical planes that can be in the low-cost or expendable class. Alden makes it possible with complete range of stock items for circuitry layout: Pre-punched Terminal Boards that take any layout of unique Ratchet-Slot Terminals requiring no pliering or wrap-around, and Card-Mounting Tube Sockets so that complete circuitry can be put on one board.

Send for complete story—get "What's New at Alden's"—make it a point to visit Alden Display at the IRE Show, Booths 185-7.

Do you want more information about

PRODUCTS advertised in

LEADING MANUFACTURERS

are using space in this issue to acquaint you with their products. Perhaps you want more information on some of them—on one or two, or possibly a score. You can cover all of your needs with the cards below. They are convenient and postfree.

TELE-TECH

ELECTRONIC INDUSTRIES

Use the convenient postage-free card below to get information quickly about products listed here—all advertised in this issue

- 801 Abrasive production units—S. S. White Dental Mfg. Co.
- 802 Alarms, carrier interruption—Eust Industrial Co., Inc.
- 803 Amplifiers, remote—General Electric Co.
- 804 Audio generators, two-signal—General Radio Co.
- 804A Automation aids: cylinders; comparators—Clippard Instrument Lab., Inc.
- 805 Cable clips, nylon—Weckesser Co.
- 805A Cable, coaxial, for UHF-TV—Phelps Dodge Copper Products Corp.
- 806 Cable for telephones—Bell Telephone Laboratories
- 807 Capacitors, ceramic disc—Radio Materials Corp.
- 807A Capacitors, metallized-paper—Aerovox Corp.
- 808 Capacitors, mica molded—Aren Electronics Inc.
- 809 Capacitors, mica molded & trimmer—Electro Motive Mfg. Co., Inc.
- 810 Capacitors, molded tubular—Sprague Electric Co.
- 811 Capacitors, piston-type variable—JFD Manufacturing Co., Inc.
- 812 Capacitors for printed circuits—F. R. Mallory & Co., Inc.
- 813 Capacitors, stainless-steel tubular—Cornell-Dubilier Electric Corp.
- 814 Capacitors, variable vacuum—Eitel-McCubough, Inc.
- 814A Catalog, electronic equipment—United Catalog Pub., Inc.
- 815 Ceramics, extruded—American Lava Corp.
- 816 Coaxial transmission lines—Prodelia Inc.
- 817 Coils, deflection, for color TV—Raypar Inc.
- 818 Coils & transformers, i-f & r-f—I-T-E Circuit Breaker Co.
- 819 Coils & yokes for color TV—Videocraft Mfg. Co.
- 820 Communications equipment—Collins Radio Co.
- 821 Connectors, miniature—Eico Corp.
- 821A Connectors; plug-in units; terminals—Alden Products Co.
- 821B Connectors for printed circuits—Harvey Hubbell, Inc.
- 821C Connectors, printed circuit & miniature—DeJux-Amesco Corp.
- 822 Contact, assemblies, screw mounting—U. S. Components, Inc.
- 823 Controls, aircraft navigation equipment—Kollman Instr. Corp.
- 824 Controls, automatic—Ford Instrument Co.
- 825 Control systems, remote—Paul Schaefer Custom Engineering
- 826 Cores, iron; resistors; capacitors; switches—Stackpole Carbon Co.
- 826A Counters, electronic—Hewlett-Packard Co.
- 827 Crystals for color TV—Midland Manufacturing Co.
- 827A Crystals, frequency control—James Knights Co.
- 828 Deflection yokes—Tel-Rad Mfg. Co., Inc.
- 829 Degasser for tape & film—Cinema Engineering Co.
- 830 Digital volt-ohm-milliammeter—Telecomputing Corp.
- 830A Diodes crystal—National Union Radio Corp.
- 831 Diodes, fusion sealed—Hughes Aircraft Co.
- 832 Diodes, sealed germanium—General Electric Co.
- 833 Deltim, all-directional TV—Coco Distributing Corp.
- 834 Dynamometers, precision—George Scherr Co., Inc.

- 835 Engineering personnel—Federal Telecommunication Labs.
- 836 Engineering personnel—Hughes Res. & Development Labs.
- 837 Engineering personnel—Lockheed Aircraft Corp.
- 838 Engineering personnel—Malpar Inc.
- 839 Ferric oxides; iron powders—C. K. Williams & Co.
- 841 Film cameras & sound equipment—Berndt-Bach, Inc.
- 842 Filters, radio noise—Potter Co.
- 843 Filters, rejection network—White Instrument Labs.
- 844 Focus unit, ferrite magnet—Heppner Mfg. Co.
- 845 Fuses—Littelfuse, Inc.
- 846 Fuses; fuse holders—Busmann Mfg. Co.
- 847 Generator, square wave—Measurements Corp.
- 848 Generator, studio TV sync—Radio Corp. of America.
- 849 Generators, UHF-TV sweep, FM—New London Instrument Co.
- 850 Glass tubing and cone—Demuth Glass Works, Inc.
- 851 Hardware; accessories—Federal Service Products Inc.
- 852 Indexing turntables—Eklar Engineering Co., Inc.
- 853 Insulators for color TV tubes—Anchor Industrial Co., Inc.
- 854 Interpolators, frequency standard—Gertsch Products, Inc.
- 855 Iron powders, carbonyl—Antara Chemicals Div., General Aniline & Film Corp.
- 856 Klystron tubes, reflex—Bendix Aviation Corp., Red Bank Div.
- 857 Lacing tape, nylon—Gudebrod Bros. Silk Co., Inc.
- 858 Lamps, glow; pilot lights—General Electric Co.
- 859 Lead and multiple headers, sealed—Electrical Industries
- 860 Lenses, TV and film—Wollensak Optical Co.
- 861 Lenses, zoom-type camera; titlers—Faillard Products, Inc.
- 862 Magnetic materials; cores—Arnold Engineering Co.
- 862A Motors, 250 arc—Hiakok Electrical Instrument Co.
- 863 Microphones—American Microphone Co.
- 864 Microphones, dynamic—Turner Co.
- 865 Microphone stands—Atlas Sound Corp.
- 866 Microwave assemblies; radar—N.R.K. Mfg. & Engineering Co.
- 867 Microwave precision instruments—Waveline Inc.
- 867A Microwave relays—Philco Corp.
- 868 Microwave signal generators—Polarad Electronics Corp.
- 868A Modular electronic systems—Audio Products Corp.
- 869 Nameplates, metal adhesive—North Shore Nameplate Co.

PERSONAL

Richard D. Schotter was recently made vice-president of Phen-O-Tron, Inc. New Rochelle, N. Y. Jack Bayha, formerly associated with Emerson Radio Phonograph Corp. in the capacity of senior engineer, was named chief engineer of the company's new printed circuit plant.

Harold J. Adler has become vice-president in charge of engineering of the Edwin I. Guthman & Co., Inc., of Chicago, Ill. Mr. Adler will coordinate

Harold J. Adler

the diverse engineering activities of the company. For the past four years, Mr. Adler has been director of engineering for Hallicrafters Co., Chicago, Ill.

Harold Higinbotham has retired from active service as technical director of Acheson Colloids Ltd., London, Eng., unit of Acheson Industries, Inc., New York. He will remain on the board of directors, however. He became technical director of E. G. Acheson Ltd., as the company was then called, in 1935.

Lawrence R. Thielen has become a member of the New York district office staff of Ampex Corp., Redwood City, Calif. The New York City office of Ampex in the Chrysler Bldg. serves New England, New York, New Jersey, and Pennsylvania.

Franklin L. Eger has been made senior field investigator of the technical survey staff of Designers for Industry, Inc., Cleveland, Ohio. Dante J. Domizi joined the company as senior project engineer, electronics engineering. Philip N. Bredesen was promoted to assistant project manager, electronics; Guilbert M. Hunt to industrial designer, mechanical; Alfred L. Lea to project engineer, mechanical; Roger L. Chaloupka and James V. Westberg to project designers, mechanical; and Hiram G. Gilbert, Edward Holasek, Edward F. Mazur, and George J. Prusha to project designers, electronics. Andrew M. Filak has transferred to the sales department, and will cover Ohio, Michigan, Indiana, and Kentucky.

NTSC COLOR EQUIPMENT

PRICED RIGHT

BUILT RIGHT

by

Tel-Instrument

A COMPLETE NTSC COLOR
EQUIPMENT PACKAGE FOR LESS
THAN \$15,000!

Consists of the following:

- | | |
|-------------|------------------------------------|
| Type 2600 | Color Sync and Waveform Generator. |
| Type 2610 | Matrixer and Encoder. |
| Type 2303 | Color Monoscope. |
| Type 2120-A | Color Transmitter. |
| Type 2700 | Equalizing Filter. |
| Type 2401 | Color Picture Monitor. |

Above equipment includes all power supplies which are of basically new design.

Tel-Instrument the world's leading manufacturer of TV Production and Laboratory Test Equipment, now makes available to the TV industry the first complete NTSC COLOR package based on completely new and integrated circuitry. This equipment is not to be confused with any presently available which is essentially a modification or adaptation of obsolete black and white equipment.

This new approach enables *Tel-Instrument* to realize radical economies in manufacture, and still maintain the highest degree of electrical and mechanical standards.

