GAMBLING: In Law. Contracts by way of gaming or wagering are not enforceable at law. Cheques and other securities given for gaming debta may be stopped or recovered from the person to whom they are given. But if a cheque has been paid the money cannot be recovered : and if a cheque or security comes into the hands of an innocent party the latter can recover on it. If an agent is employed to make bets and he pays any bets lost for his principal, the latter is not liable to repay him, even though he expressly requested him to pay the winner.

Money lent to pay a betting or gaming debt is not recoverable at law. If A owes B a gaming debt. and $\mathbf{B}$ threatens to do something which will bring $A$ into disgrace unless he pays, and A promises that if $\mathbf{B}$ will hold his hand for. say, a month he will then pay him, and 13 agrees to do this, then A must pay at the end of the month. This is bccause the law regards the forbearance as a fresh consideration. If a betting agent wins for his principal and receives the money from the loser, he is bound to pay the money over to that principal

It is a criminal offence to send a betting circular to a person under 21. It is also a criminal offence to keep a house or place for the purpose of betting with persons resorting thereto. A house kept as a gambling house is a disorderly house, and both the kceper and the frequenters are liable to penalties. If both parties to a bet deposit the money with a stakeholder, the loser may demand his money back before the stakeholder has actually paid it to the winner.

GAMBOGE. This is a reddish-yellow gum resin that acts as a powerful cathartic, producing copious watery motions. It is therefore useful for ridding the body of fluid in dropsy, and may also relieve chronic constipation. It is generally used combined with other drugs in the compound pill of gamboge, but it should not be used except on medical advice.

## GAME : Choice and Cooking

 choosing game, select birds with firm, thick breasts, smooth legs, short spurs and quill feathers, and feet that are supple and easily broken. The time required for hanging depends upon the weather, the individual tastes of the person for whom the game is being prepared, and also upon the particular type of game concerned. Waterfowl, snipe, and woodcock, for instance, should be cooked while fresh, but most other kinds of game may be hung from between 5 and 10 days, and in some cases for a full fortnight. In damp weather 5 days will probably be found suflicient unless the birds arc liked high, while game that is bruised or damaged in any way shou!d be cooked as early as possible.Hang the birds, unplucked and undrawn and with a piece of string tied tightly round the neck, in a place where there is a constant curient of fresh air, and examine them carefully each day. If there arc any signs of taint, wash the bird in a strong solution of salt and water to which a little vinegar has been added, and then rinse it in clean, fresh water. When plucking game be careful not to break the skin, and before cooking wipe it inside and out with a cloth wrung out with hot water. Snipe, woodcock, and plover, however, should never be drawn.

Roasting is the most satisfactory way of cooking most young game. To roast, pluck, clean, and truss the birds, tying a slice of fat bacon over the breast of each. Cook them before a clear fire or in a hot oven, the time depending on the kind of bird, keeping them well basted with butter or good dripping. If the bird has been hanging for a long time, it will require to be cooked thoroughly. Ten minutes before the game is cooked remove the slices of bacon, dredge with flour, baste thoroughly and return to the fire or oven to brown well. Ilace two or three slices of buttered toast under the birds so that any gravy which drips from them may be absorbed. Then lay the slices of toast on a hot dish, place the birds on them, and garnish the dish with sprigs of watercress. Hot gravy, bread sauce, and fried potatoes and breadcrumbs should be served as an accompaniment.

Game Cutlet. Prepare by melting 1 oz . of butter in a pan over the fire, adding to it $\frac{1}{2}$ oz Hour and $\frac{1}{2}$ teaspoonful chopped shallot, and frying these a light brown. Then pour in 1 gill stock, and stir the sauce until it boils. Add $\frac{1}{2} \mathrm{lb}$. chopped game. free from bone, 2 oz . chopped ham, 1 teaspoonfu! red-currant jelly, $\frac{1}{2}$ teaspoonful lemon juice, and the beaten yolk of an egg. Stir the mixture, but do not let it boil or the egg will curdle. Season it carefully and turn it on to a plate to cool.

Next shape it into neat cutlets, roll these in breadcrumbs, then brush them over with beaten egg and again cuat them with crumbs. Have ready a pan of hot fat, put in the cutlets, one or two at a time, and fry a golden brown.

Game Kromeskie. Mince finely $\frac{1}{2} \mathrm{lb}$ game, 2 oz . ham, and 8 mushrooms. Melt 1 oz . butter in a small pan, and in it fry 2 small chopped onions, browning them as little as possible. Add these to the ganne, etc., mix all well together, and season to taste, using enough brown sauce to bind it well. Turn the mixture on to a plate to cool, and then cut some fat bacon into thin slices about 3 in. square.

Put some of the cold game mixture on each slice, roll these into cork shapes, and fasten the
ends with match-sticks or small skewers. Dip the kromeskies into frying batter, drop them into boiling fat, and fry them a golden brown, finally draining them on soft paper and garnishing them with fried parsley.

Game Pie. A raised game pie is best eaten cold. Instructions for making the psustry are given under the heading Pastry. Chop up fincly 1 lb . each of veal and pork, and season them well with salt and pepper and grated nutmeg. Put a layer of this meat all round inside the pastry, and fill in the centre with strips of raw game of any kind. A mixture of different kinds such as grousc, partridge, hare. and pheasant may be used if liked.
The bones should first of all be removed, put into a pan containing cold salted water and a small onion, and left to simmar for about 1 hour. This will provide the stock. In layers with the game put 2 tablespoonfuls of chopped truffles, the same quantity of chopped mushrooms, and 2 teaspoonfuls of chopped parsley. Cover these layers with some more of the veal and pork mixture, brush the edges of the pastry with a little cold water, and roll out the remainder of the pastry to form a lid. Make a hole in the centre.

Brush this lid over with a little beaten egg, and tie a greased band of paper round the mould to reach 3 or 4 in . above the top. Bake the pie in a moderate oven for $3 \frac{1}{2}-1$ hours, then take it out of the mould, and leave it to get nearly cold. Melt a little aspic jelly, add it to $\frac{3}{3}$ pint of the stock, and strain these into the pie and leave it to grow cold.

Game Pudding. Cooked in the following way, old game can be made quite tender: Cut a brace of birds into small joints, and chop up the hearts and livers. Skin 1 lb . of sausages, roll the meat into balls, cach about the size of a large inarble, and stalk and peel $\frac{1}{2} \mathrm{lb}$. of mushrooms. Make some suet pastry, using $\$ \mathrm{lb}$. of tlour, 6 oz . of chopped suet, a teaspoonful of baking.jowder, a small teaspoonful of salt, and water to mix. Cut off a third of the pastry for the lid, roll out the remainder, and with it line a well-greased pudding-basin. Fill this with pieces of bird, sausage balls, and mushrooms, then pour in enough scasoned stock to reach three-quarters of the way up the basin. Wet the edges of the pastry, cover the pudding with the remaining piece rolled out to fit the top, and then press the edges together. Tie a clean pudding-cloth over the top, put the basin into a saucepan of boiling water, and boil its contents for at least 2 h hours.

Game Saimi. For a game salmi, first of all roast the birds, and then cut them into joints about the size of the wing of a partridge. Lay the joints on one side while the sance is being prepared. The drumsticks should be cut off quite close to the flesh of the log, and put with the trimmings, broken small, into a stewpan, with a slice of fat bacon, an onion, or 3 shallots, prepared and chopped fine, 1 oz of butter, and a bay leaf tied up with a sprig of parsley.

Fry this briskly for 5 min ., then pour over it 1 pint of good Havoured brown stock and a gless of sherry ; 3 or 4 mushrooms, prepared and cut fine, are an improvement. Season and boil the stock until the liquor is reduced by one-half, then stir in $\frac{1}{2}$ pint of brown sauce. Let it simmer for $\frac{1}{2}$ hour, skimming off the fat as it rises, then strain it and add a piece of butter the size of a large nut, and a teaspoonful of lemon juice.

Heat the game thoroughly in the sauce without allowing it to boil. Arrange the pieces on a dish in the form of a pyramid, and pour the salmi sauce over and round it. Garnish with crouttons of fried bread and button mushrooms cooked in butter. See Bread Sauce; Grouse: Gun; Hare; Paitridge; Pheasant, Wild Duck; Woodcock, etc.

GAME FOWL. Originally renowned for its fighting prowess and now for its unique tablequalities, this is one of the most popular of our domestic fowls. It lays a fair-sized

Game Fown. Cockered of one of the most po,ular domestic breeds

Courtesy of The Poullry World

Sometimes it grows no larger and causes no inconvenience. Generally, however, it gradually enlarges and may cause weakness of the wrist. Usually the only satisfactory treatment is by operation.

A more serious condition, compound palmar ganglion, results from tuberculous infection of tendon sheaths. Pron Gang-gle-on

GANGRENE. This means the death of a portion of the body tiesues of some considerable sizc. There are two main varieties: dry gangrene, in which there is little fluid in the tissucs and the part becomes dry, hard, shrunken and black; and moist gangrene, in which the affected part is swollen with lluid and is putrescent

GAPES. A diseare peculiar to young chicliens, gapes arises from the presence of a gape worms in the windpipe. These cause
the chickens to open their months as if gaping, and if not removed in time will result in death by suffocation. The worms can generally be disindged by dinping a long, soft feather in turpentine, gently inserting it into the windpipe, and twisting it round, and then withdrawing it, when the worms will be coughed up by the chicken

Thorough disinfection of soil, conps, and runs must be resorted to whenever an outbreak of gapes occurs. The plan usually adopted for cleaning the land is to lime it thornughly and let it lie fallow for two years at least See Chicken : Poultry.
GAPING. Due to a lack of oxygen in the blood, gaping may result from fatigue or from sitting in a stuffy roum. Gaping is common symptom in persons who suffer from chronic lung trouble.

## Garages and Their Construction

## Housing Large Cars, Small Cars and Motor Cycles

By following the instructlons givent.e!ow the motorist who is handy with a carpenter's toals can easily erect a garage to suit his requirement; Consult the articles Amateur Carpentry: Asbestos: Cement; Door; Wea herboard, ctc. Sec also Bicvele Shed

A garage is a necessity to very many householders, for the requirements of mudern life demand the use of a motor vehicle, and even if this be nothing more than a motor-cycle or a side-car combination, it is desirable to house it in a sound. dry building.

Suitable materials of construction are numemus. In brick districts the use of the chenpest grade of brick might prove most economical: where gravel abounds, the walls could be put up in concrete at small cost. There is a wide choice of timber structures, and suitable asbestos and other building boards.

The motor-cycle and side-car garage shown in Fig. 1 is made on $n$ timber framework covered with asbestos sheeta nad roofed with galvanized iron. It is highly desirable to fix the dimensions of the building so that the sheets can be used in their stock sizes. Cutting them is $n$ tedions business, and there is the risk of breaking the sheets; the sizes available can bo ascertained from the makers or from the builder's merchants

The first thing to do is to prepare a plan of the site and of the building, and to mark the leading dimensions, sumething in the manner of Figs I to 7. The side (Fig. 2) and end frames (Figs 3 and 4) are then made up from 2 in. square deal, halved at the corners, and well nailed together at these and all joints. Cross braces are cssential to provide the requisite stiffiness, as the asbestos sheets look to the frame for their support, and do not support the frame to nny great extent, as is the case when timber is used.

The floor (Fig. 6j) is prepared by nailing 1 in . tongued and grooved boards 10 3 in. by 2 im . joists, the underside being treated with creossote or some other prescrvative The site is cleared of top soil, and nine little piers of brick or stone placed as shown in Fig. 6 so that they will support the sleeper plates, which are of 4 in by 2 in . deal. The sleeper plates should be creosoted, and held in place by pegs driven into the ground to keep them from shifting while

Garage. Fig. 1. Garage for motor cycle and side-car. Constructional drawings are given in the next pare
the floor is placed in position upon them. The Hoor could be laid in cement concrete but in this case the expense is considerably greater

Having placed the floor in position, the walls are erccted by setting up one side frame, and supporting it temporarily with a cross batten. The end frame is ret up and the corners bolted together The walls must be plumbed up true with a plumb bob, and the angle set square, testing this with a large straight edge and a large set square or by the 3.4.5. angle system This is done by measuring a distance of 3 fl along the end wall from the corner, and measuring along the side wall a distance of 4 ft . Mark thesa placea by driving nails into the frames at the exact spots, and when the distance acruss the angle between them is 5 ft , the corner of the building is square. Adjust the wall frames until the corner is squarc and then fix them to the Hoor with two bolts in each section putting them through the joists. The other side and end frames are then erected, and all corners bolted up tightly

The ridge board is fixed in position, and the walls covered by nailing the ashestos sheets to the framing. the uprights for the latter having been spaced so that the jointe between the shects come on one of the frames. The hottom of the shcets should come just below the bottons of the floor to prutect it from the weather and to allow the water that runs down the walls to drip away and not accumulate under the building. This is one of the reasons for the sleeper plates, as they raisc the lloor above ground level. The top surfaces of the slceper plates are improved by nailing a strip of stout roofing felt, or preferably $n$ bituminous damp course, to prevent the damp rising from the ground. Free circulation of air under the floor is ossential.

The roof is $n$ simple inatter when corrugnted iron is used, as the sheets have only to be nailed to the ridge and to the plates or to the top of the wall frames If preferred, it can le made with
hoards and covered with a good quality roof. ing felt or imitation roofing tiles. The interior is all the hetter for a lining of thin matchboard or $3 \cdot \mathrm{ply}$ wood. hut this is not ahsolutely essential. The gable ends are covered with weatherboard, as this is easier to fit than cutting the asbestos sheets. All cornery and the joints between the sheets are covered with vertical strips of wond nbout 4 in . wide and $\frac{1}{2}$ in thick as shown in Fig 7. The doors (Fig ${ }^{2}$ ) are made of matchboard, ledged with 4 by 1 in. deal, and hraced with the same material, provided with a bolt and a stout padlock and hasp.

The whole of the exterior woodwork is creosoted, and the ronf coloured with a dark red paint ; this had better be done after the building has been erceted, as the sheets will have mellowed and will take the paint hetter. The interior can be lined with matchboard or 3 -ply wood ; but if this is not done, a skirting hoard and a striking board should be nailed to the walls to take the thrust of the wheels when the machine is pushed in. An exterior ramp or sloping approach must be made and fixed in place to enable the machine to be pushed in without trouble; these boards should have an casy slope, and he supported on wedge-shaped blocks.

Weatherboarded Garage. For housing the average car a garage of the size given in Figs. 8 to 12 is ample. It mensures about 14 ft .6 in long by about 7 ft .6 in . inside.
nid has a head elcarance of 6 ft. 4 in. Belore starting to build, however. it is a wise precaution not only to measure up the car, but to consider whether a larger car is likely to be purchased

The building consists virtually of four frameworlis forming the walls and a roofing. The frames are made up from 3 in . by 2 in stuff and are covered with weatherboard Each side is made up as a complete unit in itself. and all four are fixed logether with bolts afterwards. This makes the whole collapaible, a great convenience if it is desired to move at any time, and simplifies the crection

Figs. 9, 10 and 11 . give the sides, back and door ends respectively Cut off the various parts to length, taking care to make each set of parts the same length. A simple form of joint to use is the halved joint: all parta can then be cut off to the overall size and the joint marked out with a gauge. When nailing the frames together test carefully for squareness A good micthod of doing this is to pince a lath of wood diagonally across the whole and mark the length. When put into the opposite corners it should show the same length. The diagonal struts shown in Fig ? are added afterwards

The two ends are made in the same way cxcept that the sloping top part is added after the main square part has been put together. Here again the joints are halved, except at the ends of the top sloping members,

Garage : How to construc! the garage for a motor cycle and side-car shown in the previous page,
Fig. 2. Side frame. Fig. 3. Rear end frame. Fig. 4. Front end frame. Fig. 5. Doors, shown Fig. 2. Side frame. Fig. 3. Rear end frame. Fig. 4. Front end frame. Fig. 5. Doors, shown
irom both outside and inside. Fig. 6. Plan of foor. Fig. 7. Details of corner, showing coverbosrds
which are simply bevelled at the underside and nailed down.

Erecting the Garage. The type of flooring the garage is to have must first be determined Concrete is much used nowadays, and has the adzantage of forming a founda. tion for the whole. If this is used channels must he formed in it th allow the hottom members of the walls to sink in so that there is no projection beneath the door A ranip can be formed outside as shown in Fig. 8.

Assistance is necessary when fixing the walls together. They are hell by handscrews. and bolt holes are bured through the joining uprights. Pass the bolts in from the outside. and put washers heneath the nuts. It will be noticed from Fig. 9 that an extra sloping roof piece is fixed at the centro. When this has been added a series of long pieces known as purlins are nailed down on to the sloping pieces, as shown in Fig. 12. These are to take the roof boarda. The last named should preferably be tongued and grooved. Note that the top ends must be cut off at an angle so that there is a good ridge joint. It is a good plan to cut off one hoard to length, and then cutall the others to it.

The roofing felt is laid on in long strips running from side to side without a join at the top. At the joints an overlap of about 2 in . should he allowed. To make these waterproof use the special cement supplied by the makers. Clout nails are used to fix the felt, and hattens of 2 in . by $\frac{1}{2}$ in stuff are nailed down over the joints. When cutting the felt to length an extra allowance of about 2 in . should be minde so that it can he turned up undeineath at the edges.

Fig. 13 shows how the weatherboarding should be fixed. It is added from the hotton upwards, and the nails are driven thmugh the overlap, as shown. Note that the boarding at the sides reaches only to the ends of the side frames. A batten fixod to the edges of the front and back frames has the effect of hiding the ends of the boarding. The decorative battens above the doors are nailed direct over the boarding.

An ordinary casement window framing is made for one side. The framing is serewed or nailed to the sides, and the casements hinged to them. For the doors use tongued and grooved hoards secured by a series of cross picese. Diagonal hraces should be added to prevent the whole from sagging. All timber should be croosoted to make it durable. For a good job rebated or matched weatherloard could be used, which would present a flush inside surface.

Garage in Asbestos Board. A soniewhat lighter garage suitable for the " baby" type of ear is given in Fig. 14. The main frame. work is similar to that in Fig. 8, but the walls are covered with ashestos hoard instead of weatherboarding. Apart from the size of the car it is to shelter, and the space a vailable for it, one should consider the sizes of asbestos board available before starting on the framework. Otherwise, there may be a good deal of unnecessary waste and lahour. The boards are in long panels fixed upright, and the framework has to he so made that the framework uprights coincide with the vertical joints in the boards.
A side framework is given in Fig. 15 This allows for panels 2 ft . wide. If the long sides are made to suit the ashestos boards, the two ends (Figs. 16 and 17) can be made any convenient size, for in-any casc there is a fair amount of trimming to be done here. A fixed uindow is provided nt the back. The frame. work for this is made up complete in itself and is lixed in the space for it after the whole job has heen erected.

Having completed the four frames for the sides and ends (the joints are halved as before),

is connected by telephone with the onner's house, the delay in summoning the car will the slight.

Safety Precautions. The re gulations known as "Statutory Rules and Orders, I929," relating to the storage and usn of petrolcum spiril affect the garage owner. Every private garage or other building in which petrol is stored, whether it is contained in the usual two-gallon cans or in the lank of the car or mntor cycle, must mect with certain requirements.
It must he effectively ventilated: it must have an entrance direct from the open air: it must he separated from adjacent buildings or from other rooms in the same building by fireproof floors or partitions: and suitable fire extinguishing a pparatus must be kept in tho storage place or as near to it as is reasonably practicable. Tho extinguisher carried on the car complies with this last requrement. As an alternative to a fire extinguisher. a supply of sand or other offective means such as loose fine cartli-may be kept in a pail ready for use, but annd and carth are much less effective than a chemical fire extinguisher. Water should not he used on any account. sinec both oil and petrol float on top of the water, which will therefore merely assist in spreading the flames.

If any petroleum spirit is kept in the garage. other than that in the tank of the ear, it should always be contained in the proper screw. stoppered cans and must not be left in on
they are crected in position and holted together. 10s. n week They are often built in Either a concrete foundation can he madc, connexion with a puhlic garago, or or stout wooden slecpers can be laid down petrol filling station

Alternatively. bricks can be sct out and the garage mounted upon these. If concrete is not used for the flooring. a framework with boards laid across it must be made up. In size this should just lit inside the walls, and is lain in position hefore the walls are erocted.
large clout naila are used to fix the asbestos board. Fix the whole in position, trimming them where necessary with an old handsaw. A series of battens of 2 in . by $\frac{1}{2} \mathrm{in}$. stuff can be fixed over all the joints (Fig. 18). These give a decorative touch. It is advisable to stain them liefore fixing. The roof can be made similarly to that in Fig. 8

Ledged and braced doors mado up with tongued and grooved boards are hinged with strap hinges at the open end. A covering strip is nailed down over the right hand door. The ramp can be a series of stout boards nailed down on to three tapering cross pieces.

Numerous by lawe of local authorities contmol the buidding of garagea, and in particular the materials of which they may be constructed and their distance from the public strect or other build ing. Building a garage usually increnses the rate. able value of the premises.

Hiring a Garage. Some motor car owners, such ns those who live in flats, possess neither a garage nor the ground on which to erect one. To these owncrs two courses are open. They can either hire a garage or can keep the car at a public one.

In large citien many lockup garages have been erected, with rents usually in the neighbourhood of

In public garages the charge is so much per week or per month. but this method will be found more cxpensive than building or hiring a lockup one. It has, however, some advan tages, one being that the requirements for repairs of all kinds are on the spot Moreorcr, since it

open vessel. The greatest care must always be taken to avoid any fire or naked light hicing so near any vessel in which the petrol is kept as to he dangerous. It should be remembered that cven a particle of red ash dropped from a cigarette inay cause a fire when filling the car tank.

The fumes from the cxhaust of a motor vehicle may contain the highly poisonous gas known Rs carbon monoxide, produced by imperfect combustion of petrol in the engines.

If the engine is allowed to run while the car is standing in the garage, the exhnust should be ionnected to the outer air so that the dangerous fumes do not escupe into the building. $A$ surther precaution is to open doors or windows in order to ventitate the gurage thoroughly.

## Gardens and How They Are Planned

## How to Lay Out a Town or Suburban Plot

Here are given threc ways of arranging a small garden, together with a plan for a large one Further information appears under the headings Dutch Garden: Flower Garden and Kitchen Garden. Consult also the succeeding artleles Gardener: Garden Furniture; and Gardening; those on Crazy Paving; Dirging: Fence, Fixtures; Greenhouse; cle., and, in addition, entries under the names of individual Howers and vegetables

Planning is garden must be done with $36 \times 5$ ft, $31 \times 4 f$. and $18 \times 2$ ft., after method, otherwise mistakes will happen which wards pegging out the narrow edging for may entail much labour To lay down ferns and iris against the house. Next hard and last rules is not practicable, rince mark out a rectangle for lawn and rose one garden may differ entirely from another beds measuring $32 \times 18 \mathrm{ft}$., which will leave

This article does not cater for those who are three fontpaths well defined as shown in the fortunate enough to posscss a large position plan. The rose-beds $A$ and $B$ mensure $u m i d i d e a l$ surroundings, but for those whose $21 \times 4 \mathrm{ft}$. and $15 \times 4 \mathrm{ft}$. The skeleton of the p!casance is limited to the rectangular plot in town and suburb. The maker of auch a garden is usually confronted with a rectangle of ground encosed by bare wooden fences With a sheet of paper acctionally rulerl, some wourlen pegs and string, and ordinary intelligence, the novice may achieve success with his garden.

For the purposes of illustration a plot of old meadow land is assumed to be the site avail. able, and its measurements are $68 \times 30 \mathrm{ft}$., a good average size. The requirements are space for flowers, roses, vegetables, a lawn. and, if possible, a little fruit, grown within the limitations defined. With this purpose in view three plots are dealt with, each precisely the same size, but differing in aspect. the respective plots facing approximintely north, south, and east.

Fig I deals with a plot of the measurements mentioned : it bas a northerly aspect when faced from the back of the house, shown by the darkly shaded portion at the bottom of the plan. The first operation may be to locate and erect the trellis about 41 ft . from the house, dividing the llower garden apace from that to be devoted to vegetables and fruit: this is shown by the irregular sharled line running between the arch ( $B$ ) and the small summer-house (C).

It is then advisable to take atring and pegs and mark out the borders $A, B$, and $C$, their respective length and width being

Garden. Sanken rarden, with grass and crazy paring, that centres round a llttle lily pond Above, walled formal garden, with paved paths and square beds filied with tall tulips, a different colonr in each bed
mny proceed by following the advice on digging, path making, and lawns, given under their respective headings
The space fot vegetables is necessarily small, hut most amateur pardeners like to raise a fow fresh vegetables for the bousehold in addition to cultivating flowers, and therefore it will give adder interest, as well as some profit. to the general scheme The diagram is almost self-explanatory, the fences being fronted with a bed of rhuharb, a $12 \times 6 \mathrm{ft}$ cool greenhouse $A$, the space allowed being devoted to a storing shed if preferred, a frame $6 \times 4 \mathrm{ft}$, a row of sweet picas $18 \times 4 \mathrm{ft}$, ample room for loganberries, and a bush apple $B$ A path 3 ft . wide divides these from the centre p!ot. and leads directly from

the main path of the flower garden to the greenhouse.

It is suggested that cordon fruit trecs C , nid a second bush npple $D$, be planted as shown in the sketch, leaving the remainder of the space for vegetables Quite a useful crop of such vegetables as carrots, turnips, salads, etc., can be grown here, but, if preferred, raspberries, currants, and gooseberries may be planted instead. Potatoes would be prolitable during the first scason, as these break up new ground admirably Whatever is chosen should be planted or sown diagonally.

In Fig. 2 the plot is identical in size with that in Jig. 1, but the house faces due south instead of north. This difference in aspect naturally requires a different layout. and the suggested remodelling is shown in the diagram
'I'he main border $A$ is now placed on the eastern side, not the side with the eastern aspect, which is a very different thing, continuing squarely to the arch $B$, which leads to the vegetable garden. The path also is transferred to the same side of the plot, the house end enclosing a bed about $10 \times 6 \mathrm{ft}$., which may well be devoted to dwarf ruses, with perhaps a wceping standard in the position shown. Standard roses on the lawn to run parallel with the path would he $n$ pleasing arrangeinent. The dimensions of the laivn are $26 \times 18 \mathrm{ft}$., and flowering trees or shrubs may be planted with excellent effect at C C.
The greenhouse proposed in Fig. 1 is trans. posed against the dwelling house, and it is suggested that instead a conservatory would be an agreeable adjunct to the drawing room.

In the portion reserved for vegctables and small fruits, dimensions $27 \times 17 \mathrm{ft}$., a shed is conveniently placed at $D$, while the frame is placed in a more suitable position at E . The trellis screen is now 43 ft from the bouse, whilst the sizes of the various heds and borders are: A, $38 \times 5 \mathrm{ft}$. F, $38 \times 4 \mathrm{ft}$. : G, $14 \times 3 \mathrm{ft}$. and H , $16 \times 3 \mathrm{ft}$. Bush fruits of various kinds may be planted at J J .
In Fig. 3 an aspect facing due east adds to planning difficulties by reason of the southern side of the garden facing direct north. The diagram, however, makes suggestions which may overcome the drawbacks of nspect Naturally heds should be confined to the north side, suitable climbers heing planted to cover the southern fence as delined in the sketch. The trellis screen and arches A A A are 40 ft . from the house, the length of the main border $\mathbf{B}$ being 36 ft .

The bed $C$ is 43 ft . from point to point, and is about double width at the house end. Bed V may be $14 \times 3 \mathrm{ft}$., and border E $19 \times 3 \mathrm{ft}$. Shrubs may be planted at $F \mathbf{F}$. and standard roses at G G G. The vegetable plot is $30 \times 24 \mathrm{ft}$., and positions are given to a greenhouse or shed at H , and frame J . There is also room for a Howering tree, a loganberry against the bottom fence, and a morello cherry against the fence facing due north. Burders which have a north aspect are often a suurce of trouble and disappointment in small gardens, but the natural shortcomings of such a position may in great part be overcome by judicious attention to suitable plants. Ruses recommended are Dundee rambler, Bennett's seedling. Gloire de beink due to difference in aspect. In Fig. 1 the aspect is north, while in Fig. 2 it is south

A number of hardy plants that will grow successfully in such a pusition include columbincs, various campaunlas, lily of the va!!cy, day lilics, irises, Michaelmas daisics, herbaceous phlox, montbretias, golden rod, spiraeas, Solomon's scal and meadow rue, with ed ging plants of polyanthus, London pride and mossy saxifrages. The soil in a nurth border should always be well dug, and tendency to sourness dissipated by the free use of lime. Amongst shrubs the flowering currant and laurustinus will be found useful.
In Fig. 4 the lay-out of a more extensive plot is dealt with, its measurements being about 154 ft . by 119 ft . This design gives the foundation of a charming garden, whioh is adaptable to any aspect, and sufficiently elastio to allow for alteration according to individual fancy.
Garden Law. Every man is under an obliga. tion to use his property so as not to injure that of his neighbour, and this legal maxim applies as much to the garden ns to the house Most people who have a garden devote more or less attention to its cultivation, although they are not actually bound to do so unless there is a olause to that elfect in their agree. ment in the casc of tenants. But they render themselves lisble to be sued for damages if negligence on their part results in injury to adjoining property. Thus if a drain is not kept in proper repair, and it overflows and works havoc in a well-cultivated garden adjoining, the neighbour will be entitled to compensation.

On the other hand, if the owner of the drain can prove that the flooding was caused by a violent downpour of rain and not through any negligence on his purt. then he can escape

Fig. 3. Another method of laying out the same plot. In this case the garden looks east
liability. The same principle holds good where a tree is blown down by a storm and damages the flower-beds or the greenhouse in the next garden. But if the tree was old and in an insecure condition, so that it was likely to le blown down, and no attempt had heen made to support it. the owner of the green-' house has a good cause of action.

A tenant is usually responsible for the upkeep of the fence in his garden. Where it ahuts on a public road or footpath, he should he specially careful to see that it is kept in repair. If any person blunders into his garden in the dark and sustains injury through atumbling over a spade or a frame, or perhaps has his eyesight injured by contact with pea-sticks, the tenant will be liable if he has failed to keep the fence in proper repair, unless he can prove that the injured peraon was a trespasser. Holes or broken parts in a fence should be made good to prevent dogs or cats straying through from one garden to another and damaging flower beds. This is specially necessary where poison bas been laid down for rats.

Innumerable legal decisions have been given on the subject of fixtures, and some of these apply to the garden. The old rule is, in effect, that what is once affixed to the soil must not be removed. For example, a tenant who has improved the appearance of his garden by planting an ornamental border of box is not allowed to remove it unless by special agreement with the landlord, and the same rule hollds good in regard to trees that have taken root and become established.

But there are exceptions to the old rule of law. Thus, where the tenant is a gardener by
occupation, he may take away any trees and shrubs which he planted for business purposes, and even greenhouses or other structures As a rule, much depends on the terms of the acreement made with the landlord, and it is always advisable at the outsct not to forget the garden when settling what fixtures may be removed at the expiration of the tenancy

A good example of a popular error occurs in regard to fruit trees, for it is often presumed that a tenant is entitled to any fruit which falls into his garden from his neighbour's trees. This, however, is not the law on the subject. In such a case the fruit still belongs to thic owner of the trees, who may exercise his right of recaption by recovering it from the adjoining garden if he chooses. The same rule applics to branches lopped from trees which fall into a neighbour's garden. Where branches overhang the next garden, the tenant of the latter is entitled to romove them if he has cause to believe that they interfere in any way with the growth of his plants, but the branches which he has cut off belong to his neighbour, and he must not destroy them without his permission.

Cutting hedges requires to be done with rensonable care, hecausc where a party hedge is badly injured or dies through carcless cutting the responsible person may be called upon to make good its value to the owner Digging which affects the foundations of a party wall involves similar liability. (See Hedge.)

GARDENER. A gardener is $a$ manscrvant whose duties are to look after the garden, greenhouse, etc. He should, therefore, possess a good practical knowledge of plants, whether for the fower garden or the kitchen garden. He must know when each should be planted, dug up, or transplanted, and his judgement in these and other matters will be frequently tested. His duties include the care of the lawn, while a knowledge of the greenhousc and greenhouse plants is necessary for most gardeners.

Some appreciation of colour is also desirable, as he shonld be able to lay out flower beds. The number of gardencrs kept depends upon the size of the garden. In large oncs there will be a head gardener and onc or more under. gardeners. The best training for a gardenev is to scrve in a junior position in a large garden.

Is he is a malc servant, his employer must pay 15a. a year for a licence for a gardener, whon nust also be insured under the National Health Insurance schemc, but not against unemployment.

Many persons with small gardens require a garilencr for only one or two days a week Such can be hired at a fixed charge per day or per hour, cither from nursery gardeners or privately. No licence is necessary, but in the case of a gardener hired privately one of the employers is responsible for the weekly insurance contributions. For some phases of garden work women gardeners are eminently suited, but obviously are less so than men for the henvier duties. There are in England several institutions where training can to olitained. They, too, must be insured, but no

## Garden Furniture and Ornaments

## Practical and Decorative Open-Air Furnishing

For other information of interest in this connexion see the articles on Bird Bath; Cane ; Cushion ; Hammock: Osier; Summer House; Sundial; Trellis; also Brick; Crazy Paving; etc.
Special furniture and accessories make the garden more enjoyab!e and henlthful during the summer months : well chosen and placed ornaments give it decorative value even when flowers are scarce. The type of furnishing required for the particular garden needs almost as careful choosing as that for the interior of the house. Classical styles in seats and ornaments look well in the formal garden ; rustic furniture, and the decorative touch of anold stone trough, or sundial, in the cottage garden; while in the seaside bungalow garden some kind of shelter is usually desirable ns a protection against the wind. Here too the most modern type of furniture adds a gay note which suits the otherwise somewhat bare look of a new lay out. A useful and attractive little osier shelter is shown in Fig. 1. Its roof is weatherpmofed on the inside, and two windows admit plenty of light when closed against wind or rain. levolving floors en. nbling shelters to face in any desired direction can be supplied.
Many houses, both old and new. have a practical cxtension into the garden either by means of $n$ ver. anda, with or without windows which slide back on warm days, or by the simpler means of a bricked or flagged loggia outside the dining room windows, rden Fig. 4. Plan of an extensive plot which can he transformed into
charming garden, with tennis court, crazy paths, pergolas and borders

Poisonous trees or shrubs growing in a carden have led to legal proccedings when the leaves are eaten with fatal results by n neighhour's dog, a prize rabbit, goat, or ot her pet. Here the deciding factor is whether the leaves projected into the other man's garden, as in that case responsibility attaches to the owner of the trec or shrub, but not otherwise under ordinary circumstances
Garden Chair. See Garden Furniture
which can be delightfully furnished as shown in Fig. 2. Meals can be taken under shelter here, and yet in the open air. Plenty of folding or cane chairs, cushions. a table large enough for meals, and a hammock couch, comfortably furnish such a corner. The important points about garden furniture are that it should be light to carry, should stow away into small space when not required, and that any falsric used for it should be durable, damp resistant
and bright in colour. Nothing is more de pressing out of doors than shably, dingy chairs and cushions Striped canvas in brilliant colours nearly alwaps looks right, and for paintal furniture blues, clear yellows, warm grey and ivory are the best shades from which to choose. In very hot weather for perfect shelter on the lawn from the sun a huge umbrella can ke obtained fitled into a table, which when no longer required can he folded and stowed a way.
Garden furniture will make $n$ delightful change from the more formal interior of a town sitting room if a halcony or flat roof space can lie utilized to provide accommodation for it, and sufficient greenery and flowers in boxes and tubs introduced in order to create the outdoor feeling.

Strong teak wood is made up into good garden suites, and in it settees, armchairs, chairs and tables are obtainable. A square teak wood tahle is designed with slotted top so that rain water drains off quickly. Chairs are made in this wool with fonthoards to keep the occupants' fect dry. Metal furniture has lor a much longer neriod been recognized as serviccable for outdoor than for indoor use. Folding chairs and tables of this type are made with rounded and shaped leg supports which do not make holcs on a lawn. Padded ground cushions with back rests which can be raised when required, and book rests for use with them, are lixurious for lazing or reading Oilcloth may be employed for the underside of ground cushions; raffia cloth is a good material for garden upholstery. Crctonne.

Town and Country Associated Industries, LId
covered mattresses with waterproofed lining and bolster cushionstomatch provide open-air sleep. ing accommodation A tivo-tiered wagon which can be wheeled out into the garden with all equipment for luncheon or tea and converted into a table by touching a linob is a great convenience. Square stonls made the same height as armehairs, and loose-cushioned and painterl to match, can be used with

Garden Furniture. Fig. 2. An attractively furnished loggia. Fig. 3. Folding table and stools laid for a picnic lunch
slats in each wing can Le 2 in $\times \frac{1}{2}$ in., and the bottom rail of the wing, entered about 8 in above ground, can be $1\}$ in. $\times\}_{8} \mathrm{in}$, mortised and tenoned to uprights.
The uprights of back can he about 1 ft .9 in . long, litted with staples to drop into position in cyes on the back uprights of wing returns, a length of canvas being provided for the hack after the back uprights have been connected by $13 \mathrm{in} . \times \frac{5}{6} \mathrm{in}$. rails. On removing the back, the wing retums will fold up with the stool hetween, clips being fitted so that all will pack llat together with the back

Another type of chair, as shown in Fig. 5, can be made from a barre! An oak bariel is the beat, as this wood when wax polished or oiled luoks and lasts well. Such barrels can be purchased inexpensively. The illustration shows how the chair is made ; inch timber is used for the neat, and the hoops are cither stained a darker shade of brown in the case of an oals barrel, or if the chair is to be painted in a bright colour the hoops look well in black Fig. 5 also shows all attractive table which is casily con-
structed from a barrel. Threc lhesc to form day beds, or without the extra ply wood can be used for the middle shelf. cushions as convenient low tables. A group of a simple folding table and stools arranged as shown in Fig. 3 makes a pleasant tea or lunchion corner. The constructional details for a suitable folding table are given in p. 477.

Garden Chairs. Folding chairs for the garden are simple to construct when made of wood and striped canvas

Fig. 4 shows a light garden armehair. The scat portion is made separatcly, like an ordinary camp stool, the crossing legs being of wood $1.3 \mathrm{in} . \times \frac{8}{4} \mathrm{in}$ and about 2 ft 2 in . long, pivoted on pins burred over on washers. These legs are finished with a stout dowel at top to enter tho seat rails, which are lit in diameter. The canvas is turned in 1 in. at edges and brought over tant to be nailed to the underside of those rails. Height of seat when open can be 1 ft .4 in . to 1 ft .6 in

The armchair effect is obtained by separate wing returns, the uprights of which are $1 \frac{3}{} \mathrm{in} . \times 1 \mathrm{in} . \times 2 \mathrm{ft} .4 \mathrm{in}$ long, and connected at ground by pivots to the cross legs of the stool. The arm rests are 2 in . wide by 1 ft .3 in . long, cr may. be increased to 1 ft . 6 in . The threc

Garden Seats. A wooden seat is a practical
family piece of garden furniture. It can, if well made and brightly painted and cushioned, be also quite attractive
Such seats are usually constructed to accommodate three or four persons. For the former a length of 4 ft . $\boldsymbol{j}$ in is necessary between the ends. and for the latter an overall length of $\mathbf{6} \mathbf{f t} \mathbf{6}$ in. The seat shown in the slictch, Fig. 9, is intended for four persons, and could be mode in painted deal or varnished oak, or, if preferred. teak

In making the scat, start upon the ends. preparing the front and back legs, and fram ing in the rails and elhows The top ends of the fron legs should be turned to the pattern shown at Fig. 15, and the back legs laper above

Garden Furniture. Fig. 5. Dseful garden seat and table made from two oak barrels. wax polished or oiled

monotony, and 's in keeping with either brickwork or crazy paving, and also with stone rases containing decorative evergreens and the bird bath or sun-dial of classical type. Fig. 7 shows a rustic stone seat suitable for the less formal garden.
Stonework gives n dignified air to any laynut, however simplc. Quite delightiul ornanients are made from old stone troughs and sinks placed on two piles of bricks or on
 stone pillars to bring them table-high. Drainage holes having beon pro. vided, and a Iayer of rubble before filling in the soil, rock plants, ferns and mosses $m \cap y \quad b e$ planted in these sinks with one or two pieces of rock placed to give the outcrop cffect.