We welcome the opportunity to further acquaint you with complete details concerning our NTSC color package.

Visit us at Booth 256-258 Radio Engineering Show

Manufacturers of a Complete Line of TV Test Equipment

Tel-Instrument Co. Inc.

728 GARDEN STREET • CARLSTADT, N. J.

**Broadband
Coaxial
Transmission Lines**
**Lowest Power Loss
No Electrical Discontinuity**

Designed for continuous service at any frequency to 2700 MCS, Prodelin Series 800 transmission line offers the highest microwave signal transmission efficiency with the lowest VSWR obtainable anywhere! And Prodelin Series 800 line can be cut at any point in the system, without regard for insulator spacing—it still retains its extremely high efficiency and low VSWR! Available in $\frac{7}{8}$ "", $1\frac{1}{8}$ "", $3\frac{1}{8}$ " and $6\frac{1}{8}$ " sizes and in 50 ohm impedance.

Prodelin Air-Tite couplings are electrically smooth and completely air tight. Simple mechanical assembly cuts field installation time by 50%! (Proved in actual field installations by experienced installers.)

Product Development Company manufactures parabolic antennas, omni-directional and bi-directional arrays, corner reflectors, coaxial cable and associated system components for various types of commercial and military service. Investigate Prodelin "Job-Packaging" today!

PERSONAL

(Continued from page 173)

William C. Jenner has joined the engineering staff of Reliance Electric and Engineering Co., Cleveland, Ohio, and will be responsible for the development and application of electrical insulating materials. March 1943 to January 1946, he was a lieutenant commander, USNR.

Bron Kutny has joined Channel Master Corp., Ellenville, N.Y. as field engineer. Mr. Kutny was formerly educational director of Emerson Radio and Phonograph Co.

Martin V. Kiebert, Jr., formerly director of the special products research department of Bendix Aviation, has been appointed chief engineer of

Martin V. Kiebert, Jr.

the tuner division of P. R. Mallory & Co., Inc., Indianapolis, Ind. Mr. Kiebert will be in charge of all research, development, and design for the division.

Harris O. Wood, who has been in charge of Philco Corp., Philadelphia, Pa. TV receiver design, was recently made chief engineer of the television division. **Wilson P. Boothroyd**, who has been in charge of Philco's engineering development laboratory for the past four years, was appointed chief engineer of the advance development laboratory.

Albert Lederman was recently made engineering specialist in a new mechanized circuits department of the parts division of Sylvania Electric Products Inc., New York, N.Y. As section head of the new department, Mr. Lederman will make his headquarters at 43-20 34th St., Long Island City, N.Y. With Sylvania since 1946, Mr. Lederman was a technical representative in Washington, D.C. prior to his present assignment.

Charles W. Baechler, Jr., until recently chief engineer of Lucian Laboratories and formerly chief engineer of Raymond Rosen Engineering Products, Inc., has joined the engineering staff of the Applied Science Corporation of Princeton, Princeton, N.J.

J. P. Smith, Jr., formerly chief engineer of the Daven Co., Newark, N.J. has been promoted to director of engineering. Walter Voelker, who was ap-

J. P. Smith, Jr.

pointed chief engineer of the company, was formerly with Day & Zimmerman, Inc., Leeds & Northrup, and Bell Telephone Laboratories.

I. F. Matthyse, formerly chief design engineer for Burndy Engineering Co., Inc., Norwalk, Conn., was recently promoted to assistant chief engineer, and Dr. W. F. Bonwitt, formerly chief planning engineer was made chief administrative engineer. Mr. Matthyse has been a member of the Burndy engineering department for 25 years. Dr. Bonwitt, who has been largely concerned with the firm's testing, research, and quality control programs, joined Burndy in 1938.

Reeves Develops Lifetime Magnetic Tape

Reeves Soundcraft Corp. has developed a magnetic recording tape which it "unconditionally guarantees will never break or curl when used under normal conditions of recording and playback." It will be marketed under the trademark name, "Lifetime" Tape.

"Neither recording machines nor ordinary handling will ever break it," said Frank B. Rogers, Jr., Reeves vice-president and general manager. The new tape owes its permanent qualities, Mr. Rogers said, to Soundcraft's newly developed magnetic oxide coating and to its base of DuPont "Mylar" polyester film, neither of which contains a plasticizer. He said it is a third as strong as machine steel, and offered the following comparison with standard cellulose acetate base tape: Its break strength is two-and-a-half times greater; Its break elongation is four times greater; Its impact strength is twenty times as great; Its tear strength is five times as great; Its flex life at 75 degrees Fahrenheit is 500 times as great.

- ★ Single deck, single pole, 36 or 60 positions
- ★ Easily Ganged
- ★ Large Current Capacity
- ★ Non-Shorting with Detent
- ★ Isolated Shaft
- ★ Four Point Mounting

Here's the answer to complicated range or circuit switching problems in high quality test equipment or experimental apparatus.

A number of these single deck switches may be ganged to provide additional poles. Both switches have a special detent which also provides the non-shorting action. The rotor arm is actually *lifted* as it moves from one contact to the next. This Shallcross design provides more usable contacts in less space than conventional non-shorting switches. Write for prices and drawings. Shallcross Manufacturing Co., 518 Pusey Ave., Collingdale, Penna.

SPECIFICATIONS

Types 10061-S (60 pos.) and 10054-S (36 pos.)
 Shaft Extension: 1" beyond spacers
 Size: 4 7/8" sq. x 1 1/2" d.
 Insulation: Phenolic. Isolated shaft.
 Avge. Contact Resistance: 0.006 ohms max.

Type	10061-S	10054-S
Voltage Breakdown:	1500 v.	2500 v.
Current Capacities		
Carrying—	30 amps.	40 amps.
Breaking—	2 amps. at 110 v. a-c	3 amps. at 110 v. a-c

Youth Connects

New horizons are ever present. Leo Kagan of Elco Corp. received a letter from 12-year old John Little, which reads: "I use them (varicon connectors) on my electric train. I also plan to spread them around (sic) the house for speaker extensions (sic), and I plan to make a rack of female sockets (sic) and male plugs to make different things work."

Microwave Impedance Tester Developed

A microwave impedance measuring instrument covering the frequency range 400 to 1600 mc has been developed by the Engineering Research Div. of New York Univ. The new device eliminates certain elaborate slotted-line set-ups, and permits rapid measurements of variable SWR and impedance. Accuracy of the reflection coefficient is better than 5%. High sensitivity of new impedance bridge permits measurement of impedance in such elements as bolometers and crystal mounts.

Tube Application Data Released

Important tube application information on the type 6x4 has been released by the Panel on Electron Tubes of the Research and Development Board. It includes charts which help the user to avoid many tedious calculations, particularly for military equipment. CBS-Hytron is distributing copies to its customers.

High Altitude TV Freeze

Community TV antennas atop 13,770-foot Mt. McNamee recently bore the brunt of storms which cut off reception in Climax, Colo. Antennas were completely blown off the supporting masts. Temporary erection of a Davis antenna is intended to provide reception from Denver, pending construction of permanent Yagi antennas with internal electric heating elements.

POLICE TV

RCA industrial TV system is tried out in New York City police lineup. Daily display of criminals will eventually go to all precincts

Training Programs in Modular Design

Sanders Associates, Inc., Nashua, N. H., has initiated complete training programs designed to give an immediate working knowledge of modulator design techniques for electronics. The courses are based upon the vast background of experience gained through their major design-engineering participation in "Project Tinkertoy" and their further extensive explorations into application of the modular design system to all types of commercial equipment.

Two complete courses in modular electronics are available. The first, *Introduction to Modular Design Principles*, is primarily for key engineering personnel, and is designed to acquaint them with the field of modular electronics. Six lectures, covering basic principles and reduction of circuits for modular electronics; design and manufacture; mechanical and circuit layout, plus demonstrations, laboratory tours and discussion periods, will permit the engineer to gain an appraisal of modular techniques and principles. The course, furthermore, will allow the engineer ample opportunity to ascertain pertinent facts relative to his particular circuitry and enable him to intelligently discuss with his top management the feasibility of modulizing the company's equipments.

The Advanced Course

The second course is the *Advanced Course in Modular Design*. This course has been designed for engineering, production and technician personnel. It consists of three weeks of lectures, demonstrations, discussion groups, tours and laboratory periods. Subject matter will cover basic principles and reduction of circuits to modular electronics; design and manufacture of components, circuit and mechanical layouts, test and assembly; and, plant layout for modular production. In the laboratory training, special emphasis will be placed upon that phase of modular electronic production with which a specific category of personnel is principally concerned. Engineering personnel will undertake the modular design of a specific circuit and supervise its construction and testing. Production personnel will schedule and supervise the operation of the semi-mechanized module facility of the school. Technician personnel will be instructed in the operation and use of the special jigs and fixtures peculiar to modular assembly.

Delay Lines

(Continued from page 78)

from 1/4 in. to over 6 in. The NBS study revealed that there was little effect on the transmission of ultrasound attributable to specimen cross-section so long as it was not less than transducer cross-section.

NBS investigated 14 materials in the course of the work. A number of characteristics such as attenuation, distortion, and temperature response were studied for each material. The total attenuation of a high-frequency signal is the result of several factors. Besides losses in the delay line itself, there are losses due to the crystal transducer and due to the bond between the crystal and delay line. The attenuation losses of the line have been attributed to elastic hysteresis, sound scattering, and a sound diffusion process. Distortion also has several sources. It can be caused by the crystal transducer or by the matching between crystal and delay line. Internally, the principal sources of distortion are scattered signals which have been reflected or refracted back into the main beam. To investigate these effects, the laboratory made studies of the relationships between the transmission of ultrasound and such factors as chemical composition, cold deformation, annealing treatment, specimen length, and sound path cross section.

The third, and most important quality, sought in the NBS investigation was temperature stability of time delay over the range from -50° to +200°C. See Fig. 2. The delay time of a delay line is affected by the length and the shear modulus of the material. For most metals, the temperature coefficient of the modulus is negative and of much greater magnitude than the positive expansion coefficient. Actually, the expansion coefficient is relatively small especially for certain alloys of iron and nickel. Consequently a thermally stable delay line material must have a very small negative temperature coefficient of shear modulus.

Materials chosen for study included two magnesium alloys, a high purity and a commercial nickel. Invar, a 32% nickel-iron, and 18:8 Cr-Ni steel, a 1% carbon tool steel, an aluminum single crystal, and five isoelastic alloys. Of the isoelastic alloys three were of commercial origin, one was an experimental alloy, and one was a special alloy prepared in the Bureau's experimental foundry and treated in the NBS thermal metallurgy laboratory.

The electronic apparatus consisted of an r-f signal generator and amplifier; pulse, marker, and delay generators; an output cathode follower; and an oscilloscope. See Fig. 3. For attenuation studies, a pulse modulated signal was fed into both the ultrasonic delay line and directly into the oscilloscope. The outputs were applied to the vertical input of the oscilloscope. As the oscilloscope deflection sensitivity and circuit constants were known, the attenuation of the delay line could be determined. For delay time studies, the marker generator provided marker pulses for the vertical input of the oscilloscope and synchronized the pulse generator output which was being applied to the delay line. The delay generator was synchronized by the pulse generator and provided in its output a delay pulse which was used to trigger the oscilloscope sweep. The sweep delay was variable over a wide range. By this method, the expanded sweep could be observed over a wide range, facilitating accurate determination of the delay time of the delay line.

For tests at elevated temperatures, a nichrome-wound alundum tube furnace was used having a uniform temperature zone over the specimen length. Thermocouples were attached to the center and both ends of the delay line. In order to obtain sub-zero temperatures, a very simple but effective low-temperature test chamber was constructed. It consisted of an open-top wooden box with holes drilled in its opposite ends. A thick-walled copper tube ran through the holes. The delay lines were inserted in the tube. By gradually filling the box with dry ice, the specimen was cooled slowly. The copper tube maintained effectively uniform temperatures over the specimen length.

Of the 14 metals and alloys investigated, only two of the isoelastic alloys possessed satisfactory temperature stability over the range from -50° to $+200^{\circ}\text{C}$. These materials were alloys of iron, both containing approximately 36% nickel and 7 to 8% chromium plus other minor constituents. While mercury and the magnesium alloy have temperature coefficient of delay time of about 300ppm/ $^{\circ}\text{C}$ and 400ppm/ $^{\circ}\text{C}$, respectively, one of the isoelastic materials tested had a temperature coefficient of only 8ppm/ $^{\circ}\text{C}$. The second isoelastic alloy was nearly as good; it exhibited a constant delay time over the range from -50° to $+170^{\circ}\text{C}$, with a slight increase in delay time at temperatures above 170°C .

THE PROBLEM MAKING A CONTROL MORE ADAPTABLE

A designer wanted to provide the aircraft thermostat shown below with a sensitive, accurate means of control. The problem was complicated by the fact that the thermostat had to be located in a remote and inaccessible spot — while the control dial had to be adaptable enough to allow its being mounted at the pilot's station, the flight attendant's panel or any other desirable location. To solve the problem, the designer chose —

THE LOW-COST SOLUTION AN S.S. WHITE REMOTE CONTROL FLEXIBLE SHAFT

The shaft provides the required degree of sensitivity and allows the control dial to be mounted wherever desired. According to the manufacturer, "Test results indicate that the operation of the shaft is satisfactory at temperatures ranging from -65°F to $+160^{\circ}\text{F}$. There is no measurable variation in torque required to turn the shaft or in torsional deflection incurred in initiating cam movement."

Send for the Design Engineer's Bible

The 256-page Flexible Shaft Handbook has many helpful suggestions on how to use, select and apply flexible shafts. Copy sent free if you request it on your business letterhead.

PHOTOCIRCUITS, INC. selects **NEW HUBBELL Interlock**

SUB-MINIATURE CONNECTORS FOR WIRING PRINTED CIRCUITS!

Made for each other! Hubbell Interlock's sub-miniature connectors make wiring of printed circuits fast and safe. Note how Interlock Type "C"

Connectors pass through set-in eyelets from back and lock automatically on opposite side. Eyelets manufactured by United Shoe Machinery Corp. Eyelet setting machines are available.

Hubbell Interlock sub-miniature Type "C" Connector. Simplicity of design is the key to its constant low contact resistance and ease of installation.

Hubbell Interlock's latest development, the sub-miniature Type "C" Connector, featuring low contact resistance, automatic locking — quick disconnect wiring, found immediate application to another recent advancement in the electronic field — the "printed" circuit. The tiny connectors met every requirement for wiring the illustrated rotary switch plate circuit manufactured by Photocircuits, Inc. of Glen Cove, N.Y. Their automatic locking — quick disconnect feature eliminated difficult soldering and made possible fast, easy wiring maintenance. The exclusive Hubbell Interlock mechanism assured a vibration-proof, constant low contact resistance.

For Difficult Wiring Problems Requiring Sub-Miniature Connectors, Our Development Laboratory Will Cooperate With Your Engineers To Adapt Interlock For Your Specific Applications.

See Booth #406 at the IRE Show Kingsbridge Armory, N.Y.C.

scope with the line selector on one of the horizontal gray scales of the Chart pattern. The adjustments can then be checked on the tricolor monitor for uniformity of hue (gray) along the gradation wedge.

In the previous description, the color picture monitor is used chiefly for checking the similarity of the gradation scales in the primary colors, and for noting errors in the transient response of the individual color channels.

Chart B is also useful in adjusting the tricolor picture tube. Using the bar pattern generator and a transparent form of Chart B, the horizontal and vertical linearity and aspect ratio are adjusted. With the three gun type of color tube, the purity coil current, the convergence voltage and the small convergence magnets must be carefully adjusted for the most accurate registration of the three electron beams and the mask.

During this procedure the electron beams must be kept in good focus, and the grid bias controls adjusted for a uniform white shade. When correctly adjusted, the picture should consist of uniform white lines or dots against a black background.

It should be noted that these two charts, A and B, the only ones presently available, are almost indispensable for testing color TV systems. Additional charts specifically designed for color TV are in the planning stage, but these charts probably will be in black-and-white, and not in color. Hence, charts A and B will continue to be of great value.

"SECRET WEAPON"

Ralph Mardueno, welder at Dalma Victor, proudly displays gag antenna, "the Ideo-radiator," a universal cold war antenna primarily used as a counter flying saucer measure. It is maintenance-free, and temporarily unclassified at present!

Capacity Commutator

(Continued from page 77)

$$Rq + \frac{q}{C + a(2t_1 - t)} = E \quad (7)$$

where: $C + a(2t_1 - t) = C(t)$

$$t_1 < t < 2t_1$$

($2t_1 = t_2$ in the notation used in Fig. 3a) Thus, the condition for continuity of the charge on the variable condenser at t_1 would be entered in a more elegant way. On the other hand, in order to emphasize the physical aspect of the circuit behavior, two different equations are here written respectively for the meshing and for the unmeshing phase of the complete cycle. This because both phases may be physically made quite independent of each other.

Between t_0 and t_1 there is only one active element in the circuit: The battery E and two ohmic resistors

R and $1/C$

Between t_1 and t_2 there are two active elements: The battery E and the resistance

$-1/C$ (a negative resistance),

R remaining necessarily the same.

While during the interval

$$t_0 t_1$$

the electrical charges from E flow naturally into the increasing capacity without any expenditure of mechanical torque; during

$$t_1 t_2$$

some mechanical torque is instead expended to force these same charges back into E . Therefore during the unmeshing time there is a voltage q/C across the condenser which opposes the voltage E and it must be taken into account in the representative equation. This is

$$Rq + [q/(C - Ct)] = E \quad (8)$$

The solution of (8) is

$$q = \frac{E(C - Ct)}{1 - RC} + K \frac{1}{1 - t} \quad (9)$$

The initial conditions for the second part of the cycle are

$$\begin{aligned} q &= q_1 \\ C &= C_1 \\ t &= t_1 = 0 \end{aligned} \quad (10)$$

Hence $K = q_1 - \frac{EC_1}{1 - RC}$

Entering (10) in (9)

$$q = \frac{E(C_1 - Ct)}{1 - RC} + \left(q_1 - \frac{EC_1}{1 - RC} \right) \left(1 - \frac{t}{C} \right) \quad (11)$$

$$\left(q_1 - \frac{EC_1}{1 - RC} \right) \left(1 - \frac{t}{C} \right)$$

A SUBSIDIARY OF THE WESTINGHOUSE AIR BRAKE COMPANY

CAPACITY COMMUTATOR (Cont.)