Lead vases and ornaments give beautiful accents of colour among greenery. Wroughtiron is effective in the old-world garden of sophisticated charm. Wrought-iron wall

anterns, gates, nntiquc well heads and tri angular rose pillars nre all decorative pieces

Statuary requires particularly careful choosing and setting. Ormaments of this kind can be easily overdone and give a restless, crowded effect. The line of low brick wall, topped by Yoik stone, may be broken by one or two figure or animal pieces of good design. Stone dragons or owla treated in a formally decorative style look effective flanking shallow steps, or guarding a stone seat. Realiatic animals and birds do not seem so appropriate for garden ornaments, though obtainable in a variety of deaigns. Pieces of old stone carvings introduccd as reliofs on

brick walls have a benutiful effect. Particularly effective far Horal decoration on terrace walls are simple vases of stone such as the one shown in Fig. 8.
ligeon cotcs and bird shelters are always interesting. Little thatched bird-tables can be bought ready for placing on poles, and alford endless at. traction and opportunity for nature study.

GARDENIA. This is a beautifui evergreen Howering shrub for use in the heated greenhouse, bearing rosetteshapod, strongly scented Howers with thick, waxy, whitepetals. It was popularised as a buttonhole Hower by King Edward VII, but as the habit of wearing buttonholes hos to some extent declined, there is little demand for gardenias now, except for the purposes of funeral wreaths Many people dialike the somewhat overpowering perfume emitted by this Hower. The plant requires a
hasid atmosphere, and a temperature ot about $70^{\circ}$ F Equal parts of well-drained loam and peat, with a quarter of decayed manure and a liberal arlmixture of sand, suit it. It is propagated by inserting the tips of young shoots in sandy soil in a propagator in spring. If the gardenia is grown in the horder of a stove-house, very little difliculty will be experienced so long as the atmosphere is kept moist and the foliage is periodically syringed. If mealy-bug and scale put it an appearance, the lcaves must be sponged with insecticide.
If no border is available, it is quite a simple matter to grow gardenias in pots Very little pruning is reyuired Plants in borders require to be cut back occasionally to keep them within bounds and to preserve their shape. It is well, too, to tie down the lower branches, in order to prevent them from smothering the more prolific wood, which is usually sit unted in the middle of the bush Gardenia floridn is the kind commonly grown See Flowers.

GARDENING: Some Eints. The gardener's first necessity is tools, and thesc should include a good steel spade, a stout fourpronged fork, a clean-tuothed rake, a Dutch hoe. a five-claved cultivator, large and small trowels, $n$ pair of shears, a grass-mower, a birchbroom, pruning shears and knife. an insecticide syringe or sprayer, wheelbarrow, gloves and strong apron, and n garden line A storing shed should be available wherein all equipment may be kept clean and tidy.
Site and drainage will be the beginning of all work. Digging and trenching must be studicd, for earth preparation is the key to success in gardening Soil composition and the application of suitable manures are other matters for study

Practical guidance as to the preparation of seed beds. depth of sowing, together with the thinning and planting out of seedlings, may casily be obtained.

Flowers for cultivation minke fascinating study for the gardener. The formation of a lawn is not a matter for haphazard undertaking. A well-kept and truly-laid sward, even though it be only a few yards square must be made on definite principles. The planting of n fruit garden should be undertaken with suitable varicties of apples, plums, pears, etc. Pruning of branches and roots, perhaps grafting for the purpose of propagation also, will call for attention. In due course a greenhouse may be installed and equipped, giving culditional interest Frames and hotbeds also may find place, becoming a centre for early crops and for rearing tiny acedlings. Propagation by seeds and cuttings in greater variety becomics possible where such appliances arc available, while the cultivation of choice but tender plants for indoor decoration adds pleasing occupation for gloomy days.

The beginner should early learn to distinguish between insect friends and focs, to become familiar with the best insecticides for the crarlication of those that nre harmful, to understand the value of spraying trees in season, and to apply suitable renicdies for the curc or prevention of fungoid discase. See Digging: Fungicide; Spraying.

Gardenia. Bloom of the white gardenia, a fragrant bot-house flower

GARDEN PARTY. In Great Britain this lont, and to prevent decay it is advis form of summer entertainment is very popular. When it is provided by owners of large houses. penple who may be invited only to this one function in the year are glad of an opportunity to see the gardens anc alan the reception-rooms, which are generally thrown open for the necession. A tennis or croquet tournament. archery, or a cricliet match may form the special attraction. and sometimes a compang of pastoral players is engaged Provision may be made for wet weather in the form of a large tent or marquee with an improvised stage.

In tow us a garden party is often an At Home. Wherever tho party is given there is music, either a band or a large or small orchestra, and such games as clocli golf, croquet. etc. are provided for players. with chairs and sents grouped about. Tea may be served in the house or in a marquee.
A good plan is to have a separate marquen for drinks, ices, fruit, and cream, as people who are taking part in strenuous gainos appreciate these refreshments at more or lcss frequent intervals throughout the afternoon Sometimes all arrangements for refreshments, tents, etc.. aro put into the hands of a firm of caterers. In the casc of a large party this saves a strain on the household staft

Receptions, concerts, plays by limelight and informal dances are sometimes given at evening garden parties Semi-evening dress is usual for the women, evening dress for the men. Illuminations for the gardens are generally carried out by a firm of entertainment caterers; brilliant coloured paper Ianterns, patterned with boldly stencilled designs, hanging from the trees, are an effective decoration. Sce At Home: Ices; Marquee, etc.

GARDEN ROLLER. A roller suitable for a small suburban garden should weigh about 2 cwt. ; for Iarge lawns or tennis courts the roller can be 5 or 6 cort., or even more
'The usual types are madc of cast iron, the smaller sizes with solid rollers; the larger have two rollers. and are generally made hollow and are then filled with water or sand to provide the requisite weight.

A good roller should have its elges rounded to avoid cutting lines on the

Garden Roller made from an oil-drum flled with concrete turf. The
handle should be balanced and remain upright when the roller is standing, and be available on either side of the roller, as this saves frequent turning. The bearings should be substantial and easily accessible for lubrication, a matter that should not he overlooked, for if the spindle and bearings are kept well oiled, not only will the machine be easier to push, but its life will be doubled. Rollers madc of concrete are durable, serviceable, and less expensive.
GARDEN SHED. The shed illustrated is marlo in sections, so as to be movable, and consists of two side frames, two end frames, and two frames which, when joined together, will make the top. Suitable sizes are sug. gested on the diagrams, but these may, of course, be modified for special purposes. The upright rails go into the earth at least $n$
lont, and to prevent decay it is advis
able to ohar the portion that is buried. This is better thin dipping the endsin tar

Any rough straight-grained timber can be used for the framework, and when the parts are assembled, $\underset{z}{ }$ in tongued and grooved flooring boards should bc nailed round to complete the work The top should then be covered with a good roofing felt, and a coat of lar will make a reliable and waterproof roof The donr is not illustrated in detail, conaisting only of 3 in boards, nailed to threo cross-pieces and hinged to the upright by $T$ hinges. It may be bracod as shown in the article Door.
The two side frames are mortised and tenoned together where the rerose inils:

meet the uprights, as at the enlarged sketch F , and the centre upright is halved to the ornss rails as at E. A simple and quick way of mortising and tenoning rough framing such as this is to take a $\delta \mathrm{in}$. twist bit and bore out the mortises, leaving the top and bottom of the mortise half-round, as shown at alicteh J ; the tenoned portion is cut with a tenon saw, and a rasp is used to work away the corners, as shown. When putting the tenons into the mortises they should be smeared with thick paint. and secured by a couple of nails driven in from the face
The end frame which will contain the donr is also illustrated. The ends are nailed together, the long centre rail being tenoned into the top at $A$ and halved at $E$, the cross rail $B$, is tenoned at each end. At $G$ a window may bo put in, if desired. The opposite end frame does not require a door, and in this case the rail, $B$. runs right aoross the frame. to be mortised and tenoned into the outside rails; while the centre joint, C , is halved together. The side frames are screwed on to the end frames so as to facilitate removal when necessary. The top consists of two frames nailed together, all the joints being halrod together, as shown at D The triangular end pieces are made previous to making the two top frames. 'The bottom of the shed should be made of old bricks or pieces of stone flag.

GARGLE : For Sore Throat. Gargles are not as much used in medicine now as formerly. Their place has largely been taken by sprays, which reach the back of the throat much more effectively. Gargles, however, are sometimes useful for npplying drugs to the tonsils, soft palate, and for washing out the mouth. A mouthful of the gargle is taken, and the head is thrown back so that the Huid is held at the back of the throat. Then, with. out swallowing, the patient gently breathes out from the lungs, the air bubbling through the Huid. Gargles must never be swallowed.
 a teaspoonful of common salt in a glass of water. This can be used every morning. An astringent gargle for a slightly inflamed or relaxed throat is made as follows

> Spirits of wine
> Glycerin of tannic acid ...... 11 Immas
> Wnter to make.
> 4 drams

A soothing gargle compounded from the following prescription is used for irritable sore throat due to dust, heat, etc

Water to make
dram
An antiseptic gargle is often useful in cascs of sore throat, especially where the breath is of sore throat, especially where the
foul. The following niay be tried :

Solution of notrasium)
permangninte B.P.J
Water to mukic.
20 minims
GARLIC. A bulb belonging to the oninn family, garlic is noted for its pungency both of odour and taste. It is used far more gencrally upon the Continent than in Great Britain.

For ordinary purposes the bulbs are planted whole, 2 in . deep and 8 in . apart, in rows 9 in . from each other, in February. To obtain exhibition produce the cloves or bulblets must be pulled apart and planted separately. In late summer bulbs should be stored indoors.

Garnish. See Decoration in Cookery
Garret. See Attic
GARRYA. This is an evergreen shrub, 8 to 10 ft . high, of which male and female Howers are bornc on separate plants. It is the nale or catkin bearing form that is valued chietly; the long, yellowish-green cathins which appear in early spring are very decorative. This shrub is not very hardy and, except in mild districts, ought to be planted in well drained loamy soil against a sunny wall. Little pruning is needed except tn keep the plant shapely; this should be lone after the fowers arc over. Propagntion is by layering in summer or by sowing seeds in H frame in spring. Pron. Gar-re-a.

Garrya. Cackius of the evergraen shrub

# Gas: For Heating and Lighting 

## How to Utilise Modern Appliances to the Best Advantage

#### Abstract

This article corresponds to the one on Electricity in the Modern Home, and trats the subject in a gencral but comprehensive way. Gas Cookers ure dealt with in the article Cooker, and reference should be made also to the one on Hot Water Supply. Sec further such arric!es as Brazing:

The choice bet ween gas or electricity for the cessential scrvices of lighting, heating. cookking and hot water supply is usually dictated by the presence or availa bility without much expense of one or other of the respective supply mains. When both clectricity and gais are laid on, tho houscholder is in the favourable position of being free to employ either or both ns he wishes, limiting each to the use for which it is best adapted. For it may not be altogether wise to aim at an "all gas" or "all electric" house, as the case may be; the better way generally is to utilise hoth services, in conjunction perhnps with solid fucls, the latter being employed for some portion of the heating arrangements. The choice will be governed, too by the kind of atoves and fuel employed for cooking, and the preliminary remarks in the article Cooker may well be studied in this connexion.
How Gas is Sold. For many years after it was first supplied to the publio coal gas was used mainly for lighting purposes, and even since the introduction of the electric light, the incandescent mantle, an immenso improve ment on the old Hat-Hame burner, has enabled it to hold its own ay an illuminant with remarkable sucocss.
So long as gas was used chielly for lighting with flat-Hame burners it was esential that
on Hictop which has no bearing on the reading, but is used by the gas undertaking for testing purposes (see Fig. I).
Pay no attention to the top dial. Taking the lower dials in their order from left to right. write down the figures shown by the hands. If the hand is between two figures, always write down the lower; if the hand is between 9 and 0 always write down 9 . Then add 00 at the end. The index shown in the diagram reads 751,900 cubio ft. If the reading of a month before had been 740,600 the month's gas consumpition would have been 11,300 (the difference between these two totals) cubic ft.
To convert the ges consumption into Therms multiply by the "declared calorific value of the gas " (gencrally a figure hetween 400 and 500 British Thermal Units per cubic ft. : the gas oflice will tell you exactly what it is for your district) and divide by 100,000 thus :
$11,300 \mathrm{cu}$ bio $\mathrm{ft} .=\frac{11,300 \times 450}{100,000}=50.85$ Therms
Generally, in gas appliances, a Bunsen flamo is employed, and the gas, before it reaches the burner, is mixed with the volume of air neces sary to its combustion. Modern gas appliances are provided with menns for making this adjustment, and if the consumer cannot mako it for himself he should get his gas supply undertaking to do it for him. No one slould continue to use a gas rppliance which is not functioning properly an a defect due to faulty adjust ment is speedily remedicd by a competent person

Much gas is wasted bylcaving burners alight when they are not wanted. Another source of wasto is putting a small kettle or saucepan over a laige boiling ring, or turning on the burner too high; a lame that spreads out from under the vessel and up the sides is mercly wasting heat All vessels should burn with a self-luminous fame With the incre:ssing use of gas for heating pur poses, and the general adoption of the incandescent mantle, which emits light because it is heated to a high temperature, the tendency became to take heating power or calorific valuo as the criterion
This tendency culminated in the Gas Regulation Act of 1920, which introduced a new unit and a new method of charging the consumer. The Act provided that he should pay for the amount of heat represented by the gas he received, so much per therm of 100,000 British Thermal Units, one B.Th.U. being the quantity of heat required to raise the tempera ture of 1 lb . of water by $1^{\circ} \mathrm{F}$. The gas under. takings have to declare the henting value of the gas they supply (so many B.Th.U. per cubio ft .) and to keep to it within close limits.

The Meter. The quantity of gas consumed is registered on the meter by several dials, the coursc taken by the hands being indicated by the numerals. One dial indicates hundreds of cubic ft . of gas up to 1,000 ; the next dial indicates from 1,000 to 10,000 gradunted in thousands; and the third indicates up to $160,0(N)$ cubic ft ., and is graduated in ten thousunds. In larger metors a fourth dial is fitted which records hundred thousands of cubic feet. There is in addition a small dial
used on gas burners should the
教 kept clean and should not be used on coal fires Conl gas is perfectly safe so long as it is conlined to its supply pipes and is not allowed to escape into the roonis unburnt, but if this condition is not observed it becomes danger ous in two ways. In the first place, when mived with from 8 to 15 times its volume of air it will explode violently if a light is brought in contact with it. This is the reason why it is unsafe, when a smell of gas is noticed, to search for the leak with a lighted mntch or candle. In the second place, gas will not support respiration ; in other words, a person immersed in it will be suffocated because there is no oxygen in it for him o breathe. In ad.
 Qas. Fig. 3. Built-in mantel and Ras nre, sultauld $\quad$ or a sanall ourvoun $\quad$ no
chimney breast is needed. Fig. 4. Insert gas fre to replace a coal grate. The Iront bars of the latter are removed and the insert fits into tae opening
of air to the room, with consequent inadequate ventilation. Modern gas fires are provided with what is termed an in-jector-ventilator (sec lig. 2). Of the two openings under the gas grate canopy, leading to the flue, the lower or injector opening carries away the products of combustion, and the upper or ventilator opening takes off a large volume of air drawn from the room. The ascent of the current from the lower outlet causes, by injector action, the outlet above to function as a ventilator. The result is that, while radiant heat is distributed throughout the room, the air is changed often enough to ventilate the apart ment in a proper measure. An interesting development in design is a radiant clement which gives out a larger proportion of its energy in the form of infra-red rays, so that the heat cmitted bears a closer resemblance to that derived from sun rays. and designed to stand indepandently, but the
Gas fires, or gas grates, as they are some- third or insert type is only an auxiliary to an times called, always requirc a flue. Gas fires ordinary fireplace, and is used generally for may be roughly classified into threc main adapting an existgroups, known respectively to the manufacturers as: (a) self-contained: (b) interior, or built-in ; and (c) inset
The self-contained type can be bought in any style or period. So long as an adequate gas supply and flue are available, it can be connected up without further adjunct. It is provided wit.J a canopy to collect the products of combustion and ventilate the room, and the body projects out into the apartment, the back being almost flat. A pedestal boiling burner is often fitted.
The interior or built-in type is one in which the body of the stove is let into the chimney breast, or inantel, and the front is filted more or less flush with the surround. If this type is chosen the coal grate must be removed to make roon for it, and a special surround, of tiling or other material, provided to fit it, as the body of the gas stove projects out behind the surround and takes up $n$ considerable space inside the fireplace. lig. 3 showe a fire of this type used with a special "built-in" mantel. The latter is of cast iron, and is complete with hearth. It does not need a chimney breast, the fluc being formed in the wall by the use of gas. Hue blocks. A substantial cconomy in building costs is possible if such methodis are employed.

Both the self-contained and the interior types of gas firc are in themselves ornamental

Gas. Fig. 5. Stainless steel built-In fire. Two oxidized conper wall lights are seen above, with glass shades of orange verging to yellow Courtesy of British Commercial Gas Association
applied wall fittinys agree well with modern furnishing Fig 6 shows a pleasing example of a fan-shaped wall fitting with plates of shaded orange glass and mountings of oxidized metal suitable for a sitting room. Fig. 7 is a simpler wall fitting for a batliroom or extra light in a kitchen, pasange or scullery. The central sitting room fitting in frosted glass shown in Fig. 8 is of excellently balanced design, while Fig. 9 illustrates the favourite howl type of ceiling fitting particularly suitable to a dining room.

For kitchen and hathroom use silica shades are recommended, as they diffuse the light, last well and are not affected by heat. In a large living-room the central fitting can be provided with two or three mantels to afford extra light, and in addition wall fittings are an inprovement, as shown in Fig. b. When a local light only E:7 Mren is required such fittings
can be uned without the central light.
For a halla lantern lamp as illustrated in Fig 10 is a good choice, with sides of tinted and frosted glass and bottom of clear ribbed glass. The finish of the lantern may be in bruss, copper, or egg shell black. Ges standard lamps call be placed where required and attached by a flexible tubc with rigid screw to a convenient gas point. They can be obtained either for floor or table purposes and in a variety of designs and finishes.

Useful Gas Appliances. Gas cookers are described in the article Cooker. Other inportant uses for gas are to operate a refrigerator, and to heat the water for domestic purposes. These are dealt with under Refrigerator and Hot Water Supply reepectively A gas tired boiler is a convenient method of lienting a conser. vatory or small greenhouse. The boiler is placed outside the building in a protecting hutch, so that the products of combus. tion are excluded. Such a henting instal lation may be controlled by a thermostat, whioh automatically regulates the temperature.
The introduction of the gas plug point with bayonet fitting (Fig. 1I), has made it possible casily to connect up such an appliance as a gas iron or gas poker (Fig. 12) The latter is used to ignite the coal or coke in a solidfuel grate, and for this purpose is plugged into a special gus point. The poker is pushed into the grate and the gas lighted; neither wood nor paper is needed. The act of plugging in the flexible attachment automatically turns on the gas, while the operation is reversed when the connexion is removed from the plug point, the gas supply being automatically turned off. One gas poker may be used in turn to light several fires in different

Fig. 11. Gas plug polnt with bayonet ftting. Fig. 12. Gas poker used to iknite coal or coke
in a solid fuel grate. Fig. 13. Gas burner for beating curling tongs or a flat iron
rooms, if, of course, plug points are in existence. There are two main types of gas heated Hat iron: in one the appliance is internally heated by a gas hurner, and the iron is, of course, connected to the gas supply pipe by a flexible tuhe. The other type is heated by placing it over a lighted burner on a atand. The latter is placed on the ironing table and is connected when in use to a plug point. Fig 13 shows a useful fitting for bedroom or dressing room, comprising a burner which may be used for heating either curling irons or a sinall flat iron, as desired.

In the summer the disposal of kitchen refuse is sometimes a problem, especially where no cole or coal fired grate or hoiler is used. This difficulty may be overcurne by installing a gas heated incinerator, the cost for gas being negligible.

Gas Mantle. This term is used to describe a manufactured article used in conjunction with a Bunsen burner for producing an intense light. There are two principal varieties, the upright mantle, used in a vertical position over the gas flame, and the inverted mantle, suspended beneath it.

The mantle should be carefully removed from the cardboard box in which it is packed, placed in position, and ignited by the flame of a match. This burns away the coating, and as soon as the flame has died down the gas may be turned on, and the mantle should give a brilliant light. To ensure this, it is necessary that the mantle should be exactly upright. The air and gas regulators on the burner should be adjusted until the best result is obtained. In the case of the inverted mantle a similar procedure is adopted, but here the mantle is fixed on a framework of stentite or similar fieproof material, and comprises a ring with three projecting lugs, which are slipped through slots in the bottom of the burner and rest upon little supports made for the purpose. F'or a small

Fig. 14. Gas rlak with an enamelled base plate. Fig. 15. Drip proof boilink burner, with flat disk at top above central coamber in which gas and air are mixed before issuing through jets

charge inany supply companies undertake the maintenance of light fittings, cleaning them periodically and replacing hroken mantles, etc.

Gas Ring or Boiling Burner. In its older form the gas ring consists of a hollow iron casting. This is in the shape of a pipe leading into a hollow ring, through the top surface of which a series of holes is drilled. The gas, which enters at the end of the pipe farthest from the ring and mixes with air at the inlet, issues through these holes and burns with a bluc llame. The gas ring stands on cast-iron feet, and has vertical webs projecting up from the ring, in order to support a vessel.

Fig. 14 shows a good form of this type of burner, provided with an enamelled base plate. Boiling burners can he obtainedin any size : from 4 in. to 10 in . in diameter, with anything from one to four concen. tric rows of jets. Those containing four rows may, if desired, be fitted with a duplex burner with two taps, so that the ring could the used with eitlier the two inner rows or the two outer rows of jets burning sepsrately, or all four together. The hurner over a sink. It has a storage capacity of 11 gallons should be provided with an air regulator in order to vary the amount of the air supply.

Another form of gas ring (Fig. 15), has a flat disk over a central circular chamber having a series of rectangular holes around its upper end. Gas and air become thoroughly mixed in this chamber, and spread out in a series of horizontal fan-shaped jets. The gas jet openings cannot become clogged nor the Hame extinguished by liquids which hoil over.
The only adjustments required as a rule with any gas ring are those of the gas pressure and the air. The flame of the jets should be adjusted by the gas pressure regulator so that they are just long enough to play over the full holtom surface of the vessel being heated, and they should never be allowed to
lick round its sides. The air should he adjusted so that the cone in the centre of the flame is of a greenish colour, the rest practically colourless, and on no nccounl uminous, otherwise gas will be wasted, the heating power will be too low, and the surface of the heating vessels will become sooty

The central cone should be short, sharp, and steady, and the flame should hiss a little. while having at the same time no tendency to back fire when the flame is turned down low Otherwise the burner is getting too much air. The positions of both the gas pressure regulator and the air regulator should be capable of being fixed by means of a set screw when the final adjustments have been made, so that they do not get out of position when the ring is heing used.
GAS: Poisoning By. Many deaths arc reported every year from suffocation by the breath. ing in of ordinary illuminnting gas. Besides these acute oases, fatal or otherwise, vague illnesses, slight headaches, mental depression, and anaemia often result where a person for hours and days brcathes in even tiny quantities of coal gas

Prominent symptoms in acute poisoning are drowsiness, varying from a slight degree up to the deepest unconscious. ness, with a bluish purpling of the complexion, hard or chalky pictures if printed on the stcrtorous breathing with puffing out of the vigorous paper lips at each expiration, and perhaps frothing about the mouth

Remove the patient from the polluted atmosphere, see that the mouth and throat are clear, loosen tight clothing, and, if hreathing has stopped or is shallow, carry out artificial respiration. The doctor is to be summoned at once. Even after apparent complete recovery, the patient should remain lying down in bed for at least 48 hours See Artificial Respiration

GAS ENGINE. This is a form of internal combustion engine which uses gas as the fuel. In its commonest form the engine is designed to work on coal gas. but types adapted to other forms of gaseous fuel (e.g. producer gas) are similar in general characteristics, differing only in details of design. Most small gas engines operate on the Otto or four-cycle principle. See Internal Combustion Enginc.

GASKET. This is a thin packing piecc of metnl, asbestos, rubher, paper, etc., used to make n gas or watertight joint between metal surfaces. The gasket used for the cylinder head of a motor car engine is often formed of a sheet of nsbestos letween two layers of thin copper. Esch side is given a thin coating of gold size. For joints not subject to heat a gasket of thick brown paper coated with grease nay be used. See Motor Car.

## GASLIGHT PAPER.

Gnslight differs from bromide paper (q.v.) in being very much slower, but a gaslight print has much more snap or brilliance than one on hromide paper. The most brilliant prints are given by the so-called vigorous or contrasting grades. There are other grades, usually called normal or portrait, which give softer prints These are the best to use for negatives which have plenty of contrast and would yield too

gastric juice, but when its vitality in impnired part of the lining is digested off, leaving an acute ulcer The devitalisation of the lining is almost always due to bacterial poisoning, and this may have a definite origin, such as septic tecth, a diseased nppendix or gall bladder, or chronic stagnation of the contents of the large bowel.

Acute ulcers are usually multiple and may ocour on any part of the stomach lining. It may chance that an acute ulecr does not heal, hocoming chronic and possibly persisting for months or years This may somelimes be due to coarse, irritating food, but it appears to be definitely associated as a rule with delays in the cmptying of the stomach due to spasm of the pylorus. There may he varinus causes for this, but it is generally helieved that excessive sinoking inay be one of them

Acute gastric ulcers may be present without causing symptoms There may, however, be dyspepsia and vomiting of blood. A chronic ulcer causes pain which comes on from a few minutes to one or two hours nfter eating and is generally relieved by vomiting. There is always blond in the stools.

The treatment of an acute ulcer consists of rest in bed, a bland diet and a free administra. tion of bismuth and alkalies. Chronic ulcers are treated in the same way, but in certain circumstances an operation hecomes necessary See Indigestion : Stomach.

GASTRITIS. Inflammation of the lining of the stomach, otherwise gastritis or gastric catarrh, may occur as an acute disorder or may he chronic. Acute gastritis may be caused by overloading the stomach with food; by taking decomposing food, an accident more likely to occur in hot weather ; by an alcoholic bout ; or by taking some other poison capable of causing irritation.

At the beginning the patient fecls dull and depressed and usually suffers from headache. There is fullness in the pit of the stomach, a sense of weight and perhaps pain. Nausea is felt sooner or later and culninates in vomiting. At first the vomited matter consists of undigested food, hut Inter there is much mucus and bile. In children there is diarrhoea, with colicky pains, as a rule.

In the treatment of acute gastritis it is obviously desirable to clear irritating contenta out of the stomach, and this may be done in a natural way by the onset of vomiting, which should be encouraged rather than otherwise. By drinking large draughts of tepid water the patient will make the process of vomiting easier and will help to cleanse the stomach. To clear offending substances from the bowel 2 or 3 grains of calomel may be given, to he followed by a dose of salts in the morning.

No food should be given if the vomiting tends to recur, hut as much plain water or soda water as is desired. As the symptoms abate, milk in some form should be given.

Thercafter arrowroot or other milk foods are diagonal member and mortise it into the added, and then sweet breads or steamed white fish Ordinary food is not resumed for two or three days.

Amongst drigs most used for calming the irritation of the stomach preparations of bismuth talie the chief place

If acuto gastritis is at all scvere. or even when it is mild if the cause is obscure. treatment should be superintended by a doctor
Chmonic gastritis may follow an attack of the acute disorder, hut more frequently hegins insidiously. It inny be caused by habitual over-indulgence in food or alcohol, in tobacco and, in some parts of the world, in iced drinks. Habitual failure to chew food properly is annther cause Many suffer from the disease from swallowing septic discharges from the tecth, tonsils and adenoids.

The treatment of chronic gastritis cannot be asfely prescribed until a careful investigation of the habits and functional condition of other argans besides the stomach permits
and if tobacco is used at all it should be very moderately. See Indigcstion; Stomach.

GATE. In its domestic sense a gate refers to the outer entrance to a house, or to the movable part of a fence or wall. Gates leading to suburban houses are frequently made of cast iron in a stuck pat. tern, but the practice in more modern work is to employ oak or other wood. A design for an entrance gate is illustrated in Fig. 1, the making of which is more or less similar to that for a field gate. The joints are mostly the mor. tise and tenon, secured by a wooden peg. Staves or pales are nailed on with galvanized iron or copper nails. The field gate illustrated in Fig. 2 is a typical example. Commence by making the stile or upright to which the hinges are fixed: mortise the top bar and then the other bars into it. Prepare the other stile in the samc way. Thetop bar is tapered on the underside as shown, and mortised to take the three upright picces, noting that two of them come hehind the centre line and one in front of it. Next prepare the

 gate. may be driven in with a hammer; they should he so positioned that the gate has a tendency to swing shut of its own accord The shutting post is fixed in a similar manner, and carries the catch of the latch.

Ornamental gate posta can be made of brickwork or concrete, some very decorative
to shape at the top and left in the natural
form of a irce stump Fix the stile top bar, and dingonal first, then fit the outer stilc and horizontal bars, driving then together with a mallet to make sure they are properly home Sccure all thcac joints with wood pegs properly draw-borcd ( $q$. v.). Then fix the uprights, peg them to the top bar, and nail them to the others. The metal work can be purchased ready for use, and only requires bolting in place with coach holts and nuta.

The hanging of a gate calls for some care if it is not to drop before it has been long in use. The chicf requirement is a very secure hanging post For a carriage gate, if an oak post is used, it should he at lenst 6 in. square, and 2 ft . in the ground, or more if the soil is light. An oak gate post should be sawn to shape at the top and left in the natural
to shape at the top and left in the natural top har and into the stilc. When fitting the diagonal, arrange for it to carry some of the weight by giving the top bar an initial upward inclination
ward inclination

Gate. Fig. 2. Details of a common typa of feld gate
of a fair estimate of the underlying cause or causes. Sound dietetic habits must be insisted on; alcohol should be discontinued, hooks, or the pegs on which the hinges turn.
These pegs arc holted in place or, for a light part being known as the butt. To set up the post dig a hole on the side where the gate will he hung Try the post in place and, when it is all correct, strut it up with temporary battens and pour in sufficient strong concrete to fill the hole; rain it well, and leave it for a day or two to set hard; then drill the holes for the gate
ooks, or the pegs on which the hinges turn.

effects being possible with these materials Those made of brick must have proper concrete foundations: those made of concrote require similar founclations, but may be reinforced with a central bar of imon about $\frac{?}{?}$ in diameter. Thoy are usually cast in a wooden mould and can he erected as described for a wooden post.

Many devices have been adopted to hold a gate shut, some of whioh are illustrated in Fig. 3. They are mostly of imn, wrought or malleable. Means to close a gate nutomatically include tho spring, a weight suspended by a cord running over a pulley on the gate post and attached to the gate. A simple dovice to accomplish the same result is to adjust the

# Gate-Leg Tables 

With a Useful Model for the Amateur Carpenter
Other articles in this work on various kinds of tables include Afternoon Tea Table; Dining Table: Folding Table, and Kitchen Table. Consult also the entries on Amateur Carpentry; Cabinet Making; Dovetail Joint; Drawer; etc.

The gatc-leg table was introduced into England in the 17th century. It developed from the type of table on which the flaps when in use were supported by movable hinges of wood. Instead of these two additionai legs were provided which were hinged and could be moved back when the flaps wero let down : from their shape they were and are still known as gates

The majority of these tables were of oak and circular or oval in shapo with four legs, but others were square or oblong in shape and wero fitted with one, two, or four gates. Some tables have drawers at the ends, while others have the turning known as barley sugar on the legs. Such variations arc not likely to date earlier than the latter half of the 17 th century.

The gate-leg table, especially the round or oval varicty, has been much reproduced by modern makers, as it agrees well with onk dining-room and hall furniture and also suits the sinall rooms of the cottage house.

One authority thus spenks about the age of these pieces: "Their age may be roughly arrived at by a careful examination of the turned members of the legs and, where they occur, of the rails and stretchers. Enrly ones are coarser in design than the later ones. The turning may be a perfectly simple series of balls one above the other, or a pillar with rudimentary cap and base, and the stretchers heavy and near the ground. These tables were nearly always made of oak, and some of the early ones have carved tops. An early date may be assigned to those examples which show an arcaded pattern at the ends carved between the upper part of the legs."

The type provides a good size of top so that the table can be used for dining purposes, though it is really more convenient as an occasional table in the living-room, as it can bo closed down to occupy a small space. Another advantage is that a lrawer may be fitted without interfering with the movable parts of the piece.

Making a Table. Fig. 1 is a table of useful size, measuring $\overline{5} \mathrm{ft}$. by 4 ft . when open, and shutting down to a width of 1 ft .4 in . It is advisable as a preliminary to set the job out so as to get the right shape for the oval top and the correct arrangement for the turnings. A full-size drawing of the legs must be prepared to take to the turner. Prohably a suitable set of legs and swingers, ready turned, could be purchinsed from a local timber merchant, if the turning presented any difficulty. Notice that the legs are all the same shape except the inner legs of the gates, the ends of which have two fin. dowels turned, upon which the gatos swing (Fig. 2).

Start by getting out the material for the legs from 2 in. oak; square them up and mark out the mortises for the rails At the drawer end two rails are put at the top, the upper une
rides so that the upper is nearer the gate post than the lower ride. Thus the gate will always swing shut Practica! ly the same effect can be more generally obtained by inclining the top of the gate inwards.

Attention to a gate inoludos periodical oiling of the hinges and the repainting of all woodwork at least every three years, unless the gate has bcen treated with wood preservative, when similar material must be used instead of paint. Oak gates that havc not been painted can be kept in excellent condition by brushing them with boiled linseed oil. When a gate has worn and aaga it can often be oorrected by removing the rides and resetting them.
being dovetailed (Figs. 3 nnd 4). A drawer may be put at the other end as well if desired, or altogether omitted, in which case a plain rail similar to those at the siden must bo used When marking out the mortises be careful to sce that the inner edges of the top and bottom rails come exactly the same distance apart as the length of the inner gate leg, measuring between the shoulders (Fig. 2). All the rails are then prepared and the tenons cut: the top rails are out of 1 in . stuff and the lower ones of 2 in . squarcs. A moulding is worked along the top of the lower rails to lighten the appearance, but this may be dispensed with by simply rounding tho edges over.
All the joints having been cut and the turnings finished, the two ends and the gates may be glued up and allowed to set. The holes to take the clowels of the gates are bored and the outer legs of the gates cut away as in Fig. 1, so that they close in flat with the side of the table. The side rails may be glued up, fitting in the gates and testing the joh for squareness. It will be neccssary to join the flaps up in pieces to get the width, and a great deal of waste is obviated by joining them up in accordance with the full-size drawing, so that shorter pieces are used for the outer edge.

In better olnas work, instead of a square edge being left at the hinging sides (Fig. 7), n rule joint is used, shown in detail in Fig. 5. Fig. 6 is useful in n long table, as it ensurcs the main top and tho Hap being always |c叉el by reason of the berd

Fig. 8
fitting into the corresponding cavity. The rulc joint, however, is the best. and presents no great difficulty if the essential principle upon which it works is clearly understood
The ourve for the two parts must be struck from exactly the point occupied by the centre of tho hinge. and the squares above the hinge and on the flap must run diametrically to the circle thus struck, as shown by the dotted lines in Fig. 5. Plano the wood up true and thickness it and square the edges to form a close joint. Now set a gauge to half of the diameter of the circle and gauge both sides of the top and the underside of the flap. Tho depth of the square also must be marked. The surplus wood is then cut away and the parts tested together.

Back-llap hinges are used, the knuckles being sunk into the wond to get the required centre No greasc nor any lubricant must be employed until after the job is polished, as grease prevents the stain from taking properly. Before fixing the top, runners and kickers are attached, as shown in Figs 4 and 8 The drawer is either dovetailed or rebated together. The top is fixed down with screws from the underside, putting them through the rails skow-uiso. The table is opened. the top) levelled off, and cleaned up: two stops are secured to the underside of the flaps to prevent the gates from opening ton far.

GATHERING: Of Material. Large or small puckers in cloth that are made by running a thiread through any fullness of material to be reduced, and drawing it in to the required size, are known as gathering. Difierent weights and kinds of material require different treatment in gathering up the

Gate-lez Table. Fig. 1. Oyal-tonped oak table. Fir. 2. Lers, showing turned dowel of inner gate-lep. Fig. 3. Drawer end. Fig. 4. Details of framework beneath table top. Firs. 5, $\boldsymbol{\theta}$ and 7. Three methods of loining the hinging faps. Fir. 8 . Detail of Fig. 3, showing drawer runners and kickers
fullness Thick velours and serges do not gather well. and any surplus fullness should be taken away or pleated. in avoid un neccssary bulk, very little material being left to gather or ense into the band or tighter edge of the mnterial. Most silks gather easily if a thread is run evenly through the fullness $\{$ in from the edge. The smaller the stitch the liner the folds will be when drawn up.

All finc gathering in cotton and linen materials, especially in making babies' and chil. dren's clothes, should be stroked before they are placed into a band or yolie. It is wise to use a double thread for any gathering which is to be stmked, and draw it up tightly, securing it at one end by twisting it round a pin. Take a needle without a very fine point. and, placing it between each tiny fold, draw it awiftly down, making a finc strake with the point. and drawing the gather under the left thumb If this is carefully done, each fold will be of uniform size In hemming down the inner side of the band or yoke on to gathering which has been stmked one stitch should catch each fold

Rows of gathering 1 in or less apart are sometimes used as a trimming. It is often effective if used on light material for summer frocks or children's clothes, and forms the preliminary work in smocking (q.v.) ; a atrong or double thread should be used for this purpose.