Eq. (11) gives the charge on the variable capacitor at any time between t_1 and t_2 . By differentiating (11) the current is found

$$i = \frac{-E\dot{C}}{1-RC} + \frac{2E\dot{C}}{1-R^2\dot{C}^2} \left(1 - \frac{t}{RC}\right) \quad (12)$$

The output voltage is

$$e_{out} = \frac{ER\dot{C}}{1-R\dot{C}} + \frac{2ER\dot{C}}{1-R^2\dot{C}^2} \left(1 - \frac{t}{RC}\right) \quad (13)$$

For $t = t_1 = 0$, Eq. (13) reduces to Eq. (4). Hence they both apply at t_1 .

The discussion of Eq. (13) is presently delayed because it will acquire more significance if this is done at the very end.

Actual values are instead immediately given to the parameters. The following orders of magnitude are considered within the realm of engineering feasibility.

$C_1 = 10^{-11}$ farads = Value of the fully meshed capacity where $C_1 = \dot{C}t_1$

$t = |t_0 - t_1|$ or $|t_1 - t_2| = (2)(10^{-4})$

sec. = Meshing or unmeshing time

$$\dot{C} = \frac{C_1}{t} = 0.5 \times 10^{-7} \text{ mhos}$$

$R = 5 \times 10^6$ ohms

Entering the above values in (4) and (13) and respectively calling e_1 and e_2 the output voltages during the meshing and unmeshing periods.

$$e_{1out} = 0.2E$$

$$e_{2out} = -0.33E + 0.53E(1 - 5000t)$$

When $t = t_2 = (2)(10^{-4})$ sec. or $1/5000$ sec.

$$e_{2out} = -0.33E$$

As soon as the transient dies out, the circuit suddenly opens and the current drops to zero.

For the purpose of illustrating the behavior of the curve between t_1 and t_2 , the following values of t following t_1 are chosen.

$$t_a = 0.5 \times 10^{-4} \text{ sec.}; t_b = 10^{-4} \text{ sec.}; t_c = 1.5 \times 10^{-4} \text{ sec.}$$

The respective values of e_{2out} are

$$-0.11E; -0.27E; -0.30E$$

and the entire output voltage curve for the complete cycle appears as shown in Fig. 4.

The unmeshing part of the cycle is again analyzed for the circuit of Fig. 5 where a ground plate is introduced following the input plate. Edge fringing is again ignored. After

t_1 , as before, the first capacitor starts decreasing. At time t_1 , before it has completely unmeshed, the second capacitor (to ground) starts meshing and increasing. The voltage source for this second condenser is the voltage across points BC with the indicated polarity. Because the initial charge on the second capacitor is zero, it behaves like a conductance. Hence an equivalent resistance

$$1/C_2$$

suddenly appears in parallel to R at $t = t_1$, where t_1 is a time between t_1 and t_2 which depends upon the physical spacing between

Fig. 9: Typical output waveform for any input plate preceded and followed by ground plates

the first (input) plate and the second (ground) plate. After t_1 the load resistor is no longer R but

$$R_1 = 1 / [(1/R) + C_2]$$

where C_2 = Fully meshed capacity of capacitor to ground
For convenience assume that

$t_1 = t_0$ of the preceding case where Fig. 4 applies

$$C_2 = C$$

Then $R_1 = 4 \times 10^6$ ohms and after t_0

$$e_{out} = -0.27E + 0.42E(1 - 5000t)^2$$

$$t_2 > t > t_0 > t_1$$

The output voltage curve is modified as in Fig. 6. The presence of the ground plate is seen to lower the absolute values of the negative voltage output.

Fig. 7 applies to the analysis for $t > t_1$.

At t_2 the first input capacitor suddenly disappears, but a certain voltage ($-27E$ for the above numeric case) still exists on the second ground capacitor and is applied across R. It would appear that to treat the problem rigorously an equation valid between t_2 and t_3 should be written and solved. Thereafter, an equation valid between t_3 and t_4 should also be solved. There is no need for it. The

CAPACITY COMMUTATOR (Cont.)

final aim is to find out whether or not the second ground capacitor is completely discharged before the leading edge of the moving plate meshes with the third plate or the second input plate at t_1 . Any residual charge would be detrimental to the device, because it would carry over from the first input plate to the second input plate. Such a "voltage memory" cannot be tolerated because it would otherwise introduce a "dynamic crosstalk" between the sampled circuits. Said dynamic crosstalk is surely avoided if the time constant of the fully meshed ground capacitor C_k times R is smaller than $\frac{1}{4}$ the time interval between t_2 and t_1 . The validity of this criterion is self-evident. The full discharge time for the variable C_k capacitor can never be greater than $4 RC_k$. This criterion is easily satisfied because in practice it is always possible to make C_k from 50 to 100 times less than C . By reducing the capacity between ground plates and movable plate while still retaining their static decoupling function the π section was evolved as it was first represented in Fig. 2. Also, by lowering the C_k capacity, the negative voltage swing of Fig. 4 will not be any more reduced as it was shown in Fig. 6. Qualitatively the output voltage between t_0 and t_1 will appear as in Fig. 8.

Unmeshing Capacitance Effect

Finally, the effect of the unmeshing capacitance C_k upon the initial output voltage due to the meshing of the third capacitor after t_1 must be analyzed.

At $t = t_1 - \epsilon$, a portion of the unmeshing C_k is still in parallel with R but by now completely discharged. At t_1 the third capacitor starts meshing, hence a step voltage is applied to R and to the remaining unmeshing section of C_k which is in parallel with R . After t_1 the unmeshing section of C_k must accept charges at a rate falling faster than the exponential die-away rate which would be experienced should the unmeshed section of C_k remain constant. Consequently, the voltage across R increases at a rate greater than the exponential one because of the diminishing shunting effect due to C_k . At t_2 , capacitor C_k disappears altogether and the voltage across R then reaches the steady state given by Eq. (4). The typical output waveform for any input plate preceded and followed by ground plates is shown in Fig. 9, which is similar to Fig. 8, but for the rounded, initial step.

As mentioned at the beginning, the

introduction of a stationary coupling capacity, as represented by the two coaxial cylinders shown in Fig. 2, is necessary for the elimination of sliding contacts. In practice this coupling capacity C_c can be easily made several hundred times greater than C and because RC_c is relatively very large no practical deformation of the output waveform is introduced by it.

In addition to fringing, the unavoidable practical stray capacitances have been disregarded in the present investigation. Their pres-

Fig. 10: Qualitative picture of output voltages for various values of RC , fringing ignored. Boundary conditions and magnitudes will shift the boundary conditions of the equations when applied to fit a particular design of the commutator.

The discussion of Eq. (13) is now entered,

$$e_{out} = -\frac{ERC}{1-RC} + \frac{2ERC}{1-RC^2} \left(1 - \frac{1}{RC} e^{-t/C}\right) \quad (13)$$

For $RC = 0.5$ the exponent in Eq. (13) becomes unity and the curve representing the output voltage between t_1 and t_2 transforms into a straight line. Making $RC = 0.5$ in Eq. (4) and (13) the output voltage is $0.333...E$ for the meshing phase and reaches the peak of $-E$ during the unmeshing phase as shown in Fig. 10. Eq. (13) must be analyzed for $RC = 1$. Eq. (13) can be written as

$$e_{out} = -\frac{ERC}{1-RC} \times \quad (14)$$

$$\left[1 - \frac{2}{1+RC} \left(1 - \frac{1}{RC} e^{-t/C}\right) \right]$$

$$\text{Making } RC = A \quad (15)$$

Stable TWIN-T REJECTION NETWORKS

For applications requiring Twin-T RC rejection or notch networks, investigate the Series 500 Filters.

Built TO ESTABLISHED STANDARDS FOR MAXIMUM SHIELDING EFFICIENCY

Lindgren True Double Shielded SCREEN ROOMS
 Patent Pending

Lindgren SCREEN ROOMS

Minimum RF interference

Sales Engineering Representatives Throughout the United States

A screen room is no place for makeshift construction. Where RF interference must be eliminated to a known degree, SCREEN ROOMS must be built to scientific standards, not "by guess and by golly." That is why LINDGREN double-shielded enclosures are increasing in use by so many of America's leading industries, where testing and operation must be done under controlled conditions that will not tolerate leakage or uncertainty.

HIGHEST ATTENUATION GUARANTEED

BRONZE SCREEN 126-128 DB
 COPPER SCREEN 142-146 DB

LINDGREN screen rooms are economically manufactured at the factory. They consist of pre-fabricated units, easily assembled where you want them... conveniently portable to any location. More than 30 standard sizes available.

Used by leading manufacturers of electrical and electronic equipment... and more than meets government specifications.

WRITE for Descriptive Circular, Attenuation Charts, Construction Diagrams, Specifications and Prices.

CAPACITY COMMUTATOR (Cont.)

$$c_{out} = -EA \frac{1 - \frac{2}{1+A} \left(1 - \frac{C}{C_1} t\right)^{\frac{1}{A}-1}}{1-A}$$

Differentiating numerator and denominator with respect to A

$$c_{out} = EA \left[\frac{2}{1+A} \left(1 - \frac{C}{C_1} t\right)^{\frac{1}{A}-1} \times \ln \left(1 - \frac{C}{C_1} t\right) \frac{1}{A^2} + \left(1 - \frac{C}{C_1} t\right)^{\frac{1}{A}-1} \frac{2}{(1+A)^2} \right]$$

For A = 1; the above equation reduces to

$$c_{out} = E \left[\ln \left(1 - \frac{C}{C_1} t\right) + \frac{1}{2} \right] \quad (17)$$

At $t = t_2$; $Ct = C_1$

$$c_{out} = E \left(\ln 0 + \frac{1}{2} \right) \quad (18)$$

A spike of infinite voltage occurs at t_2 .

In this case, for an idealized capacitor where fringing effects have been arbitrarily removed, a step function would be obtained at t_1 , at an impulse function at t_2 .

Fig. 10 presents a qualitative picture of the output voltages for various values of

RC

While these curves would only apply to the ideal case represented in Fig. 3a when the fringing effect is ignored, nevertheless they convey quite clearly the trend shown by the output voltage versus the range of values assumed by

RC

The capacity commutator is a high impedance device and it requires double-wall electrostatic shielding. A few laboratory models of the device were built while the writer was Director of Research with Communication Measurements Lab., Inc., Plainfield, N. J. The experimental work done at the above Laboratories also extended to the investigation of the commutator as a dc chopper and voltage amplifier. Furthermore, a more complex commutator was designed with the π plates "enclosing" the input plates. The decoupling between the adjacent π plates being obtained by means of grounded vanes. Also by means of individual cathode followers the capacity between any input plate and associate π plate was furthermore reduced. More recently, while the writer was Electronic

Consultant with the Electronic Dept. of the Glenn L. Martin Co., Baltimore, Md., a 16 channel experimental capacity commutator was built there. This last model incorporates bearings which could stand up to 65,000 rpm. From the experimental evidence available at this time it appears that the rms noise voltage output can be kept at least 6 db below 1 mv for a well machined sample. At such a high level the noise is purely of microphonic origin. Hence it is quite premature, for all practical purposes, to start worrying about the ultimate theoretical sensitivity of the device.

Electro-Optical Image

(Continued from page 91)

electronic circuits if the scanning velocity is the same in two orthogonal directions. The NBS system achieves this type of scan by applying triangular waves to the horizontal deflection of the scanner and a slightly different frequency wave of the same type to the vertical deflection. The result is a Lissajous figure of rectangular shape that changes its proportions with the in-

Video picture (l) of photo is changed to outline form (r) by differentiating and rectifying signals, and then clipping to constant level

stantaneous phase between the two waves. The same waves are applied to the monitor for identical scanning.

This image processing system has so far been employed in the study of the enhancement of contours in photographs and to the production of outline pictures from half tone photographs. The process of contour enhancement is essentially that of increasing the abruptness of tone transition at contour lines. A similar phenomenon occurs in the "brightness contrast" in human vision. If a dark area is adjacent to a light area, the dark appears darker and the light appears lighter close to the boundary.

The sharpening of tone transitions for contour enhancement is accomplished by modifying the waveform of the signal applied to the monitor oscilloscope. This is done by elec-

SPEED UP

factory and service tests!

UHF TV SWEEP GENERATOR MODEL 130

Features continuous frequency coverage in one band; at least one volt output into 75 ohms; wide sweep; blanked signal on return sweep provides a reference baseline.

SPECIFICATIONS

Freq. Range: 450-900 mc.
Sweep Width: 0-40 mc min.
Sweep: 60 cycle, sine wave.
Output: (1.) 0.1-1.0 volts
(2.) 0.01-0.1 volts approx.

FM SIGNAL GENERATOR MODEL 100C

Designed to give precision performance over a single tuning range (27-230 mc). Negligible leakage; low spurious outputs; no auxiliary frequency changer unit required.

Write for specifications and catalog on complete line of measuring equipment. See our demonstration at the New York I. R. E. show - Booth 166.

Pick 'DIAMOND H' RELAYS

FOR HIGHER
VIBRATION
RESISTANCE

Vibration resistance range of "Diamond H" Series R Relays has been more than doubled, extending now from 0 to well over 1,000 cycles per second at 15 "G's." Hermetically sealed, miniature aircraft relays, they are basically 4PDT but are also available in DPDT and 4PDT with two independent coils, either or both of which will operate the unit. They meet all requirements of USAF Spec. MIL-R-5757B . . . and far surpass many.

Operating shock resistance exceeds 50 "G's"; temperature range is from -65° to +200°C. They operate consistently over 400,000 cycles without failure at 5 A. and go 3,500 or more under 30 A. at 30 V., D. C. resistive. Voltages up to 300 D. C. at 4/10 A. are carried for more than 400,000 cycles. Coil resistances up to 50,000 ohms available. Operating time is 10 ms. or less; drop out time 3 ms. or less. Sensitivity approaches 100 mw. at 30 "G's" operational shock resistance. Inter-electrode capacitance is less than 5 mmf. contacts to case; less than 2½ mmf. between contacts. All standard mounting arrangements.

Bulletin R-150, giving basic performance data under varying conditions, is yours on request. Our engineers are prepared to work with you to develop variations to meet your specific requirements. Tell us your needs.

Everything in Electronics from One Dependable Source

ELECTRO-OPTICAL IMAGE (Cont.)

trically adding an enhancing signal (the negative of the second derivative) derived from the original signal. Mathematical analysis of the process indicates that a first approximation to a correctly focussed picture is obtained when this process is applied to an incorrectly focussed picture. Used in this way, the system is a two-dimensional (visual) analog of a high frequency compensated audio system.

The formation of outline pictures from photographic negatives is accomplished by using different modifying signals. If the signals from a differentiating network are rectified, a positive pulse is obtained as the light spot passes over a region of sharp tone gradient. The application of such signals to the intensity control of the monitor results in pictures that show only the contour lines, like line drawings.

Use of Process

This outlining process may be used for automatic production of sketch maps from terrain photographs or the display of contours on X-ray pictures or coronagraphs. In picture transmission where line drawings are acceptable, economies in bandwidth are possible through reduction in the information that must be transmitted (Fig. 2). Also, contrast enhancement may be used in TV to reduce the effects of low transmission bandwidth. The suggestion has been made that the system would be useful in the field of analog computers as an aid to the solution of some types of differential equations.

Dalmo Victor Stock to Textron, Inc.

Sale of the entire stock of Dalmo Victor Co., 1414 El Cannino Real, San Carlos, Calif., to Textron, Inc., leading textile manufacturer in Providence, R.I., has been announced by Tomlinson I. Moseley, president of the San Carlos electronics firm. Under the terms of the transaction completed, Dalmo Victor becomes a wholly owned subsidiary of Textron and maintains intact its present operation and management.

Dalmo Victor is a leading producer of airborne radar antennas with five plants and more than 1400 employees in San Carlos and Belmont. Its entire output is under defense contracts and sales volume exceeded \$24,000,000 during the fiscal year ending September 30, 1953.

BULLETINS

Tape Recorder

Bulletin No. AB 3-1-2 presents the general performance characteristics and specifications covering the model 350 tape recorder made by Ampex Corp., 934 Charter St., Redwood City, Calif.

Telephone System

Telecom Inc., 1019 Admiral Blvd., Kansas City, Mo. has released Bulletin Tel 101 which describes the model 4A23 dial telephone system.

Tubes

Two catalog sheets were recently released with a price list by Lewis and Kaufman, Ltd., Los Gatos, Calif. The sheets provide engineering data and general characteristics covering the "Los Gatos" high-vacuum rectifier, 3B24W and the medium mu triode, 3C-24 24G.

Rectifiers

"Selenium Rectifiers for Color Television," a new folder published by Federal Telephone & Radio Co., 100 Kingsland Road, Clifton, N.J., provides information about the design of color TV power supplies, and lists a special group of selenium rectifiers adaptable to this application. Folders are available on request.

Switch

Thompson Products, Inc., announces the availability of a bulletin that describes the Model DOY3AA coaxial switch for 3 1/4 in. coaxial cable. The switch is distributed through the Andrew Corporation of Chicago.

Measurement Techniques

Hewlett-Packard Co., 395 Mill Page Road, Palo Alto, Calif., has issued Vol. 5, No. 1-2 of the *hp Journal* which discusses techniques for measuring operating time of high speed clutches, rpm on very high speed shafts, stability of rotation, electrical relay operating times, and phase delay in 1-f devices such as servo mechanisms. May be obtained at no charge by writing Dept. P.

Seals

The Hermaseal Co., Elkhart, Ind., has published a 20-page color booklet which explains "Why glass-to-metal sealing" and presents drawings and characteristics and performance data covering electrodes, tubular button-seals, headers, octal plugs, etc.

Potentiometers

A new 19-page catalog (form No. 79-7) is devoted exclusively to carbon and wire-wound potentiometers and associated hardware. Designed for equipment-design engineers, it contains electrical and mechanical characteristics, descriptions, drawings, dimensions, etc. Write to P. R. Mallory & Co., Inc., Resistor Div., Frankfort, Ind.