GAUGE. A gauge is an instrument used to compare an object with another of known and accepted size or form; and generally called the standard In a wider sense a gauge is a standard of comparison: consequently the word refers both to a gauging instrument, and to the accepted dimensions adopted as a standard
As an example, take the Birmingham standard wire gauge, generally abbreviated to B.W.G This is simply a recognized nad accepted set of figures defining the diameter of wires, and is also used to define the thickness of some sheet metals On the other hand, the Birmingham wire gauge is a measuring instrument in the form of a metal plate with holes drilled in it, corresponding in diameter to the standard dimensions of the B.W.G

The steanigange and water gange on $\Omega$ steam boiler indicate in different manners the pressure of steam and the level of water icspectively. A rain gauge measures tho rainfall in inches of depth, the smount collected in the gauge in a given period being measured by pouring into a graduated glass.
The marking gauge used by carpenters for scribing lines upon a piece of work comprises a wooden bar and n stock made to slide upon the bar, and provided with a thumb acrew or n wedge for fixing it Near to one end the inarl.ing pin or scriber is fixed into the bar, and this is used for producing the marks on the work. In use the sliding part is fixed to the bar so
that the distance from the face to the scribing pin is exactly the desired distance for the required marks from the working fnce o!
the wood This trol is shown in Fig 1. A mortise gauge has two independ. ent adjustable scribers. and a cutling gauge has a movable chiscl-like blade instead of a scriber
A wire gauge (Fig 2) is a round or oblong piate of metal, preferably nicliel plated to protect it from rusting. The cdge is pierced with a number of slots whioh terminate in holes somewhat larger in diameter than the width of the slot. The gauging part is the space betwcen the jaws, or the breadth of the slat. In gauging cither a piece of sheet metal or a wire, the correct gange size of the metal may be taken to be that corresponding with the number atamped against the slot into which the material just fits If in doubt as to the proper size. it is as well to compare by testing with the gauge sizes next larger and smaller. Similar gaugos, known as wire or plate gauges, are used for distinguishing metal up to about $t$ in in thickness or diameter

When using an instrument of this type it is important to ascertain the particular kind of gauge being employed, i.e. whether the Inıperial standard wire gange is being used, the Birming. hain. or the Stubbs gauge The Imperial gauge was legally eatablished in 1884 The Birmingham and Stubbs gauges are both in extensive use, the Birminghnm being employed chiefly for measuring iron shects
 The absolute dimensions sizes commonly used are shown in decimals the propurtions should not be less than one to of an inch in the following lable, arranged three. See Coarsc Stuff; Fine Stuff ; Plastering. under the heading lismingham, Imperial standard, and American wirc gauges :

The full details can be obtained from any asandard text book. As a rough and ready method it may be taken that No. 3 is equivalent to $\frac{1}{d}$ in. No. $7, \frac{3}{1}$ in. ; No. 11, $\frac{1}{\frac{1}{8}}$ in. ; No. 16, $\frac{1}{16}$ in , and No 22, $\frac{1}{2}$ in.
A standard twist drill and steel wire gauge is most useful, cither in the plain type or giving the imperial standard wire gauge sizes. A combination gange, showing the standard size of drills, the corresponding tapping size, and also the full thread or clearing size, is also used.
The screw thread or screw pitch gauge (Fig 3) consists of a number of separate plates secured in a handle, somewhat like a pocket. knife. cach sejuirate jaw being fashioned to
gauges. The gauge to set, and also the strength. For heavy cornices
the correct shape and pitch of the screw thread corresponding with the number and size. stamped upon it.
The fecler gauge is used to feel the distance het ween two objects relatively clnse together. such as the width of a slot. It has separate blades of hard steel of different thickness, marked with numbers, these being the number of 1 ()00ths of an inch of thickness. Such gauges are used by inserting a blade or blades into the slot to be measured.
By means of the depth gauge the depth ol a hole can be readily ascertained. It has a central measuring rod supported by the stock. To use it, the rod is pushed to the bottom of the hole, and the end of the stock placed upon the outer surface or upon the place from which the depth is to be measured Some forms have a micrometric adjustment.

Another uscful gange for the amateur mechanic is a sliding caliper This is made of steel. 6 in to 10 in . long, the stuck being graduited usually in both English and metric measures. Onc jaw is part of the stock : the other slides along the stock and is fixed by a set screw. A vernier incorporated in the alide enables rea.lings to be taken down to Tha in. and ${ }^{3} \sigma$ min. respectively. The jaws are adapted both for inside and outside measure. menta See Cutting Gauge ; Calipers: Wire.
GAUGED STUFF. This term is used in plastering work for coarse or fine stuff which has had plaster of Paris mixed with it, thus shortening the period requited for setting. One part of plaster of Paris to four parts of coarse or fine stuff may be used, up to equal proportions a ccording to the rapidity with which the material is required Gaultheria. See Winter Green.
GAUZE: The Fabric. Although the term is applied loosely to light silks and cottons of open texture, gauze has a special meaning founded upon the method by which the fabric is woven In true gauze the threads are locked in position by being brought round one another. This principle is employed in goods not sold under the name of gauze, e.g in many Madras curtains, in cellular cloth for underwear, and, partially, in leno fabrics.
In fancy dress, gauze is frequently used to form wings for fairy costumes. Wire gauze, aq used for ment-safes and for window shields, is wire woven upon a lonn.

Use in Surgery. Gauze is extensively employed as a surgical dressing to absorb discharges, or narrow atrips may be introduced into a wound to act as a drain, or wounds or cavities may be plugged with it for the arrest of haemorrhage. Gauzes impregnated with some chemical antiseptic have distinctive colours. Thus boracic gauze is pink; cyanide of potassium, mave, etc. See Dressing.

GAZANIA. This flowering plant, whioh is unfortunately not hardy in most gardens, makes a gorgeous show in summer in welldrained soil in a sunny position. Gazania splendens is the favourite kind; its orangecoloured Howers with dark central ring are 2 to 3 inches ueross. Propagation is by cuttings inserted in sandy soil in a frame in August ; it is unwise to plant the moted cuttings out of doors until May. Pron. Ga-zā-ni-a.

GEAR : Spur and Bevel. Gearing as a means of transmitting power from its source to a given point is carried out in its commonest form by the spur tooth wheel, of which there are two forms, the involute and the stub. The former is used alnost exclusively in Great

Gauge. Fig. 1. Marming gauge used by carpenters for scribing lines upon wood. Fig. 2. Standard wire gauge shown measuring the thickness of a brass bar. Fig. 3. Screw thread gauge

Gear. Various types of spur and bevel gear in common we. Fig. 1. Large driving wheel, amall driven wheel. Fig. 2. Small driving wheel, large driven wheel. Fig. 3. Gears of a mangle. Fig. 4. Lawn mower gear. Fig. 5. Single helical gear. Fig. 6. Double helical gear

Britain, while the latter is most favoured by the A merican engineer. Both types have their technical advantages.
With any form of tooth gearing the drive is positive ; therefore, if a wheel of, say, 48 teeth is in mesh with one of 12 teeth, their differenco in speed will always be 4 to 1 . This means an increase or decrease of the power transmitted according to which wheel is acting as the driver. Should the large wheel be the driver, then the small wheel would only transmit onc-quarter of the power expended to drive it. Conversely, if the small wheel is the driver, then the large wheel will transmit four times the power expended to drive it.

By a suitable combination of gears enormous power can be obtained at the sacrifice of speed of the driven end of the train of gears, or a very high speed can be obtained at the driven end at a sacrifice of the power expended. This will he better understood by a reference to Figs. 1 and 2. Two examples in everydiay use are the mangle and lawn mower, shown at Figs. 3 and 4.
On referring to Fig. 3, it will be secn that a train of six gears is employed by which to obtain the necessary power called for at the rollers, and operates as follows: The drive commences via the fly wheel through $a$ to $l$, thence through $c$ to $d$, and then through $e$ to $g$. The $\operatorname{cog}$ wheel $a$, that is a part of the fly wheel, rotates independently on the extension of the shaft of the bottom roller, shown dotted. The cog wheels $c$ and $b$ are in one piece, and rotate on the pin $h$. The cog wheels $d$ and $e$ arc also in one piece, and rotate solid with the bottons roller.
A combination on a similar principle is employed for the screw-cutting train of gears on a lathe. The driver is always mounted on the end of the mandrel, and the last gear wheel in the train is mounted on the end of the lead screw. By varying the combination any desired screw pitch may be cut. Fig. 4 shows the method by which the side wheel type of lawn-mower cutters are driven.
A few of the commonest uses of the spur gear may bo mentioned. The change wheels of a screw-cutting lathe; all types of printing machinery and factory machinery; the timing-gear of the internal combustion engine; gear boxes; clocks and watches. In all cases where power is to be transmitted in the same plane the spur gear can be employed.
Two other forms of square-faced gear are the skew or helical gear and the double helical. With the former the angle of the teeth is in one direction only, and, through the
medium of the sliding engagement, greater silence in operation is attained, but owing to the side thrust that is created by the tooth angle, an additional thrust bearing must be provided for each wheed employed. Fig. 5 illustrates the skew or helical gear. The double helical type of gear (Fig. 6) is, next to worm gearing, probably the most silent gear there is, and with this type, owing to the $V$-formstion of the teeth no side thrust takes place

Where a drive has to turn a corner a beve or worm gear is employed, and with it the angle of the turn need not be a right angle. The bevel gear is used extensively for machinery and bench drills; one notable application of it is the mechanic's breast drill. As with the spur gear, the bevel gear is also constructed with the tecth set at an angle from the centre of the wheel and known as the helical or skew gear, and double helical gear Both typea are used as the drive for the live axle of a motor car.

The worm gear is invariably employed tor a true right-angle drive The percentage of efficiency is not as high as that of the spur and bevel gears, owing to the large area of sliding contact between the faces of the worm and teeth, but worm gear has the merit of extreme silence in operation. Other forms of gear drive are chain drive, the round, the $V$ and flat section forms of belt transmission, and electric and fluid types.
Of chain gearing probably that of the ordin. ary pedal bicycle is the most common type in use. It nay be noted that with this form the gear ratio is not worked out on quite the same principle as with the other forms of gear, the formula being as follows: Number of teeth on chain wheel multiplied by the diameter in inches of the back wheel, and divided by the number of teeth in the hub chain ring.
The proper functioning of all forms of gearing will depend in a large measure upon the correct meshing of the teeth. One of the worst evila to be avoided is bottoming of the teeth, i.e. the tops of the teeth must not come in contact with the base of the engaging teeth. See Bevel Gear; Bicycle; Chain; Clock; Coaster Hub, Differential Gear, Drill; ThrceSpeed Gear.

## Gears for Motor Vehicles

## Types of Chango Speed Gear in Common Use To-day

For further information on this important piece of mechanism consult the articles Bicycle; Differential Gear: Three-Speed Gcar. Sec also Live Axle; Motor Car; Motor Cycle

As understond for motor cars, gear provides gear wheel $c$ and give the direct drive or fourth up to four forward speeds and one reverse speed. When the sleeve is moved to the right, speed. A common type of three-speed gear is shown in Fig. 1. The four smaller diagrams show the positions of the gear teeth for each speed. The gear shafts are arranged to run in the same plane as the engine, and connected to the clutch and the cardan shaft by means of universal joints. With this arrangement the torque, or drive from the engine, is direct through the gear shaft to the gear wheel.

An example of a four-speed gear box is shown in Fig. 2. The first and second speeds are obtained by a pair of sliding, straight-toothed gear wheels; while, for the third and fourth speeds, dog clutches are used to bring into operation permanently meshed gears of helical tooth formation. The helical gear wheels $a$ and $b$ on the ends of the countershaft are in permanent mesh respectively with the wheels $c$ and $d$, the former being driven from the engine and the latter running freely on the driven shaft $e$. The sleeve $f$ is splined to the driven shaft $e$ and, when it is moved to the left, teeth $g$ at one end engage corresponding clutch teeth on the side of the

Gear. Fig. 1. Three-speed car type gear bor, showing engagement of teeth on the three forward gears and reverse
teeth $h$ at the other end engage corresponding internal clutch teeth on the gear wheel $d$, giving the third indirect speed through the permanently meshed helical wheels $c, a$, and $b, d$.
The first and second speeds are obtained by sliding the pair of gear wheels $j, k$ into mesh with the gear wheels $l, m$ on the countershaft in the usual way The gear wheels $j, k$ are splined on the outside of the sleeve $f$. The pair of gear wheels $j, k$ and the sleeve $f$ thus alwnys rotate with the driven shaft $e$, but it should be noted that either of these members may be adjusted independently of the other. Epicyclic Gears. This type of gear is less commonly employed for motor car work, its chief use lying with the motor cycle and the pedal bicycle.

In the epicyclic gear all the pinions are in constant en. gagement. The mode of operation may be easily understood with the aid of Fig. 3; $a$ is a metal ring which carries internal teeth around its periphery; $b$ is an ordinary spurtoothed cogwheel keyed to the engine shaft, whilst $c$ is a cogwheel, the diameter of which is
such as to allow of its engagement with dogs formed integral with the gear wheel $c$, the interna! teeth on the ring $a$ as well as its whioh is capable of longitudinal movement: engagement with the pinion $l$. The arm, $d, c$ is therefore always rotating with the shaft, acts as the bearing for $c$, and is capab.e of $a$, the whole being driven by the engine. rotating independently of the crankshaft $f$, The gear wheel $b$, which rotates freely on the from which it takes its support. To obtain the shaft, $a$, also earries the pulley that conveys high gear, $a, c$ and $b$ are locked solid by a suit- the drive via the belt to the back wheel The ablo means, which causes the whole mass of wheels to rotate as solid with the crankshaft, the arm $d$ being the driv. ing medium to the transmission.
The second speed is obtained by locking $a$, by means of the band, $e$, and allowing pinion, $c$, with the arm, $d$, free movement : by so doing pinion, $c$ which is being rotated in the opposite direction to the crankshaft pinion, $b$, is through the medium of the stationary ring, $a$, being forced to move slowly with the arm, $d$, in the same direction as the crankshaft pinion, $l$, the arm, $d$, being suitably connected to the trans mission, thereby giving the low gear, (A Fig 3). To obtnin the reverse the arm, $d$, is secured stationary ie. temporarily disconnected from the transmission, and the ring, $a$, allowed free movement. By so doing the crankshaft pinion, $b$, which operates the pinion, $c$ in a reverse direction, obviously causes the pinion, $c$, to rosate the ring, $a$, on the inner side of which it engages, in the same direction as itself, the ring, $a$, in this case being the driving inedium to the transmission. The the gear wheel, $g$, allows it to run independently position of the gears is shown at B (Fig. 3). or the lay slaft, $j$, when top gear is in engage-

Gear. Fig. 3. Diagrams illustrating the principle on which the epicyclio gear is worked
A neutral position is obtained by allowing ment; also when first speed is engaged. The the gear to run free, i.e. the outer ring, $a$. is position of the gears for the three speeds prorunning free and being driven by the pinion, $c$, vided is shown at $A, B$ and $C$. It will be noted which in turn is driven by the cranishaft that all gear wheels are constantly in engagepinion, $b$, so it follows that unless the outer ment, the dogs providing thic driving medium. ring, $a$, is locked by means of the band, $e$, the driving arm, $d$, will remain at rest.
A somewhat different design of epioyclic gear is used in conjunction with the pre- boxes, like live axle casings, are provided with select or or self-changing principle of operation. The actual changes of gear are effected by the depression of a clutch pedal, but, prior to the operation of the pedal, a small hand lever mounted on the steering column below the hand wheel is moved to select the appropriate gear. In a typical system there are four epicyclic trains of gear, giving four forward speeds and one reverse. By adjusting the hand lever any gear may be preselected, to be engaged when desired by first depressing and then releasing the clutch pedal.
Fig. 4 shows a type of change speed gear used on motor cycles. It operates as follows: The clutch complete with the chain wheel that is driven by the engine is mounted on the tapered end of gear shaft, $a$, on the central position of which is formed the keyways that drive the

special filler openings, which are so arranged that the gear box is easily filled to the proper level but cannot be over-filled, since any surplus would overflow from the opening. The filler opening is so placed that the oil is approximately level with the axis of the countershaft In cold weather, when the oil is thick, the motorist may prefer to fill the gear box from the top, but the plug of the filler opening must then be removed to ensure that the gear box is not over-filled.

An excess of oil may in some cases be a source of much trouble, since it may leak on the one hand into the clutch casing, or may overflow into the torque tube and raise the level in the axle casing to such an extent that oil may leak on to the brake drums When supplying oil through the ordinary filler opening, the passage into the gear box must be clear, so that the oil does not merely fill up the opening.

Most makers advise that the gear box on a new car should be emptied after the first 500 miles, preferably when the car comes in from a run and the oil is therefore warm and liquid. A plug is always provided at the lowest point of the box for this purpose. After the oil has drained out the plug should be re-inserted and the gear box flushed thoroughly with paraffin, or better still with a special thin flushing oil The gear box should again be drained completely, and then refilled to the proper level with fresh oil. Thereafter the gear box should be emptied, flushed, and refilled at less frequent intervals

GELATINE: The Substance. When bones, ligamonts, and other connective tissucs of animal bodies are boiled in water, a colourless and odourless solution is obtained, and if this is evaporated to dryness, gelatine remains in translucent shreds, of a pale yellow colour. When dissolved in warm water and ailowed to cool, the liquid is converted into a jelly.

In surgery gelatine may be used to check bleeding. As a food, gelatine has a certain value in that it can partly replace the proteins, lean meat, egg white, gluten, etc., which are required to replace what is lost in the wear and tear of the body. Gelatine is much used by manufacturing chemists for making capsules, pastilles, and other articles. See Demulcent.

GELATINE : Use in Cookery. Of the various kinds, sheet or leaf gelatine is the best. It is made in thin, transparent sheets, and will dissolve quickly in water, -1 oz . being noeded for every pint of liquid. Packet gelatine is opaque and yellowish. Of this 1 oz. will stiffen $1 \frac{1}{2} 2$ pints of water, but it may need soaking for 6 hours.

A third kind, opaque gelatine, is chiefly used for strengthening stocks and soups. used for strongthoning stocks and soups.

Gear. Fig. 4. Diagram of a common type of change speed gear, largely employed in motor cycles

Of this $\frac{1}{2}$ oz. dissolved in $\frac{1}{2}$ pint of water, with a teaspoonful of meat extract added, makes a good glaze for a tongue, etc. Powdered gelatine is also greatly used, and is very successful. Sec Glaze: Jelly.
GENERAL POST. The name of this game has become proverbial for a complete cliange round of persons or things The game can be played by any number of people.

Each player chooses the name of a town, which should be written down by the person who acts as postmaster. One is then blindfolded and stands in the middle, while the others sit down in n circle. The postmaster reads out the names of two of the towns, as, for example: "The post is going from London to Exeter": or from Liscrpool to Edinburgh, etc., and the persons representing those towns have to exchange places, while the blindfolded man tries to catch one.
The blind man continues in the middle until he has caught somebody, though the post may pass successfully inany times before he does so- The postmaster should vary the changes as much as porssible, sometimes choosing two people at opposite sides of the room, sometimes two who are next to each other. At the words general post all the players have to change their places. A variant of the game is for a player, not blindfolded, to try to gain the place of one of the two persons exchanging scats.
GENERATOR. The object of the various kinds of generators is to convert one form of energy into another. As an example, the acetylene generator comprises $n$ vessel containing calcium carbide, another to hold water, and a third to receive the gas, which is generated by the drip of the water on the carbide.
An electrical generator is an apparatus for converting mechanical into clectrical energy. The name is generally used in electrical work for a part icular type of machinc, the alternating current generator; but from the domestic point of view it may be applied also to dynamos generating a continuous current Occasionally thic term generator is applied to a boiler which generates steam, particularly the type known as the flash boiler See Acctylene : Dynamo.
GENOA CAKE. To make this cake, wash $\ddagger \mathrm{lb}$. sultanas and 2 oz currants, drain them thoroughly and leave them to dry. Beat $\frac{1}{2} 1 \mathrm{l}$.

Genoa Cake, decorated with almonds, and wrapped in greased paper as removed from baking tin
butter or margarine to a cream with 6 oz . granulated sugar, then add 3 eggs, one by one, beating each in well before adding the next. Stir the mixture for 5 min .
Mix together the currants, sultanas, 2 oz glacé cherries, the same quantity of mixed peel, and $\frac{1}{2}$ oz. blanched and chopped almonds; then sieve $₹ \mathrm{lb}$. flour, measure out I tablespoonful, and mix this quantity with $1 \frac{1}{2}$ teaspoonfuls baking powder. The remainder of the flour, mixed with the grated rind of a lemon, must be folded alternately with the fruit into the butter, etc.
Stir all together lightly, add a little milk, if necessary, and then stir in the baking powder. Put the whole into a greased cakc-tin lined with greased paper and bake it in a moderately hot oven for about if hours. lessening tho heat
after the first 20 min . The top of the cake may be decorated with a few blanched and chopped almonds at the same time as the heat is reduced.

GENOESE PASTRY. Made either white or coloured, this pastry forms the foundation of many small fancy cakes. To make it, whisk 3 egga and 4 oz . castor sugar in a hasin placed over a pan of hot water unti! the mixture becomes thick and free from strcaks. This should take about 10 min .

Put the basin on the table, continue whisk. ing for $n$ few minutes, and then stir in by degrees 3 oz Vienna flour and the same quantity of butter Add the flavouring, then turn the mixture into a shallow baking-tin lined with greased paper, and bake it in a hot oven until it is tirns and lightly browned.
Genoese Biscuits. To make these, cut some Genoese pastry into crescents and other small fancy shapes, coat them with royal icing, and

then leave them in a cool oven until the icing becomes of a palc biscuit tint. When cold the biscuits should be decorated with a few pieces of glacé cherries or angelica, and, if liked, a little more icing. See Biscuit; Icing.

GENTIAN. Most of these dwarf Alpine plants are suitable for the rock garden, and some of them thrive in the mixed border. The drug gentian is obtained from the root of G. Iutea, with yellow, spotted flowers in July ; height up to 4 ft . The interior of the root, like the Hower, is yellow.
Gentiana acaulis is a most beautiful but capricious plant, which frequently will not thrive under conditions which might be expected to favour it It likes well-drained stony loam, a sunny place, and must be watered frecly in early summer. The blue tlowers are largo and tubular, and are borne on very short stems
Gentiana verna is a lovely miniature kind for the rock garden; it is most likely to flourish in gritty loamy soil in a sunny place, and needs an abundance of water in early summer. Decumbens and septemfida are two other beautiful gentians which thrive in deepsandy loamy soil if kept moist in spring and early summer. Farreri is one of the best of the newer kinds.

Andrewsii, 18 in. high, and asclepiaden, 2 ft . ligh, aro more vigorous plants suitable for well-drained loamy soii in partiai shade. Lutea is a distinctive plant with large leaves and stems 2 to 3 ft . high, bearing whorls of yellow flowers in summer ; this thrives in ordinary loamy soil.
Many gentians are unreliable and short lived under cultiva.

Gentian. The beautiful blue trumpet-shaped flowers of Gentiana acaulis, a favourite plant for the rock garden

Georgian Style. Exterior of an 18fh century red brick house by Sir Robert Lorimer. This style is distinguished for its simplicity, dignity and repose Courlesy of Country Llle
one of the most attractive features of these old houses.

The roofs are invariably hipped, i.e. they slope upward and backward from the walls on all four sides. They were not brought down to form overhanging eaves, but were stopped behind the walls, and there was often a low brick parapet or a pediment on the front of the house. At the beginning of the $18 t h$ century the division between roof and walls was generally a heavy wooden cornice. This disa ppears in the Georgian house, a red brick moulded cornice being substituted a little below the parapet. The roof was often pierced with dormer windows, as shown in the first illustration. At first the roofing material was red tiles, but these afterwards gave .way to slates. especially on town or city houses.

Our fine example shows that the central fcature of the façade was the doorway. This was generally of wood in the earlier examples, stone being employed later, and was often covered as seen here by a fine hood and supported on either side by classical columns or pilasters with their correct entablature. Porches were rarely used.

In these houses a great deal of inventive talent was lavished on the hood and the doorway generally, the intention being to contrast this feature so rich in detail with the sedateness of the rest of the front. A fairly sub stantial string course marked the storeys of the house and separated the rows of windows from each other.

The windows were always of the sash variety, tall and narrow, with wide frames Hush with the brickwork, the sashes themselves being divided by glazing bars into scveral rectangular frames. The frames were painted white It was usual particularly in twin or terrace houses to build a basement storey, the entrance floor being raised a little above the ground level. Hence there was the opportunity of a flight of stone steps up to the front door, and these steps were often, in the more preten tious mansions, extended in a sweeping curve on either side as they a pproached the pavement.

Interior Decoration. Throughout this cen tury the tendency was towards lighter construction, inside and outside. Just as the glazing bars of the tall window became less solid, so the constructive decoration of the interior grew less massive.

The Georgian staircase, for instance, is easily distinguishable from its predeccssor The string or support of the stairway was stepped so as to show the end of each stair, instead of being, as formerly, a long, solid entablature. This expressed the main idea of the Georgian staircase makers, that the stairway was a continuous series of steps from floor to floor. Pedestals at the foot of the stairway, which in Jacobean architecture were heavily carved, became little more important than the balusters. The handrail was thinner.
Chimney-pieccs grew altoget her !ightcr in construction, until they culminated in the daintiness of the Adam period Panelled walls continued as the basis of the decoration, but

Georgian Style. Mid-Georgian drawing room with characteristic panelled walls, richly ornamented ceiling and pediments over the door and chimney-piece. The furniture is of the Chippendale period Courtesu of Countr" Life
the panels were simpler and shallower, and ware often in carved pine or were painted in white or cream. It is noteworthy that the same panelling was used throughout the house. The only assertive decorations were the ceiling cornices and the superstructures to overmantels, doors and windows. Wrought-iron work was very largely used, and this minis tered to the craving for light construction Necessarily there are to be found in some purely Georgian houses Queen Anne and even Jacobean features. but overlapping is inevitable in

Geranium graudiflorum, a hardy plant with vioietblue flowers in summer. See below
any architectural period, and the Georgian atmosphere is less mistakable than most.
Our second illustration shows a midGeorgian drawing room with richly ornamented ceiling and broken pediments crouning the larger door and the chimney-piece. The panels are simple in well designed contrast to the cornice decorated with dentils and classical motives. The furniture is of the Chippondale period with side tables enriched with fretted ornament and chairs with pierced splats of carved ribbon patterns. The writing table is an example of the French taste then in vogue with its delicate ormolu decoration. 'The Georgian dog grate, serpentine fender and Oriental hearthrug are furnishing points of interest.
An important development in connexion with Georgian interior decoration was the use of wallpapers. Several factories in London after the first half of the 18th century produced printed and coloured papers in Chinese designs, and as the classical styles became the vogue with the work of the Adam brothers and continued till the end of the Georgian period, designs introducing classical landscapes with temples and statues were popular.

Modern adapters of the style somctimes dispense with some of its most beautiful details. One does not often see a neo-Georgian house with a parapet or a pediment. There is a preference for over-hanging eaves, and only a fow modern houses can carry the ta! windows of the old-time terrace house. A profusion of artistic wrought-iron work is financially impossible in most cases. But the vitality of the style is proved by deviations that may be inade in details without the sacrifice of its general content. See Adam Style ; Bedroom; Chippendale Style; Fireplace; Furniture; Glass; Hepplewhite Style; Regency Style; Sheraton Style ; Silver.

GERANIUM. The true geraniums are hardy perennials suitable for the flower border and the rock garden. The zonal pelargonium, a popular flower for summer bedding, and commonly though erroneously called geranium,

Is a tender South American plant which doe is described under pelargonium ( $q$ v.).

The bardy geraniums suitable for the Hower border Hourish in ordinary soil and are in. creased by division in autumn or spring and by seeds sown in boxes of soil in a frame in April. All are summer-flowering The best of the vigorous border kinds are armenum, $2 \frac{1}{2} \mathrm{ft}$, crimson purple; Endressi, 15 in , rose pink; grandiflorum, 12-15 in., violet-blue: and ibericum, 18-24 in., violet-blue

Geranium argenteum, 4 in , grey leaves and rose-coloured Howers; cinereum 4 in., grey leaves and pink flowers; and lancastriense, 3 in ., rose colour, are suitable for the rock garden where they thrive in sunny places and well drained sandy soil Geranium pratense is the common orowfoot which grows wild in Britain. See illus. pages 334, 528.
GERBERA. This beautiful summerHowering perennial from South Africa, commonly known as the Transvaal daisy or gerbera, rarely succeeds out of doors in Britain. unless grown in a well drained sandy soil in a "arm sheltered position. It belongs to the daisy order and bears very showy flowers, carricd singly on stout stems a bout 1 ft. long; in the newest varieties the flowers are of various shades of red, orange red, salmon, and rose. The typical kind is Gerbera Jamesonii, with bright red or scarict llowers
The beat way to grow the Transvaal daisy is to plant in a sunny border at the foot of a heated greenliouse or in a bed of soil in a sunny frame: it may also be grown in pots under glass. A compost of loam, leaf-mould and sand is suitable. Propagation is by division of the plants in spring or by seeds sown under glass in March.

GERMAN MEASLES. The symptoms of German measles, also known as rubella, resembles those of measles but the discase is much less contagious. The microbe has not been discovered The incubation period is about 14 days. The infection probably spreads from jerson to person on the breath, skin scalcs, and clothing.

An attack may be ushered in by feeling of chilliness, running of the nose, sore throat, headache, pains in the hack and legs, and some feverishness. The glands of the neck generally awell a little, and a red eruption may be seen in the throat. On the first or second day a pinkish-red rash appears on the face and neck, and then spreads down over the body. It lasts from three to five days as a rule. The neck glands remain enlarged, and occasionally those of the armpits and groin become a little swollen.
It is best to put the patient to bed and keep him there until the rash fades. Give him light, digestible food, and if there is any constipation give a mild aperient such as hali teaspronful of confection of senna.

Keep the patient from mixing with other children for 8 or 10 days after the appearance of the rash, and until all catarrhal synnitoms in the nose and throat have disappeared Children who have been exposed to infection should be in quarantine for 20 days. See Infectious Diseasca; Notification; Measlcs.
GERMAN SILVER. German silver is known under several different names, among which are nickel silver, Nevada silver, electrum, and others. It is an alloy of copper, nickel, and zinc, the composition varying. The best quality is composed of two parts of copper, one of nickel, and one of zinc. This grade is more difficult to work but possesses a fine polishing surface, and is used to imitate real silver.
The metal can be easily worked, rolled, hammered or drawn; ease of working depends upon the proportions of the alloy, a higher porcentage of copper generally making it softer. While fairly hard, tough, and not
easily corroded, it becomes slightly tarnished and play is as at whist. Players must follow if long exposed to the air It can easily be soldered Sep Metal Work; Soldering

GERMAN WHIST. This variety of ordin. ary whist is played by two persons. The players cut for deal, the lower cut being the winner. Here the ace counta as the lowest card The winner of the cut then denls out alternately 13 cards to himsclf aild 13 to his opponent. He turns up the next card to show what are trumps and leaves the reat of the pack on the table.

The player who has not dealt then leads.

## Gesso Work in Various Forms

## Modern Uses for this Decorative Handicraft

For related information consult the articles on Italian Renaissance Work; Lacquer Work: Leather
Work and Stencilling. Sec also other ornamental crafts, including Batik; Lampshades: Pattern Printing Work and Stencilling. Sec also other ornamental crafts, including Batik; Lampshades: Pattern Printing

Gesso is a furm of applied decoration The material that is employed consists of a pasty substance compounded chiefly of plaster of Paris and glue. It was used for ornament in relief, and is found Irequently on the fiames of Queen Anne mirrors, on chairs, and other furniture of that period The woodwork was overlaid with gesso in a decorative design and then gilded, which produced the ornate character of the gilt furniture of the late 17th and early 18th centurics.

When used for high reliol gesso powder is unsatisfactory in wear, and for such work barbola paste has taken its place, as it can be easily modelled owing to its plastic nature. and when dry it is quite hard. The box illustrated in Fig. 4 is an example of modern gesso work in low relief; the mirror frame and bowl. Figs. 6 and 7, are ornamented in barbola work The latter is particularly effective when used for decorating painted and gilded cane furniture The former is the loundation paste for alightly raised lacquer work designs.

The wooden box for handierchiefs (Fig. 4)

pencil It is better to make the design on tracing paper, as if much is rubbed out on the box it becomes greasy and the colours work hadly The horder of a conventional floral embroidery design can be well adapted from a transfer on to tracing papei
Mix some gessu powder into a creamy paste with water Apply this to the design with a brush and avoid going over the edge Cam is necessary, as the gesso paste should be modelled a little and applied in the direction it is to lie. Each leaf should be modellecl separately and the roses worked in a circulitr dircction. Several conts of gesso may tee used, but not very thickly as it louks rough when dry. Any unevenness can he rubhed down gently with sandpaper

When the gesso is quite hard it can be coloured with barbola colours Allow these to dry and then varnish with Barbula varnish. Articles can be obtained with the raised work on them and are then ensily finished in colours. The real fascination of the work, however, lies in the nodelling.

Barbola Decoration. Experimental outfits for barbola work can be obtained for 3s. fid Varnish, paste, gesso powiler, tubes of colours. bronve powders, brushes and tools can all be obtained as required in a good ast department.

Barbola can be applied in many ways, one of the most effective being for mirrors Pro. cure a wonden inirrorframe, sandpaper it. then coat it over with quick drying lacquer or ptain. Select a suitable design to trace or copy is first rubbed down with sandpaper and then painted white before being coloured the desired shade with transparent Iacquer. When this is quite dry make a tracing of the size of the top of the box, and design something suitable. Conventional work of the type shown is the most effective. Trace this on to the box by turning the pencil side on to the wood and going over the back with a fairly hard pencil: but should the design be incorrect when reversed, go over the back of the design with an H.B. pencil, lay this side next the wood, and trace off with a harder

Gesso. Fig. 4. Eandkerchlel box, with border of leaves and flowars

Model groups of fruit or flowers, using barbola paste, and stick them to the wood. using a paste made from the barbola to which water and a little powdered glue have been added. It is important to allow the modelled work to become absolutely dry and liard before attempting to paint it.
In modelling use a little gesso powder on the hands, as the paste will work more easily and will not show the marks of the skin. Avoid labouring the work. Takc out the amount of paste required and roll it in the hands, Fig. 1. Should it be desired to form an apple or similar fruit, roll it into a ball, and when the correct shape has been obtained put it on a picce of glase or board, and finish off with a barbola
effective. Try rather large fruit and llowers first, as they are easier and do not tend to overcrowd the work

As the work dries, touch it up where necessary. When all the colours are diy and there is no riak that the paste will shrink, varnish all over with clear varnish. The wreath, shown in Fig. 6, is an equally suitable design for a mirror frame or, in a amall size, for an applied decoration to ornament a waste. paper basket or linen basket in cane. A charming effect is gained by leaving sonie of the Howers silver or gold

To denorate the bowl shown in Fig 7, it must first of all be coloured, using for this purpose either quickly-drying lacquer or barbula colour, which is varnished when dry. While the bowl is drying, model the fruit and lowers which are required for decoration. To make the bowl waterproof it is a good plan to coat the inside with, gold size, using $n$ farge, soft brusli.
Having modelled the apple, leave it on a sniall board to harden, and then model the leaves.

Fir. 5. Toots used for delicate modelling in Gesso work
many opportunitics for the skilful modeller. A liquid medium is sold for use with bronze colours, which are obtainable in glass tubes

Examples of this kind of work are illus. trated in lig. 8. On the left is a powder bowl of papier maché, on which is molelled the heal and bust of a dancer. The bowl itself is lacquered a shade of petunia red, and petals of the pasta are arranged round the dancer's waist and at the edges of the bowl to represent a billowy skirt. The figure should be done in the ordinary manner with barbola paste, and must be affixed to the howl before it is dry, as the bodv must be shaped to the lid of the bowl. 'Then the long petals forming the rest of the decoration should be modelled and placed in position. In this work the modelling tools should be used as muich as possible to nvoid into $\Omega$ ball, then press it fat and form the shape of a leaf. The sides of the leaf should be held in the two hands and pulled gently towards the worker. This appliea to rose petals, as shown in Fig. 2. The modelling tool is then used to finish off delicate hollows, veins of leaves and curled edges (Fig. 3).

Coloured Bronze Powders. Another modern form of gesso work is executed chiefly in gold and silver and applied on a lacquered bacligmund. Ita particular charm lies in its lustrous effecte produced by using colnured bronze powders. It is used for ornamenting many kinds of hnusehold articles, among them candlesticks, mir. rors and powder boxes, and is a form of work that affords use gold and silver bmon put on these coluurs powder, and a grood washable medium, which should be applied with n soft brush.

For the smaller covered bowl, decorated with a rose, the petals must first be modelled and pinced in position, using the modelling timls as much as possible. (See Fign 2, 3.) A few of the petals should be made rather thin to form a centre. Round this centre fix the rest of the petals, pulling them into position, and turning over the edges of some of them. When the rose is linished, put it on a small board, and thuch it up with the modeller. It is aulvisable to finish this before the paste gets hard

The bowl itaelf must then be lacquered deep blue. When it is dry scrape the top and place the rose in ita position. Then make a few leaves and arrange them round the rose. Next gild the rose, and colnur the leaves green, using bright green bronze powder. As suon as this is dry, trans. parent Incquer can be used, a little scarlet for the centro of the lose, then orange, with yellow for the outer petals. Finally the leaves should be coloured with green lacquer.

GEUM (Avens). These are splendid hardy border plants, some of which will bloom throughout the summer months if the faded Howers and the old atems are cut off. The two best are Lady Stratheden, yellow, and Mrs. Bradshan, scarlet; both bloom from May to September. Other ahowy varieties with a shorter flowering season are Orangeman, orangecolour, and Fire Opal, orangered. All these are about 2 ft . high when in bloom Borisii, 1 ft., has orangescarlet flowers. Geum montanum. 6 in., and rep. tans, 8 to 10 in., have yellow Howers in abundance in spring, and are auit. able for the rock garden

Geyser: For Instantaneous Water Heating

## Types for Local or Multi-point Service

## Related articles include those on Rath; Cistern; Gas; Hot Water; W'ater Supply

Strictly speaking, the geyscr is an apparatus must be turned on very slightly, so as to which takes in cold water at one end and discharges it almost instantanenusly at the other, heated to any desired temperature Geysers are made to burn any fuel, but the chief sorts used are coal gas, paraftin, coal, coke, wood and alcohol. Only those burning coal gas are dealt with here, since the principles on which they all work are the same.

The working is as follows: Cold water enters at the inlet pipe and flows around a jacket in the lower part of the geyser until it becomes hested, when it rises automatically into a series of cylindrical chambers, and in passing through these it receives more and more hent from the burner below. Finally, it enters a boiler in the centre of the geyser, from which it emerges through the outlet pipe and flows out into the bath or receptacles placed to receive it. A special typo of heater (describicd below) is connected by pipes to different points in the house.
The main gas jet should never be turned on unless the water is flowing through the geyser. and in most types this is provided for in the construction of the apparatus. The best way is by means of an automatic valve, so constructed that it is the flow of water which turns the gas on, and directly the water stops the gas supply is cut off and the flame dies down. A second way is by interlocling the gas tap with the water tap. This makes it impossible to turn on the gas before the flow of water has started, and renders it necessary to turn off the gas before the How of wnter can be turned off

Besides the geyser proper, illustrated in Fig. 1, there is another type, known as the pressure heater, and illustrated in Fig 2. It has a very tiny pilot light, not unlike the bypass of an ordinary incandescent burner, going continually, and whenever $n$ hot-water tap connected with it is turned on in any part of the house the main gas jot lights up and provides inatantaneous and continuous hot water so long as the water tap remains open. Immediately the tap) is closed, the gas Hame in the geyser dies down, leaving only the pilot light.
Roughly speaking, it may be assumed that the average rise in temparature required to provide $n$ hot bath is $40^{\circ} \mathrm{F}$. above that of the cold water in the main. For this purpose the gas used would be in the neighbourhood of I cubic ft. for every gallon of water heated. So that, if the average hath is assumed to require about 30 gallons of water, 30 cubic ft . of gas will be used in heating it up.
In choosing a geyser, the size is determined in terma of the number of gallons of water to be heated per minute. As the geyser is only capable of imparting a certain quantity of heat to the water in $n$ given time, it follows that the tem. perature of the water flowing out of the geyser will depend upon the rate at which it is Howing If very hot (or even boiling) water is required, the water tap

Geyser. Fig. 1. Geyser for the bath, with automatic valve and swing-out burner. Fig. 2 Automatic water heater for multi-point service. See text
pound. The metal ones are used in connexion with window boards, and should be mounted flush with the outside wall. The asbestos ones are mounted flush against the wall, the shank being cemented into the wall itself.

Ventilation. No gas-heated bath geyser should be fitted in a room without a window, and the window should be capable of being opened-preferably at the top. Where gashentell geysers are fitted in sma!! bathrooms, it is important that special provision should he made for the ventilation of the room, apart from that provided by the flue equipment of the gevser The special ventilation can best be provided by the fitting of a 9 in. by 9 in airbrick in an outer wall of the bathroom. If an ordinary air-brick is fitted, a deflecting board should be fixed over the brick on the room side, to protect the person using the bath from dranghts The smaller the room in which the geyser is fixed, the greater the need for special mesns of ventilation.

Safety Precautions. A cause of accidents has been the piroduction of explosions due to the application of a match to the gas jet after it has been fullo turned on for some time. This

avoided
following the instructions issued by the makers: but one or two general points must be at.tended to. Never turn on a gas tnp until you have a lighted match in your hand, ready to apply to the ssouing $g$ as. When selecting a geyser, ingist upon having one with either an automatic value or interlocking gas and water taps If the geyser is of tho type in which the burner withdraws from the heating chamber, never light the burner when it is inside the chamber. Always withdraw it first and apply a light to it outside. In most modern geysers of this type, the gas is not fully turned on until the burner is inserted bencath the geyser, so that only a small amount of gas is liberated when the burner is outside If the geyser is of the type in which the llow of water automatically turns on the gas and cuts it off when it ceases, do not turn on the water without lighting the pilot jet. If the pilot jet is alight and in position, no explosion can possibly ensue when the gas is autornatically turned on.

GHERKIN, Although it is, strictly speaking, the name of a dwarf-fruiting variety of cucumber, Cucumis sativus, the term gherkin is generally applicd to immature and discarded cucumhers of all kinds that are used for pickling and other purposes. The true gherkin can be grown in the open air from seedlings raised in pots in March on a hotbed, and transferred in Junc to well manured ground

How to Cook. Gherkins have various uses in cookery, and are excellent when pickled. 'They should be left to soak for 3 or 4 days in salt water, then dried and put into a clean jar. Pour into a saucepan enough vinegar to cover the gherkins, allowing to each quart of vinegar 1 oz of allspice and $\frac{1}{2} \mathrm{oz}$. of ginger Let these boil for 10 min ., then pour it over the gherkins, cover the jar with a plate, and leave it overnight at the side of the fire. In the morning drain off the vinegar, re-boil it, and pour it over the gherkins again. When cold cover the jar with a bladder. The pickle will be ready for use in ahout six weeks See Cucumber.

GIANT FGNNEL. The scientific name of these graceful plants, with umbrella-like effect of foliage, is Ferula. They are at their best in the spring in the wild garden, but are also remarkable in the summer and autumn, when the branching, flowering shoots reach a height of about 8 ft ., and bear innumerable ycllow blossoms. The giant fennels should be raised from seed, as they are not easily divided or moved with success Of several species, F. tingitana and F. communis are those which respond most. readily to the culture of the wild garden.

GIBLET : How to Cook. The giblets of a chicken, duck, goose, or other bird consist of the head, heart, liver, gizzard, neck, fect, and the joints of the winga. They are usually employed in the making of stock, soup. and pies, but may also be stewed. In stewing, wash and scald two sets of goose giblets, skinning the feet and removing the beak and the inside bag of the gizzard. Cut all into small pieces, and stew them until they are tender in enough water to cover then, seasoning them with salt, pepper, a minced shallot, and a little nace.
Then strain off the stock, and in a separate pan melt a lump of butter about the size of a hen's egg, stirring into it about 1 dessertspoonful of flour. When these are lightly browned, add the stock from the giblets and stir the whole until it boils. Put in the giblets, heat them up thoroughly and then serve.
Giblet Pie. The giblets of a goose or a pair of ducks, some short pastry, and one or two slices of slightly salted breast of pork are the ingredients required to make giblet pie. Clean and scald thoroughly the head, gizzard, liver, legs, the ends of the wings, and the neck, and stew them gently in a little water for about 2 hours Add 2 or 3 onions, hlack pepper, a limpl of butter, and a littlc salt, parsley, sweet marjoram, and thyme. When the giblets are iender take them from the fire to grow cold, then strain off the stock and remove any excess of fat Line a pie-dish with short crust, moisten the latter with beaten egg, and place the pork at the hottom, putting the giblets on top. Pour in a little broth Cover the pie with more pastry, and bake it in a moderate oven for about it hours, pouring in a little more stock before serving. See Fowl: Soup.

## Giddiness. See Dizziness

GHIDING. The process known as gilding consists in coating the surface of an objeot with an adhesive and applying to it a very thin film of gold leaf. When dry it appears as a solid gold surface The usual method is to apply gold leaf or metallic powder, the best results being always obtained with gold lcaf.
The tools required are the gilder's knife and cushion. The knife has a thin, narrow blade like a table-knife. The cushion is a board about 6 in. square, the upper surface padded with flannel and covered with wash-leather; three sides are shrouded with thin card to protect the gold leaf from the wind. The underside has a loop so that it can be held with the thumb and supported by the fingers of the left hand. The cushion is used to support the shcet of gold leaf and to facilitate the cutting operations.
The gold leaf is obtained in broks containing about 25 leaves approximately 3 in . square, each sheet separated by a piece of thin tissuepaper. The knife is used to cut the gold leaf; it must be kept perfectly clean and free from the slightest trace of grease The blade must never be touchnd with the fingers, but must be wiped from timc to time with a piece of clean rag. A gilder's tip, a long camel-hair brush, is em. ployed to transfer the gold leaf from the cushion to the work. Two or three camel and hog hair brushes will be useful for applying the size and manipulating the gold.

Gilder's gold size can be obtained ready for use, a small bottle covering a considerable
amount of work. Suppose that the work is already cleaned and prepared. The gold size is brushed over the part to be gilded, and it is absolutely essential that it should be applied thinly and evenly : if there are little mounds of size on one part of the work, and scarcely covercd prortions on another, the result will be failure. The next step is to protect the work se that no dust can settle. upon it.

The size should be fit to receive the gold after 12 hours, but no hard and fast rule can be laid down as to the right time to apply the gold leaf. If thesize is wet, it will worls through the gold leaf and result in a muddy appearance; if too dry, the gold will not adhere properly. It is best to make May. They grow some trials on an odd piece of work and to learn by experience. When the size is judged to be in good condition a little of the gold leaf is laid on with the gilder's tip, and pressed down lightly with a pad of cotton wool covered with soft linen. The surface of the gold is then brushed oves with a soft hog. hair brush, and if the gold remains in position and appears bright and lustrous, ill is well.
An actual piece of work can now be undertaken by taking a leaf of the gold and, with the nid of the knife, laying it upon the cushion. Do not touch the leaf with the hands, as any grease will spoil the contact. A strip of the requisite width is cut off with the knife, picked up with the tip and applied to the proviously sized work, preseing it into place and brushing over the surface of the gold, the process being continued until the whole is completed A sheet of clean white paper should be laid underneath to cullect any gold powder that falls. After being left in a warm, dry place for a couple of davs, the work is finished with ormolı size, a varnish of shellac and clemi, or gamboge, which can be bought ready for use.

Regilding a Frame. To prepare a gilt frame for regilding, after removing the picture the gilt work is washed in a weak solution of soda, in lukewarm water, rinsed with clean cold water, and thoroughly dried. Any cracks should be made good with a putty composed of whiting, yellow chrome, and size. When this is dry, paint the frame with a mixture of whiting and a red or vellow pigment to make a rich yellow-gold colour. Mix this with size to the consistency of thin paint, then strain it through a piece of muslin, and while it is still warm brush it on to the frame. Aftrr it is dry give it a coat of size, and the gilding may then be procceded with

Most frames are gilded in several different ways, and comprise a burnished portion, a matt portion, and modelled parts that have to be done with gold size. The burnishing is done with burnishers generally made of agate or bone. The framc is brushed over with gilder's burnishing size the consistency of thick paint, apread evenly, allowed to dry, and rubbed down with old sandpaper until it is perfectly smooth. It is then dusted and another coat applied. This is allowed to dry and rubbed down as before, after which the work is brushed to remove all dust.

The gold leaf is applied by wetting a part of the frame with water size, laying the gold upon it and blowing gently upon it to force it into contact with the work. If any craoks appear, or there are any portions deficient in
will, if too dry, the gold dainty hardy annual

Gilia. Delicate blooms and leaves of a
lay. They grow March and planted out in best are capitata, lavender; nivalis whitc; tricolor, lavender and white; and tricolor rosea, rose colour. The finest of all is Gilia coronopifolia, which is often grown as a biennial and raised from seeds under glass in June to provide flowering plants the next year ; it will, however, blooun in summer from seeds sown under glass in warmth in Febriary: The brilliant rose-scarlet flowers are on stems 2 to 3 ft . high. Pron. Jil'i-a.

Gill. Mcasure of capacity. It is the fourth part of a pint.

GILLYFLOWER. This is the old English name for carnation. It is sometimes applied to wallHowers and stocks. See Carnation: Wallitower.

GIMIETS. This is a woodworker's tool used for boring small holes, gencrally prior to inserting a scrow. It comprises a handle, and a steel rod pointed at one end, with a tapering screw thread of variable pitch. It is used by pressing it upon the work and rotating the handle in the manner illustrated.

The rotation of the gimilet causes it to screw its way into the woorl, and should cut the wood after it has entered a short distance. It should be kept clean and bright., with the edges of the cutting thread quite sharp, as a blunt gimlet. choked up with chips, will split

Gimlet. How this woodworker's tool should be held when in use the wood. A bell - hanger's gimlet is made with a long shaft, some. times 3 ft . in length. The extremity is formed like an ordinary gimlet, but the blade is larger in diameter than the remainder of the stock. It is employed for boring holes through thick joists, or at a considerable distance, and will be found useful in making holes through which to pass electric bell wires. See Amateur Carpentry; Boring.

GIMP. Flat ornamental edging used as a finish in upholstery is the commoneat form of gimp, and usually it is of a lonped formation Gimps nre quickly and cheaply made by machine to match the colourings of chairs, settees, or cloth ourtains, and can be had to order. Looped yarn for use in knitting shawls reccives the name of gimp from the presence of little loops or curls upon its surface. In lace the gimp thread is a braid or cord used to thicken or outline the pattern. Fancy braids for trimming are sometinies known as gimps.

GIN. Gin is made from maize and harley flavoured with juniper berries. There are several varieties. Old Tom has a small percentage of sugar; dry or unswectened gin has none. Plymouth gin is said to be the purest; genievre, well known in various European countries, is made from corn.

Gin does not improve much with age. It should be of whito colour, unlike old Hollands, which is of straw colour. Gin and bitters is a favourite appetiser, and gin forms the basis of many cocktnils, such as gin fizz, gin julep, gin sling, gin smash, and many others. Sloe gin can be made nt home with the juice of sloe berries. See Cucktail; Sloc Gin.

GINGER. Ginger is much used in cookery as a powder, when it is known as ground ginger, as preserved ginger in syrup, or as whole ginger. The Inst-named is also termed mont or stem ginger, and the pieces are a palc buff colour, toughi and fibrous. Whole ginger is usually bruised, i.e. well benten with a rolling pin or similar article, so that the flavour is more easily extracted.

Ground or whole, it is best to buy ginger in small quantites, as it soon loses its pungency. Preserved ginger is sold in jars of varying sizes Its main use is in the form of dessert, but, like ground ginger, it is also employed in the making of oakes, puddings, eto. The syrup in which it is preserved is used for flavouring purposes.

Medicinal Uses. The most important constituent of ginger is an aromatio volatile oil which gives it its well known tlavour. Ginger is chiefly used in medicine, dose 5 to 15 grains, for its stomachic and carminative effects It is also a common flavouring agent. Ordinary preparations are the syrup of ginger, duse $\frac{1}{\frac{1}{2}}$ to 1 dran, and the tincture of ginger, $\frac{1}{2}$ to 1 dram. Tincture of ginger is an oldfashioned and sometimes efficacious remedy for flatulence. See Flatulence : Indigestion.

GINGER ALE. Except that extract oif ginger is used in place of the root, ginger ale is made on similar lines to ginger hecr, but with the addition of bitter Havours. These include one or more of the following : tincture of capsicum (enyenne pepper), gentian, cardimom seeds, tincture of cinnamon, canomile, oil of rose, or geranium, etc. Sufficient caramel is ndded to give a golden colour. These matcrials are added after cooling and before fermentation.

GINGER BEER. This becr can be made from ginger root and pure cane sugar alone, but the addition of one or two other ingredients is an improvement. The simplest method for brewing it at home is the following : assuming the copper holds 5 gallons, a wooden tub of the same capacity is required. Get the copper quite clean and frce from grease, but do not scour it bright. Fill it with water and bring the water to the boil.

While this is heating weigh 8 oz . of ginger root and crush it by putting it in a linen brg and pounding it with a hammer on a stone. Directly the water boils add the crushed ginger root and draw a way from the fire so as to stop boiling. Let it stand for three hours, covered to keep the heat in, and stir occasionally.

Put 5 lb . white granulated sugar in the tub, then strain through muslin the hot ginger root
liquid from the copper on to this sugar, and stir it till disso!ved; cover the tub, and when the liquid is quite cold bottle it. In about three weeks the ginger becr sioould be brisk with gas and ready to drink. If it is wanted sooner, 3 oz. fresh brewer's yeast may be stirred into the tub dircetly the ginger beer is cold, and bottling done 24 hours later. The beverage will be ready to drink in a couple of days.
GINGER BISCUIT. Ginger biscuits are made by sieving together $\frac{1}{2} \mathrm{lb}$. Hour, $\frac{1}{2}$ teaspoonful ground ginger and $\ddagger$ terspoonful bicarbonate of soda and the same of salt. Rub into thesc $2 \frac{1}{2}$ oz. butter and mix to a stiff paste with golden syrup. Knead the paste together, roll it out on a Houred board to the thickness of $\frac{1}{2}$. Cut it into round biscuits and bake in a modorate oven for 15 minutes See Biscuit.

Gingerbread. See Cake.
GINGER CȦNDY. To make ginger candy, put into a pan over the fire 12 oz. sugar and $\$$ pint of cold water, and when the foriner is

Ginger Candy, a dellcious and wholesome sweetmeat
dissolved add 2 oz. glucose and a lump of butter about the size of a walnut. Boil these to $240^{\circ}$, then add $n$ small $\downarrow$ teacupful of preserved ginger in syrup, about 6 drops of gingerine or any ginger flavouring, and a dessertspoonful of ginger syrup. Stir the whole gently and continue boiling and atirring until it has reached $248^{\circ}$.
Pour the mixture into a bayin previously rinsed in cold water and leave it !or 5 min ., then stir it with a wooden spoon until it is thick and creamy. Cover it with wax paper and a thick towel, let it stand for about 20 min ., then knead it thoroughly with a spatula and the hands, finally patting it out between candy bars set on wax paper. When set it may be cut into cubes or any other shape desired.

GINGERNUT. To make these, take 1 lb soft flour into which has been sifted it teaspoonful bicarbonate of soda and the same quantity of cream of tartar. To this flour is added if oz butter or other good fat, $2 \frac{1}{2} \mathrm{oz}$. castor sugar, 1 teaspoonful ground ginger, and $\frac{1}{2}$ a teaspounfut powdered mixed spice. A stiff dough should be made with about 6 oz. warmed golden syrup. Roll this out about $\frac{1}{8}$ in. thick, and cut with small plain cutter. The biscuits spread a little, so inust be placed slightly apart on the shcet. This should be slightly greased, and then sprayed with a litt!e water before the biscuits are placed on it. Bake them in a moderate oven for 12-14 min. They are soft when finished, but harden on cooling. See Biscuit.

GINGER PUDDING. A steamed ginger pudding can be made in the following way: Mix together $\frac{1 \mathrm{lb} \text {. flour, } 2 \text { teaspoonfuls ground }}{}$ ginger, $\ddagger$ teaspoonful carbonate of sodn, $£ 1 \mathrm{l}$. chopped suet, 2 oz . candied pecl cut into small pieces, $\frac{1}{2} \mathrm{lb}$. breadcrumbs, and $t \mathrm{lb}$. Demerara sugar. Warin 2 tablespoonfuls golden syrup
and pour it into the centre of the dry ingredients, mixing the whole together with a little mill: and water to a wet consistency.

Beat the mixture well before turning it into a greased basin covered with greased paper, not a pudding cloth; then stand it in $n$ sauce pan half-full of boiling water and steam it for 2t-3 hours. Serve the pudding on a hot dish, with hot custard, if liked. This is sufficient for six persons.
GINGER ROCK CAKE. Small ginyet mok oakes arc made by sieving together $\frac{3}{} \mathrm{lb}$. Hour, 1 terspoonful ground ginger, $\ddagger$ teaspoonful powdered cinnamon, and level tcaspoonfut of bicarbonate of soda. Rub into these 7 oz . of margarine : then add 6 oz . white sugar, and a teaspoonful caraway seeds

Mix these ingredients to a stiff paste with a beaten egg and, if necessary, $\Omega$ little milk. Grease a baking sheet and drop the mixture on to it in small, rough henps, leaving a space betwcen each. Blanch 1 oz . almonds, stick one on the top of each heap, and then bake the cakes in a hot oven for 15 to 20 min

GINGER SAUCE. A good ginger sauce can be made by heating $\frac{1}{2}$ pint milk in a small pan over the fire, and in the meantime mixing the yolks of 2 eg gs and the white of one in a basin containing about oz. sugar. When the mill: is hot, pour it on to the contents of the basin, stirring all the time, and mix thoroughly. Return to the pan and stir it until it thickens without boiling. Just before it boils pour the sauce into a basin and add sufficient ground ginger to taste.

## Ginger Snaps. See Brandy Snap.

GINGER WINE. Ginger wine is made by boiling together for $\frac{1}{2}$ hour $3 \frac{1}{2}$ gallons of water, 12 lb . sugar, lb . good bruised ginger, and the thinly pecled rinds of 6 large lemons. Put the wholc when lukewarm into a clean, dry cask, with the juice of the lemons and $\frac{1}{2} \mathrm{Ib}$. sultana raisins. Then add 1 tablespoonful of thicts yeast, and stir the wine daily for 10 days. When it has ceased to ierment, add 1 oz. isinglass and a pint of brandy; bung the wine closely, and hottle in two months.

GINGHAM. Long is favourite for chilIren's dresses, house and summer frocks. aprons and overalls, gingham is a cotton fabric inade principally in check designs. The patterns range from siniple block checks up to elaborate plaids in two or three colours The cloth normally is finished pure, or with very little loading. The pattern is not printed, but woven from yarn usually dyed in fast colours. The general effect is bright and clean-looking.

The advantages of gingham led to its use in other spheres; for instance, as breakfart cloths, curtains for kitchen or cottage eascment windows.

Coloured ohecks are sufliciently showy in themselres, but an original touch can be added by oross-stitching simple designs upon some of the white chequerings. To ornament every white square is to invito an overcrowded appearance, and it is advisable to seloct squares at intervals for trentment in one or two colours: or a plain border in white or to match the colour of the check may be cm broiderd with the design. For example, $n$ daffodil yellow check ginghanı cloth could have a 6 in. white linen border with a crossstitch design in the yellow. When washing gingham which has faderl, add a little vinegar to the last rinsing water. This will help to revive the original colour. See Embroidery.

GINSENG. This is a plant of the genus Ariblia, from the root of which a drug is extracted. That obtained from the wild plant is regarcled as better than that ootaincd from the cultivated one, and the older the root the bettor the quality, so it is belicved. The drug, which is slightly bitter and aromatic to

He taste, was formerly belioved to possess wonderful medicinal powers, but the existence of these is now doubled. It is, however, widely drunk in China as a gpecific for all manner of bordily ailments.

GIRANDOLE. This is a branched candlestick used for $n$ cluster of lights. They are usually ornamented, the design being fre. quently made to imitate bunches of flowers. See Candelabrum ; Candlestick.

GIRDER. A girder is n principal and horizontal beam of wood, or more generally of iron or steel, which rests upon supports at oither end or at different positions throughout its length, to support a lond. The load may be distributed along its entire length or at different pointa throughout its unsupported length.

As a general rule girders are formed in what is known as the I shape, that is, in the form of the letter I, with Hanges at the top ind bottom, these being elightly thicker in section than the web or upright piece which connocts them. The modern girder usually is composed of special steel, and when rolled from one solid bar is known as a rulled steel joist. In enginecring practice a girder means a compound structure forming a beam to reccive a vertical load. It is marle up of several pieces, which are riveted tognther at the joints.

GIRDLE or Griddle. This cooking atensil consists of a circular piece of iron, about 12 in. in diameter, spanned by a strong metal handle. It is uscd in the making of girdle cakes, etc. The girdle is greased and heated over the fire, the dough being dropped on it when it is hot

Girdle Cake. These light teacakes, also known as Scotch pancakea ur drop scones, are made with batter and cookod on a girdle. To make then, beat together an egg and $\&$ tablesporonfuls of milk, add a pinch of salt and, if likod, a pinoh of sugar. Sift in enough self. raising four to make the whole into a batter stiff enough to drop, not run, from the spoon. More flour or more milk should be added until this consistency is attained.

Reat the batter woll, then grease the girdle and heat it over the fire. When it is hot, drop sponnfuls of batter on to it, so that they will form neat rounds sbout $d$ in. thick. When brown on one side (and they will take a very short time to conk), turn them over. This will snake about 18 small sconca. If there is no girdle in the house a frying-pan man be used, but great care is then needed to see that the cakca do not burin. They can be caten either hot or cold, and require plenty of butter.

GLADIOLUS. An indispensable garden flower, this is in full benuty in Iate July, August and September. Varieties of the cairiy flowering type grown in pots under glass bloom in late spring and early summer.

In recent years new types and innumerable new varictics of gladioli have bcen raised, and among them are many beautiful flowers. There ne two distinct types of late summerflowering gladioli, the large flowend, and the primulinus or small flowered. The recent astonishing progress in popular favour of this flower dates from the introduction of the gellow Gladiolus primulinus from the vicinity of the Zambesi Falls early in the 20th century; its fluwers are small and of hooded shape, and the growth is slender.

By orossbreoding between this specics and varietics of the lange-flowered gladioli a remarkable new race has been obtained which

Gladiolus. The primulinus type, which bears small
has slender, graceful growth and medium-sizod flowers of remarkable and varied colouringyellow, orange, salmon, primrose, apricot, roso, and other tints. Meanwhile the range of colour of the large-flowered gladioli has also been extended, and modern varieties have particularly fine spikes of bloom-one spike may bear seventeen or more flowers.

Both types are invaluable for garden display nnd for cutting. If the spikes arc cut when the lowest flowors are out the others will open in water indoors. It would servo no useful purpose to give the names of varieties, for thcy are innumerable, and many similar ones have different names. They are fully deacribed in the gmwers' catalogucs.

The cultivation of the gindiolus is a simple matter. The corms or ronte are planted in
 March or April, 2 in. deep and 6 to 8 in . apart, in well dug soil enriched with dconyed manure ; it is worth while adding leaf-mould and sand to clayey ground. Ashes from the gar. den bonfire are alsn beneficial. Gladioli look especinlly well in groups in the herbacenus border or in ${ }^{2}$ Hower beds carpeted with dwarf white alyssum or other low growing plants. In October, when the leaves begin to turn yollow the planta are lifted, and placed under cover for a week or two; dead leaves and soil are then removed and the corms are stored in paper bags in a frostproof place for the winter ready for planting in spring. By setting corms at intervals of 10 days from early March until mid-April a succession of bloom is assured.
The corms of carly-flowering gladioli nre potted in nutumn, kept in a cold frame for 6 or 8 weeks and then placed in tho green. holise. A temperature of 50 degrees is high cnough. Favourite varieties are Colvillei, The Bride, white; Blushing Bride, blush; and Salmon Queen, salmon.
Gladioli are propagated by seeds sown in a 10 in . deep box of soil placed under glase in March or out of doors in April : the seedlings should not be disturbed until the leaves have
died down in autumn. If planted on a reserve bed the following spring some of them will bloom in suminer, others may not do so until the next year
GLADWYN. This is the naine given to one of the iris family of flowers, Iris foctidissimn It is n native iris, with blue flowers, about 2 ft . in height, and is remarkable for the bright red seeds which make their nppearance after the flowering period is over it likes a moist soil. See Iris.
GLAND. Literally meaning acorn, this name is given to a collection of specinlized cells which manufacture certain substancos needed by the borly. Some discharge their fluid through a duct, and othem, the ductless glands or endocrines, pass it directly into the blood. Glands aro of many different kinds and are of great importance in the mainten ance of the health of the body.
Lymphatic glands are widely distributed over the body. They consist of masses of lymphoid tissue in connexion with the lymph vessels which collect used-up fluid from the tissucs and carry it bnok to the blood. They act as filters, stopping in some degree various poisonous matters on their way to the blood.
Intlammation and enlargement of lymphatic glands (lymphadenitis) is a common consequence of any irritating matter which reaches them through the lymph vessels. A wound in the hand may thus cause swelling of the glands in the armpit, or a wound in the foot or log of those in the groin.

Ono form is inflammation of the lymph glands of the neck, due to their invasion by the tubercle bacillus, and commonly known as "glands in the neck." A child with a constant cold in the head is liable to develop tuberculous glands of the neck. Eczema of the scalp, suppuration in the ear, decayed teeth, may all set up irritation of these glands and favour their infection by the tubercle bacillus. Treat. ment should bo directed to tho cause. Se Glandular Fever; Mumps; Tubereulosis.

GLANDERS. Also known as farey, this infectious disease of the horse, ass, and mule is communicable to other animals, including man. It is due to a germ known as tho bacillus Malloi. When the nasal cavity is affected the condition is known as glanders, but when the lymphatics are involved, and there are nodules under the skin, it becomes farcy, the nodules consisting of the farcy buds
Corchmen, stablemen, and others who have to do with horses are the persons most likely to contract the discase, and the danger is inoreased if they have cuts or abrasions about the hands. Anyone suffering from the disease can convey it to another.
The site of infection becomes red and in. flamed, and the inflammation spreads along the lymphatics to the nearest lymphatic glands, whioh become swollen and painful. There is fover and the patient feels ill. He may pass rapidly into the typhoid state, and his con dition will look like the form of blood poisoning known as pyacmia. Commonly there is a purulent discharge from the nose.
GLANDULAR FEVER, Children are affected chiefly by this infectious diseasc, which sometimes appears as an epidemic, attacking all or most of those in the house or in a school.
The neck becomes painful, tho glands of the neck enlarge, and some of then may become as large as an egg. Occasionally the glands in the armpits and in the groin enlarge. The temperature may rise to $103^{\circ}$ or $104^{\circ}$. Early in the second week the fever disappears; and thore may be diarrhoea The swollen glands then slowly return to their normal size, but may remain enlarged for weeks or months. Tho usual treatment for this diseaso is to apply hot fomentations to the glands two or three times daily.

## Glass and Glazing

## Choice, Cutting and Uses of Glass in House and Garden

This article deals whth glass as used for windows and general constructional work. It is followed by one on Glass Ware, while other entrics related to the subiect are Lended Light; Mirror ; Picture Framing: Window. Sce also Conservatory; Frame; Puity, etc.

At a casual glance all sheet glass may tops of dressing-tables and other places wher appear to be of substantially two forms, plain a clean surface is needed. The edges ahould or tranaparent, and obacure or rippled, but be ground and polished, and, if necesanry, there are in fact many kinds of sheet glass, with various properties rendering them suitable for specific purposes Ordinary sheet glass is made in three varietics, known as crown, sheet, and plate glass.
Crown glass is made by blowing the glass in such a way that it ultimately forms a shect with a boss, or bull's eye, in the centre. This method is not often practised nowadays, but the bull's eyes are valued for their decorative use in windows, doors of cabinets, and other positions. Ordinary sheet glass, such as that used for windows, is made in tubular form cut, flattened, and afterwards annealed. The usual size is up to 12 to 16 sq . ft. in area, while the weight varies according to thickness from 15 to 42 oz . per superficial foot.

By the aren of the glass is mennt the number of square feet it contains, and by the weight in oz. is meant the approximate weight of a piece of glase exactly 1 ft . sq., that is, 21 oz . glass means that 1 sq . ft . of it would weigh 21 oz Thickness and weight vary with different manufacturers, as does the grade or quality. Approximately, 15 oz . glass is a little over在 in. thick, and 21 oz . glass about ${ }_{2}^{10}$ in., while 42 oz . glass is about $\frac{1}{3}$ in

## Sheet and Plate Glass

The objection to sheet glass is that it always imparta a wavy, or broken appearance to the objects seen through it. For ordinary window purposes this may not be on objection, especially if a first-grade sheet glass be used, but for good class work, or in windows where the view should be unimpaired, polished plate glass should be used. Sheet glass can be purchased at so much per sq. ft. from pictureframe makers, or from builders' merchants, or ironmongers. This method is suitable when only a small quantity is required, as the sheets are out to the size specified.

If a quantity of glass is required, a case or hox may be purchased, which usually contains 200 or 300 ft . of glass, that is, a sufficient number of pieces of glass to cover an aren of 200 or 300 sq . ft . as the case may be. The sizes of the pieces and their thickness might either be uniform, as, for example, so many pieces of a certain size and all, say, 21 oz ; or it is sometimes possible to buy a mixed case, containing two or three different sizes, or varying in thickness. Many stock sizes are available, and particulara can generally he obtained from the local builders' merchant.

This method of purchasing glass is particularly economical for such constructions as greenhouses and garden frames, where quantities of glass of uniform width can be used, and if the nearest stock-sized glass be ascertained before fixing the bars in new work, it will be found to save considerable expense for glass-cutting. As regards thickness, shect glass of 15 oz . should only be used for small frames or for little pancs in windows; 21 oz . glass is generally recognized as the thinnest that should be used, and if the window is of any size, such as a sliding sash, a heavier glass is preferable.

Plate glass is made by casting, grinding, smoothing and polishing. Hence it is uniform in texture and thickness, and the objects secn through it are not distorted in any way. It is made in various thicknesses from $\frac{1}{16}$ in. upwands, and up to 100 sq . ft. or more in area. It is purchased according to fractional sizes, that is $\frac{3}{16}, \frac{1}{2}$, in etc., in thickness. Plate glass is used extensively as a covering for the
be ground and polished, and, if necesan y,
holes drilled near the comers for fixing the glass in place.

Plate glass can be bent by the makers to various shapes such as are required for the curved cnds of a cabinet or other furnituro, or for a window, but as a rule the amateur should avoid hent glass as it is very difficult to bring it to the exact curvature desired. For small areas, up to about 2 or 3 kq . ft., $\frac{3}{10}$ in. plate glass is satisfactory, but polished plate glass is generally about $\frac{1}{4}$ in in thickness.
Fancy Glass. Of the fancy or patterned glasses, those known as the rolled plate are perhapa the most uscful to the amateur, and are made in different patterns, some quite ornate and others softly wa ved and subdued in texture. They are used in partitions or places where light is nended but vision is to be obstructed. Prismatic glass diffuses light and gires better internal illumination; it is used for lighting basements and other dark parts of buildings. Coloured glass is generally in the form of ordinary sheet glass.

Of the apccial glassos, those made with wire nctting embedded in the centre and known as wired and cast, rolled, or polished glass, according to their methord of manufacture, are about $\ddagger \mathrm{in}$. thick, and are used for roofs, windows and doors. They cannot be cut with a diamond in the ordinary way, and therefore are partly burglar-proof. They are also to a large extent fire-resisting.

Another kind of glass is made up of several layers cemented tngether. It is used for all purposes where glass is liable to fracture, e.g. a motor car wind screen. The material will resist heavy blows without splintering.

A proprietary glass which passes the health giving ultra violct rays is coming into common use. for windows in houses, offices, and factorics. Its use entails only a comparatively small outlay to the houseowner.

When purchasing shect glass to fit into a specific size frame, it is customary to make an

allowance for the roughness of the edge of the glass, the amount of this allowance being determined by the width of the rebate in the frame. For example, if the frame is 24 in . wide and has a rebate in it, say $p$ in. wide. thus leaving a sight opening of 23 in ., the glass should be ordered as 238 in . in width. It is advisable to inforn the dealer of the purpose for which the glass is required.

Cutting Glass. The cutting of glass is carried out with a diamond pointed tool or with a hard stcel glass cutter. The former is expensive to buy, and requires considerable skill to manipuiate in an effective manner The steel cutters comprise a wooden handle with a stcel end-piece or block fitted with a small circular plate cartying two or three small steel wheels, one of which projects beyond the and of the head nnd docs the cutting. When it gets blunt the screw holding the circular plate is loosened and a fresh wheel brought into position by partially revolving the circula: plate and again screwing it up tight
To use either of thesc cutters they should be hold in the right hand in the manner shown in Fig. 1, with the handle between the first and socond fingers and the thumb behind them. The diamond is set at a certain angle in the end of a steel block, pivoted on the handle and freo to move through about $45^{\circ}$; this is to facilitate the citting of intricate shanes and to allow a certain amount of latitude when cutting long straight lines. The particular angle at which the diamond must be held varies with each individual stone, and must be learned by experience, the best cutting angle being judged by the sound. When cutting properly the sound should have n ripping quality ; when the diamond is wrongly held it is more like a scrateh. The tool is usually held in a nearly upright position.

For ordinary use in the home the wheel cutter answers al! requirements and will stand more rough treatment than a diamond. As an example, if n now panc is wanted for a window, and it is to be cut from a piece of odd glass, lay this on a firm flat table-top on which has been placed a piece of thick cloth, and place a steel or wood straight-edge on one side of the g!ass. Binging sufficient pressure to bear on the cutter, draw it once across the glass, guiding it by the straight edge. If the glass is thin it will rever easily if

Glass Cutting. Fig. 1. How to hold the diamond. Fig. 2. Bench arrangement of battens and nails How to cot a hollow, corved plece ol glass. Note criss-cross cots and nase of diamond to tap out the piecea
turned upside down with the line of the cut resting on the edge of the table, or upnn a clean straight batten, and the surplus glass pressed down. The end can now be cut. guiding tho cutter with a set square, or proferably a glazier's tee square: the opposite end and remaining side arc then cut. When placing the straight-edge as a guide for the cutter, be careful to allow for the thickness of the cutter block, otherwise the glass will not be the proper size.

The cutting of glass to fanoy shapes, such as those needed in leaded light work, is rather more difficult. One method is by preparing a full-size drawing of each picce of glass, then drawing a parallel line on each side of the outline. The distance between the outer lines represents the thicknoss of the heart of tho lead, and consequently the true shape for each picce of glass: it is to these lines that the glass is out. Another method is to out a set of thin cardboard patterns to the exact shapes of the glass, and to employ them as templates.
bad cut. A cut should be startôd and finished at the yery cdges. Extra thick glass should be tapped on the side away from the cut.

Glazing Windows. In the case of a broken pane in a winduw the first thing to do is to remove the hroken glass by gentle tapping and lifting out the fragments If the glass has been fitted by a wooden bead, it must be unserewed or prized out of its place with " chisel. Most windows, however, are secural by putty. This is best removed with a hacking knife, as shown in Fig. 5. The work must be done thoroughly: if any lumps of old hard putty are left in the frame, they will strain the glass and ultimately make it crack.

If the frame is shrunk and the putty exhibits small cracks, it should be removed by inserting the end of the blade into the cracks and levering the putty out. In exceptional cases it will have to be chipper, by tapping the back of the blade with a small hammer. As this work proceeds, remove the fragments of glass, taking care that those on the top part.
putty adhering to the glass or sine irame must be scraped off, the whole dusted over and the glass lefít clean.

In fitting glass to new woodwork, the latter must be painted prior to applying the putty, or the putty will be liable to siake and fall out soon after it hai set hard. In the case of a repair, the putty should be painted to match the existing woodwork as soon as it is dry, say 24 hours or so after its application. Where the glass has to be fitted to a frame and secured by a bead, the same proceeding is followed except that the putty is often omitted. The edge of the glass should be painted a dull black before inserting it into the frame.

Metal framed windows are glazed and treated in the same way as those with wooden frames
GLASS PAPER : How to Use. Shects of paper covered with glue and coated with powdered glass, sand or other abrasive are known as glass paper, or sand paper. They are made in many grades, the finest ranging from No. 0 to F2, medium No. M2 to S2, and the coarsest No. 2i to No. 3. Glass paper is used to work up a sinooth surface on woodwork, and to nssist in the shaping of curved surfaces; as for example when making a handrail, the top is rounded off by the planc, and the flats or ridges rubbed down with glass paper. Painted surfaces are prepared with glass paper prior to the applica. tion of fresh paint, as well as between each coat of paint. Glass paper is employed for some of the finishing processes in leather work and also on fibre, or any other material of a similar nature.

In using glass paper, a piece of suitable size should be cut neatly to shape and folded round a block of cork, wood or other suitable matcrial. The ordinary block is a flat picce of eork about l in. thick, 5 in . long, and 3 in .

A simplo device for eutting diamond or other panes is illustrated in Fig. 2, and comprises a lath of thin wood nailed to the bench. Two nails are partly driven into the bench at right angles, of at any required angle; the edge of the pieco of glass is rested against these. Tiwo other nails are also driven into the bench and a straight-edge laid against them, this acting as a guide for the culter. The method is effective when several pieces of the same size are wanted, as it avoids the need for repeated measurements. Ciroles are generally cut with a special tool known as a circular glass cutter. It has a central pivot, adjustable arm, and a wheel or diamond.

When cutting curves the outsido curve will come away easily, but a notch, or interior curve, will hare to be cut across and across, and the parts removed one by one somewhat as shown in rig. 4. To separate the glass when cut to curved forms, tapping is necessary. This consists in striking the baok of the plate of glase with the block of the cutter, carefully following the line of the cut. Steady tapping is important, and if the glass has been properly cut the fracture will run along it at each tap. Any ragged edges can be trucd up by grozing, a process consisting chiefly in biting off the ragged edges by means of a pair of pliers, using the jaws to squerze or bite the edge of the glass, as shown in Fig. 3.

Finally, the worker in glass should remember a few simple rules. The glass should be supported on a really tlat surface such as a drawing-board. If much eutting is to be done the barerl should be ruled with two sets of lines, $\frac{1}{4}$ in. apart at right angles, to divide it into a number of squares. This will save marking when the glass has to be cut on the square. When cutting properly the diamond makes a soft sound and leaves an almost invisible scrateh, while a large rough serateh shows a

Id putty with the hack knife. Fig. 6. Applying a uniform
of the window do not fall out instead, and eut the hands. If working on a first.floor window. care must be taken that fragments of glass do not fall on anyone beneath.

When all the old putty has been removed, the rebate must be measured. This should be done at the top and bottom and at both sides, in case the window-frame is not perfectly rectangular. A piece of glass may now be cut, slightly less than these sizes; in most cases about $\frac{1}{8}$ in. less will be correct. The putty must be worked up, softening it by rolling it between the palms of the hands until it is quite plastic. If it shows a tendency to crumble, moisten it with a few drops of linseed oil, and again roll it between the hands.

Place some of the putty into the comers of the rebate, and apply it with the finger and thumb to a uniform thickness all the way around the frame, as shown in Fig. 6. The glass is then placed on to the bottom part of the frame (Fig. 7), pressed in closely, and pushed into place. pressing it all round the edges into close contact with the putty. It may be further secured with the aid of a few brads driven into the framework with the heads just touching the glass. A pellet of putty is then pressed into the comers between the glass and the frame, and consolidated by forcing it hard up against the two with the aid of a putty-knife.

The remainder of the rebate is then filled, and to get a neat finish the knife is used with long sweeping strokes, if possible from end to end of the window, held at an angle to the glass, and with the blades Hat on the edge of the frame, to act as a guide for the knife. This should remove any surplus putty. The inside of the frame should be inspected, and all surplus putty should be removed with the putty-knife or glazing knife. This latter is somewhat thicker in the blade, but otherwise similar in shape to a putty-knife. Any surplus
widc. The proper method of use on a Hat surface is shown in the illustration, the movement of the hand being in a series of circles combined with a forward motion, the result being that it traverses the whole surface.

For finer work the rubbing is in a straight line with the grain of the wood, as, although the action of rubbing across the grain tends to produce a true surface, the scratch marks are more pronounced. For curved work the rubber may be hollow or otherwise shaped to assist in producing the desired shape ns quickly as possible. When glass paper has to be used on small holes, it should be wrapped round a circular piece of wool, a lead pencil, or the blade of a gouge.

The best grade of pajer to use on any particular jub will depend ujon the style of finish and the nature of the material ; but in general a rough grade such as No. $1 \frac{1}{2}$ or 2 will. b) used to commence with, following this with a medium grade like No. M2, and finishing' with the finest. It should be noted that a worn piece of paper is better to use than a new piece, as it does not scratch so deeply and produces a hetter result, being more mellow and pliable and not so harsh in action. Worn paper is always to be preferred for rubbing down coats of paint or varnish.