Guide Pins & Sockets

DeJur-Amsco Corporation, 45-01 Northern Blvd., Long Island City 1, N.Y., have released an engineering data sheet covering their "Continental" Series 20 miniature precision connectors that are now available with polarizing "screwlock" guide pins and guide sockets.

Wire Forms

A new educational brochure describes wire forms and shows how they can do the job of more complicated parts. It includes a chart on coil spring manufacturing variations, and simplifies technical data to enable easier ordering. Write Dudek & Bock Spring Mfg. Co., 2100 W. Fulton, Chicago 12, Ill.

Capacitors

Dumont-Airplane & Marine Instruments, Inc., 15 William St., New York 5, N.Y., have released catalogue 53, a 19-page booklet that describes and presents detailed descriptions, drawings, and ratings covering "Milcaps" glass-to-metal hermetically sealed miniature capacitors designed to meet military specifications MIL-C-25A.

INDEXING TURNABLES OF EVERY DESCRIPTION

Eisler is considered a pioneer of indexing mechanisms. Has designed and built turntables for over 50 years. Indexing range from 1 to 4000 RPM. Eisler indexing turntables have been adapted as standard for over 33 years by some of the largest firms in the U.S.A. Use Eisler indexing machines as the basis and you can add parts for your own production. Hundreds of Eisler indexing machines are in daily use all over the world.

Accelerometers

Bulletin A104 describes, illustrates, and presents engineering data covering "Glennite" accelerometers, models A104 and A104-2, manufactured by Gulton Mfg. Corp., Metuchen, N.J.

Papers

A brochure recently published by Potter & Brumfield, 233 N. Main St., Princeton, Ind., contains papers selected from those delivered during the Symposium on Electro-Magnetic Relays at Oklahoma A&M. It is available without charge.

Precistors

Bulletin B-8, catalog section B, presents important information for engineering and purchasing departments covering molded boron-carbon μ w precistors made by International Resistance Co., 401 N. Broad St., Philadelphia 8, Pa.

Library Edition

A library edition of the complete catalog of the Ampere Electronic Corp., 230 Duffey Ave., Hicksville, N.Y., incorporates general and operating data covering every electronic tube and accessory made by the company. The plasticized "Fabrihide" covered, 578-page, loose-leaf, ring-binder-bound manual, priced to sell at \$2.00, will be made available to qualified engineers.

Speed Tally

Details of the "Speed Tally" and how it functions is described in a new four-page folder, EL148, that is available on request to Remington Rand Inc., 315 Fourth Ave., New York 10, N.Y.

Greater Efficiency

The booklet, "More Dollars from Less Space," released by Alden Systems Co., Alden Research Center, Westboro, Mass., tells how to improve the efficiency of job, department, and factory.

Scientific Equipment

The Edin Company, Inc., 207 Main St., Worcester 8, Mass., has released a four-page condensed catalog describing their recording equipment, accessories and supplies.

Pulse Instruments

Bulletin 1-53, published by Electro-Pulse, Inc., 11811 Major St., Culver, Calif., is a four-page brochure which describes and gives performance data covering block utilized multi-purpose pulse instruments.

Plastic

The Richardson Co. 2735 Lake St., Melrose Park, Ill., has released Cat. No. 20,000-12 "Index of Grades by Outstanding Properties," which lists various grades of "In-surok" laminated plastic by their outstanding characteristics.

Filter Aid

Johns-Manville, 22 East 40th St., New York 16, N.Y. has issued an illustrated 8 page brochure on the use of "Sorbo-Celite," a specially treated "Celite" diatomite filter aid for removing emulsified oil from condensate or process water. Available to power engineers and others on written request.

Plastics Catalog

A new general plastics catalog and hand book featuring polystyrene rod, tubing and sheets, plastic covered steel, plastic splicer and channels, etc. has been released by Julius Blum & Co., Inc., Carlstadt, N.J.

Transducer

Gulton Mfg. Corp., Metuchen, N.J. has released bulletin P-401 covering the characteristics of the "Glennite" blast gauge wide range pressure transducer.

NEW HOPE in the battle against CANCER

THE FIGHT against man's cruellest enemy is far from won. If present rates continue, 23 million living Americans will die of cancer—230,000 *this year*. And thousands of these will die needlessly—through cancer that could have been cured if treated in time.

ALL THE SAME, there have been victories. Thousands who once would have died are being saved—thanks, in part, to your donations to the American Cancer Society.

AND, LAST YEAR, the Society was able to allocate \$5,000,000 of your donations to research aimed at finding the ultimate cure for *all* cancer. That's more money than ever before.

MUCH MORE, of course, remains to be done. So please make *this year's* gift a really generous one!

Cancer
MAN'S CRUELEST ENEMY
Strike back—Give

MAGNET WIRE

We produce our own magnet wire of the highest quality . . . specializing in sizes from 22 AWG to 50, insulated with enamel, formvar, dipsol (liquid nylon), cotton, silk glass, or any combination of the above insulations. Our automatic machinery combines high capacity with precision control at every step.

SPECIAL COILS AND WINDINGS

We wind coils in one of the best-equipped departments of its kind, furnishing either windings for your assemblies or completed and tested coil components for a wide range of electrical and electronic units, including precision transformers as described below.

PRECISION TRANSFORMERS

Efficient production of audio and special purpose transformers, including MIL-T type transformers and reactors using nickel alloy, Hypersil or standard core materials—hermetically sealed, varnished, or Fosterite* type. If you are looking for help in meeting an exacting specification, Wheeler is a good company with which to do business.

*Westinghouse Elec. Mfg. Co.

SOUND POWERED Electric TELEPHONES and HANDSETS

Wheeler Standard and High Level handsets and inter-communication units are increasingly used as components of specialized systems in military and civilian services. We invite correspondence with inter-com engineers and original equipment manufacturers.

News of MANUFACTURERS' REPS

Jack Carter and Robert L. Bray, sales engineers on the staff of John B. Turbergen Co., 2232 West 11th St., Los Angeles, Calif., have become associates in the firm of manufacturers' representatives. Allen B. DuMont Laboratories, Inc., Clifton N.J., has announced that the John B. Tubergen Co., will handle company replacement sales on tubes and tube parts to jobbers in the Southern California and Arizona areas.

George Davis Sales Co., 5259 E. Beverly Blvd., Los Angeles, Calif., electronic representatives have been appointed to cover the Southern California and Arizona areas and Las Vegas, Nev., for Vaco Products Co., Chicago, Ill. producers of electronic tool items.

G. S. Marshall Co., Pasadena, Calif., electronic manufacturers' representatives, have been named to cover California, Arizona, and New Mexico for San Fernando Electric Mfg., Co., San Fernando, Calif., producers of hermetically sealed paper capacitors. Tom Williams and Frank Stevens, formerly with the Brown Instrument Div. of Minneapolis-Honeywell Co., recently joined the staff of G. S. Marshall Co. as field engineers.

Kerrigan Sales Co., Room 310, 1313 West Randolph St., Chicago, Ill. has been appointed exclusive representative for Ilco Copper Tube and Products, Inc., Cincinnati, Ohio, manufacturers of electrical connectors, lugs, neutral bars, etc.

Weller-Rahe Co., Worthington, Ohio, will represent Brook Electronics, Inc., Elizabeth, N.J., manufacturers of audio amplifiers, in western Pennsylvania and Ohio.

E. V. Roberts and Assoc., 5068 W. Washington, Los Angeles, Calif. have been made representatives for Houghton Laboratories, Inc., Olean, N.Y., in California, Arizona, Nevada, and New Mexico.

J. O. Malvin, associated with the Idaho Power Co., for 34 years, has been appointed sales representative for the Idaho area by Burndy Engineering Co. Inc., Norwalk, Conn. Mr. Malvin will handle the entire Burndy electrical connector line and will operate from offices located at North 36th St., Boise, Idaho.

Charles E. Ruckstuhl has been made electronic sales engineering representative for the Pacific Division of Bendix Aviation Corp. He will handle the company's telemetering beacon, sonar, and other electronic products on the east coast, and make his headquarters at the division's New York office, 475 Fifth Ave.

Jack Grand recently retired from Burlingame Associates, 103 Lafayette St., New York, N.Y. after having been with the company for 12 years. However, he continues to serve the company in the capacity of consultant.

for every application . . .

ATLAS MIKE STANDS

**most complete—
most diversified
line in the world!**

From a professional boom stand to a flexible goose neck to a tiny fitting—whatever your need in mike stands and accessories—depend on it, ATLAS has it for you. Designed and manufactured for highest stability, quiet, ease of operation, durability. And backed up 100% by ATLAS—world leader in mike stands, public address loudspeakers and accessories for 21 years. Compare them all at your distributor—You'll make your next mike stand an ATLAS.

Major Armstrong Dies

Major Edwin H. Armstrong, famed radio pioneer, fell to his death on Feb. 1, 1954. He is generally credited with being one of the most important inventors in the field. Among his inventions are four basic discoveries that revolutionized radio, and made possible the present state of the art. These include: the regenerative circuit, which took radio out of the crystal detector stage; the superheterodyne circuit, the basic circuit of today's standard radio; the superregenerative circuit, used in military and UHF communications; and the FM communication systems which achieve static-free high-fidelity reception. Major Armstrong was born on Dec. 18, 1890, attended Columbia University, and became Professor of Electrical Engineering at the school. Among the many honors bestowed on Major Armstrong are the Medal for Merit and the IRE Medal of Honor.