Giass Paper. How to use a rubber of glass paper

# Glass Ware: For Use and Ornament 

Beautiful Antique and Modern Household Pieces

This article first deals with collecting glass as n hobby, then with modern household sets and pieces, follow'ed by a section on the care and repair of glass, and finally with detailed insiructions for dainting on glass. The entrics on separate artiales such as Decanter; Finger Bowl; Vase: Wineglass, should be consulted, and also those on Flowers; Table Laying

The glasses used in the 17 th century were light and thin, never quite pure white nor of brillinnt lustre. They were mninly either of Venetian makie adapted to English patterns or were made in England by Venetian workers or under Venetian intluences. Towards the end of the century the English makers dis. covered or introduced a stronger kind of glass.
In the early part of the 18th century, glasses with narrow funnels and bowls with round bares were in use Thesc were succeeded by pirces with drawn trumpet shaped bowls and thinnish stems, and in little later appeated the glass with a plain bowl on a straight stem, which stem soon became quite a long one. These long.stemmed glasses, made sometimes with one small knop in the stem, appear to have been the commonest type for tavern use during the second half of the

Others tonk the form of goblets on shortish stems : thesc were of ribbed or plain glass, with square bares to the howls Some ol them, it is interesting to learn, were provided with lids, the reason being that in those days beer was often drunk when hot. The ordinary ale hlass held rather less than half a pint, but some were larger.

Cider glasses, which came into use in the middle of the 18 th century, are very rare, and therefore good specimens are valuable. The bowls of these are usually atraight sided, alnost rectangular in shape. Some of them are finely engraved, the design slown being usually apples, apple-trces, or cider barrela Their size varied considerably Mead glasses are equally rare Here the howl is generally incurved and it stands on a short, strong stem. They were usually made in coloured glass

Another special kind of glass was introduced about 1700 to hold punch. The earliest used for this purpose appear to have bcen narrow funnel glasses with a slight collar. Afterwards stemless glasses of the type immortalized by Hogarth and named after him were used for this drink (see Fig. 2). Later, tall glasses with extremely small howls and thin stems came into use for punch, and these re. mained in favour until nearly the end of the 18th century.
The art of glase cutting, rarely practised before 1740, was hrought from London to Stourbridge about

8th century, although those with wide funnels were employed side by side with them. A knop is a rounded protuberance.

There were other kinds of glass that have value or interest for the collector. Prominent among such is glars made especially for the Jacobites after 1688 and during the $18 t h$ century. used for drinking at their gatherings Examples of these are shown in Fig. 1. Most of these glasses are engraved, the engraving taking the form of reference to the Stuart family; for instance, the word Fiat, and various emblems such as the star, the rose with two buds, the oak leaf, and the thistle, associated with the royal exiles.

Of kindred origin are the glasses made in honour of William III and the battle of the Boyne. These date mainly from the middle of the 18 th century, but were reproduced after that time. The earliest of them are decorated with a portrait of the king, either as a bust or as a full figure on horseback. Other glasses are adorned with the words of a toast in honour of King William, words of contempt for his enemies being added in some cases.

In addition to these there are a number of special glasses that appeal to collectors, on account of their beauty or rarity, or both. 1'rominent among these are the ale glasses which were used for drinking ale or beer in the 17 th century. One variety had very widemouthed funnels, ribbed or plain, with short stems and large conical feet with wilted edges.
the glass by improving the colour purity and increasing the light refraction In old Irish glass the large percentage of lend oxide was responsible for the bluish tint and metallic lustre, which, though admired and sought after to-day, was reckoned by the makers $t o$ be a fault.

Wine Glasses. 'l'he tive main periods in the listory of English wine glarses are illus. trated in Fig 3 baluster stems dating from 168); the simpler knopped and plain stems from 1730; the transparent air twists in their many artistic and diverse variations starting about 1740 and extending to $17(00-1770$, the opaque white spiral stems from 1750-1760: and lastly the cut or laceted stems, early examples of which are occasionally met with, but whiclı generally were not in vogue until 1780 These extended to 1800 and a little later, glasses made after this date ceasing to be of interest to the collector proper.

The five main types of bowls found in wine glasses are shown in Fig 4. They are drawn trum pet; bell; straight sided ; ogee ; and double ogee Changes in these shapes frequently occur, and Fig. 5 illustrates six
 examples o

Tig. z. Horarth Giass. Eipht eenth century trnmpet shapos glass with buttonlike stem Geor

A good plan in collecting is to commence by getting typical examples of the various periods. When each main perind is illustrated, progreas can be made by representing each characteristic shape in the bowl of the glass. Endlesa forms of specialization will suggest themselves If it is out of the question to excel in each section, much pleasure can be ohtained by taking a certain type. such as double ogee glasses, and by paying special attention to the particular form. and embracing every opportunity of adding specimens that show some different feature, in time a section may be completed illustrating the evolution of the type from its earliest inception.

A collection of the many varieties of the opaque twist wine glasses is an interesting pursuit. Combinations of these stems are

Courlest of Cecil lravis

decorated in the Chinese fashion with figures, flowers retc., in brilliant enamels reminiscent of oriental art. Millefiori glass paperweights are a study in themselves. The rare ones are the dated examples. The dates invariably found are 1847, 1848, and 1849, and these particular examples show quaint animal decurations. Thesc were made at Bristol, and many artistic specimens in festooned patterns of great variety occur Largor specimens showing less originality of design were made at Stourbridge, as were also ink-hottles.

Cameo Glass. Another variety of glass which is increasingly popular is the cameo glass, invented in England by Apsley Pellatt in 1819. Portraits and other decorations composed of chinn clay are encrusted in panels, on the sides and in the interiors of decanters, vases, plaques, etc., and these medallions present a brilliant surface, which is, morcover. impervious to the effects of nge and wear. A selection of these pieces is shown in Fig. 9. Similar cameo pieces were made in conteniporary times by the lirench and Bohemians, lut the English specimens are the liner in quality, and with their silvery appearance at once attract attention; the larger and more impurtant specimens of these are usually of Eng. lish matio.

French examples of the Legion of Honour and other Orders are to be found in enamelled colours encrusted in

## With regard to the carly pieces, great care the glass in the same manner.

has to be excrcised. for even in the early days continental copics of tine l rish glass were made, and they are atill copied, and sent over to trap the unwary. The early factories copied each the fine bluish metal that collectors of to day engerly seek and to sulnatitute white metal of greater brilliancy. This they succeeded in doing about 1815 , "hen the glittering step.cut pieces were first made. This glase was almost metallic in its brilliance, and the object of this manner of cutting may have been to simulate silver"are on the table. After this date, English and Irish
 other, nnd, except for the rare examples that are im. pressed on the hase with the name of the maker and factory, no one is able to assert positively the source of production

Old Coloured Glass. Anongst other varieties of old glass, the self.coloured Bristol blue. nmber. and purpleglass commendsitaclf to some, as well as the many shapes in small early cream jugs, bowls, etc. Freak pieces in the shape of hoots, hats, hellows, weather glasses, miniature animals, puzzle glasses, ctc., npieal to those who wish to collect curiosities. The splashed and striped Nailsea is of interest to those who like colour, and a cabinet of the quaint wine llisks makes a room gay even on a dull Novenber day, for the blues, pinks, and purples are of the brightest. The two Nailseal factorics near Bristol were famous for loottles, jugs and
metal and designs are very similar, and The beautiful it is impossible to assert definitely the opaque white nationality of such pieces. The tendency Bristol glass of was to increase the detail of cutting. Thus early period is made the bolder diamond cutting gave place to of such density that strawberry diamonds and fine and close at first sight one cutting, as shown in Fig. 7. In 1850 glass imagines the piece had to a great extent lost its simplicity of to be of porcelain. outline, and in the Great Exhibition held in An example of a London in 1851 the glass wares of Bohemia candlestick is and the European Continent were closely shownin Fig. 8. Courlesu of Cecil Davis

Caring for Glass. To water, the only possible cement is that made clean glass it should be with white lead or Hake white, which is white washed in warm, soapy lead in a pure and grit-free form This cement water, rinsed in cold is not affected by wates. either hot or culd, or water, and left to drain by chances of temperature. The white lead is before being dried and obtainable at any oil and colour shop, and the polished with a special Ilake white from an artist's colourman

The lead is spread evenly over the broken surface in order to cover every angle and crevice. The two surfaces are then pressed firmily together, squeczing out any excess cement. The mure thoroughly this is done the less the line of repair shows on drying. Only a very tine film of cement should be lelt, just sufficient to hold the pieces together. Any excess nust be removed hefore it hardens.

Two other cements are useful, but they will not stand very hot water. One is composed of a little white of egg mixed with enough plaster of Paris to make a thin creain, and spread on the broken surfaces before it can harden. Another cement consists of । oz. of g!!n noncin dissolved in water, strained, and mixed with as much plastar of P'aris as will make a tlin cream lBoth these cements must be sparingly used andwell pressed out when the broken sur. faces arc joined to. rether. Thc mended ar. ticle must be putina safe place for the cement to

Fig. 11. Persian alass beaker dating from the 14th century, decorated with paintings in Oriental designs From the Eumorfopoulas Collection
three dara being allowed for the comipletion of the process. Sometimes the weight of the broken pieces of glass keeps them in position. Failing this, two or threc elastic bands can be used, and the article tied up with taje.

Painting on Glass Warc. Painting on glass is a hobby in which artistic training is not necessary, though where talent is possessed it can be well employed by originating beautiful designs. Fig. 11 shows a lovely example of a Persian beaker dating from the 14th century. Such oriental hirds can be copied, or form the inspiration for some beautiful modern designs. Vases, Hower bowls, dessert services, cocktail sets, and similar articles can be ormamented according to individual taste in designs.
If the articles to be decorated are chosen with fairly large openings, a pattern or design, a picture or drawing cut from a magazinc, etc. can easily be inserted and pasted or even held on the inside, and the outline copied on the outside of the glass. Designs may be traced from copies on to tracing paper and affixed to the back of the glass, as shown in Fig. 12. The body of the design can be filled in according to personal taste and the colour acheme desired. The copy is washed off after the painting has been completed. In all cases the surface to be painted nust first be cleansed thoroughly to remove any possible traces of grease. I'his can be done by washing it in warm soapy water and, after tinsing in cold water and drying, by lightly sponging with methyIated apirit and allowing to stand for a few minuted. Nany plain glass articles can be purchased at a sixpenny store. These will scrie to make experiments on with various

the work unless removed instantly with the point of a pin

A very simple form of glass painting without brushes, which can be done by children and is a delightful indoor pastime, is executed with an Instunta outfit consisting of tubes of colours and rubher stamps with different designs. The latter are charged with colour and pressed on to the glass object which it is wished to decorate Flowers and leaves can be arranged to form groups or borders.

GLAUBER'S SALTS. The chief constituent of many of the aperient natural waters is sodium sulphate or Glauber's salts. They form a useful purgative for chronio constipation, particularly in persons of a gouty tendency, being taken in a small glase of warm water hefore hreakfast. Glauber's salts are often prescribed as a purgative for sufferers from liver troubles, particularly
designs and methods of colouring. Glass painting colours and bruslies can be obtained at a good artists' colourman.

No other prepara. tion of the surface is necessary, and the colours are supplied in bottles or tubes ready mixed for direct application. These colours possess great brilliancy and, at the same time, a high degree of transparency Very little colour need be used to obtain tho best results. The design is outlined in black first befone filling in
with the flat colours.
A No. 1 sable hair brush should be used for this The colouring may be executed with a No. 3 squirrel hair brush. Where shading is necessary, the colour must he put on quickly. The paler ahades are applied first, the darker being superimposed before the first colour is dry. Articles painted in this method dry almost immediately, and can be washed after a few days in warm water and a mild soap without harm. Soda nust not be used.
Should the first colour be allowed to dry, a hard line results. It is better to finish off a bird, animal, or flower separately rather than try to do a group at once. Simple designs are best, us there is less chance of overcrowding the effect. The colours should be lightly put on, or the transparent effect will be marred. A speek of dust or hair from a brush will spoil

Fig. 14. Simple design of lemons and rreen leaves for a lemonade set

gall-stones The dose is $\frac{1}{2}$ to 2 drams, where repeated doses are to be taken ; to $\frac{1}{} \mathrm{oz}$ when prescribed as a single dose. Effervescent sodium sulphate may bo taken in doses of 60 gr or more.

GLAUCOMA. Commonest after middleage, this disease is one in which the natural Huid within the eye accumulates, raising the intra-ocular tension and so stretching the coats of the eye. The disease may come on gradually, without pain, but with a loss of visional acuteness. On the other hand glaucoma may be found as an acute condition. Warning may be given of its imminence by a rapid loss of power to read small type, and by the appearance of coloured halos round lights, combined with dimness of vision An immediate operation is necessary. See Eye.

GLAZE. Meat glaze is very strong meat stock, boiled down until it resembles melted gluc. It is used when rewarmed to give a shiny and sa voury exterior to galantines, cold roast poultry or game, or to brush over raised pies. A small piece of glaze added to soups and sauces adds greatly tu their colour and tlavour. If stored in pots and kept in a dry cool place, glaze will keep for long, though an equally good way of preserving it consists of pouring a little "armed clarified butter or mutton fat on the surface and allowing it to set. To prepare glaze, put the strained stock into a
saucepan, and hoil it quickly till only about a quarter of it is left. In the meantime keep it well skimmed. When it has cooled slightly. pour the glue-like liquid into a clean pot and leave it till it is cold and hard. Eight quarts of stook will yield about $\frac{1}{2}$ pint of glaze.
Glaze for Vienna bread is made hy boiling a hout $\frac{1}{2}$ gill of milk with a piece of butter the size of a walnut. This liquid is then brushed over the bread and dried off for a moment in the oven. Sugar-glaze for buns, etc., is mado by hoiling 1 tablespoonful of white sugar with 3 tablespoonfuls of water for 2 or 3 min . It should then be brushed over the baked buns and dried off in the oven

To make egg glaze for pies, sausage rolls, meat patties, etc., beat a raw egg well, add 3 teaspoonfuls of cold water or milk, and brush over the surface of the pastry before baking it. See Bread; Galantine, etc

GLAZING: In Upholstery. Glaze of the right kind belps to prolong the life of certain fabrics, c.g. chintz and window blinds, by reducing their liability to hold dirt, thereby avoiding frequent washing. Glazing stiffens chintz, and is effected in course of manufacture by the use of heavy calendar rollers under a pressure of many tons.

Machines fitted with a flint polishing tool are used by dry-cleaning firms to rub a polish on loose oliair covers. To apply similar pressure by hand would be exceedingly laborious: the more practical method is to use heavy, heated irons, after starching the material with the addition of starch glaze. The latter can be made with three parts paraffin wax and two parts stearin, melted together, and this is boiled in with the starch, or applied lightly to the article with a cloth before starching.

Glaze that is produced solely by heat and pressure without the aid of starch disappears on exposure to moist air.

GLOBE AMARANTH. A half hardy annual with "everlasting" llowers of various colours, most suitable for cultivation in pots in the greenhouse. The hotanical numo is

Globe Daisy. Blue flowers of one of the varieties suitable lor the rock garden. See article below
gomphrena globosa. Seeds are sown in warmth under glass in February-March; the seedlings are potted singly in small pots and subsequently into others 5 inches wide in a comport of loam, leaf-mould and sand. If the Howers are cut before fully open they last well and are useful for vases indoors in winter.

Globe Artichoke. See Artichoke.
GLOBE DAISY. Known botanically as Globularia, this small genus of shrubs and herbs is suitable for the border and the rock garden in light lonmy soil. The species usually grown are cordifolia; a trailing dwarf shrub; nana, a low trailer ; nudicaulis, herbaceous, 6 in . high (alba, a white variety); and trichosantha, glaucous, 6 in . high, herbaceous. All have rounded heads of blue or purple-blue flowers. Propagation is by division in September or hy sowing smeds in a frame in spring. See illus. above.

Globe Elower. See Trollius.

GLOBE THISTLE. This is an attractive bardy plant with grey-green spiny leaves and round heads of thistle-like summer flowers of a shade of blue. They are easily grown in ordinary soil in a sunny position. One of the best is Echinops ritro, 3 feet high. The globe thistles are increased by division and by root cuttings in autumn or by sowing seeds out ol doors in April.

GLORIOSA. This genus consists of handsome hothouse bulbous plants belonging to the order Liliaceae. The best and most noteworthy, $G$. superba, known as the Malabar glory lily, is a very showy climbing plant which bears orange-red flowers in summer The bulbs are planted in spring in large pots filled with a compost of loam, peat, and sand Warm, moist conditions are necessary to encourage free growth. As the leaves fall, watering must be discontinued gradually ; in winter the soil should be kept dry. Propagation is by secds or by removing small offset bulbs. See Bulb; Flower Gurden.

Glory of the Snow. This is another name which is given to the Howering bulb known as chionodoxa (q.v.).

GLORY PEA. Also known as clianthus or the parrot beak flower, the glory pea thrives under cold greenhouse treatment in a compost of loam, peat and sand, and is useful as a basket plant. Dampieri, the best known species, may be raised from seed or cuttings under glass in spring. It is not an casy plant to manage. Puniceus, which bears crimson blooms, is also very showy. It is nearly hardy, but the best results are generally obtained when it is protected by glass.

GLOUCESTER CHEESE. Gloucester cheese, one of the principal British varieties, is milder than Cheshire cheese and for toasting purposes is one of the best. In shape flat and circular, it weighs from about 22 lb . upward. Double Gloucester is made of the whole mills: single Gloucester is made of skimmed milk, or nilk deprived of half its cream. Sec Checse.

GLOUCESTER PUDDING. These little batter puddings are made by creaming together $\ddagger \mathrm{lb}$. each of butter and sugar and two eggs. To these ingredients add 5 or $t i$ blanched

Globe Taistle. Hiut nowera and grey-green leaves ot Echinops ritro, a lavourite herbaceous border plant
and pounded bitter almonds and $3 \frac{1}{2}-4 \mathrm{oz}$. of fine llour. Beat all to a light batter; then pour it into some cups, half filling them, and bake the puddings in a good oven for about 25 min . They should be served with a sauce made thus: Melt a lump of butter about the size of a small cgg in a saucepan over the lire, mixing in smoothly half a tablesponnful of Hour. Move the pan to the side of the fire before adding a little less than a breakfastcupful of water; then replace it, and stir its contents until they are boiling. Put in a heaped tablespoonful of sugar and $\frac{1}{2}$ gill or $=$ little more sherry, and continue boiling for a few minutes before serving.

## Gloves: For Men, Women and Children <br> How to Choose, Repair and Make Them

In conjunction with this article, such entries as Chamois Leather: Dry Cleaning; Knitting; Leather; Mending may usefully be consulted

Leather gloves are made from a variety of skins, including kid, goat, sheep, lamb, reindeer, antelope, etc. Kid skin finished on the liair or grain side is known as dressed kid, and that finished on the flesh side is called undressed kid. Cape gloves was a term at one time applied exclusively to articles made from skins imported from South Africa, but it is now generally applied to all gloves with a nappa finish. Suede is leather dressed on the Hesh side, and mocha is a finish imparted to the hair or grain side, the grain being removed. Chamois is a leather usually from a split shecp skin specially dressed with oil, and makes a glove which is comfortable, and economical because of its washing properties.

Men's Gloves. Styles in men's gloves change very little from season to senson, and there is little ornamentation. For everyday wear the most useful and economical ones are of suéde, chamois, and docskin. These are, as a rule, fastened with one button or one fastener, and some makes are silk lined. More expensive gloves made in the same atyles are of deerskin, buckskin, reindeer, and similar materials. For winter wear there are deerskin and Cape gloves lined either with wool or fur. Others are of beaver lined with coney. Some have elast ic or sac wrists, others fasten with a strap.

For motoring the gauntlet type is favoured. These are of goatskin, bark, tan, nutria, coney, and other materials, and are usually lined with wool. Driving needs a different type of glove. Tan of one kind or other is popular, and nome have double palm and lingers where the friction of the reins is felt. For special evening wear there are white kid gloves.

In purchasing gloves, attention should be paid to quality as well as price, for a sound glove made from reliable skins, and with the best sewings, cannot be obtained at the price at which many cheap varieties are offered. Inferior gloves may split the first time they are put on, and invariably after a short time the stitching gives way.

Women's and Children's Gloves. Fashions in women's gloves change frequently, but usually the alteration is limited to some new form of decoration. White kid gloves, for instance, arc sometimes ornamented with gauntlets in black and white checks or stripes, while a similar contrast is achieved with white on black gloves. Fabric gloves are used both for women's and children's wear, grey, black, white and brown being the colours in which they are generally made.

Gloves of this kind are not so warm as those of wool, but they are cheap and wear reasom-
ably well. Mocha suède gloves, plain, fringed or edged with fur, and those of dark-coloured kid, are popular, while for children's sports and school wear woollen gloves are most usual. The mode of fastening women's gloves varies according to whether they are for evening or day wear. Those for the former лre usually 12,16 or 20 button length and are fastened with 3 buttons, while the latter usually bave gauntlet or sac wrists with short lengths of elastic on to which the wrist portion of the glove is gathered.
Babies' gloves are $k$ nitted so that the fingers are all in one piece and the thumb only is allownd a separate place. This allows free movement of the bands, and also dispenses with the difficulty of making a very small child put his fingers in the right stalls. These gloves arc usually worked with a series of holes at the wrist, through which riblon can be threaded for tying.
Care of Gloves. When putting on new gloves they should not be pulled violently at the wrists, but worked on gradually finger by finger. A glove stretcher may be used if necessary. In removing the glove the rame care should be observed in drawing it off the fingers and thumb, with the use of as little force as possible.
Suede and kid gloves when soileal are best treated with petrol, while stains on silk, woollen or cotton gloves will generally yield to ordinary washing. Petrol cleaning should not be attempted except in the open air or in a room without a fire or other naked light. If the suede gloves are white or of any delicate ahade, the petrol should be perfectly clean and not used beforehand for any other purpose. Pour the petrol into two bowls, placing the gloves in the first to soak for a few minutes. Then put them on the hands, and, in the case of long gloves, draw them well up the wrists and arnis.

Rals then together as though washing the hands and rub the finger-tips of one hand against the palm of the other. Pay upecial attention to any badly soiled parts, and when all marks have been removed peel off the gloves, squecze them well, and then rinse them in the second bowl of petrol. Squecze out the petrol, pull the gloves gently into shape and hang them up to dry. Dark coloured suede or kid gloves may be cleaned in the same petrol, but dark brown or grey doeskin or reindeer gloves generally require double treatment before they become thoroughly olean.

If a dry process is preferred, the gloves should be rubbed with a mixture of equal parts of finely powdered alum and fuller's earth. If, however, they are of white kid or suede. French chalk should be substituted for the fuller's earth. After applying the powder, leave the gloves for an hour or more, then brush and slake them well. A final application of warm bran or oatmeal should le given. White or light coloured kid gloves may also be cleaned with a piece of suft white india-. rubber. Put the gloves on the liands and, commencing with the fingers, ruh the leathes well with the eraser. If the surface of the rubber hecomes dirty in the process, rub it over new blotting paper until it is clean.

When splits occur in kid, suède, or wash. leather gloves, it is useless to stitch the leather together in the usual way, as this will only tighten the skin and cause it to split again. The most satisfactory repair is achieved by working round the hole with a buttonhole stitch, using silk of the same shade as the glove. When this is done, commence a second round, working this time into the loops of the first round of stitches, and continue the operation until the hole is filled. This mend is almost unnoticeable.

Discarled gloves may be worn to protect the hands while housework is in progress, or

Glove. Fig. 1. Woman's chamois reather Rloves of an easy fitting, pull-on snape. Fig. 2. Outline of patterns needed for the chamois leather Rloves. Fig. 3. Woman's auede gauntlet aloves. the fingers may be used as finger stalls in cases round piece of leather in circles and should of cuts, gatherings. etc. Two pieces of tape mensure about in. wide for glove trimmings. should be sewn on to the ends and tied to keep the covering secure Odd bits of old chamois gloves may be stitched together to form a pad for cleaning silver.

Making Gloves. A glove for placing pieces of con on the fire can he cut fiom black velvet or velveteen. To make, place the hand on a piece of paper and draw round it very roughly. A separale thumb covering is allowed, but the fingers are cut in one as for a baby's glove. Allow a generous margin when cutting the naterial and use one lhichness for the back of the glove. and two for the inside. Seam the cut edges together and hind them with tape

Thic skin gloves which arc illustrated in Fig I are of white washable chamois. The lieginner should experiment with an ordinary window lenther to get the correct way of cutting and fitting in the thumb and finger gussets.

1sesides the skin a leather-cutter's knife is required, a glove needle (which is three-sided), llax thread, and a pattern such as that shown in Fig. ?, which can be cut from a pair of old nappa gloves. Drawing pins with glass or cork heads are also required. A leather-worker's punch is an addition to the set, if it is decirled whave a faney gauntlet. A skin 12 in. wide by $2\left(0\right.$ in. long will cut a pair of gloves sizes $6 \frac{1}{2}$ to 7 , and a larger akin that will cut two pairs ja an economy, ns the gussets can be cut from odd corners Examine the skin when buy ing. and sec that there are no thin places that will break into holes when worn Thongs aro cut from a

To cut. place the pattern on the skin in such a position that the stretch of the glove will be ncross the hand Fasten the pattern down with draving pins so that each piece is quitc lant, or the skin will move in cutting. There are six pieces, nud they should all he placed on the skin hefore deciding to cut, so that the best position can he judged for cutting with. out waste, and to get the main part of the glove on the thickest part of the skin, the gussets being cut from the edges of the leather. Cut the straight lines and botween the fingers with the knife, but the tips of the fingers and the thumb gusset can be cut more easily with n sharp pair of embroidery scissors. When the six pieces for the right hand are cut, number them as shown.

The stitch used is known ns jab-stitch or atabbing, and is worked so that the cut edges of the skin are on the right side of the glove. This makes a strong edlge and one that is easy to miend if the thrend wears. To jabstitch. place the two erlges of skin together and puah the ncedle right fhrough the two picces, push hack again about $\frac{1}{8}$ in. nway. This is shown in the illustration (rig. i) with the

## Centre Back of Glove

glovers needle in position. Begin to sew

Fir. 5. Thongs for gauntlet glove. Dotted lines show direction of thong on back of skin. This trimming atarts in centre of gusset
at point No. :3, on to 2 and then 1 (Fig. 2), lollow right round the thumb and hand, setting this part in very carefully so that there are no puckers on one side. and continue the process right moind to point No. 4

To sew the first finger begin at the point marked with an asterisk and sew round the curved top. Take the finger strip marlied 1 and 2, place this in position so that the outward curve nt the centre, which is marked 3 , points to the hack of the hand and the end marked I nt the tip of the first finger. It will he noticed that each onc of these strips is a different shape, and it is important lo number them nccording to the fingers against which they will fit. In some gloves these strips are cut straight, with curves at the ends for the tips of the fingers, hut the centre curve shown gives a better fit, with much spring and much longer life to the glove.

Sew along both sides of the gusset to the point marked 2, which lits against the top of the middle or second finger. Join the other strips betwoen the second and third and third and fourth fingers in the same inanner, the tinal point markel 4 coming at the top of the little finger Now sew lown the outside of the little finger, down the side to where the gusset comes in. Place the gnsset in position, and sew along one side of that to the palm of the glove. and along the opposite side of the gusset to the back of the glove
The back of the glove has three very tiny tucks oversewn with black flax thread, or three lincs of running stitches (the centre one longer than the two side ones) can he worked down each of the three strips. Measure off the seallops with a sixpence or other small coin, pencilling round ono half of it, and cut out with embroidery scissors, then punch a hole in the centre of each scallop. If a straight edge is preferred, punch holes all round about $\ddagger$ in npart, and thread with thongs of tho leather, carrying this decuration right round the glove and up the sides of the gusset. It should be borne in mind that it is not necessary to sew the sides of the gloves helow the wrists if it is decided to thong them.

Gauntlet Gloves. In making women'e gauntlet gloves, such as those sliown in Fig. 3, it is a good plan to cut patterns for two hinnds. ns it is much easier to fit them on the selected skin. Good quality chamois, doeskin, suede, and Firench gloving suede are all suitable. They vary in price, but home-mnde gloves are much cheaper than bought ones, and are not difficult to make with some practice if the direction are carefully followed.

Choose a akin of a size that will cut the pattern without much waste. Before putting down the patterns finally, hold the leather up to the light, and mark all tiny holes or thin places with a pencil. Avoid these when cutting out the gloves. The next point is to deternine the right way to use the skin Stretch it carefully in lisith directions, and arrange that the way which gives the most is across the hand, otherwise the gluves will be tight across the hand and will neither fit nor wear well.

Lay the skin face downward on n hard surface, arrange the patterns, and go round the nutside first. Then lift up the lingers, one after the other, so $n$ s to mark down the side of the next finger to the one lifted up. Tailor's chalk is best for all dark colours, but for chamois a soft leal pencil may he used

If there is only one pattern, reverse it for the other hand. Always try and get a good piece of skin for the thumbs, and sec that the
leather stretches across them. Do not forget to roverse the pattern for the second thumb. Fig. 4. right, shows the shapes of the pieces needed.
Threeguaset pieces are required for each hand, half a clozen small dia-mond-shaped gus. sets for the base of the fingers, and two long gussets for the front of the glove.

Take one thumb, fold the tops togethor, and stitch. using twist. Follow the directions given in making a man's glove. Stitch in the gusset in the same way, but instead of a strap insert a piece of elastic from

the finger, continue and $a_{0}$ sct of four No. 11 steel knitting stitching to the end needlos Cast 52 stitches on the three of the seam. Push needles altogether, in the proportion of 18 the needle through on each of two ncedles and 16 on the third; the inside to the top of the gusset and stitch tho other side down to the base. It is important to make sure that the point 0 on the pattern comos exactly to the point of the fingers.
Do the other fingers in the same way, but continue down the outer side of the fourth finger about 7 in . Insert the end of the strap fastening betwcen the back and front of the hand. Stitch it to the back, and then continue the seam to the end. Trim off any surplus. Fix the steel to the corresponding 2 dots. Trim off the top bar to the small strap of leather by slipping of the glove when the gusset is lixed. Turn up it over the end and folding the two ends round the bottom about $\frac{1}{}$ in., stick it down together. Stitch close to the har and fix it with a little gum paste, and press it. Then to the glove. Put in the front gusset. Begin cut holes round the hem thus made. using a sewing at the bottom and work to the point thonging punch. Thread some thongs from the same skin, as shown in Fig. 5 .
Man's Winter Gloves. A pair of man's gloves in goatskill with fur cuffs, size 8, is illustrated in Fiy. ©. Cut out as explained for a woman's glove. The pieces needed are shown in Fig. 4, left. The stitching "p the back must he done tirst. 'This consists of three rows of stal-stitch. helow the fingers (Fig. 7).

Fold the leather and commence sewing from the top. The tiny ridge of leather made lyy sewing the two pieces together must be as small as possible, and the lines must he kept even. The line betiveen the first and sccond on the rightside

Fig. 7. Stabbing or jabbing stitch used in glove-making pone side, then from the point to the bottom of the other side. Nake the hottom even by turning off any unnecessary pieces of leather.
To put the fur inside the cufis, cut a piece of fur 3 in . wide and long enough to go round the bottom of the glove, noting that the fur is to brush downward. Place the fur
side towards the outside of the glove and stitch firmly all round the edge. Oversew the two ends of the fur together. Turn the top of the glove back sufficiontly, so that the fur can he turned over, and slipstitch the other and inside the glove Do not take the stitches through The fixing of the press-studs
 between the second and third 3 d in., and the half of the stud at the 0 nark shown on the
last one 3 in . Always avoid unpicking. If the strap. Then put the strap through the bar work does not look very flat, press it by leaving it between some hooks.
Sew up the seam of the thumb as far as the hottorn of the short side. Do not fasten off, but leave the thread hanging. Place point $C$ on the glove to point $C$ on the thumb and sew together seam CD. Continue the seam to B, and then on to ahout $1 \pm \mathrm{in}$. down the side of the thumb. Unthread the needle as liefore. Now thread the needle with thic first end left at G , join seam CA and continue $1 \frac{1}{2}$ in. down the side of the thumb. Fit the reniainder of the thumbihole and thumb by placing the edges wgether, taking great care not to stretch either colge. Should tho thumb seens too !arge, as is usually the case, trim off the hole, but on no account cut anything off the thumb. Do this very gradually until the thumb fits well. Continue sewing together, and when ready to fasten off pull the loose end through to the back, also the one which is being worked, and tie the ends together.

Sew the small shaped gussets into the bottons of each pair of tinger gussets, taking care that the point comes exactly in the point hetween them. Then sew the gussets marked 1 and 2 into the glove, the small gussot to he towards the inside of the hand. Begin sewing on the hack at the point up the first finger to a bout 1 in. from the top. 'Trim off the gusset at the top until it fits the middle of the top of
and fix the top half to the end of the strap with the top side of the press-stud underneath, so that when the end is brought over to meet the lower half the stuil will shut properly.

Be careful to put the strap through tho bar before fising the stud top, as this will not go through afterwards. Use good stout glazed thread or fine twist for uewing, and to not use too long a piece of silk. The edges are put together and sewn with stab-stitch, which is simply pushing the ncedle down through the two pieces of leather and bringing it up again, making a tiny stitch. It is not prossible to run gloves togethor.

Knitted Gloves. The pair of man's gloves, one of which is shown in Fig. 8, were knitted with a fairly heavy wool, and are for a size equal to No. 9 in kid. For smaller sizes uso No 13 steel needles instcad of those given. The materials required are 4 oz . of 3 -ply white heather wheeling varn, or the samic quantity of Beehive double linitting wool,

Fig. 8. Knitted glove for a man. Fig 9. Baby's gloves with crochet chain for securing up the sleeves
of the hand, and cast on tour stitches to come between the fingers. making 23 stitches altogether Knit one mund, knitting together the first and second of the six stitches at the bottom of the first finger, and the fifth and sixth of these stitches On the remaining stitches knit 28 rounds then finish of the top like the first finger. decreasing until there are only 10 stitches left, and graft them together.

For the third finger take six stitches from the palm end of the thread. pick up and knit four lonps at the foot of the second finger. take seven stitches from the opposite end of the thread and cast on three stitches, 20 stitches altngether. On these stitches knit 25 rounds, then finigh off the top like the first finger For the little finger take the remaining 13 stitches and pick up four lonps at the side of the third finger, making 17 altogether. Knit 20 rounds, and finish of the top like the ot her lingers.

The thumb can now be finished, so take the stitches of the safety pin and pass them on the needles. Pick up five loops where the stitches were cast on at the back of the thuinb, and $k$ nit one round on all these stitches. In the next mund knit together the second and third of the five cast on stitches. *Knit one mound plain, then decrease again over the two knitted together in the last round, then finish the round. Repent from * once. On the remaining stitches knit 18 rounds, then finish off the top of the thumb like the fingers.
The left-hand glove is worked exactly the same until the first finger is reached. Here take two stitehes to the right of the five cast on behind the thumb, and seven to the left of these stitches. This will reverse the hand, and the rest of the fingers are taken of in the order given for the right hand.

A Baby's Gloves. The linitted gloves shown in Fig. 9 have a thumb piece and the bag shape only for all the fingers.

The materials required are 1 oz . of 4 -ply Beehive Scotch fingering wool in white and a small quantity, about $\ddagger \mathrm{oz}$, of pale blue silveraheen for the edge of the wrist and top of bag, and the surplus for the crochet chain. Use No. 10 steel knitting needles, and work at a tension of about 7 stitches to the inch in width; the wrist portion will measure nearly $3 \frac{1}{2}$ in. wide when measured flat across the double portion, 3 in . across the palm, and 8 in . long from the wrist to the top of the linger portion. A No. 10 bone crochet hook is also required, and lyard of narrow ribbon to match the silversheen.

With the white fingering cast 45 stitches on the three needles in the proportion of 16 on each of two needles and 13 on the third. The lst round is knitted plain. 2nd round : * purl two stitches together, purl two single stitches, wool round the needle and back to front again to make a stitch, purl 1, wool round the needle, purl 2, purl 2 together: repeat from * all mund. There should be five patteris in the round The 3rd round is knitted plain, and the fourth is similar to the second.

Repeat the third and fourth rounds once, and Innit the 7 th to llth rounds all plain. Repent from the second to the lith rounds twice, then knit one round plain, increasing three stitches in the round at equal distances apart by knitting in the front and back of each of three stitches. Work 10 rounds in plain knitting but without any shaping.

In the next round make the ribbon holes for the wrist as follows: *nit one, bring the wool to the front of the needle so that it will pass over the needle when knitting the next stitch, then knit the next two stitches together: repeat from * all round. In the next round the wool that was passed over the needle will be knitted in the ordinary way, thus making a stitch and so forming the hole.

To form the hand, work 12 rounds in plain linitting: then divide the stitches for the thumb ns follows. Jinit the firat stitch, slip the next eight stitches on a asfety pin, and leave them until the hand is finished : cnst oll two stitches and knit the rest of the round Knit 16 rounds on these stitches for the hand, then liegin to decrease to shape the top. Forthe 17th round, knit 1, linit 2 together, knit 15, knit 2 together. knit 2. knit 2 together, knit 15 , knit 2 together, knit 1 ; and for the 18th, knit 1, knit 2 together, knit 13, knit 2 together. knit 2, knit 2 together, knit 13, knit 2 together, linit 1. Continue decreasing in this manner until only 18 stitches remain. Cast off the stitches and, with the silversheen crochet the top together. using a No. 10 bone crochet hnok.

The thumb is made by taking up the stitches that were left on the safety pin, dividing them on to two needles, and with a third necdle knitting up three stitches under the two enston stitches. Work 12 rounds in plain knitting, then knit 2 together until all the stitches are worked off, and with the silversheen work 1 double crochet into each atitch at the top of the gauntlet. Work the second mitten exactly the same as the first, as they are interchangenble on each hand.
GLOWWORM. Where the glowworm appears in the garden, usually on a grasay bank, it should be permitted to remain, for as a grub it feeds entirely upon snails. The male somewhat resenibles in form the common wayside heetles known as soldiers and sailors; the wingless female, the chief light giver, differs little in appearance from the grub. As a rule, she climbs a grass atem at night to make her light more visible to the flying male. The latter often flies into open windows where there is a light. Attempts to establish the glowworms in gardens are often made, but are doomed to failure unless the snail pest is already there.

GLOXINIA : How to Grow. With bell like flowers of innumerable colours and shades, the gloxinias are a family of very beautiful greenhouse or stove-flowering plants. They

Glue. Fig. 1. Applying glue to two surfaces simultaneously. Fir. 2. Rubbing the two edges of joint together. Fig. 3. Cramping un the joint; two
are tuberous perennials, hut are usually raised in the first instance from seed. The seed, which is very small, should be sprinkled in well.drained pans or boxes of light, sandy soil with which a little leafmould is mixed January and February are suitable monthe for sowing.
In an ordinary greenhouse heat, say of $55^{\circ}$ to $60^{\circ}$, the seed will germinate in less than a month, and as soon as the young plants, which grow rapidly, arc large enough to handle they should be pricked out. A change froin a 3 in . pot to one of larger size will be all that is required. Ordinary potting soil of loam and leaf-mould will suit them admirably. They will tlower in summer.
After the flowers arc over gloxinias should be dried off gradually by giving decreased supplies of water and finally keeping the soil dry in winter: the pots containing the roots must remain under the glass safe from frost. In early spring the tubers should be taken out, repotted, and started into fresh growth Gloxinias must be shaded from strong sunshinc. During the summer montlis they need little or no artificial warmth.
Gloxinia tubers are not much gond after the second or third year, but attempts may be made to perpetuate favourite sorts by cutting half-way through the mid-rib of one or more bealthy leaves, when the llowering season is over, and pegging them down to a sandy surface-soil with pegs or hairpins. In the course of time tubers will form at the bases of the wounds, and new plants thus procured may be grown in the ordinary way.

GLUCOSE. Grapes and other aweet fruits contain the colourless syrup known as glucose or grape sugar. It is found in the human body, in the blood and lymph, and in medicine it is added to nutrient enemata, being readily absorbed. Glucose is prepared artificially from starch, dextrin and canc-sugar. It is used in brewing, confectionery and jam making See Diet; Food; Jam; Sugar.
GLUE : How to Prepare. Gluc is an adhesive preparation, often in the form of impure gelatine, obtained by boiling down animal substances such as skin, horns and hoofs. It is mostly either of the cake type, such ns Scotch glue, or purchased in a tube, generally in the form of a patent preparation. Fish glue is sold in convenient form in a tin or tube. Various grades are available. Casein glue employed by bookbinders, is made by dissolving casein in a solution of borax. Dutch, Flanders or Cologne glue is a pale, strong adhesi ve bleached with chloride of lime. Elastic or flexible glue is obtained by combining glue with a preparation of glycerin, glucose, etc.

The preparation of Scotch glue is simple, but unless carried out properly results in par. tial failure. The glue is purchased in the form of rectangular blocks about 6 in. square, and one of these should be loosely wrapped in a
piece ol old paper, and broken into small pieces with a hammer. The contents of the paper are placed in the inner vessed of the glue-pot, covered with cold water, and left to soak for 24 hours at least. The glue-pot is then placed on a slow fire, gently brought to boiling point. and left to simmer until its contents are completely dissolved and ready for use

Glue should be dissolved by gentle heating : $f$ it is allowed to boil for any length of time it will darken, and much of the strength will be lost, and the same applies to reheating. It is, therefore, prudent to mix only such a quantity as will be used up without delay Never put new glue in a pot containing old hard pieces; the pot should be cleaned out, and fresh glue made as required
The glueing up of the parts is best carried out in a warm room, the surfaces to be united being warmed, and the adhesive applied sparingly but thoroughly ( Fig 1) to both surfaces. The two parts are pressed gently together, as in Fig. 2, to squeeze out all surplus glue and exclude air bubbles: the ultimate strength of the joint depending upon the closeness of contact between the two pieces of wood If this is properly done the joint will never come apart under ordinary uses Repeated testinga have shown that the wood itself will splinter before the joint will give way.

Another point is to provide means for cramping the parts together (Fig 3), as the joint should be kept in firm contact until the glue sets hard, and 24 hours is none too long for this esmential process. In some cases it is necessary to unite pieces of wood in such a manner that they can be parted without difficulty. This is accomplished by placing a piece of thin brown paper between the faces of the wood while the joint is made. When it is to be severed, the paper can be split and the surfaces cleaned up with a plane, and finally glued together. This class of glue-joint is in considerable demand for curved work, when several pieces have to be shaped, and for some reason separated, before the tinal completion of the work

When any considerable area has to be covered a short stiff brush may he used, hut on delicate work it is better to apply the glue with a thin atick of wood shaved at the ends to form a sort of knife blade.

Patent adhesives, such as the various liquid glues, are convenient for repair work and amall jobs, being applied direct to the joint faces They should be pressed close and cramped, although they set hard in a few hours. Similar remarks apply to most of the fish glues. A glue for metal may be made from fish glue and carefully prepared flour puste in equal propurtions.
GLUTEN. When mixed with water gluten has a gluey consistency, from which its name is derived. Gluten or vegetable albumen is one of the constituents of most cereals. It its weight of water till it is stiff and then continuing the kneading under running water, which washes out the starch

Wheat Hour contains ahout 12 per cent of gluten, and it is to this quantity together with the elastic nature of gluten in the flour that bread owes much of its light and spongy texture. The grains of other cereals, such as oats, rye, barley, that are deficient in gluten, will not by themselves yield a light, porous loaf. Gluten is sometimes used by itself, or with only a very amall quantity of starch, for making gluten bread, or gluten biscuits used in diabetes. See Bread; Food.

GLYCERIN. Obtained from fats, glycerin is a colourless, thickish, transparent fluid which readily diswolves other aubstances, and does not turn rancid or evaporate Consequently it is often used as a means of apply. ing other drugs to skin surfaces, or mucous
membranes. It is also commonly included for its soothing qualities as an ingredient of throat lotions.

Common glycerin preparations are glycerin of boraoic acid, sometimes called boroglyceride, for fomentations; glycerin of alum; glycerin of tannic acid, a useful astringent preparation ; glycerin suppositories, etc. A characteristic quality of glycerin is its power of absorbing water from any moist surface with which it comes in contact

When mixed with an equal part of plain water or rose-water, glycerin forms a good application for chapped hands and helps to keep the skin white and soft Used pure it is generally too irritating. Perspiring feet may be rubbed with glycerin and then sprinkled with borax with excellent results. Shoes that are to be put away temporarily should be rubbed with a cloth dipped in glycerin. This will make the leather soft and pliable and prevent cracks.

GNAT. The mosquito family of insects are also called gnats Many species of this fnmily. which brecds on stagnant water, carry nialaria and others carry yellow fever, dengue and filariasis. They are b!nod-sucking insects and they introduce infection in the act of biting. The common English gnat carrics nothing The irritation following bites may be trated by applying solutions of ammonia, bicarbonate of soda, or juermanganate of potash. See

## Mosquito.

GOAT. As a profitable animal costing little to keep, or simply as a childien's pet, the goat can be strongly recommended. It can be kept where a cow would starve, and its milk possesses high dietetic qualitics A goat takes up little space, and the stall of a disused stable will accommodate two or three lior breeding purposes a male goat should be hired. Goats firat come in season at a few months old, but 18 months is soon enough to put them to a male. To breed from a goat earlier ruins the milk yield

A goat-keeper, unless he has ample space, should kill the kids when they are born, that is to say, if he kceps a goat for her milk, fur the young will take it all ; and, unless of verv good pedigres, kids do not pay to rear. The flesh in tlavour is very like veal. The milk yield of a goat varies grently. An animal that will give four quarts when in full profit is a remarkably good milker, two quarts being nearer the average. Nilking qhould be done regularly twice a day, and the bag thoroughly stripped
The best food for goats in winter, when they have to be kept indoors, consists of leaves, grass, vegetablea, and a little hay and corn Out of doors they can subsist on a hedgerow, eating grass and leaves which would otherwise be wasted; and all through the spring and summer, if there is plenty of such food for them, they nced not cost a jeenny for their keep. They should, however, have some concentrated fond if they are milking. Anyone owning a beavy milker of a good strain will find it pays to feed the animal well in winter, atall feeding, as for cows, on hay, crushed or whole oats, bran and oracked maize.

A goat can very rarely be allowed its !iherty owing to its fondness for barking trees and the inquisitive disposition it manifests towards everything it can reach. It is, therefore, customary to tether it on a rope or chain with a swivel attached to a stout iron pin driven into the ground, moving it to fresh ground every day, or even several times a day. Goats are very hardy. The only thing likely to upaet them is a surfeit of wet greens. They have aversion to damp and heavy winds, and in wet weather should be confined to their stall and given a little hay.

Goat's Milk. Goat's milk is an exceedingly nourishing and valuable food for infants which cannot receive their natural nourishment Both the protein and the fat are greater than
in cow's milk, but there is less sugar than in human milk. An important reconimendation for goat's milk is that these animals do not suffer from tuberculosis For very young infants goat's milk is too strong If given at all it should be well diluted with water. For growing children it is an excellent and nutritious fond.

The following notes are taken from Leaflets $30 f$ and 383 issued by the Ministry of Agri culture :

Goat's milk is as sweet and palatahle ns cow's milk, richer in cream, and more easily digested Butter niade from it is white, anil may be coloured with nnnatto. Soft and hard oheeses of excellent quality can be made from the milk Two points to note in milking are that it should be done at reqular intervaly and done quickly, as the goat becomes impatient if the operation is delayed. The milk should be strained through a clean butter-cloth and stored in a cool place All utensils must be kept scrupulously clean by scalding with boiling water, and the hands should always be washed before milking.

Feeding the Goats. For feeding purposes the best receptacle is a metal pail. Variety of food is essential, but there should be no waste. Food of anv sort should never be placed on the ground. as the goat will refuse to touch it if it is in the least soiled or tainted Cabbages and similar green food should be hung up by the roots Hedge clippings, garden produce o all kinus. acoms, roots, weeds such as dandelions, sow thistles, and docks are all caten by goats ; but everything must be perfectly clean and sweet, or they will reject it. Milking goats may have two or three handfuls of corn or cake daily, and when the lactation period extends through the late autumn or winter months, some concentrated food such as grain, ineal, or cake is necessary if a satisfactory milk yield is to he obtained Mangolds and swedea may be given, cut in half and placed in the manger, or sliced or pulped and sprinkled with bran or middlings Good, sweet hay should form the staple food for winter

Dyed gaat fur is a cheap and pupular substitute for bearakin. It is used largely for trimmings, white 'Thibet goat providing an attractive decoration for evening wraps and cloaks See Fur

GOAT MOTH. The caterpillars of the goat-moth bore galleries in the stems of many trees. and render the wood of little or no use

Goat Moth Toe caterpillars attack tree stems by boring, thus rendering the wood useless for practical pur poses. The odour of the caterpillars and their burrowe has been compared to that of the goat The moth, which Hies at night, is large and plump, the female being $1 \frac{t}{2}$ inches long or nore, with asw-like antennae, brown winge mottled with grey and black, whitish rings on the abdomen. The caterpillar meas ures up to 4 in . in length, and more than 100 have sometimes been taken from one stem
Prees which are hadly attacked and are of no great value should be cut down and the larvae destmyed. When a tree is only slightly atiacked, or when it is of special value for shade or ornamental purposes, the following methods destroying the pest are recom mended in Leatlet No. 60 issued by the Ministry of Agriculture. Snıall quantities of
carbon bisulphide may be injected into the holes in the trunk, or small picces of potassium or sodium cyanide may be pushed into the holes. Whichever poison is used the holes must be thoroughly blocked with clay immediately after the "peration is completed.

## Goat's Beard. See Spiraca.

Goat's Rue. This is a variant name tor the perennial better known as the galega ( $\varphi$ v.)

GO BANG. This indoor game is played by two or four persons. The requisites are a board marked like a chessboard into 400 squares, 20 along each side, and 400 pieces. each 100 being a different colour. They are divided between the players, each taking 100 or 200 a a the case may be. The picces are all outside the board at the start, and each player in turn puts one on to any square he likes, provided it is unoccupied. The object of the game is to get five pieces in a straight line, straight in any direction, and the player who succeeds in doing this lirst wins.

A variant of the game is to place the pieco on the brard in turn as in the previous game, and to endeavour to surround an opponent's piece with thein. The piece which is surrounded is then talien from the board. The game continucs until all the pieces have been placed on the board, and the player who has then surrounded the larger number wins. Go Bang is also played on a board of 301 squares, 19 along each side. In this case 362 ccunters, or men, are used.

GODETIA. One of the most beautiful hardy annuals ; seeds are sown out of doors in spring where the plants are to bloom in
 summer. If sown in pots in Scptem. ber and grown in a slightly heate il greenhouse they will flowerin spring under glass. Thero are innu. merable tall and dwarf varieties with single or double flowers. The former as re sold chiefly by colour. Of the latter varicties the Azalea. flowered Lady Albemarle and Duchess of Albany are some of the best for the garden.

GODPARENT. Alternatively known as sponsors, these are the persons who, when $n$ child is baptized, make certain promises on its behalf and undertake that it shall bo taught the Christian faith. Godparents exist in the Church of England, the Roman Catholic Church and the Lutheran Church, but not among the Presbytcrians, W'esleyans, and other bodies. The Church of England ordains that each male child shall have at least two gol. fathers and one godmother, and each feinale child two godmothers and ono godfather.
GOFFERING. This is a laundry process, applied as a finish to lace, cambric. and embroidery frills and producing a fluted effect. It is used mainly for frilled pillowcases and muslin curtains, servants' caps and apron borders.
The goffering irons are made in various sizes for conrse or fine needs, ranging bet ween wide

Goffering Irons The patient feasible remove to another district if this is be builed, as the disease is duc perhaps to some poison or germ in the water.

The development of a simple goitre has some relation to the supply of iodine to the tissues of the body. The secretion of the thymid gland contains an organic preparation of iodinc, and the most obvious explanation of a simple goitre is that it represents an increased effort to maintain or increase the supply of iodine to the tissues One method of preventing the disease is to give small doses of iodine regularly. The administration of thyroid extract has proved successful in some cases, but this pewerful drug should never be used except under medical observation. See Exophthalmio Goitre: Gland.

GOLD : Marks and Qualities. It is com. pulsory for certain articles of gold to bear a hall-mark if they arc manufactured and offered for sale in the United Kingdom. The chief marks of the Goldsmiths' Hall for gold wares made in England is a lion followed by other letters or marks representing the particular ycar in which the hall-mark was applied, and the initials or registered trade mark of the firm responsible for the manufacture of the article. The principal marks of the IBirminghan Assay Office are an anchor followed by the marks which indicate the quality, the year of manufacture, and the maker.
The different qualities of gold that are halimarked are 9 carat, 15 carat, and 18 carat They are distinguished by the figures on the articles, as follows :

$$
\begin{align*}
& 18 \text { carat gold } \\
& 15 \text { carat }
\end{align*}
$$

The higher qualities of gold are cunsiderably softer, consequently articles which have to withstand hard wear are beat minde in the lower qualities. A 9 carat or 15 carat gold watch albert will wear considerably longer than one of 18 carat or 22 carat. In regard to gold cigarette cases these will wear better in $y$ carat than in 18 carat.

When disposing of old gold it will be found useful in calculating the price per oz. that ought to be obtained to take the average price of gold at $3 / 6$ or $3 / 9$ per carat, and mul. tiply this amount by the quality of the gold, 9 carat, 15 carat, 18 carat, or 22 carat, as the case may be. For example, old 18 carat go!d ought to realize 18 times $3 / 6$ or $3 / 9$, according to the market price. A small loss has to be incurred in the melting of old gold by the refiners

Gold jewelry of the quality 15 carats and upwarda will wear a soft ycllow colour through. out, but lower qualities ase usually gilderl. When new, these are the same colour as 15 carat or 18 carat, but after being in wear the
gilding will wear off and the gold will have more of a reddish tint or bright copper colour. This is not in any way detrimental, but it frequently causes the ouner to conclude that the article is not real gold. In the alloying of lower qualities of gold the base metal has the effect-of making it a reddish yellow colour, and it frequently happens that the colour of 9 carat gold appeary like bright copper before it is gilded and polished.

For cleaning gold there is nothing better than a paste of water and ordinary powdered rouge. This is brushed on to the article, or if the ornament has a sinooth surface the paste can be applied with an ordinary leather. A bright polish is obtained quickly. If any of the paste remains it can be removed with a damp brush No moist rouge paste should ever be allowed to come in contact with any stones such as pearls, turquoises, ctc., which inight be set in an article of jewclry; nor should any water or moisture be applied to any such articles, as this would discolour pearls or turquoises. For cleaning gold, jewelry, or ornaments set with stones other than diamonds, it is essential that $\pi$ stiff brush with dry powdered chalk should be used. See Brooch : Carat : Jewelry: Ring.

GOLDEN BUCK. Cheese and poached eggs are the main ingredients in this American recipe. To make it, put $\frac{1}{2}$ pint of inilk into an enamelled saucepan over the fire, and when it boils add $\frac{1}{\mathrm{tb}}$. of grated cheese, it teaspoonful of salt, and $\&$ of pepper. Stir the whole until the cherse has melted. and with it coat, 6 rounds of hot buttered toast. Place a prached egg on the top of each, dust. them with a little pepper, and serve them at once.

GOLDEN DROP. The name of golden drop is borne by a small family of hardy perenninls known technically as Onosma. They are excellent for the rock garden in thoronghly drained sandy loam, and may be propagated by seed or by cuttings. The plants should be covered in winter with pieces of glass, raised 2 or 3 in . above the plants by wire pers. The favourite kind is Onosma taurica (echivides). 8 -10 in., with golden ycllow flowers in summer

Golden drop is also the name of one of the best known varietics of plum. Se.e Plum

GOLDEN EYE. There are about a dozen British species of the delicate four-winged insect variously known as golden eye, lacewing. fly, and stink-Hy, but they bear so close a likeness one to another that the differences are evident only to experts. In the larval stage they feed entirely upon other insects, and these are usually some species of aphis or their near relations, which they suck dry, certain species piling up the empty skins on their back.

The eggs on their hair-like stalks may be seen standing like a cluster of pins on a roseleaf, and should be respected always. Each larva accounts for many aphides every day, as a few minutes' observation of its method will demonstrate. At the end of its scrvice it spins an egg-shaped cocoon in which it passes the winter: emerging next spring as an active pupa, it at once assumes the winged form. All the species should be treated as friends.

## Golden Feather. See Feverfew.

GOLDEN FERN. So called because the undersides of the fronds are eovered with a golden, powdery substance. Gymnogramme is the chief kind. See Fern; Gymnogramme.

GOLDEN PUDDING. Wash $\frac{1}{} \mathrm{lb}$. sultanas, dry them thoroughly in a cloth, and remove the stalks. Mix $\frac{1}{2}$ a level teaspoonful of bicarbonate of soda with 6 oz . Hour, and sieve them into a basin. To these ardd 6 oz breadcruinbs, 6 oz . chopped suet, the fruit, and a little grated nutmeg, and mix all well.

Whisk together a beaten egg and 6 oz. golden syrup and stir them into the dry
ingredients, with officient milk and water to make a fnirly soft dough Turn this into a greased basin, cover it with a greased paper and a floured pudding cloth, and steam it for 21/-3 hours.

GOLDEN ROD. A vigorous, linedy, her bacenus perennial which bears showy yellow Homers in late suminer and early autumn It flourishea in ordinary soil, in sunny or shady places, and spreads quickly. Propaga tinn is effected by division cither in autumn or spring 'The best is solidago Golden Winge, fs fect ligh.

GOLDEN SAUCE. This sance is made by boiling ingether for 5 min . 1 gill golden syrup, $\frac{1}{2}$ gill water, and a tablosponful of lemon juice

GOLDEN WEDDING. This term is applierrito the completion by both parties of 50 years of married life. Custom decrecs that presents given on such oceasions shall he of gold.

GOLD FISH. As n rule this heautiful cnrp is kept in a relatively small glass bowl, where its lidless cyes ennnot macape from the constant glare of sunlight or elect ric light, and where it is expected to thrive with little or no fool. It ahould be liept only in ornamental ponds or in aquaria proportionced to its size, with growing water plants which will nfford it shade and partial food Other food may include blondworms, very small earthworms. and crumbled biscuit Any unonnsumed lood should be removed. If gold tish are kept in a nond the Intter should have some protcction from frost in winter, a few boards laid across one end being usually'guflicient See Aquarium.

GOLD LACE. Fancy gold lace made in a manner similar to silk or cotton lace has been used as a trimming since ancient times, and there are periodical revivals of fashion for the article. Such lace need not be thmwn nway when tarnished. The original

colour can often be restored by brushing the lace gently with a soft hrush dipped in methylated spirit; the work is made much easier by first tacking the lace down upon calico.

An alternative method of freahening gold or gold and silk lace is to soak it overnight in weak acetic acid or even in white vinegar. The lace should then be gently washed in

Golden Rod. Flower sprays of a bardy perennial which is suited to a larke garden
tepid water with plenty of good soap, and it may be dricd by pressing it lightly between soft cotton cloths. If it is desired to stiffen the lace after wrahing, a dip into a weak solution of clear white gum arabie will give entisfactory results

GOLD-TAIL MOTH. In the southern and middle districts of England the caterpillars of the goldfail moth are $n$ pest. Fecding naturally upon hawthorn and various foreat trees. they show a fondness also for pear, apple nad plum trecs, likewise roses. The moth is a heautiful creature, with pure white antiny wings which, in the female, have a spread of $1 \frac{3}{3} \mathrm{in}$. The male is smaller and his forewings have a black spot. sometimes two spote. near the hind margin.

The body ends in $\Omega$ Huffy tuft of vellow, which the female uses for thatching hor batch of eggs. Thesc are laid in July or lugust, and soon hatch: the young caterpillars spin n web at the forking'of two twigs

Goll : the Midret rame. Floe pieces, selected from a set of nlne, sbowing variois bazard in this amusing rame. midget golt can be plaged either indoors or on a lawn Courlesy of A. W. Gamaye. Lid
in which they rest for the winter In spring they come out to feed. They are black in colour with a bright red stripe along the back divided by a thin black line: and there are tufts of fine black and grey hairs. Late in May it apins a cocoon. The moth emerges in July or the end of June.

The gold-tail moth should be looked for in July. when it will be found reating quietly all day on leaves. The winter nests of the caterpillars, usually not far apart, may bo seen on the bare twigs, and the awakened caterpillars may be seen sunning themselves on these nests in spring. Hand-picking :nd destruction is employed in cither case.

The very amilar brown-tail moth is re atricted in Britain almost to coast districts in Kent and Sussex. See Insectioide

GOLF, MIDGET. Within recent ycars great intercat has heen cleveloped in so-called Midget Golf, which strictly is not n game of golf at all and bears only the remintest relationalip to colf proper. In Anierica particularly Midget Golf had assumed by 1930 the propoitions of $a$ national craze and millions of money were invested in Midget Golf courses for public entertainınent. The game consiats entirely of hitting an ordinary golf ball with an ordinary putter into a variety of holes. the approach to which is made difficult by all sorts of ingenious contrivances.

To thosc unfamiliar with the game the illustrations which we give will explain it sufficiently. In most cases the hall is driven up a short incline, passes through n small opening, thence down into the scoring hole, usually placed in a difficult position. The complete set of holes may be cither 9 or 18 , the 5 which we illustrate being selected from a set of 9 . The obstacles can be laid down in any large room or on a turf lawn and the player has only to putt the hall into the hole as best he can. The one that takes the lowest number of strolies at each hole and has the lowest aggregate of strokes for the course is the winner

Many manufacturers have put on the marliet ingenious Midget Golf sets either constructed of wood or in the cheaper varicty of stout strawhoards, painted and decorated attractively. Such sets can be obtained at all sorts of prices, hut any handyman can construct them quite successfully for hiniself, and persons of inventive mind can very quickly improvise a set suitable for indoor use, as there is no limit to the devices for making entry to each hole difficult.

Much amusement and a good deal of cx. hilaration can be obtained from playing at Midget Golf, which is not to be confounded with Miniature Golf. The latter term describes those small golf courses often to be found associated with residential country hotels. They are laid out like ordinary golf courses, but designed for appiroaching the green by means of $n$ mashie, and they are, of course, outaide the consideration of the ordinary householder, who at most is likely to be able to turn some portion of his garden into a temporary Midgot course litted with obstacle holes somewhat on the lines of those here illustrated. See Clock Golf.

GOLOSHES. Waterproof rubber shoea made to wear over ordinary honts or shoes in wet weather are known as goloshes. Their chief foature is that they have no fastenings, but their elastic tendency allows them to he julled over the shoe, to which they fit closely. They can be obtained in various sizes, and are hard-wearin" if

Ireated with care, and require only an occasional rubbing with a damp flannel to keep them clean See Rubber.

GONG: For Bousehold Use. There is one principal type of gong, and from it most of the existing varieties have developed A round, smooth piece of metal is hung in or to a frame, and is provided with a beater, for which there is a resting place somewhere on the piece. The beater takes the form of a stick or bar, having a ball of some soft material, covered with leather or cloth, at the end that is used for striking.

One type of gong hangs in a heavy frame of oak or other hardwood, the frame, a square one, standing on the ground. A variant of this has an iron frame, while other metals may be used for them. Smaller gongs of the same type are made to stand on tables or other elevations, and are also suitable for use in the dining room.

GONORRHOEA. This disease is very contagious, and may be contracted indirectly from towels, sponges, clothing, etc. Symptoms usually appear on the third or fourth day after exposure to infection, though it may be rather earlier, or not for 7 or 8 days. The result of the widespread misconception as to the seriousness of the disorder is that ton frequently proper medical advice is not obtained. or if a doctor is consulted his directions are not carried out properly. No person who contracts the disease should be content until his doctor, after appmpriate tests, is able to assure him that he is clear of infection. Vaccines have proved very beneficial in some of the cases of joint affection.

GOOD EING BIENRY. The useful vegetable (chenopodium) popularly known as Good King Henry has varinus localized names, including wild spinach and perennial goose foot. The plant has two uses, as spinach by gathering its leaves, or as asparagus by earthing up the shoots

Seed may be sown 1 in . deep in drills 18 in. apart during April, thinning seedlings out to 9 in. in May. See Asparagus.

GOOSE. Anyone owning grass land or living near a common will find it profitable to keep gease, as, being persistent grazers, they need little else in the way of food. Swimming water is desirable when breeding.

Their housing is quite a simple matter, any shed or outbuilding sufficing so long as the roof and walls are sound and the floor dry. The floor must be covered with mugh-cut litter to form bedding material. The goose usually lays its eggs in rough nests in the corners of its house, the bird following her wild protective instinct by covering her egg with litter when she vacates the nest after laying. In breeding, well-grown geese are usually mated with a well-matured gander, and hatching may either be effected by a goose or a hen. The former. which will only sit on the neat she is accustomed to lay in, may be entrusted with from 10 to 12 eggs, but if a hen is used she will not be able to cover more than four. The period of incubation varies from 28 to 30 days.

Goslings are the easiest to rear of all poultry. Their first food should consist of hard-boiled egg, chopped up finely and mixed with biscuit meal, to which a little water or skim milk is added to moisten it. After a couple of days the egg may be discontinued and the birds placed upon a cheaper and plainer diet.

Wheat is a most useful food for goslings, but it should be given scaldel, not raw. A good method is to scald it for some hours, drying it off with ground oats or barley-meal. Ground oats, barley-meal, and toppings are all useful foods, either singly or mixed in equal proportions. When the goslings are eight to ten weeks old whole grain may be given, preferably wheat, and some bone-meal should be aulded
 breed, Vory popular in England. Above, dark grey Toulonse goose
hours. When it is ready for serving, take out all the skewers, lift it on to a hot dish, and hand with it some good gravy and apple sauce.

To braise a goose, pre pare and truss the bird as for roasting, and dust it over with a little flour. Melt 2 oz. margarine or bacon fat in a saucepan, and when it is hot put in the goose and brown it all over. Add a carrot, 1 or 2 sticks of celery, a sliced onion, a bunch of herbs, 1 gill white wine, 10 peppercorns, and a little salt. and cook the whole for a few
to the food. Green food, too, is necessary until they can forage for themselves.

To fatten geese for Christmas they should be confined about a month beforehand to a shed, preferably one with an open front covered with wire netting, and fed liberally on a diet consisting of barley-meal or Sussex ground oats for soft food, and barley or other good grain at night, greenstuff being supplied liberally. The goose is a long-lived bird, not arriving at maturity until its third year, and often reaching the age of thirty, but its period of usefulness does not extend beyond eight years.
Geese will continue to produce eggs profitably until an advanced age, and instances are known of geese 19 years old which still continued to lay an average of 55 egga each per year. For hatching purposes the eggs of mature birds are more reliable than those of young stuck.

How to Cook. The best way of cooking a goose is to roast it ; but geese ard also braised. To roast one, prepare it as for duck, singe it thoroughly, and then fill it from the tail end with sage and onion stuffing. Fold the skin over the opening and keep it in place with a small skewer. Turn the flap of skin at the neck under the body and fasten that in a similar manner. Truss it in the same way as a duck, tie a piece of greased paper over the breast, and roast it before a clear fire or in a quick oven, keeping it well basted. About hour before the bird is cooked take off the paper so that the breast may brown. A medium-sized bird should take from 11-2
minutes until the wine is reduced by half. Pour in enough stook to cover half of the goose, and cook over slow heat.

The time taken in cooking depends upon the age and size of the bird, but from 2-2 $\frac{1}{2}$ hours is usually required. Baste the goose occasionally with the stock, and when it is ready turn it on to a hot dish. Pour the liquid into a amaller pan, reduce it, and when it is of a rich brown colour skim it, pour a little round the goose, and serve the remainder in a sauceboat. Apple or cranberry sauce should accompany lraised goose. See Carving: Duck: Fowl; Poultry.

GOOSE : The Game. Known as the royal game of gorse, this is sometimes called the race game. To play it the figure of a goose should be drawn upon a piece of paper and divided into 63 eections, which are numbered. If desired, any other number can be chosen, but 63 is the usual figure. A draught-board or any piece of paper can be used instead of a gooso. A pair of dice and a dice box are also necessary, but no particular number of players is needed.

Each player has a counter. In turn each rattles the dioe, and according to the number thrown he moves his counter along the goose. The object of the game consists in exactly reaching the 63rd partition, and the player who does this first wins. For instance, if a player has reached the 56th partition he must throw 7 to finish. If he throws more, e.g. 9, he must go back 2, and this continues until he secures the number that carries him cxactly into the 63rd division.

## Gooseberries from Garden to Table

## The Cultivation and Cooling of this Useful Fruit

For other information on the subject of fruit culture the reader is referred to the articles Frult; Grafing: Kitchen Garden : Pruning; anol those on other fruits, e.g. Apple: Currant. See further Botling; Insecticide; Jam; Spraying; and the entries on Magpie Moth and other pests
This is the most useful of the bush fruits, for soil. An annual top-dressing of stable or under fair treatment it crops well and farmyard manure in February is beneficial. regularly, and the fruits are valuable both when green and ripe. Botanically it belongs to the same genus or plant group as the currants (ribes): its botanical name is Ribes grossularia.

The gooseberry flourishes in ordinary well. tilled land which is kept in a fertile state by adequate manuring. The bush form is the most profitable, but the single, double and treble cordons are useful for planting alongside a walk in the kitchen garden: they bear exceptionally fine fruits in limited numbers, and in addition the bushes are casily and conveniently managed.

The best time to plant is in November, but planting may be done at any time in mild weather between October and mid-March. The bushes ought to be set at 5 feet apart each way. The uppermost roots need not be covered with more than 2 or 3 inches of

Pruning is an important detail of management. Amateurs often make the mistake of pruning the bushes too severely, with the result that growth is vigorous but the crops are poor. Pruning should take the form of thinning out rather than severe cutting back. The branches ought to be so far apart that the hand can be passed between them conveniently, and to ensure this it is necessary to cut out shoots that tend to crowd the main branches. Parts of the old branches can often be cut out with advantage to make room for young shoots.

The tips of the branches ought to be out off, and branches which are so low down that the fruits would be spoilt by soil splashed up during rainy weather should be removed. The ideal gooseberry bush is one with a stem 8 or 9 inches high. After thinning out is finished the remaining side shoots should be shortened to within two buds of the base of the past
summer's growth. It is usual to defer the pruning of gooseberry hushes and cordons until towards the end of February, because the buds are so linble to be damaged by birds. In many gardens it is in fact necessary to net the bushes Scattering a mixture of soot and line over the branches affords some protection, su also does the practice of tying the branches lonsely together.
The pruning of condon gooseberries is perfectly simple, for it consists merely in shortening the side shoots to within two buds of the base of the past summer's growth. The lcading shoots, those which extend the branches, are pruned so as to leave about 8 inches of the past year's growth.
Cuttings provide a simple way of increasing gonseberrics; pieces of the previous summer's shoots 8 to 10 inches long are inscrted out of doors in October or November: a small straight-backed trench is dug out, sand is scattered along the bottoin and the cuttings are set at 8 inches apart, at least half ench cutting being beneath the soil. All except three or four buds at the tops of the cuttings should be cut out.

These are some of the best varieties of goose herries with large fruits: Red: Crown Bob, Lancashire Lad, Whinham's Industry Green Plunder. White: Careless, Shiner. Yellow Keepsake, Leveller. With small fruits: Red Ironmonger (first-rate for jam), Keen's Seed ling, Wrirington. Green: Langley Gage. Green Gascoigne. Yellow: Golden Gem, Ycllow Sulphur White: Whitesmith

How to Cook. In cookery, the gooseberry is employed in a variety of ways, pie-making, stewing, and bottling being among the most common. It is used for making jam, winc, chutney, and many different kinds of sweets, including compôtes, jellics, flans, puddings, etc. The amount of sugar required depends almost entirely upon the kind of gooseberries used, green, unripe ones naturally demanding more than the riper fruit. Directions for bottling gooseberries will be found in the general artiole on fruit bottling: goosebery recipea are dealt with undor their respective beadings.
Gooseberries for use as dessert may be either red or golden, the latter being generally preferred. There are hairy and smooth, varying from the size of a cherry to that of a small plum. For all ordinary cooking ригровен, unripe green gooseberries are undoubtedly the hest sorts to employ

To stew gooseberrics, top and tail them and wash thens if necessary, then put them into an enamelled sauce pan with 3 tablespononfuls of sugar to every pint of the fruit, and just cover them with water. Let then boil gontly until tender but unbroken, and serve them, hot or cold, with custard.
Gooseberry Amber. This sweet is made by melting 2 oz . of butter in a saucepan over the fire, and then adding to it 1 lb of trimmed and washed gooseberries and $\ddagger \mathrm{lb}$ castor sugar. Let theso cook gently until the fruit is reduced to $n$ soft, thick mass, then stir in 1 oz hrenderumbs
previously rubhed through a inire aieve and heat in well the yolks of 3 eggs. Turn the whole in a buttered piedish.

Bake the mixture in a moderate oven for about $\frac{1}{2}$ hour or until it seems set, then beat up the whites of the eggs to a very stiff froth. adding lightly to them 3 . level tablcspoonfuls of castor sugar and a few drops of vanilla essence. Heap this meringue roughly all over the top, and sprinkle a little more castor sugar over all. Put the dish in the coolest part of the oven. and let it remain there until its contents are crisp and pale brown in colour Serve the swoet at once.
Gooseberry Chutney. Gooseberry chutney is made by ohopping finely about 1 quart green gooseberries, ${ }^{3} \mathrm{lb}$. stoned raisins and if oz onion. Put these into an enamel pan, with $\frac{1}{2} \mathrm{~b}$ brown sugar, 2 tablespoonfuls nustard seed, 1 quart vinegar, $\frac{f}{2}$ saltsponnful turmeric, 1 good pinch cayenne, I tablespoonful ground ginger, and 2 small tablespoonfuls aalt ; then heat the wholo slowly, and keep it builing gently but steadily for 1 hour.

The chutney may be atrained through a coarse sieve or left unstrained, and when cold should he put into clean, dry jars, and corked and tied down tightly. It iniproves if kept for n time.

Goosebarry Cream. To make this sweet, tako about 1 lb . or $1 \frac{1 \mathrm{lb}}{}$ gonseberries, top and tail them, and put them into a saucepan with $\$$ pint water and 4 oz . castor sugar. When the fruit is soft ruh it through a hair sieve and addl a squeeze of lemon juice. Then melt $\&$ uz. ge!atine in two tablespoonfuls of water and stir this into the gooseberry purec. When this is quite cold, whip $\frac{1}{2}$ pint oream and mix it lightly in. Colour with a little green colour. ing and put into a mould to set.

Gooseberry Fool. Tup and tail 2 lb goose berries, wash them in cold water, then put them in a pan with olb. sugar and I gill of water Boil gently, and if the saucepan gets too dry add a little moro water, but aa little as possible. When the gooseherries are soft rub them through a wire sicve and measure the pulp. To each pint allow $\frac{d}{d}$ pint boiled custard. Mix pulp and custard well together, sweeten to taste, and serve it in a glass dish or in custard glasses, with whipped cream on top. Either cream or milk can bo mixed with the gooseberries in place of oustard.

Gooseberry Jam. To every pound of green fruit used in making this jam allow the same quantity of sugar and $\frac{1}{d}$ pint of water. P'ut

Gooseberry Cultare. 1. Cuttings with top bads retained. 2. First prunjng of malden plant. 3. Second year pruning. 4. Result alter pruning. 5. Good type of seedling. ©. Bád type with doable stem at root. 7. Good type of bush showing tip pruning. 8. Cordon wilth good lateral pruning

By apecial arrangement with Amateur Cardening
the sugar and water into a pan over the line, and hoil then for hour; then skim the syrup and add the gooseherries. Let the whole simmer gently for about hour, stirring all the time, and thon test the jam on a plate When it is done, pour it into jars and tie them down inmediately.
Gooseberry Jelly. To make this, take two quarts of green gooseberries, which should be washed. topped and sta!ked Two quarta will make a pint of juice, so if more is required moro goose berries can be taken Put them in a preserving pan and just cover them with cold water. Bring thein to the boiland aim mer then until they are broken and $p u l p y$, when they should be strained through n jolly lung or a clean cloth
 ticd on to tha legs of an inverted chair. After this has been done, they should be left to drip overnight into a bowl
The juice should he measured and put into a clean jar uith I lb of loaf sugar to each pint. Stir it until the sugar has molted ; then boil it fast for about 20 minutes, until the jelly sets when tested. Keep it well skimmed, after wands putting it into small pots, which should be covered in the same way as jam jara

Gooseberry Pudding. A boiled gooseberry pudding large enough for 5 persons can be made by sieving together $\frac{1}{2} \mathrm{lb}$ of llour, $\frac{1}{2}$ tcaspoonful of baking-powder, and a little less than that quantity of salt. Then add 40 oz of finely chopped beef suct. and mix the whole to a stiff paste with some cold water. Cut off two-thirds of the pastry, moll it out. and with it line a greased pudding basin. Wash about I pint of goorcberries, then top and tail them.

When the hasin is half-full of fruit, add 2 or 3 tablespoonfuls of brown sugar. then put in the remainder of the gooseberries, and lastly enough water to half-fill the basin. Roll ont the remaining piece of pastry to fit the top of the basin, wet the edges, and then press them together. Cover the pudding with a scalded and flourod pudding cloth, then put the basin in a pan containing plenty of fast-boiling water Let it hoil steadily for 2 hours, adding more hoiling water when necessary When the pudding is cooked, lift the hasin out of the pan and let it atand for a minute or two after removing the cloth, so that the steam may escape; then scrve it on a hot dish
GOOSEBERRY CLUSTER CUP. This is a disease that affects gooseberry bushes: the fungus forms bright orange patches on the leaves and fruit. The most satisfactory method of arresting its spread is by collecting and burning infected leaves and fruit

GOOSEBERRY MILDEW. The goose berry plant is attacked hy two distinot mildews, the European and the American. The former occasionally attacks red currant bushes.

The most obvious differencos between the two may be summed up as follows: Whereas in the Eumpean mildow the fungus occurs as $\Omega$ very de!icate mould or mildew on the leaves, the American mildew forms a dense whitc woolly mould which, though found on the
leaves, attacks ohiefly the shoots and berrics As the growth of the American mildew continucs, the white stage gives place to a light. brown woolly phasc, and finally to a thin dark brown felted mat, which is very conspicuous on the berrice and shonts. This condition is never found in European mildew.
The American mildew is a much more serious danger to the fruit-grower. There are two principal lines of treatment against it: spraying, to prevent and to destroy the white or summer state; and tipping, to climinate the brown or second stage.

For spring and sumnier spraying limesulphur is the minst convenient and eatisfactory substance. The strength usually employed is 1 gallon of lime-sulphur to 29 gallons of water. Three, or at least two, aprayings should be given. the first about the first week in April. the others at intervals of three or four weeks.

Tipping consists in the cutting away in autumn of all shoots which show signs of the presence of mildew ; they must be burnt. The ground under diseased bushes should be dug over in winter in order to bury the winter spores, and if only a few bushes are grown dead and fallen discased leaves must be burnt.
It is illegal to sell gooseberry or currant bushes affected with the disease, but the bushes may be sold after notification if all the diseased shoots are out awsy. Nuch of this information is taken from Leaflet 52 , published by the Ministry of Agriculture. See Spraying.
GOOSEBERRY MOTH. This pest, more commonly known as the magpie moth, is very destructive. It is only scen at night, as a rule, and can be easily identified by its creany body and wings prettily marked with ulack and white. The parent moth deposits its egge on both gooseberry and currant bushes, and these hatch out into voracions looper

Gooseberry Moth. Pest destructive to gooseberry bushes. Top risht, caterplllars attacking soung leaves
caterpillars, which are spotted black and creamy yellow, and about 1 in . long.