The following statements, by two of the electronic industry's leading figures, are representative of the widespread recognition and deep appreciation of the man and his great inventions.

"The name of Major Edwin H. Armstrong will go down in the history of science as one of the great contributors to the growth of modern communications. I feel a personal loss in his passing, as must every engineer who knew him, as well as a recognition of deep loss to the electronics industry and the scientific fraternity. He was a kindly man, and in many respects, shy, but through this shyness always could be felt a sincerity of purpose and a professional integrity.

"The many contributions he made in the field of radio will live for uncounted years and his name must be linked with the other pioneers upon whose discoveries the great radio and television industries have been built. They exist today as monument to such scientific giants as Major Armstrong.

"Major Armstrong was one of the few great individualists in science. It is to his credit that working alone he made his major discoveries. He well deserved the many professional honors bestowed upon him."—Dr. W. R. G. Baker, Vice President, Electronics Div., General Electric Co.

Major Edwin H. Armstrong

"In the death of Major Edwin Howard Armstrong the world of science has suffered an irreplaceable loss, for the Major was one of the world's great engineers and unquestionably one of the greatest inventive geniuses in human history.

"In my opinion he contributed more to the development of radio and television than did any other person, but my sense of personal loss goes far beyond regret for the passing of a great scientist.

"I knew Howard Armstrong for thirty years, the last twenty as his friend and confidant. I knew him as a man of highest personal integrity who stubbornly refused to sacrifice his principles for any consideration: I saw him refuse a million dollars in cash rather than make such a sacrifice.

"I knew him as a patriot, who was the first to grant the United States government free wartime use of all his radio patents, even though some others charged the government royalties while also profiting from manufacture for the government. This was done at great personal loss since Armstrong's major source of income was invention, not manufacturing.

"No man can say what was in Howard's heart during his last hours but this I do know: Armstrong, the man, had stature equal to that of Armstrong, the scientist. I have lost a great friend."—E. F. McDonald, Jr., President, Zenith Radio Corp.

FM Net Formed

An FM radio network, the Good Music Network, has been set up to continue a broadcasting service which had been privately financed by Major Armstrong's Continental Network as a public service. Musical programs will be relayed from Washington to New York, and eventually Boston.

Colored Tape

Rapid identification of magnetic recording tape is facilitated by the development of colored tape. Audio Devices is now making plastic base types in blue and green, as well as standard clear. Plastic reels come in a choice of five different colors, further facilitating selection of stored reels.

GERTSCH

MODEL AM-1 VHF
INTERPOLATOR

Increase the Range of Your Present
100 k.c. Frequency Standard to 1,000 Mc.

The Model AM-1 Interpolator is a self-contained direct reading instrument designed to provide the means for extending the range of your present frequency standard.

- Can be used with any 100 k.c. frequency standard and 1-2 mc measuring equipment.
- Generates or measures any frequency within 20-1,000 Mc.
- Ultimate system accuracy better than 1 part in 10⁶ (one cycle in 10 megacycles)
- Frequency range 20-1,000 Mc.
- Power source 105-127 volts, 60 cycles AC unregulated

Symposium Planned on Information Networks

"Information Networks" is the subject of the third in a series of annual international symposia which will be held April 12-14, 1954 at the Engineering Societies Bldg., 33 West 39th St., New York, N. Y.

The symposium will deal with network theory, particularly network synthesis as it is influenced by the newer concepts developed in information and general communication theory. In particular, the first part will concentrate upon the performance of networks and their design for specific types of information such as pulses, pulse modulation, statistical inputs, etc. The second part will concentrate upon the generalized network concepts and their application to computer and switching systems, neuron networks and optical systems. American and European authorities will participate.

The cooperation of the IRE Professional Group On Circuit Theory and the cosponsorship of the Office of Naval Research, the Air Force Office of Scientific Research and the Signal Corps permits this symposium to be held without charge.

"Proceedings Of The Symposium On Information Networks" will be published by October 1954, at a cost of Four Dollars (\$4.00) per copy. A cloth bound edition will also be available at additional cost. Members of the IRE Professional Group On Circuit Theory may obtain a copy at a saving of One Dollar (\$1.00). Orders for the "Proceedings," accompanied by check or money order, made out to Treasurer, Network Symposium, will be accepted in advance.

Copies of the detailed program, hotel accommodation information and registration forms are available on request. All correspondence should be addressed to: Polytechnic Institute of Brooklyn, Microwave Research Institute, 55 Johnson St., Brooklyn 1, N. Y.

CONNECTOR ENGINEER

Well established manufacturer of precision components seeks top flight engineer with successful record in development of RF and UHF connectors. Must be capable of assuming entire responsibility of designing and developing new line of precision sub-miniature connectors. Right man can expect commensurate salary and opportunity to share substantially in growth of new division. Location Metropolitan New Jersey. Box A354

Helipot Offers Pocket Slide Rule

A handy pocket-size slide rule is available for the asking from Helipot Corp., 916 Meridian Ave., South Pasadena, Calif. Made of heavy-gauge plastic, with a transparent runner, it carries the most-used C, B, C, D and C1 scales. The slider is also useful as a ruler; one edge is calibrated in sixteenths, the other in millimeters. The reverse of the slider bears Ohm's Law formulae and Fahrenheit-Centigrade conversion scale.

Measure
PHASE
Difference
Directly 0° - 360°

Type 320AB PHASEMETER

- . . . In 4 full scale ranges, 0°-36°, 0°-90°, 0°-180°, 0°-360°, without ambiguity
- . . . Independent of voltage amplitude from 1 to 170 volts peak
- . . . Independent of voltage wave form
- . . . Independent of frequency from 2cps. to 100kc. (accuracy: 20cps-20kc, 1% of full scale +3%; error increases slightly above 20kc.)
- Large, easily read, mirrored scale panel meter
- Ease of operation — ideal for production testing or laboratory use
- Eliminates tedious and inaccurate oscilloscope techniques
- Terminals for recorder . . . instantaneous response of output voltage to phase changes
- Incremental accuracy better than 1% of full scale
- Proven performance and quality workmanship

In audio facilities, ultrasonics, servo-mechanisms, geophysics, vibration, acoustics, aerial navigation, electric power transformation or signalling, . . . in mechanical applications such as printing register, torque measurement, dynamic balancing, textile and packaging machinery and other uses where an accurate measure of the relative position of moving parts is required . . . the type 320AB Phase Meter has achieved widespread approval as a unique and versatile measuring instrument.

For further information on measuring phase, send for specification bulletin and TIC Laboratory Reports

Jan King joined the West Coast sales organization of Gates Radio Co., Quincy, Ill. He will work the north-western area of the U.S. and maintain headquarters in San Francisco.

Joseph H. Quick has been elected president of National Co., Inc., Malden and Melrose, Mass. Mr. Quick who

Joseph H. Quick

came to National from the presidency of Harrington & Richardson Arms Co. had been a director and member of the National Company, Inc. executive committee.

W. Walter Jablon has been named sales manager of the home instruments division of the Freed Electronics & Controls Corp., 200 Hudson St., New York 13, N.Y. He will devote his efforts to the promotion and distribution of the company's products.

Larry F. Hardy has been appointed vice-president in charge of product development and **John M. Otter** has been made vice-president in charge of consumer products divisions for Philco Corp., Philadelphia, Pa. Mr. Hardy has been president of the TV and radio division of Philco since 1949. In his new position he will be responsible for the development of all Philco product lines. Mr. Otter has been vice president and general manager of the refrigeration division since early in 1952. He will coordinate the activities of all consumer product divisions including sales, merchandising, and distribution of TV, radio, and major appliances.

Michael F. Callahan, recently named vice-president in charge of all CBS-Hytron plants, headed a list of seven men who were promoted to new positions in the firm. **Edgar K. Wimpy** was made director of engineering, a newly-created post. **Dr. Russell R. Law**, was made director of research and development. **Clifford Hughes** was made plant manager of the Newburyport receiving tube plant. **Elwood W. Schafer** was made manager of color planning. **J. Farley** was made director of quality control. And, **David A. Sokolov** was made supervisor of development of receiving tubes.

THE DURO-POCKET STAMP THE PIN & PEG

**NEW! ENGRAVED
Vinylite
INSPECTION
STAMPS**
**Are better than rubber
3 ways**

ENGRAVED Vinylite IS ACID-PROOF

Acid etching inks, used for permanent stamping on metal and all non-porous surfaces will eat away at rubber. Vinylite resists this action—gives longer life by far!

**ENGRAVED Vinylite STAMPING
GIVES RAZOR-SHARP
IMPRESSIONS EVERY TIME**

Opaque inks will clog shallow rubber stamp faces rapidly. Our deep-molded engraved VINYLITE stamp faces have more than three times the depth of ordinary rubber stamps. Markings always remain super sharp . . . an important advantage since this mark is a permanent record of your inspector's approval.

**ENGRAVED Vinylite HAS CUSHION-
LIKE RESILIENCE**

Our VINYLITE molding process includes a timed curing that imparts to this versatile plastic all the elasticity of rubber. Resilient VINYLITE resists abrasive action, conforms to irregular surfaces . . . and lasts much longer!