Remedies are forking a generous dressing of fresh lime and soot into the top soil around the bushes in winter, applying a winter wash to the trecs at the same time, together with hand-picking of the caterpillars. See Caterpillar ; Fruit.

GOOSEBERRY SAWFLY. The sawlly caterpillars devour the leaves and, in a bad attack, strip the bushes completely.

The adult aswtlies firat appear in April and May. Eggs are laid on the gooseberry leaves, and when the caterpillars are hatched they feed on the leaves. The two methods recom mended by the Ministry of Agriculture and Fisheries (Leallet 12) are hand-picking and spraying. Hatnd-picking is the simplest method in the case of a few bushes, but it must be done before the colonies of young larvae have scattered over the bush. Some prefer to pick the leaves on which the eggs have been laid.

Spraying is thoroughly effective; the chief difficulty lies in the fact that the beat washes are poisonous. Lead arsenate, 1 oz. in I gallon of water, may be used in the case of an early attack, where it can be applied before the gooseberries have flowered and also after the fruit hus been gathered. Hellebore, when fresh, and nicotine are also effective and, though poisonous, do not retain their poisonous qualities for long. They may therefore be used with safety if ain interval of three weeks be allowed botween the dates of spraying and picking. See Insecticide: Spraying.
GORE. A gore is a triangular piece of material sewn into a garment to enlarge the lower part when the material is not wide enough to cut the full width required in one piece. These gores are usually added to the lower ends of side seams.
GORGONZOLA CHEESE. This is the name of a lighly esteemed and excecdingly nutritious Italian cheese, considered by some to be superior to Stilton, which it slightly resembles. It is a round, flat, broad cheese, which when cut should be of a deep ycllowish cream colour, with rich green veinings.

GOSS PORCELAIN. The china produced by W. H. Goss was made at Stoke-uponTrent about 1860 . The name is sometimes used inaccurately to indicate the products of other heraldic potteries as Gosa name is usually but not invariand on ambitious pieces a rising falcon is used is a mark

## GOUDA CHEESE. Flat.

 with rounded cdges, Gouda differs from Edam or Dutch cheese in shape and also in colour, being of a dusky yellow. Its weight variesfrom 3 to 15 lb ., and some are larger.
GOUGE. A gouge is a curved chisel, the blado being curved transversely so as to be t.ough shaped instead of flat. Paring gouges are ground internally, and are intended for hand planing of grooves. Firmer gouges are ground čternally and are used for scooping out timber into hollows Gouges are made in various widths, but a ${ }_{8}^{5} \mathrm{in}$. firmer gouge is a useful size See Firmer Gouge.

GOURD. These are deciduous climbing and trailing plants, bearing large fruits of diverse shapes; they are useful for rapidly

Goure. Left to right, paring gouge, Grmer gouge, ront bent

Gooseberry Sawfly. Larvae of a destructive insect pest which attacks Rooseberry and currant busbes.
Top, left, female adult fy
on raised beds like marrows. The seed is sown in a greenhousc or frame in March, and the seedlings are hardened of and planted out in June in rich soil.

The following list of varieties suggests the many quaintly shaped and marked specimens which can he grown: 'Turk's cap, bislioj's hat, serpent, gooseberry. Hercules' club, gorilla, siphon, half moon, giant's punchbowl. These are large fruiting kinds. Arnong the smaller sorts are gourds resembling fig, cricket hall, thumb, cherry, hen's egg, pear, bottle and pumge.
G OU T. Gout is a disorder of metabolism in which uric acid nccumu. ates in the blood and lisaues and causes various manifcsta. tions.

Thetenclency to gout is often inherited and may be trans. $m$ itted through females who

Gourd. Calabash Rourd growing in a greenhouse
show no sign
Courtesy of Amateur Gardening of the disease themselves. Other oauses are an excessive consumption of rich food and of wines. A regular and copious consumption of nult liquor, even when the food supply is spare, results in what is called poor man's gout. Sedentary habits predispose, especially in conjunction with other causes.

An acute attack of gout is due to the deposition of crystals of biurate of sodium in the cartilages of a joint. A poor circulation in the part, some slight injury or something similar may be the exciting factor, but the exccss of uric acid in the blood and tissues, which is the essential fenture of gout, alone makes the attack possible. The painful joint should be treated by heat in some form; cold applications are dangerous. The best drug for relicving the pain is colchicum, either the wine or the tincture, in doses of $\mathbf{2 0}$ to 30 minims every four hours. until the pain ceases; but colchicum should only be used on medical advice, as it may cnuse depression. Water or gruel containing potassium bicarbonate should be drunk freely. On the night of the attack
it is as well to take a mercurial purge, say 3 or 4 grains of calomel, and follow this up with a dose of Epsom salts in the moming. The diet should he restricted to milk and barley water unless other directions are given

In chronic gout more joints are affected and there is a greater tendency to deposits in the soft parts ahout the joints and elsewhere, such deposits, or tophi, sometimes ulcerating through the skin. Because of their white, chalky appearance these deposits are some times called chalk-stones; they do not, however, consist of chalk, hut of sodiuin urate. In chronic gout there is a tendency to arteriosclerosis. The patient often has a sallow complexion and suffers from dyspepsia.

A person who is of the gouty habit should be moderate in eating, avoiding fats and rich food, meat extracts, sauces, liver, kidney and sweetbreads, and restricting red meat, starchy foods and sugar. Fresh fruit and vegetables may be taken, but, as a rule, tomatoes, cucumber, rhubarb, bananas, gooseberrics, currants and strawberries are unsuitahle. Potatoes may generally be allowed. Asparagus and beans and other pulses should be talien in small quantities only. Alcohol is best avoided altogether. Water should be taken freely.

An active open-air life should be adopted. Clothing should he warm and the skin should be kept active by regular haths and brisk friction witlı a towel.

When attacks have occurred, or there are manifestations of irregular gout, it inay be worth while to have a spa treatment at Bath, Buxton, Harrogate, Aix-les-Bains, Contrexéville, Karlshad, Homburg or elsewhere

GOVERNESS. A nursery governess is one who gives the ohildren simple instruction in addition to looking after them generally. Nursery governesses are almost nlways resident, but other governesses may be either resident or daily. Sometimes two or more fainilies combine to engage a governess for their children. Most governesses are expected to supervise the children's recreation or some of it, but the extent and nature of this duty should be clearly stated on engagement.

Unless she is able to secure exemption, a governess must be insured under the national health insurance scheme. Governesses can be engaged through the advertisement columins of the newspapers and through some of the teaching agencies in London and elscwhere. Nursery governesses can be secured sometimes through the ordinary registry offices. The remuneration, which varies considerahly according to duties and capabilities, is usually paid by the month. See Insurance.

GOVERNOR: Of an Engine. This is a device for maintaining a constant speed of rotation of the crankshaft under variable loads. It derives its motion from some rotating part of the engine, and is so devised that when the speed of the engine increascy the govemor reduces the power supply, and

Governor for regulating the speed of an engine. See teat
convenient part of the engine. Four links, L L L L L, connect two metal halls, B B, with the top of $S$ and with a weight, $W$, able to move freely up and down $S$. When the engine speed increases beyond that at which the governor is set to function, the fly-balls, B B, swing out, raise the weight, W, and a collar connected by lever $D$ to the thirottle, and olose or partly close the throttle, thus cutting off the supply of steam and reducing the engine speed.

The governor fitted to a clockwork mechan. ism (e.g. a gramophone motor), hrings a friction brake into operation when the fly weights swing out, thus checking the speed.

GRAFTING: For the Gardener. This useful gardening operation is best carried out late in March and in April, during mild, dull weather, when the sap is running frecly. The graft or scion is a piece of branch of the previous summer's growth cut from a tree of the variety it is desired th perpetuate ; the stock is the tree on which the graft or scion is inserted
Grafting deprends for its success on fixing a scion on the stock in such a way that the cambium layers (the seat of growth), which lie immediately beneath the bark, are in contact. It is neces sary that the scions or grafts he in a less advanced state of growth than the stock and to ensure this it is usual to cut them off the trees in winter, tic them in amall bundles, and half bury them in the soil of a sliady border.
There arc various forms of grafting. Crown or rind grafting is the inost useful, or it enables the gardener to refurnish old trees of worthless varieties with fresh branches of good varieties. depth as the tapering part of the scion, and is lifted to allow the soion to be pushed down behind it. The scions are then made secure with raftia, and covered with grafting wax or puddled clay to exclucle the air. Any shoots which develop on the stock (the branches of the old tree) should be cut off. When. in summer, the grafts or scions begin to grow, they should be supported with thin sticks to prevent their being blown out in windy weather.

When both stock and saion are of approximately the same width saddle

The medullary rays radiating from of the variety it is wished to increase) should the centre carry nutriment and occur in every be 8 inches or so long and cut so that each one wood lut are not always visible; in oak or beech tapers to a point at the basc. Three or four they show strongly, when cut, in the form of grafts may be inserted in each large hranch. white layers which are terned the ailver grain, The bark of the latter is slit to the same as in Fig. 2. If the ends of a sawn oak log be
grafting is usually practised The top of the atock is cut in the form of a wedge and the hase of the scion is cut so that it fits over it exactly. The work is completed by tying and covering with grafting wax or olay.

Grafting Wax. Wax used for grafting purposes can be bought from seedsmen and others, but if desired it can be made at home from the following recipe :

These should he melted together and the liquid painted over all the cuts with a brush while it is still hot. See Apple: Rose.
GRAIN : The Measure. This measure of weight is chielly used by chemists, although it is also found in avoirdupois and troy weights In apothecaries'
weight 20 grains make one scruple, and in avoirdupois weight 7,000 grains go to the Ib The ounce in apothecaries' and troy weights consists of 480 grains

GRAIN: In Wood. The term grain refers generally to the character and size of the growth rings of timber. Beautiful grain is more naturally inherent in sorne woods than others; some woods depend for their figuring upon the annual rings, others upon the medullary rays, others again upon the juncture of a branch to the trunk.
Fig. 1 represents the section of a log. Every year a growing tree addla a fresh laver to the outsirle, thus forming a series of concentrio rings by which it is usually possible to tell the age of the tree. The outer part or sap-wond is in many woods of a lighter colour and is

Gralting. Method ol crown gralting. 1. Tree preparation at a. 2. Scions : $a$, correct : $b$ and $e$, badly prepared. 3. How scions are inserted. 4 Scions bound in position. 6. Final binding with krafting wax. 6. Section showing raffa binding onder wax

examined, they can be seen in the form ol narrow white lines

The boiards should te cut parallel to these rays. Fig. 4 shows a few methody of cutting in this way, $D$ giving the maximum amount of figuring, but it will be obvious that a certain amount of waste occurs batween the cuts, so that figured oak is always more expensive than plain. The latter (Fig. 3) is cut as in Fig 5, by which method there is no waste ; the centre board only will be figured. Fig. 6 shows the difference between two boards cut from the same tree in different places

A tree never grows perfectly straight, so that when the log is converted into bnards the undulations in the direction of the grain occur in the thickness of the wood by reason of the board being cut in a straight line (Fig. 7). This is the reason why, when planing a piece of wood, parts of it will tear up when planed in a certain direction Thesc waves or undulations occur with greater frequency in some woods than others. In pine they are sometimes hardly apparent, and in oali are generally large in proportion; in mahogany and sycamore they may appear as liddleback. This consists of a series of minute waves in close formation and when polished shows alternate light and dark atreaks running across the grain Fig ! shows n board cut through liddle-back mahogany

## How Curl Grain is Obtained

Another well-known variety of grain is that known as curl, which is obtained by cutting the tree at the juncture of a branch. The main direction of the curl usually is curved, and when veneers are cut the two adjoining leaves are almost identical, so that the most beautiful effects are obtainable by matching them. These curls are seldom cut into solid boards, partly because of their comparative rarity and cost, and partly owing to the fact that they are liable to twist and warp, the grain running in almost every direction.

Burrs, hurr walnut for instance, are the result of a out being made through a growth or excrescence produced on certain kinds of trees These growths are usually the outcome of the attack of fungi and result in the appearance of innumerable small shonts, the whole sometimes growing to a considerable size and yiclding large leaves of venecr. They are aliso to he found on the stumps of coppiced trees

When a pine log is cut as in Fig. 5 the centre plank does not contain the best liguring, ns the rings appear at each side in the form of narrow parallel lines of alternate light and dark stripes. In the outer planks the stripes are wider and have a $V$-shaped formation, the beauty of which is enhanced by the natural
irregularity of growth A method of cutting sawn log, so that for work requiring an for work requiring an attractive appearance absolutely reliable surface, on,y thuse running is shown in Fig 8, in which every plank runs diametrically should be used D, in Fig 4, is tangentially to the rings.

The question of cutting is important for oak the silver grain is also in evidence, the other reasons hesides that of figuring. Fig. 10 method is wholly desirable See Mahogany : shows the natural shrinking tendency of a Oak: Wood; Woodcarving.

## Graining and Marbling

## Suggestions for the Artistic Treatment of Wood Work

This article describes the surface treatment of white woods to simulate oak and other hardwood; it contains alzo a section on simple marhling. See also Wood, and the articles on other forms of ornamentation, e.g. Enamelling; French Polishing: Lacquer ; Painting; Varnish
The process of reproducing the colour and knife. Several sorts of brushes are needed. appearance of natural wood by a manipulation of paint in superimposed layers is known as graining, the grain being produced on the paint while it is still wet. Marbling is the cormesponding process to simulate marble.

Graining is essentially an art, results being gond or bad according to individual ability; success can come only with experience. The essential requirement is that the grainer himself shall be familiar with the appearance of the natural wood

The tuols required inclucle painters' brushes and combs The latter are made of steel in various widthe, and with varying numbers of teeth to the inch, usually from 6 to 15 ; others are made of leather, bone and other flexible materials. Old hairdressers' combs may be pressed into service. Leather combs can be made at home from a piece of stout leather, the teeth being cut tos shape with a pucket
 including a selection of overgrainers, mottlers, and shaders. A first-class badger hair softener is required and should be about $3 \frac{1}{2} \mathrm{in}$. Wide. A few camel hair, anble, and fitch brushes are necessary for the veining and similar work, together with a bone thumb-plate and a quantity of clean rag.

Imitating Oak Grain. The commonest form of graining is that which represents oak, ordinary deal doors being treated in this way. The ground is first prepared by stopping, priming, and undercoating, as if for ordinary paintwork; then the ground colour is a pplied. The tint must be the lightest that is to show on the finished work. The grounds will be composed of white lend, or other equally good white, stained with yellow ochre, or clirome, applied as ordinary paint, and finished with a slight gloss. The graining colour may be obtained by a mixture of raw umber or other colour, and should contain plenty of driers It is brushed thoroughly into the dour, after the previous cont is quite hard, and should not be applied thickly, but must be worked well in.

Apply the graining colour to one of the panels only at the start, having previously studied the style of graining to be copied Supposing it to be light figured oak, this will require a coarse leather comb to produce the straight part of the grain Then, next to this, the grain is worked in with a medium toothed steel

Graining : Stages in marbling wood. Left, wiping the veins with a thumb rag. Right, completing with a feather dipped in colour
improve the appearance. A little black or blue can be used sparingly. When the graining is complete the whole surface of the dour is varnished.
Finely-grained woods may be represented without combs, using brushes only. The grounds are prepared, and the graining colours diluted with beer, the graining being accomplished with hog nair mottlers, large sash tools, and the fitches and sable pencils. A piece of wash-leather, a sponge and some rag are of assistance, and two or more colours may have to be worked together.
on the comb, and using the whole width of it. The brushes are worked more or less dry, to The figure has now to be worked with the remove the unwanted colour, as a coinb. aid of a rag wrapped round the thumb, or by the use of the thumb plate, which is wrapped up and used like the finger tip. Perfect mastery of the thumb plate is necessary, using the broad part of the blade to wipe out the highest lights, and the narrow edue to work in the half lights and the finer markings. Treat all of the panels in a similar manner, but vary the grain The rails and stiles are then grained, but wil! not call for much ligure work as the wood is generally straighter in grain. Tho badger is used to soften the edges of the graining, and the mottler to soften the veins and to give a more woody appearance to the work. Fine veining can be worked with the veining fitch.

Knots and Surface Markings. The final proceeding is the overgraining and shading, the pigment is ground in water, the colour is spread on a palette and diluted with beer. The overgrainer is dipped in beer and the pigment worked into it. The brush ought to work itself into two or three parts; if it does not, it should be combed or worked with the fingers. The colour is applied with a continuous motion from top to botton Before the colour is dry work over it with the badger to break up the hard lines. Knots and other surface markings are worked in with the sable pencils and fitches, the whole idea of this part of the work being to enrich the colouring and

Bird's eye maple is grained with the brush, a command of the mottler being necessary. This brush is held so that the bristles separate and break up the straight end; it is held nearly upright, and wiped over the work so

Gramophones may be divided into three main groups according to the style of case or cabinet: portable models, table instruments, and floor cabinets. The method of sound reproduction may be (a) mechanical, or (b) electrical. In the former the movement of the needle as it travels over the track on the record imparts vibration to the metal or mica diaphragm of the sound box; the diaphragm in turn sets up oscillations of varying frequency in the column of air in tone-arm and horn, so that sound-waves are produced. In the electrical pick-up the needle movements produce electrical impulses of varying value in a circuit comprising a low. frequency amplifier and loud speaker.
The mechanism which causes the turntable to rotate may be a clockwork one or an electric motor. To test the quality of a
that it removes the colour in an undulating manner. Mahogany and walnut require the mottler for the graining cotour: the breadth of the veins is varied by altering the pressure of the fingers on the bristles.
Use of Transfers. Graining by means of transfers is a much cheaper method than hand graining, as tho one sheet will Live several copies of the design.
The transfer is cut slighitly larger than the actual size refuired, placed face downward on a clean dry table, and the back well damped with a half.wet aponge. The paper is allowed to saali for $\mathbf{3}$ or $\mathbf{4} \mathbf{~ m i n}$. until the graining print begins to have a glossy appearance. The surface of the material to be grained should be damped evenly by moans of a oponge and brush, and the transfer placed face downward on the moistened surface, the back being rubbed evenly by the brush. The paper is removed, and a soft paint-brush, or softener, passed over the surface while the latter is still damp.

Marbling. The processes of marbling are similar to those that are employed in grainieg, but as marble is a solid substance the colours employed in its representation must be opaque, and most of the effects have to be obtained by a manipulation of the brush. Two of the finishing stages in the process are illustrated.

The ground is worked up and the colourings applied to the surface, the harshness subdued with the badger, and fine veinings worked in with the sable and fitches. The colours may bc ordinary artists' colours in collapsible tubes, thinned with turpentine and linseed oil. The colours can be flattened and worked to represent soine classes of marble by rubbing them over lightly with a fine rag moistened with linseed oil

There are many varieties of marble with numerous colourings and surface veinings, all of which can be reproduced after a preliminary atudy of the natural material, or of reliable coloured photographic reproductions. The aniateur is advised to give a sufficient consideration to them until their appearance becomes quite familiar, and then to attempt the actual work on a trial piece of smooth board.

Marbled work should be finished by varnishing with a clear varnish, as a coloured varnish will never look well; the finished surface must be free from any suggestion of brush marks.

GRAMME. A gramme, or gram, is the unit of weight in the metric or decimal system. One gramme is equal to $15 \cdot 432$ grains troy. See Metric System.

## Gramophones: Their Choice and Care Mechanical and Electrical Methods of Sound Reproduction Explained

This article deals with the various types of instrument and the accessorics. A section on Radiogramophones is followed by one on the construction of a console type cabinct. Consult nlso
Pick-up and the various Wircless articles
gramophone motor it should be released at varying speeds, with a record on the turntable. A good motor is one which runs evenly, strongly, and without noise. By even running is implied the quality of revolving the turntable steadily, without jars and tremors: a strong-running motor is one that works vigorously, as though pushing against restraint. A good motor attains the desired speed quickly, and maintains that speed consistently without slackening appreciably towards the end of the spring. The sound box should always be tested by playing a varied selection of records, such as a march, a tenor solo, and an instrumental disk. The results from these records will demonstrate the range and power of the apparatus.
A floor cabinet, apart from its value as a musical instrument, forms a pleasing addition

Gramophone. Fig. 1. Garrard doable-spring motor Gramophone. Fig. 1. Garrard doable-spring motor
suitable for any gramophone. It is tested to play two sides of a 12 -inch record at one winding
to the furniture of a room. Both cabinet work and internal fittings require close attention, so that a model may not be purchased in which the quality of the mechanism is sacrificed to provide a handsome exterior. There is no danger of this if one of the well-advertised makes of instruments is chosen.
Types of Motor. A good type of doublespring motor is shown in Fig. 1, the chief parts being indicated as follows: A, main spindle; $B$, regulating disk and governor: C, winding spindle; $D$, spring cases; $E$, winding ratchet. A motor such as this will play the two sides of a $12-\mathrm{in}$. record with a single winding.
In many gramophones an electric motor is substituted for one of the usual clockwork type. Connexion is established very simply by plugging in to an electric-light or radiator socket. Two kinds of electric motor are illustrated, the universal and the inductively driven The first is suitable for all voltages from 100 to 250 , either A.C. or D.C. The second will run on alternating current only, and is supplied for $100-130$ or $200-250$ volts. Both comprise an automatic stop. The inductively driven motor has no commutator or brushes, and is thus free from sparking, which, in a radio-grainophone, might be liable to cause interference with reproduction.
Whatever style or quality of gramophone an owner may possess, it needs a certain amount of care if it is to do its work efficiently. In particular. the motor requires regular attention, otherwise it may knock, break down, or at least fail to revolve the turntable correctly. The motor should be oiled and oleaned at regular intervals, according to the quantity of work it has to do. The following procedure is recommended where a motor is in need of a thorough cleaning, which, in many cases, is due to the old oil in the springboxes becoming dirty and viscid.
Remove the motor from the case by releasing the turntable and the motorboard screws, the spring having first been allowed to run right down. The spring-box or boxes are placed intact in a vessel containing either paraftin, benzine or petrol, to remove all the old lubricant. If benzine or petrol be used, the operation should not be carried on near naked lights, and is best performed in the open air. If the spring-boxes are allowed to coak for about 24 hours, very little of the former lubricant will be left in the coils of the springe. Meanwhile, the other parts of the motor should be cleaned with a paraffin rag.
Then wipe all the parts as dry as possible, using a clean, non-fluffy cloth. Following this, the spring-boxes are filled with a compound of vaseline and graphite, which inay be purchased in a collapsible tube. The easiest way to introduce the compound into the boxes is by raising the cogged plates. The other parts of the motor are treated with a good oil
of medium thiokness. Light oil should be used for the governor bearings and heavy grease for the cogs. The springs should on no account be removed from their boxes for the purpose of cleaning, except by those who are thoroughly experienced, as it is a difficult task to get them back. When the motor has

Fig. 2. Example of a Garrard induction electric motor for use with A.C. mains. Fig. 3. Garrard
been assembled and returned to the case, it should be given a good run before the instrument is played, to allow the lubricant to be well distributed.
The Sound Box. This part of the apparatus is almost entirely responsible for the quality of the music, which is reproduced through the vibrations of the diaphragm, usually made of mica or metal. The box, although simple in construction, is necessarily a delicate article, and accordingly it needs careful handling. It should not, for example, be left on the machine when not in use. A good quality sound box rarely needs any adjustments, and if protected from dust, knocks, and harsh treatment generally, it will give good service for a considerable number of years.

Apart from tone, the characteristics of n good box are that the diaphragm is insulated with gaskets, or rings, of good quality rubber ; the back of the box fits closely, while the

Fig. 4. Columbia standard tabis grand. Fig. 5. Decca portable model, very useful for out of doors. Fig. 6. His Master's Voice acoastic gramophode
adjustment of the small bar which is attached to the diaphragm is exact, so that the bar does not press upon, nor pull away from, the diaphragm.

Cars of Records. The average record will play quite 100 times without showing appreciable signs of wear. A dustproof case is recommended, as, if records are left exposed to the air when not in use, dust fills the delicate tracks and may destroy the fine tones in reproduction. A flat camel-hair brush also may be employed. It is advisable to brush the baize of the turntable before commencing to play; this baize is a dust-trap which is often overlooked.
Records should be guarded from sudden changes of temperature. The disks should not be left exposed to the direct rays of the sun or within range of the heat of a fire, or they may warp. The turntable should be allowed to reach full speed before the needle is placed on the record, othervise the first tracks on the rim may become roughened.

Correct Speed. The speed at which records are played has a distinct bearing on the quality of the music, and whenever possible a disk should be played at the speed at which it was recorded. In many cases, this speed is noted on the record itself ; in others, it will be found mentioned in the catalogue of the firm concerned. Where the speed is not noted anywhere, 78 or 80 revolutions per minute is a good average to work on.

An automatic stop device is incorporated in some motors, and is also obtainable as a separate unit to be fixed to the motor board. It operates in conjunction with a spiral or elliptical "run-off" or finishing groove on the record.

Fibre needles may be recommended to those who like music with a soft, mellow tone. Fibres have the further advantage that they do not wear out the records as metal needles do. Steel needles afford greater satisfaction than fibre ones to those who like loud, brilliant music. Metal necdles, excepting the specially prepared, semi-permanent varieties, ebould never be used more than once.

Radio-Gramophones. These instruments are combined wireless receivers and electrical gramophones, designed either for battery or mains operation. The equipment normally comprises one or more stages of screen-grid high-frequency amplification, and a detector followed by a low-frequency magnifier. A switch is provided whereby the electrical pick-up can be brought into circuit when required, the apparatus then becoming a straightforward electrical gramophone.

Briefly the method of operation is as follows: With the switch in the position for "radio" the high-frequency stage or stages and the detector are connected by way of the low-frequency magnifier to a cone type or moving.coil loud speaker, the receiver then being employed for the reception of broadcasting in the usual manner. When the switch is placed in the "gramophone" position the high-fre quency amplifier is disconnected, and the pick-up is connected in circuit with the low-frequency magni. fier of the instrument

The movements of the pick-up needle in traversing the grooves in the record set up small voltages which are afterwards amplified by the low-frequency magnifier to a strength sufficient to operate the loud speaker

In the case of "all-mains" radio-gramophones the turntable motor is usually electrioally driven, and the total current consumed by the complete equipment is comparatively small. Electrical gramophones which incorporate a moving coil loud speaker possess definite advantages over other types from the point of view of realistic reproduction and volume

Easily-made Console Cabinet. The light cabinet gramophone illustrated in Fig. 8 is constructed from a parcel of "ready to assemble" materials sold by Handicrafts Ltcl., of Kentish Town, London, N.W.б. The home worker with few tools and limited time or opportunity for cabinct work, or one who doubts his ability to prepare his own timber, will find this type of parcel convenient. The idea is applied also to many useful and ornamental articles of furniture, such as bedroom suites, tables, cabinets, etc.

Accessories for the gramoplione include a tone-arm, sound box, and horn. Some form of motor will of course be needed, and suitable types arc illustrated on page 554. A good sound box should be purchased, since the performance of the instrument is dependent primarily on this part of the apparatus. The tone-arm also should be chosen with discrimination. and

Gramophone. Fig. 7. A typical example of a radio gramophone
needs to be fitted carefully. It should move quite easily across the record and must be free from shake or joggle. The internal horn may be built up from plywood, but it pays to purchase a scientifically-designed metal amplifier, which is a tapering horn up to 8 or v ft . long. folded upon itself to fit into the small compass of the cahinet. Great volume and pure undistorted reproduction are given by this type. The accessories can be had from most local dealers, or the constructor could write to the firm mentioned above for particulars

All the parts for making the gramophone have been prepared, the surfaces cleaned up and the joints cut. This leaves the amateur merely the work of glucing up and finishing. The main structure is put together with dowelled joints. The first step is to insert dowels in all the holes in the ends of the rails. The rails can then be regarded as having tenons. To simplify the assembling it is advisable to put the two sides together

later of wainut and mahogany, becoming more elaboratc as the years passed, until they became merged in the ordinary armchair.

An early type hns a bigh back which, like the seat, is padded, but the arms nre bare. The front legs are connected by a stretcher. Another example, also in oak, has padded arms. Its decorations include an arched top to the
independently, and allow the glue to set before adding the front and back rails An advantage of this method is that it enables one to treat the sides as complete units, and avoids the necessity of dealing with many joints in one operation.

Fig. 9 shows the two complete sides being put together by the addition of the front and back rails. When the glueing up is finished the work should be tested for squareness, except where the parts are sufficiently wide themselves, to ensure the whole
 Gramophone. Fir. 8. Console gramophone cabinet. Fir. 8. Assembling the main framework. Fig. 10. Sliding the front fret into position. Fig 11. The horn being fited into the centre compartment beneath motor board Courtesy of Handicrafls. Ltd
being square. A cramp (q.v.) is extremely high, narrow back and turned stretchers conuseful when glueing up, as it ensures tight joints necting the turned legs. Later some were and enables the work to be held firmly whilst made without stretchers, having cabriole legs. the nails are driven in. It is sometimes Grandfather chairs made in Queen Anne's necessary to put in nails to strengthen the time and style, when this type of chair was at joints, e.g. where wide rails are used with its best, have the graceful curvilinear ireatsingle dowels. The nails then prevent the rails ment so frequently found on pieces of that from twisting. Panels and front fret fit in period. At this time they were made mainly the grooves in the legs. These grooves are of walnut. See Armchair: Chair. outside the rails, so that the panels can be slid in after the main carcass has been put together. Fig. 10 shows the front being put in place.

The bottom rests on the rails, the corners being cut to fit around the legs. Partitions are provided to separate the motor and trumpet space from the record space at the sides. The back is nailed on. The lid consists of an edging made up from moulding, mitred together. A rebate is formed in the top edges, and the top fits in this. An idea of the interior arrangement is given in Fig. 11, which shows the trumpet being placed in the centre compartment. The motor board rests upon the interior divisions. Holes have to be cut in this to enable the motor and other components to be fixed. Their shape and positions depend, of course, upon the motor and components used. A suitable motor, with all the necessary fittings, may be obtained from a gramophone dealer.

GRANDFATHER CHARR. This term is applied to a type of antique easy chair found dating from the 17 th century, and also associated with Sheraton and Chippendale. In the form in which it is now known this chair was evolved from the one that was provided with ear guards as a protection against draughts. They were made of oak and

Grandfather Clocks: Their Cases \& Works

## For Collector, Cabinet Maker and Mechanic

This contribution deals with the subiect from the three points of view enumerated above. For related information sec Clock; Pendulum, and the various articles dealing with woodworking

Long-casc clocks, or grandfather clocks, as they are called, were first made in England in the early years of the reign of Charles II. The earliest existing ones date from soon after 1660 , and those who possess a specimen of earlier date than 1700 are fortunate. Oak was the material first used for the clock case, but soon walnut came into favour for them, and some of the finest examples are in that wood. Marquetry was introduced into some of the earliest pieces, and there are beautiful clocks decorated in that way in the Victoria and Albert Museum and in other collections, both public and private. In some pieces the marquetry is arranged in panels.
The objects of these clocks was to take the swing of the pendulum, which varied a great deal in length, what were called royal pendulums being up to 65 in . long. The earliest long-case clacks went for a day or rather more, i.e. from 24 to 30 hours; but when the royal pendulum appeared, eight-day clocks began to be marle, and have remained popular.

It is common to find the dials of early grandfather clocks furnished only with an hour hand, though the minute hand was introduced about the year 1690. Clocks about this period which have both arc invariably of good make and finish. The single hand was sufficient for clock makers who produced ordinary utility work for at least 100 years after the introduction of the long case.

Most of these early clocks had square dials of rather small dimensions, from 9 to 11 in. across. Early in the 18th century an arched top was made, and this coincided with the form of the enclosing case, for grandfather clocks of the reign of Queen Anne had commonly an arched moulding. The arched top to the door of the case also appeared in the early part of the 18th century, and in some early cases a bull's-cye of glass was put into the door to show the pendulum swinging to and fro behind it, as seen in No. 3 below. to and fro behind it, as seen in No. 3 below.

A grandfather clock of the period of William III and Mary would be likely to have elaborate inlaid decoration in the door panel, and also in the base. This form of ornamental enrichment was brought from Holland, and conmonly consisted of a conventional rendering of tulips, birds, seaweed, and scrolls. Twisted columins fanking the dial indicate a period about 1700 or slightly earlier.

Many casen of grandfather clocks were lacquered from about the reign of Queen Anne, i.e. from 1702 to well on in the 18 th century. Straw. coloured lacquer is very rare, red is more frequently seen, and black is commonest. All have Oriental devices in gold. An example is shown in the first illustration.

Chippendale long-case clocks were usually of mahogany and often carved, but his best work "as not elaborate, thougb applied fretwork was seen in spandrils above the archerl dial. The hornshaped top to the hood is considered typical, a nd the pillars of the front corners of the case are Iluted, often having bases and caps of metal. Sheraton designed long-case clocks with delicate columns standing free of the main structure at each side of the dial: the ornamentation is usually of graceful inlaid work. The introrluction of cheap American clocks in the 19th century resulted in the practical extinction of the grandfather clock, except as antiques.

The Mechanism. Figs. 1 and 2 show the back and front of the earliest type of grandiather clock, which requires winding every

Grandiather Clock. Left to right: 1. Early 18th cent. red lacquer clock. decorated with Chinese figures, chased br ass dial. 2. Late 18th cent. clock with canted corners, crossbanded with mahogany, painted dial. 3. Quean Anne clock in walnut case, inlaid with floral marquetry.

Courlesu of Glll \& Reigate. Lt
day, a single weight, $A$, serving both for the going and the striking. In the illustration the two trains of wheels are side by side, but they also may be arranged one behind the other, the striking train being at the back. In some clocks an endless chain is used as shown, and in others a loose mesh rope. Attached to both main-wheel arbors is a deep grooved pulley $B$ with steel spilies set at equal distances, to which the chain or rope grips; the weight hanging on a pulley $C$ supplies the motive power to both trains. The winding is clone by the chain or rope. The pulley on the striking mainwheel is loose, with a click attached which works on the arms of the wheel. When the weight is puliing, the click butte against the arm, so pulling the wheel round.

There is no centre wheel and pinion in these clocks. The wheels for carrying the hands are geared up to the mainwheel arbor, forming a compound motion work. A large wheel D nttached to the mainwheel arbor works into a smaller one (behind G), which carries the minute hand, the protruding equare for the latter being lettered $E$. On the top of the
large wheel Disfixedan other small wheel, F; this gears into large wheel, G, that carries the bour hand, the combina. tion of the four wheels making a 12-1 ratio.

Grandfather Clock. Figs. 1 and 2. Back and front of earllest type olock requiring daily windin Courlesu of J. W. Benson, Lid.
The strik. ing meohanism, in this case, is a locking plate, that is, a disk geared up to make one revolution in 12 hours. and divid. ed off into varying spaces to mark the number of blows to be struck ( H ) The pins for raising the hammer are driven into the web of the main. wheol J. Thereare 13 of them, and 78 blows are struck in 12 hours, a ratio of 6 -1 from the mainwheel to the locking place.
Pivoted between the plates is a detent K ; fixed to it is a short arin which catches on a pin in the wheel genred next to the mainwheel and locks the striking train. On one end of this is a lever $L$, which as the hour approaches is raised by a projection on the minute wheel. This lifts the inside lever clear of the locking pin and sets the train in motion, but it is held again in check by a portion of the lever until the minute hand reaches the hour, when the lever drops and the train is free to proceed. The part of the lever in question passes through a slot in the plate ( M ).
On the back of the detent $K$ is fixed another lever $\mathbf{N}$, which operates on the locking plate. When the striking train is at rest this lever is in one of the slots $P$. When the clock
slarts to strike it is lifted out, and as the lock ing plate moves forward it holds the lever up until it reaches the next of the slots, which by their varying distances apart regulate the number of blows to be struok: when the lever N reaches the slot the lever falls, thus locking the truin.

Eight-day Movement. In the clock that keeps going for eight days, two weights are used. with gut lines in the older clooks and wire lines in the more modern. One of the latter is illustrated in lrigs. 3 and 4, showing hack and front respectively. Reference to the eight.day loracket clock movement illustrated on page 282 will show that the grandfather clock differs from the former mainly in that the motive power is derived from weights in stead of aprings. The timekeeping mechan ism and that whioh operates the striking gunt are similar to those of the Eriglish brachet clock.

Attached to the mainwheel arbor is a grooved drum, A. on to which the line is coiled when the clock is wound up. This is worked with a click and ratchet 13 . the latter cut oll the edge of the drum and the click and spring fastened to the mainwheel $C$. The winding is done by a key fitting on to the squared part of the arbor D.

The figures show a modern clock movement striking hours and half-hours on a gong. The half-hour striking is controlled by a lever E , which works on a cam on the minute wheel $H$ At the hour it raises the lever clear of the pin G, and nt the half-hour lowers it so that the rack can only use one tooth, striking one blow. There is also a lever 11 operated by means of an index $J$ on the dial, which shuts off the striking work loy holding up the rack at the pin G.

Many clocks arn fitted with a calendar

showing the day of the montls. sometines by a pointer on the dial: nore often there is a slot in the dial through which the date shows, being marked on a oircular slide. This slide is operated by a whecl geared into the hour wheel and making one revolution in 24 hours. On the wheel is a pin or nib that moves the slide.

The phases of the moon are shown on some clocks. The moon is painterl or engraved on a toothed disk, which warks behind the dial. part of which is cut away to show the phases. There are usually two moons on the disk, so that as one disappears behind the dial on one side the other starts to rise on the other side, one revolution of the disk giving the period of two moons. Other types of clock chime on gongs, while some play a selection of tunes.

Making a Clock Case. A grandfather clock case can he made by the amateur who has as on plan, and glue.blocked neatly in the ore skif in cabinet work. Oak is the angles liehind The top rail of frant framing, correct wood for the Jacobean style of case upon which the capping mould is mounted here illustrated (Figs . 5 to 11), but its choice for the highest class of work has been rare. Onk inlaid with mahogany or walnut and ebony lonndings is often met with and, at a later datc, lingvood, tulipwood and other fancy woods were introduced. Onk is also

iound veneered with walnut. Maple ant sycamore are sometimes met with, in addition to rosewood, pearwood and ebony. Oak inlaid ebony and ivory dice or herring-bone, if the detail is small, has a very neat effect A quartered oak treatment with diamond centre is also good.

The shaft or pendulum case may bo put in hand for a start, and some attention should be given to the jointing in order to assure a good stiff case as the prait sometimes has to withstand a considerable dead weight strain. The worker should select his movernent bcfore cutting the case sides or settling the major dimensions, which depend on the type of mechanism, length of drop for weights, swing of pendulum, etc.

The length varies, and it is possible to make a dwarf size granilfather clock to tinish about 5 ft . high. In the present case the shaft may be made 3 it. if in. long between A, Fig. 6, and B, Fig. 9, with a depth of $7 \frac{1}{2} \mathrm{in}$. The width of the shaft will be governed by the swing of pendulum, a hare clearance being all that is necessary. An average width is about 12 in . to 14 in. The moulding which caps the shaft is built up to n height of 23 in ., an enlarged section heing indicated at Fig. 7 d . For the shaft the material should finish ? in. thick for sides and ${ }_{3} \mathrm{in}$. or $\frac{\mathrm{z}}{\mathrm{g}} \mathrm{in}$. thick for the front framing.
A plangiven at Fig. 11 f indicates the sides as rehated for the hack to enter flush, or this may be merely screwed to the siden with brass round-headed screws, after bevelling away the edges for finish. The back is continued upivards hehind the hood, the latter sliding into prosition and reating on the moulding which caps the shaft. The sides of the
 of $f$ in net thicl: ness to form a rebate, and shut over the casefront framing. This mould is necessarily shal low, and must he very cleanly worked. It would, in another manner, he possible to rebate in a wider section mould, as in Fig. $7 c$, on solid 3 in. material, and afterwards rebate the door to close on to a front framing rebated to corre

Grandather Clock. Fig. 5. Jacobean style clock case in oak. Fik. 8. Unper part. Fig. 7. Mouldings used. Fiks. 8 and 8. Section and ele vation of lower part. Fig. 10. Alternative door. Fig. 11. Worklng detail
Bu urranuement urith Ebans Bros., IoId., Lonton
spond. A central diamond, bevelled allay to form four facets from a piece $\frac{t}{t}$ in. thick. is mounted on a panel of is in. thiokness, to be glued and fixed in position on door with needle points.