Engraved Vinylite stamp faces are adaptable to any marking device. They can be used to stamp on every surface, metal, wood, fabric, paper, plastic, etc.

Contains thousands of trade names of electronic and applied products—the most comprehensive trade name lists ever compiled in this industry. Makes it as easy as A-B-C to find the manufacturer when you know only the trade name.

Why Corning High-Temperature Film-Type Resistors

*are more rugged,
more stable*

The answer lies in the way we make them. The base material is a special heat-resistant glass that not only has excellent temperature and electrical characteristics but is tough enough to withstand real abuse.

The film material, too, is entirely new for resistors. Fired in at red heat, it becomes an integral part of the glass form. And it's so stable it can be cycled from near absolute zero to red heat with little effect in its electrical properties.

Silver bands are fired in for terminations that have low resistance and low noise characteristics. And silver plated end caps are expansion fitted over the silver terminations to give a silver-to-silver contact that is both electrically and mechanically sound.

Then, a silicone varnish is baked onto the resistor which completely reduces the risk of entrapped moisture, gives better protection against external moisture and humidity and abrasion. The unit can be rubbed with a nail file without materially affecting its electrical characteristics.

It all adds up to this. If you want a high-temperature resistor that's electrically stable, mechanically rugged, then investigate CORNING Type S Resistors. They can be operated at ambient temperatures up to 200°C. and at higher power levels to save space. The thin film construction and inherent stability provide excellent high-frequency characteristics. Normal resistance tolerance is 2%.

NEW LOW PRICES

We've recently made a radical reduction in prices for Corning High-Temperature Resistors. Now you can use them in applications where price was previously prohibitive.

NEW X-78

PNP Power Junction Transistor

Transistor Products, Inc., now offers the first commercially available Power Junction Transistor. Specifically designed for use in Class B audio circuits requiring two watts of power output, it can also be used as a Class A amplifier at reduced ratings.

The X-78 Power Junction Transistor features maximum protection from humidity. This is accomplished by encapsulation of the transistor in a miniature cylindrical casting of a specially developed plastic.

The leads connecting the base and the emitter protrude from the top of the small cylinder. The transistor is mounted with its collector fastened to a copper strip which serves as both a "U" shaped support and as a heat sink connection.

For data sheets and complete information on this power transistor and other CLEVITE transistors, diodes and transistor test sets, write Dept. T3.

James B. Tharpe heads the TV transmitter department of the Allen B. DuMont Laboratories, Inc., Clifton, N.J. An operating arm of the new Communication Products Div., the department will be headed by Mr. Tharpe as national sales manager. Assisting him in the new setup will be **Charles E. Spicer**, sales operations manager; **Lewis C. Radford**, Eastern district manager; **Herb Bloomberg**, Central district manager; **Robert J. Myers**, Western district manager, and **Thomas B. Moseley**, Southern district manager. **Fred M. Link**, former president of Link Radio

Fred M. Link

Corp., was recently appointed director of operations of the company's newly-formed Mobile Communications Products Div. and will supervise system design and distribution of Du Mont's two-way mobile radio communications systems.

Charles F. Stromeier, former executive vice-president of CBS-Hytron Columbia Broadcasting System, Inc., tube manufacturing division, Danvers, Mass., has been named president to succeed **Bruce A. Coffin** who has retired as president but will retain his membership on the CBS, Inc. board, as will **Lloyd H. Coffin** whose retirement as treasurer of CBS-Hytron was announced simultaneously. **Dr. Peter C. Goldmark**, who joined CBS in 1936, has been made president of CBS Laboratories, Engineering Research and Development division of CBS, Inc. He has been vice-president of the division since 1950.

Robert G. Bach, formerly in charge of TV sale and advertising for Federal Telecommunication Laboratories, has been appointed assistant sales and advertising manager of Fairchild Recording Equipment Co., Whitestone, Long Island, N.Y. He served as administrative assistant to the director of the Columbia Radiation Laboratory from 1946 to 1950.

THE "Field-Proved" STANDARD
IN COMMUNICATIONS . . .

INTRODUCES A NEW

TELEPHONE HANDSET

...the first Handset specially
engineered for two-way
communications

- 2-Way Radio Communications
- Inter-Com Systems
- Airplane Announce Systems
- P. A. Systems

Specially Designed to Suit Your Specific Applications

Here is a truly modern functional handset specifically designed for 2-way communications! A product of the Shure Laboratories with many years of experience in safety mobile communications, the TH10 Handset brings you these features: . . . the field-proved *controlled reluctance* assembly as a receiver . . . high output *balanced response* carbon transmitter . . . oversize switch chamber providing flexibility in stacking of famous Shure long-life leaf blades . . . handle provides for maximum number of conductors . . . solderless connections for rapid servicing . . . rugged shock resistant handle . . . design smart to the eye, natural in the hand.

The answer to your complex circuitry!

SALES DIVISION
SHURE BROTHERS, Inc.
Manufacturers of Microphones & Acoustic Devices
225 W. HURON ST., CHICAGO 10, ILL.
Cable Address: SHUREMICRO

(Continued from page 202)

John Jipp, former West Coast parts and service depot manager and Southwestern regional sales manager for Motorola, Inc., has joined Ampex Corp., Redwood City, Calif., as manager for instrumentation recorder sales.

D. W. Gunn has been appointed general sales manager of electronic products, Sylvania Electric Products Inc., New York, N. Y. He will be responsible for the sales of the products of the radio tube, TV picture tube, and electronics division. Mr. Gunn has been a member of the Sylvania organization since 1931.

Willis Linn has been appointed to the newly created position of West Coast electronics sales engineer for the Electrical Products Div. of Corning Glass

Willis Linn

Works. In his new position, Mr. Linn will maintain headquarters in Corning, N. Y., but will cover 11 states along the West Coast and in the Rocky Mountain area.

Jay M. Allen, works manager of the Sunbury, Pa., TV-Radio plant, has been appointed assistant manager of operations for the Westinghouse TV-Radio Division headquarters at Metuchen, N.J. Mr. Allen will supervise manufacturing operations at the Sunbury and the local Headquarters plants.

Lynn Eaton has been made vice-president of National Company, Inc., Malden and Melrose, Mass. He will supervise both foreign and domestic sales activities, advertising, promotion, and market surveys. C. G. Barker, one of the founders of Magnecord, Inc., and former vice-president in charge of sales and president of Magnecord International, Ltd. and Magnecord Western Hemisphere, has been named distribution manager of National Company Inc. where he will direct the company's representatives and establish basic distribution policies.

Now — HIGH LINEARITY POTENTIOMETERS

3/8" - 1" - 2" DIAMETERS

Precision Wire Wound For Better Performance

1. Low Temp. Coeff. Windings
2. Precious Alloy Contacts
3. Aluminum Alloy Bodies
4. Rugged Terminals
5. Max. Rotational Life
6. Environment Proof

Minimum diameters — dual, triple or quadruple assemblies with independent phasing and optional mounting provisions.

DAVEN TURNS TO AIR

in a completely new approach

to the production of Encapsulated Seald-Ohm Wire Wound Resistors

Only DAVEN turns to air to keep the molding material absolutely separated from the resistance wire in its new line of Super Davohm Encapsulated Seald-Ohm Resistors. The wire is maintained in a slot filled with dry air . . . no external pressures are applied to it. These air pockets, between the wire and the plastic coating, guarantee absolute stability . . . eliminate shorted turns.

Only DAVEN matches the temperature coefficient of expansion of the molding compound with the ceramic bobbin, the resistance wire and the metal terminals. This removes the possibility of cracks or strains on the wire during cycling.

Because of the special construction used, Daven can furnish Encapsulated Wire Wound Resistors with temperature

coefficients below ± 20 P.P.M./ $^{\circ}$ C. when required, and with accuracies to $\pm .05\%$.

These exclusive Daven precision, wire wound resistors are completely hermetically sealed . . . yet are no larger than standard lug-type resistors.

In addition, these units are made in accordance with MIL-R-93A specifications, and are substantially more rugged than conventional resistors. They will withstand the JAN-R-93, characteristic A, salt-water immersion test, and, in addition, temperature cycling from -65° C. to $+125^{\circ}$ C. The strong molding material will resist pressures equivalent to 75,000 ft. altitude, and will not cold flow at temperatures up to 150° C.

WORLD'S LARGEST MANUFACTURERS OF ATTENUATORS

READY ... for **COLOR TV!**

RCA technical leadership in compatible electronic color television is the product of a decade of intensive research, and unequalled engineering and manufacturing experience. Today, RCA's mass-production facilities are turning out tricolor picture tubes, receiving tubes, and deflection components to meet the growing needs of industry.

Now, RCA-15GP22 tricolor kinescopes are coming off the production lines...

Now, to supplement its other receiving tubes applicable to color television, RCA has developed three brand-new types specifically for color

circuits; RCA-6AN8, RCA-3A3, and RCA-6BD4. With these additions, RCA offers a complete tube complement for color TV...

Now, RCA is producing the basic components for the high-voltage supply and deflection circuits of the RCA tricolor tube. Each is specially designed to provide optimum performance.

If you are getting into color circuitry, take advantage of RCA's integrated line of units—engineered specifically for color television. For information, write RCA, Commercial Engineering, Section C50Q, or contact your nearest RCA Field Office.