An alternative front is seen at Fig. 10, the central panel, whioh forms the door, having a shaped and moulded heading. This nust be sufliciently wide to give fair access to the pendulum, and is rebated (ns Fig. 7 b) to shut on to the panelled front. Special hinges for clocks are made with wide tlanges after the manner of Fig. $11 c$ and $d$.
The surbase, ns Fig. 5, shows 1 ft .8 in high over mould 13. An enlarged section of $t$ his mould is seen at Fig. $8 e$, the section being $2 \frac{1}{2} \mathrm{in}$. high and the projection ahout $1 \frac{1}{2} \mathrm{in}$. making the width of surbase 1 ft .4 in . full. The front is framed up of 3 in . by in . stiles and top rail, and has an applied rectangular panel, with ovolo-moulded edges, fixed to overlap the opening. I sunk panel could be fitted if preferred. The buttom rail should be sufficiently wide to reach the ground, about 7t $\frac{1}{2} \mathrm{in}$., the surbase being built out from the shaft sides, which also continue to the ground.

A douhle plinth 6 in. high is shown, with ovolo mould round each break, $\frac{1}{2} \mathrm{in}$. material
being used. A section to enlarged scale of the surbase is given at Fig. 8 . It should he noted that the shaft sides are tied by the cross rail behind the front of surbase, and a similar rail at back, in addition to $n$ bottom rail front and back, into which the case bottom is grooved and blocked under. Finishing depth of surhase is 9 ? in., and at ground the dimensions are 10 in. for the plinth

The finishing height for the hood, with $n$ 10 in . dial as shown, is 1 ft .6 in ., and width would be about 1 ft .4 in . An enlarged front elevation is seen at Fig. 6, hut, as already suggested, the movement had best be obtained hefore putting the clock case in hand The hood portion should project sufficiently beyond the dons to allow for the columns Twist columns are shown, and these will require neatly carving up, as they cannot be turned in the ordinary Inthe. Plain columns (as Fig. $11 a$ ) can be substituted if the twists present undue difficulty, but the effect will be appreciably less quaint. The columns may either be planted on door front to open with it, or can he fixed on pilasters so that the door can open between the columns.

The front and sides of the hood are preferably tongued together of in. material, or, in an inferior manner, may he merely glued and blocked toget her. In blockfitting is best to use sound and well. grain to aprecks, always cut with the to hold. The end of the hood may have a column at the back of the return (as at Fig. 11 a), or can finish plain, as Fig. 5, with the end opening glazed. The front opening is the same size as the dinmeter of the dial ( 10 in . by 10 in .), with a 1 f in . framing surround moulded $f$ in. ovolo. The columns are of $1 \frac{1}{2} \mathrm{in}$. by $1 \frac{1}{2} \mathrm{in}$. ansterial. The door will shut upon a similar frame of $\frac{1}{2}$ in. thickness, well secured in position by glue blocks behind The cornice mould can be $2 \frac{1}{8} \mathrm{in}$. high, and, with the frieze will finish a full $4 \frac{1}{2} \mathrm{in}$. high to the enlarged section Fig. 7 a. The carving on frieze is of simple gouge detail with n $3 \frac{1}{2} \mathrm{in}$. bevelled panel applied in centre as a break.

In mounting the movement, this is supported on a seat board or shelf indicated at Fig. II, $b$ and $e$. It is fixed across the upper extremities of the shaft sides, and must he cut out for the pendulum and weight lines. Often an old movement will have the sent board attached, which can be used as a template for marking out another. The movement is held to the board by a couple of hook bolts passing over the pillars of the movement and through the buard, where they are secured by nuts. Such bolts can easily he made from stont wire and a screw thread cut on one end.

The capping at top of shaft forms a ledge "pon whicl the hood slides when pushed home in position. A clusthoard should he rebated into the top of the comice. Scrolled detail could be carved on the frieze in place of the fiites shown, or the frieze could be left plain if nicely finished and not too wide. The Jacobean colour is a rich nut-brown, and inight be finished with a rubbed treatment.

GRANITE. On account of its hardness nnd durability and its excellent appearance granite is one of the most valuable building materials It is used extensively in roadmaking and engineering works as well as in the construction of houses, pillars, tombstones, memorial columns and for many other purposes.

Granite chippings or sand, mixed with Portland cement in the proportion of one of cement to six of granite powder, is useful in repairing a damaged part of a granite face. The anme or anme similar mixture is employed in the preparation of granolithic concrete, and finishes with a hard and durable surface, the colour of which will be determined by that of the granite used as the uggregate. See Cement: Concrete.

GRAPE. The grape is one of the most nourishing and wholesome of fruits. In illness it is cooling and refreshing. The content of nourishing sugar is very high in ripe grapes, ranging from 10 p.c. in some varieties to 30 p.c. in the richer kinds This compares with an average of 2 p.c. in plums, 6 p.c. in strawberries, and 8 p.c. in oranges. The grape contains $\frac{1}{2}$ p.c. of tartaric acid, as compared with l p.c. in apples and oranges and at raw berries. The acid is combined with potash, and has a slight axative effect; it also stimulates the kidneys.
In Switzerland the grape cure is $n$ long.established method of treating corpulence, bronchial catarrh, obstinate constipation, and catarrh of the inteatine. The patient eats from 2 to 8 lb . of grapes per day between meals.

Dessert grapes may be either hlack or white in colour, many varietics of both being grown, and vary greatly in size, the large ones being the best. The skin should be soft and the stones few in number, some varicties being obtainable without stones. A good buncli of grapes is very thicl: at one end, and tapers cvenly to a point.

Cooking Grapes. Small green grapes are most used in cooking. To get rid of the tough skin, dip the grapes for a moment into very hot water, after which it will be found to jeel off easily. The amount of sugar required depends upon the kind of grape used, and their ripeness. In early summer, when the bunches on the vines are thinned out. tiny unripe grapes are often on the market. These can be stewed, or made in pies, but as they are very sour plenty of sugar will be required.

Only sound grapes should be pickled, a simple method being to remove the stalks from the fruit and then put it into a clean jar. Cover the grapes with white wine vinegar; then tie them down with a bladiler and store them for four or five weeks in a cool, iry place.

Grape Jelly. Black grapes are best for jelly-making purposes if n pretty colour is desired, but green ones also give excellent resulta. Wash and atalk ! quaits of grapes, then put them into a pan and bruise them gently over a very low heat until the juice Hows freely. Strain without pressing the whole through a piece of muslin, passing the juice through two or three times to clear it. Then measure it, put it into a clean pan, and buil it for 20 min ., skimming it if necessary. Add $\frac{\mathrm{lb}}{}$. loaf sugar to every pint of juice, atir the whole until this has dissolved, and then boil it rapidly until it will set when tested on a plate. Put the jelly into jara, then cover and tie it down.

Grape Tartlet. These are made by lining some greased patty tins with short crust pastry, filling them with rice to prevent the pastry from rising, and then baking them until they are lightly hrowned. In the meantime, make a syrup of sugar and water,
making allowances for the fact that ripe grapes are naturally sweet. Flavour the syrup with a little sherry, then peel and stone the grapea, add them to the syrup, and cook the whole for 2 or 3 min . Take the rice out of the tartlct cases and fill them with the grapes and syrup, putting a little whipped cream on top of each. See Deasert: Vine.
Grape Scissors. Scissors suitable for cutting grapes are a useful accessory to the dessert service. The best are of silver, and good specimens of the 18th century are in existence. Some of these are beautiful examples of moulded work and chasing. A steel blade will be found inset in some pieces. To-day grape scissors are usually made to match the knives and forks used at dessert. See Scissors.

GRAPE FRUIT or Shaddock. Cirane fruit, which is procurable during most montìs of the year, is at its hest as a breakfast fruit:, to be eaten before the meal, and should be prepared in the following manner: first of all it is cut in half horizontally, using a special cutter or grape fruit knife. The pithy centre is out out and the pips removed, and finally the knife is passed round between the rind and the juicy fruit, and the latter cut into pieces of a convenient size.

Grape fruit is served in special glasses which can be cheaply purchased. Pointed grape fruit spoons are best used when eating this fruit, and can be obtained in sets. See Breakfast ; Diet ; Glass; Marmalade.

GRAPE HYACINTH. The popular name of muscari, a hardy bulh which bears some what grape-like clusters of Howers on stems $\mathbf{6}$ or 8 inches high in spring. It is very beautiful when massed in the shrubbery or rock garden: it makes a charming picture if planted beneath the golden bell shrub (forsythia), for both blonm together. Grape hyacinths Hourish in ordinary mil in sunny or slightly shady places: as the bulbs start to growearly they ought to he planted in September, 3 inches decp and about 4 inches apart The finest of all is one named Heav. enly Blue, a variety of Muscari conicum; the flowers are bright blue. Botryoides is another favourite, with hlue flowers; therereres are
whitevarieties of this and of conicum. Moschatum flavum is yel-
clasters of this hardy bulb low; monstrosum bears large inflorescences of pale hlue flowers.

## Grape Sugar. See Glucose.

GRAPHITE : As a Lubricant. Graphite is a form of carhon, very dark and soft, being one of the softest of minerals. It is employed in the manufacture of electrodes, pencils of the better class, and paint, also for making crucibles and for foundry facings, where the heat is intense; but its chief use is as a lubricant.

For this latter purpose ihe graphite should be of a very fine grade, so that it can enter between bearing surfoces without clogging, and be able to Hoat in the oil film between the bearing surfaces. The grade should vary

Grass. Example of a beautiful and decorative annual grass worth cultivating in a border Courlesin of Jumirs Maellonald, llurprndrn
according to the thickness of the oil, a coarser grade being used with greases and extra thick oils. Under the names of blacklead and plumbago graphite is employed with oil in lubricating slow-moving heavy bearings, cspecially cast-iron bearings, as it helps to smooth the surface of the porous metal. The best proportion appears to le a 4 per cent mixture by weight of oil and graphite.

Various branded and pmprietary mixtures of graphitc lubricants are on the market and suitable for use on cycle chains, for lubricating motor vehicle and other bearings, and in this form is convenient for domestic use. See Bearing; Lubricant, etc.

GRASS: For the Garden. For garden cultivation there are many sorts of giasses which are raised as easily as hardy annual Howers, and can be gathered and dried for ornamental purposes. The following table shows the principal sorts with their height in feet, all being annuals except the last six. which are perennials :

Stipe peunuta (Featlier grasa) graxs)
Of the 24 varieties in the above list 9 are staried as a special selection, 6 of which are annuals and 3 perennials, including Pampas grass. These are the cloicest and in most cases also the easiest to grow. Pampas grass (q.v.) is a conspicuous and beautiful object in autumn l'ennisetum longistylum is really a perennial, but generally receives the same treatnient as an annual. Most of the ornamental grasses succeed under the same treatment as hardy
annuals, sowing in rows or clumps in wellprepared soil outdoors in the early part of April. Most growers of ornamental grasses want to preserve some of them for vases and table decorations in winter, perhaps intcrmixed with everlasting flowers If so, care should be taken to gather them before the secd is ripe. As soon as the Howers have developed, the stems should he cut, hecause if left till they begin to drop they will not be durable. The stems should he laid out in a dry room for a few days. These grasses may readily be dyed any desired colour for ornamental purposes See Garden; Lawn.

GRASS CLOTH. Grass cloth is made from the long unspun fibres of a plant of the nettle species Light, fine and silky, but plain, it is a rarity and valuable, deserving of care,
although its strength enahles it to lesist tiard treatment. Unlike cotton or linen, it does not contract when it is wetted.
The same fibre of which grass cloth is made is spun and woven in Europe, and sold under the naine of ramie or China grass Often suggested as a substitute for linen, it tinds its chief use in incandescent gas mantles, which are knitted from the spun yarn, and then impregnated with minerals.

GRASS OF PARNASSUS. The heat known member of this genus is Parnassia palustris, a small plant with angular stems, each carrying one heart-shaped stemless lenf and solitary, white, green-veined Howers in summer it is found on the moors, and is an excellent subject for the bog garden or the rocky, where it should be given a peaty compost.

## Grates: TYPES FOR VARIOUS ROOMS

## Efficiency and Decorative Values of Kitchen and Sitting Room Types

All matters concerning domestic heating are dealt with in this work, and the reader should consu!t the articles on Adam Style; Central Heating; Chimney Piece; Elccıricity; Fireplace; Gas. See also Cocker: Flue ; Fuel : Hot W'duer Supply : Range, cic.

The beginning of the grate proper occurred fireclay. The tirebed is often of the well type when a basket made of iron was placed in between the two dogs in order to catch falling pieces of hurning wood and allow a suflicient air supply to reach them for the wood to burn out completely to ashes without smouldering. This form of dog grate or hasket grate is stil used for burning loge. Figs. I and 2 show two examples, as supplied by the Falkirk Iron Company. The small brackets on the front of the dogs are provided for carrying the spits, or long rods of iron, upon which joints of meat are spitted for roasting. The hasket underneath can also be used to hold the twigs and smaller logs used for lighting up the large logs in the first instance. Such a type of grate can also be used for burning coal, nnd is best suited for country houses with large fireplace recesses and an adequate supply of timber logs.

The immediate development of the basket grate was atill a dog grate. hut the fire hasket itself took the form of an oblong box with a solid back and sides, and an iron grating at thic bottom of the fire, with horizontal iron hars running along the front. A moderi stove of this type. huilt in the style of the lacobeat

period, but with the back and sides of the fire-box lined with firebricks, is shown in Fig. 3. There has been a marked tendency to return to the period form of stove, not only in the case of coal grates, but also with gas-fires and electric heaters, and dog grates of almost any period may be obtained for the use of any fuel.

The majority of sitting.room grates are now formed on the slow-combustion principle, and have no bars. In some there is no bottom grate, and the fire burns directly upon a solid block of
sunk below the hearth level. The back an i sides, made of specially prepared lirebrick. retain the heat and act as an rdded source of radiation. A barless slow combustion grate of the kind known as the heapled fire is shown in plan and elevation at Fig. 4, a picture of the grate as sct into a fireplace heing given in the article Fireplace (on page 459).
This utilizes the simplest application of the principle of slow comhustion, in the form of a metal plate which fits tightly around the front of the grate, and fills in the opening between the bottom grating, which carries the coals, and the hearth itself. It keeps the space under the firegrate hot and heats up the entering air hefore it reaches the glowing coals. When pushed close up to the grate the plate prevents practically any air from passing into the fire from underneath. In this grate the fire grating is unattached to the surrounding firebrick. It may be removed entirely during the summer, and be replaced by llowers or any other form of decoration. In other slow-combustion grates the front plate is fretted, and it slide allows the ventilation in be adjusted. Another type of grate is illustrated in Figs is and 1 i. The tire can be ignited by gas, and in summer may be replaced by an insert gas tire.

In Fig. 7 a "Pyramid" slow-combustion grate is shown, in conjunction with $a$ neat, tiled fireplace which is suitable for a bedroom. This type

Another good grate polish is made by mixing $\frac{1 \mathrm{~b}}{\mathrm{f}}$ of black. lead with a tencupful of vinegar Apply this in the usual way and polish with n dry brush For polished grates, use n paste made of fireplace is from 1 oz soft sonap and 2 oz emery powder. made in many Laythis on the steel and rub it with a dry colourings and in wash-leather. a varicty of styles. Figs. 8 and 9 illus trate a convertible grate which normally burns solid luel, but can readily be converted to gras foroccasionnl use.
Grate. Fir. 4. Section and plan it is specially at a barless slow combustion designed for coke burning, having a damper which can be lowered to start the fire. A gas poker connected to a nearby plugpoint is used to kindle the coke. For the summer months the "insert" gas fire is placed in position and connected to the supply pipe.

An attractive sitting-room grate which, presents a checrlul appenrance and permits a fair ainount of cooking to be done is illustrated in Fig. 10. It comprisen a high-pressure hotwater boiler and an oven. Pots or pans may be placed on the hob plate. The ventilating fret, when lifted out and placed on the hob in front of firo, accommodates two extra sance. pans for hoiling. The handles for the con trolling dampers are on the canopy.

Grate Polish. A useful grate polish can be made as follows: Take a cake of blacklead and the same weight in bluestone crystals and mix both to a cream with warm water. When the mixture is cold apply it to the grate with a brush When the fire is lighted the copper in the bluestone will bake in the blacklead and so form a pernia. nent polish. It should be rubbed fromitime to time with a soft

Grate. Fig. 5. Plan and section of the Dipper sunk grate with raised bearth. Fir. 日. Diew of the barless grate shown sectionally above. Fir. 7. Pyramid fire with independent tile fireplace, suitable for a bedroom 5 unil 6 Courlesy of Teute Firepluce Co., Ltd., 7, IVell Fire id Fouadry Co LII

GRATER. In its simplest form, a grater is a small piece of tin through which holes have been pierced, close together, leaving jagged edges. The article to be grated is rubbed up and down the rough surface. Bread, nutmeg, lemon. nid cheese graters nre 1 hose most

Grate. Figs. 8 and 9. Convertible grate which normally burns solid fuel, especially coke, but wheb can readily be adapted to kas l'ath: Soil
commonly used, and frequently the three latter
are combined in one. In a cheese grater the holes are larger, and smooth edged, having a sharp lip at the base. Graters should be "nalhed in very hot water and dried at once on a soft cloth, as if once allowed to get rusty they are diflicult to clean See Checse; Lemon; Nutmeg.

GRAVEL: Its Various Uses. Gravel, or amall stones rounded and smoothed by the netion of water, either in rivers or the sen, is used largely in building construction as well ns for making garden paths. For the latter purpose shell gravel is frequently purchased, containing varying quantities of broken shell mixed with the stones or pebbles. Gravel is obtainable from builders mer. chants or direct from the pita, and is sold in several grades and qualities, such as fine river or coarse beach. The latter, being impreg. nated with sea salt, cannot be used with cement until it has been washed. Fine gravel is employed for the rough cast applied as a surface finish on modern cottages. Its use as an nggregate for concrete is dealt with under that head.
In commencing the work of path-making, mark out the path by means of lines secured to pegs and remove turf and top soil to a depth of about 6 in., until a firm foundation is obtained. The trench has to be filled with
brick rubbish and covered with a layer of comarse gravel It has then to be watered and rolled, care being tation to preserve a camber or curved surface This is covered with a decp lager of fine gravel and again rolled A certain elay like consistency ensures the path being properly compacted This ant be de tected hy the cye and by touch.

Gravel has valuable properties as a tiltering medium. A natural water supply such as that from a brook, when diverterl and passed through a series of excavations filled with cloan, coarse gravel, will emerge in n prac. tically pure state See Concrete; Garden

GRAVES. This is the name of wines grown on the gravelly soil of the Graves district of Ginonde, France. Generally of a lively and brilliant colour, with more borly than the wines of Médoc, it has bouquet and fineness. The white wines of Graves nie in excellent table wine, and are drunk with oysters and fish There are many varieties Amongst the most famous are Haut-Brion, Pape Clement. Carbonnieux, Laguloup. Ferrand and du Bouscaut. See Wine

Graves' Disease. See Exophthalmic Goitre.

GRAVY. With few exceptions, gravy is the juice of ronsted or braised meat, slightly: diluted and seasoned. sometimes coloured with browning. but not thickened. That in. tended for roast meat should be prepared in the following way: Pour off all the dripping from the meat tin, carefully
keeping back the sediment and rich brown particles that can be seen under the fat, for it is to these that the gravy owes its Havour and colour. Ardd a gill or more of boiling stock or water, according to the size of the joint.

Put the tin over the fire and let the gravy boil, stirring and scraping off all the brown pieces from the tin into the gravy with an iron spoon. Nkim off any grease, add the nccessary seasoning, and strain a little round the meat, serving the rest in a heated sauce turern. Any bones remover from the ment

Fig. 10. Soloovengrate, which compriscs an open Gre, blah-pressure hot-water boiler and an oven Courtesy of Sumuel Smilh \& Sonv, l.id
can be boiled to yield stock, but no other Havouring is used. The gravy for mutton and lamb may require a drop or tivo of caramel $f$ it is very light in colour.
Slightly thickened gravy is made as follows : l'our off all except about 1 tablespoonful of He iripping from the tin. Stir into This 2 teaspoonfuls flour, and brown it carefully over the fire, stirring it frequently. Mix in gradually $\frac{1}{2}$ pint of stock, and atir the gravy over the fire again until it boils. Skim and veason it, and strain a little round the joint, putting the remainder in a sauce tureen. This gravy must never be thicker than thin cream See Baling; Beef: Browning.
GRAYLING. The grayling is nt its best during late summer. For frying, the fish is first washed, scaled, and cleaned, and the fins and gills removed Dry it thoroughly in a clean cloth, then sprinkle it with seasoning and a little flour, and fry it in a pan of smoking hot fat. When the fish is of a golden brown colour, drain and dish it, using parsley ns a garnish, and handing round some melted butter sauce.

If it is to be baked, put the lish, sprinkled with seasoning, in a baking dish, place a few lumps of butter on top, and then cover the dish with a lich. Bake the fish for about $\frac{1}{2}$ hour, basting it occasionally, and just before serving make some sance by mixing the gravy in the dish with melted butter. See Fish.

GREASE. Properly speaking grease is soft, thick, animal fat, but the word is used for oily matter of any kind. The grease that comes

Grease banding round a fruit tree, with winter moths caurbt upon it
from the llesh of those parts of animials that are used for human food. e.g. mutton, is turned into dripping, while many kinds of grease are used for lubricating purposes.

Grease is useful to the gardener. Bands of greasc-proof paper conted with grease or some sticky substance are applied to the stems of fruit trees to entrap the winter moth. The female noth, which is unable to fly, crawls up the stems to deposit her eggs and is caught by the grease. The bands may be prepared at home or purchased from horticultural dealers. They are fixed on the trees in autumn.

Cart grease may be used, but special preparations made for the purpose are to be preferred. It is imporsible to put the bands very high in the casc of bush trees on short stenis, but on standards they may be placed at any convenient height between 3 ft . and 5 ft .

It is useless to band trees and leave stakes unprotected. The bands are left on until spring; the grease must be renewed occasionally in winter. See Clarifying; Gravy ; Lubrication; Oiling.

GREAT DANE. This is a useful dog for those requiring a guard dog that is also reasonably active. It is less heavily huilt than a

Great Dane. Champion of this atrong and learless
St. Bernard, mastiff, or Newtoundland A buyer should see that its legs are straight, back and front, cow-hocks being a common fault. A long back and weak loins are also to be avoided. The body should be deep and the thighs muscular. The height for dogs should be not less than 30 in . at the shoulders, and the minimum for bitches 2 in. less. The neck should be long and well arched, free from loose skin, and it should carry the head well "p, not proed forward.

The recognized colours are brindles, lawns, harlequins, blues, blacks, the first three being the favourites. When in action the movement ahould be free and graceful. Usunlly a Great Dane is docile, but much depends upon his training lle should be kept under control from the first and not spoilt. See Dog.

GREEN FLY. The pest known as green fly affects many garden plants. In the greenhouse the pest is easily exterminated by closing all ventilation and fumigating with one of many preparations sold for the purpose.

In the open air, spraying or syringing is the hest cure. The best mixture is made up of the extract from $6 \mathbf{o z}$ of quassia chips, 4 oz of soft soap, well mixed and added to 5 gallons of water. Paralfin emulsion and dilute parallin are also efficncious. Abol, Katakilla and many other concentrated insecticides provide convenient remedies See Insecticide; Rose; Spraying, etc.

GREENGAGE. One of the most delicious varieties of plum; it is self-sterile and uncertain in cropping. It does best on a sunny
wall and must be planted near other plumtrees. preferably cooking varieties
In addition to their uses as dessert, greengages are stewed and conked to form various linds of sweets, and are also totl led and made into jam. Generally all directions given for the cooking of plums can be safely adopturd

Greengage Cream. A good cold sweet is provided in greengage cream, which is preplared by first rinsing a pretty mould in cold water, and decorafing it with clear sweet jelly and fruit. In a basin $\operatorname{mix}_{2 \frac{1}{2}}$ gills sieved green. gages, 3 oz. sugar, and the juice of lemon. Dissolve $\frac{3}{3}$ oz. gelatine in $\frac{1}{2}$ gill warm water, and strain it into the fruit, etc., adding lightly $\frac{1}{2}$ pint whipprd cream, and, if
 liked, a few
drops of green vegelable colouring. Pour the mixture into the mould and lenve it until cold, when it is ready to turn out

Greengage Jam. Choose under-ripe cooking grcengages for making this jam. Put 6 Ib of cleaned fruit in the preserving-pan with 1 pint of water, and boil them until the fruit breaks. Remove the stones, cracking some of them and extracting the kernels. and to each Ib . of the pulped fruit add is Ib of crushed lonf sugar. Let the sugar dissolve, then boil the jam quickly, atirring all the time, until it jells when tested on a plate. Add the kernels about 3 min . before the cooking is finished. Pour the jam into warm dry iars. and fasten down at once.

GREENHEART. The wood known as greenheart is extremely hard, heavy, and tough, and close and even in the gritin. In colour it is of a dark greenish hue, varying to a very dark centre. Grecnheart is remark ably elastic, and is onc of the hest woods for salmon and trout lishing rods. Sep Wond

## Greenhouses: Making and Stocking

## How the Gardener can Make the Most of his Outfit

After some general considerations of design and arrangement, followcd by hints on management and lists of suitable plants, the rcader is told how to construct a useful greenhouse. Sce Conservatory Frame; Garden: Glass, etc.

The principal object for which a greenhouse s designed is for the housing of plants not harrly enough to withstand the rigour of winter conditions. Three good types are the warm house, in which a minimum temperature of $55^{c} \mathrm{~F}$ is maintained during winter; the unheated house entirely without artificial heat, and the greenhouse proper, which can maintain a minimuin temperature of $45^{\circ}$ by means of gas, oil, or hot water. A house of the latter type is considered in this article, giving scope not for the culture of ornamental plants alone, but also for the growing of such profitable crops as tomatoes, cucumbers, etc.

There is variety in the shape of greenhouses, and possibly the most convenient and generally useful type is that known as a span rouf, having its roof sloping downward from both sides of the ridge board at an angle of about $45^{\circ}$. Other kinds are the lean-to, a popular and useful structure, and the three-quarter span, a compromise betiveen the two. Each of these types is illustratel, while for the henefit
of those prepared to crect a home-malc house, constructional diagrams are given.
It should be noted that if a greenhouse is to remain a tenant's fixture it must rest upon the soil and not be fixed to anything built into the soil, neither must its woodwork or other parts be nailed or attached in any way to the brickwork, otherwise it automatically becomes the property of the land lord when the tenancy expires.

The greenhouse ought to be in a sunny position. A roller blind is usually fitted to provide shade in hot weather, or "Summer Cloud" can he appliod to the glass.

Artiticial heating is best maintained hy hot water, the simplest system being a loiler, plus a flow and return pipe. For small greenhouses a hot-vater apparatus heated by an oil lamp is servicenble.

Ientilation should be thorough. A glassformed structure such as n greenhouse readily udmits the sun's hent, but does not readily permit it to escape; thus its quantity must be

notting-bench. This may be 3 or 4 ft. long,
built at a heiglit suitable for comfortable
work. Underncath it should be boarded off
into four compartments, to contain leaf-soil, lonm, peat, and sand.
Watering and ryringing are both important. A safe general rule is to water sufficiently to reach every particle of root, and then wait until repetition is necessary. The best times for watering are morning and evening, pot plants that have become very dry being placed in a pail of water to soak until bubbles cease
With a warm greenhouse the garlener has opportunity to raise seedlings for the garien
regulated by ventilation, preferably at the apex of the house. Fresh air is essential to the wellbeing of plants. When weather is favourable, nir should be given freely, day and night, from late May until mid-Septemlier, but at other times it should be given only during morning, if conditions are fair, and
 for cucumbers and tomatoes or for plants. Above, left, span-rool greenhouse with wood base, suitable for growing plants of all kinds
Courlesn of Boulton \& l'aut. Lid withdrawn or re- proper : to forwarl crops of beans, peas salads, onions, etc. to mise early vegetables; to winter tencler plants; to grow cucumbers, melons, and tomatoes, and perhaps to cultivate a vine or peach tree with success.
Chrysanthemums and carnations are prime favourites in the greenhouse, perpetual.flowering varicties of the latter being invaluable. So also are begonias of duced in the early afternonn at latest. Top the fibrous-rooted type, such as Gloire-deventilators must be opened first, followed by Lorraine, and its varicties Turnford Hall and the lower ones, but they should be opened on Mrs. Lenpold de Rothschild; others with the same side of the house. Draughts are drooping growth for baskets, like Golden to be avoided Shower and Alice Manning; together with the
Staging, three feet high, usually consists of handsome leaved liex begonias. Among other wooden shelving. It is an alvantage to lay plants for the greenhouse are coleus, with its thin sheets of corrugated iron or slate on the very attractive foliage, fuchsias as pot-plants bench, covering with well-washed sand or gravel.

One of the most useful accessories is a potting-shed casily accessible to the house. It will be handy for storing garden para. phernalia apart from its actual purpose of putting plants into pots, but must contain a well-lighted

or climbers, hydrangea (hortensia), cherry-pie Lord Roherts; show and fancy pelargoniums for early summer and zonals for winter blooming, scarlet sage for display in autumn and early winter, primulas, cineraria (stellata).
Amongat shrubby plants there are roses Indian azaleas, genistas, spireas. as well as those old favourites the heaths; whilst ever. greens include the well known and easily grown foliage plants, Kentias, fan palms, and aspidistras. To these may be added maidenhair, and other ferns: greenhouse asparagus. sprengeri and plumosus; and the grevillea. Then there is the wide range of bulbs and corms. Lilies, winter-flowering cyclamen, gladioli, freesias, tulips, hyacinths, daffodils, narcissi, amaryllis, gloxinias, and the little. grown, but lovely, nerine.
Unfortunately, plants grown in greenhouses are particularly subject to insect pests, but an occasional fumigation will enable them to he kept in check. Or the planta may be sprayed with an insecticide.

Making a Greenhouse. Fig. l illustrates a greenhouse 9 ft . long and 6 ft . 6 in . wide, having a door at one end and a ventilation skylight in the roof. It is constructed by making six distinct frames, which are assembled together by coach-screws or nuts and bolts, and it can be removed easily when desired. The weatherboarding shown on the lower portion is nailed on horizontally, and is preferable to matchboarding nailed on the frames vertically. When natural decay sets in, this generally begins at the bottom of the greenhouse If the boarding has been nuiled

ront Edge gftzin Fis B

Greenhouse. Fig. 1. Lean-to greenhouse which can be made by following instraction3 given in the text. Fig. 2. Part of tront before weatherboarding is fired fig. 3. Fixing spar on wall to support back edge of frame. Fig. 4. Bottom corner of skylight frame showlag throating to turn water. Fig. 5. Curb as fixed la window opening. Fig. 6. Half of top frame showing joints and sections. Fig. 7. End trame with door. Fig. 8. End without door. The letter $S$ indicates latts of wood nailed to framing to provide rebates for the glass
on to the frames vertically, decay necessitates hastened. From a digestive point of view, the ,the most imposing, they frequently lack taking off and renewing practically the whole use of green tea is undesirable, as it usually of the boarling; whercas, if weatherboards, contains a larger percentage of tannin than with their joints running horizontally, have been used, the board nearest to the earth can be readily removed and a new one put in its place.

The foundation may be made of odd bricks, broken stones or slabs, granite chippings and concrete, and it should be the first step towarels building the greenhouse. The two end frames are built up out of squareerlged timber (that is, timber not rebated on one of its edgos). The portions marked $S$ throughout the drawings refer to strips or laths of wood, which are nailed on to the framing to form the rebates which hold the glass, and their width and thickness will be in correct agreement with the rehating of the sash bars.

The front frame, of which a portion is shown in Fig. 2, is built up in the usual manner by mortise and tenon or half-lap joints. It is stayed by two diagonal braces to prevent it from racking. The top edge will have to be planed or sawn on the bevel, so as to allow the roof frame to fit and bed upon it. At the back the roof frame is supported by a spar fixed to the wall, as shown in Fig. 3.

The roof frame (Fig. 6), of which a half-plan is shown, will probably be the mort . .lifficult for the home worker to make; but, after the experience gained in making the end frames, he will be more confident to tackle it. The joints and details are so clearly shown in the diagram that little in the way of a description is needed, except perhaps to :say that a space is left for the ventilator window. Into this space a box or curb is made (Fig. 5), and fitted and nailed in, so that its top edge projects about if in. above the noof frame. This is to throw off the water and keep it out of the joint of the window opening.

The skylight frame is made to project about 1 in. over the curb, and it is throated with a small groove, as shown in Fig. 4, so as to turn the water. The skylight is hinged to the back edge of the curb with butt hinges, and the usual stay rod from the inside of the greenhouse is provicled to raise and lower it. The whole of the timber framing should be given one coat of paint before the frames are sasembled. This will prevent the new timber absorbing the oil out of the putty, which would otherwise peel off and drop out. Do not forget to make the end frames handel, that is, one frame for the left hand and one frame for the right hand (Figs. 7 and 8).

GRFINS. This term is used for green vegetables generally, such as broccoli, cabbage, and spinach. Some people class cauliflowers as greens. See Cabbage; Caulifower, etc.

GRFEN TEA. Of the green teas hyson, young hyson, twankay, and gunpowder are the best known, and are chiefly used for blending. The characteristic colour of green teas is due to the particular processes to which they are subjected. These vary considerably from those employed for black teas. For green tea, the leaves of the tea plant are gathered and roasted off at once, before fermentation seta in, while the drying, too, is also specially

Grts Ware. Siegburg jug with raised Brilisht Museuma
black tea See Tea
GREGORY'S POWDER. The common GREGORY'S POWDER. The common
name for compound rhubarb powder is Gregory's powder or mixture, of which the purgative dose is 10 to 60 grains. It is frequently prescribed for acute indigestion in children and is also useful in diarrhoea. Adults sufforing from dyspepsia may benefit from small doses, as much as will lie on a sixpence, thrice daily before food.

GRENADIN. In cookery the term grenadin is applied to an oval or round cut from the fillet or cushion of veal. It is usually larded and braised, after which it is garnished and served with sauce. See Veal.

GRESWARE. This name usually stands for the old stoneware produced in W. Europe during the 16th-18th centuries. Because it was shipped mostly from Flemish ports it was called Grès de Flandres, although the bulk of it came from Cologne and other places in the Rhineland, and some of the best from Nuremberg, Siegburg, and other towns near.

It was essentially a fine salt-glaze stoneware, in greyish and other neutral tones, with designs in relief based on wood-cut illustralions in books, or the coats of arms of nobles and well-to-do burgesses. The surface resembled orange-skin, and the forms included cylindrical tankards, tall or squat, lidded and handled, sometimes with long oblique spouts.
Specimens of Rhenish origin are sometimes unearthed on old city sites in England, because they had a great vogue here until Fulham ware, and afterwards Staffordshire saltglaze, came in to displace them. There are modern potteries engaged in turning out, in the same local white clay, reproductions of favourite old designs. See Pottery; Stoneware.

GREVILIEA. The most popular kind is Grevillea robusta, an Australian shrub with decorative leaves, suitable for cultivation in pots, room and greenhouse. It is easily grown from seeds sown under glass in spring and good plants can be grown in 5 in . pots in a compost of loam, leaf soil and sand. The red Howered Grevillea rosmarinifolia, a bush 4 to 5 ft . high, is suitable for planting out of doors only in mild districts.
GREYBOUND. Through being regarded primarily as a sporting dog, with highly specialized functions, the greyhound is seldom kept as a companion, although there are many reasons to be urged in his favour. In outline he is exquisitely graceful, his movements being gentle.

The English greyhound is our representative of one of the oldest canine families. Many thousands are bred annually for the purpose of coursing and track racing. There are not many show kennels, but occasionally a greyhound is exhibited of such perfection that he can be fairly sure of winning the prize for the best of any breed in a show.

There are many colours, all of which are permissible. Although the bigger ones look
the power to turn quickly when coursing. Experience commends clogs of medium size, and some of the most famous Waterloo Cup winners have been small. See Dog; Italian Greyhound.
GREY MULLET. Of inferior quality compared with the red mullet, grey mullet is, neverthelcss, much liked by many, but needs to be very fresh when cooked. Most of the methods which are employod for cooking haddock may also be applied to grey mullet, but sauce should always accompany it. See Haddock; Red Mullet.
GRID: In Wireless. This is an electrode of fine wire mesh between the anode and filament (or cathode) of a thermionic valve. The ordinary threo electrode valve has only one grid, as distinct from a screen-grid valve, which has two, and a pentode with three.
The second grid in a screen-grid valve is usually called the acreening grid, and is joined to the pin on the valve base which is connected to the anode in the case of a three-electrode valve, i.e. the pin farthest from the other three. The screening grid is connected to a tapping on the high tension battery or eliminator having a positive potential of $80-90$ volts (depending on the anode voltage).
In a pentode valve, one of the auxiliary grids is connected internally to the filament, while the other (known as the priming grid) goes to a terminal on the side of the valve base, and requires a positive potential which may be the same as that applied to the anode.
Grid Battery. This is a small dry cell battery employed to maintain the grids of the amplifying valves (sometimes also the detector) at a negative potential in respect to the filaments, or cathodes. The grid bias value depends upon the type of valve (e.g. its impedance) and the high tension voltage. The correct figure may be ascertained from the maker's instructions accompanying the valve.
Failure to apply the negative grid bias specified will result in excessive anode current consumption, distortion, and possibly loss of emission, i.e., valve failure. Although a grid bias battery is not called upon to supply actual current, it should be replaced about every nine months, or the valve will be damaged.
Grid Leak. This is a high resistance connected between the grid of a wireless receiving valve and a point in the circuit having a positive or a negative potential in respect to the filament or cathode.
A grid leak may be employed to assist in the process of rectification-e.g. a leaky grid detector-or to maintain the grid of a valve at a suitable negative potential, as in a resistancecapacity coupled low-frequency magnifier. No definite values can be given, although 2 megohms is commonly chosen for a leaky grid detector and $0.5-2$ megohms for a resistancecapacity coupled magnifier.
A defective grid leak may produce crackling noises, distortion, and sometimes a choking

Greghound. Two priso-winning epecimens of the lamoas breed of sporting dos
effect on reception, which develons within a short period of switching on the set. See Anode; Cathode; Detector ; Filnment: Resistance Coupling; Valve.

GRIFFON. There are several different types of this wire-haired dog with its benrded and moustached countenance. There are long.

Grifion. Long-baired and pug-nosed specimen of this breed of small dog
linired and short-haired, red, grey, faim, hlack-and-tan; but the favourite is the long. haired red, with pug nose and large eyes. The smaller dogs should not exceed 5 lb . in weight, but the larger race may run up to 9 lb . They should not be bought younger than about three months old, for from the age of five to eight weeks their rearing is attended with anriety At three months the critical time is well over. See Dog.

GRILL. The term is used to diescribe both the appliance on which food is grilled and the cooked dish itself. Grilling is usually done under the griller of a gas-stove or by a grill or gridiron jlaced over or in fmnt of the lire For cooking over the fire, a single row of bars fastened at each end, with a long handle at one end, is used. For grilling in front of the fire, the iron has a double row of bars, enabling the food to he enclosed, while underneath is a shallow trough to catch the fat.

Electric grills on which breakfast, luncheon, or a complete dinner can be prepared are useful table appointments. See l3acon; Chop; Cooker; Liver; Mixed Grill; Sausage; Steak.

GRILLE : In Building. A grating or structure of iron or other metal bars, known as a grille, is placed over an opening or aperture generally to prevent any forced entry. Such a grille is made of $\frac{\mathrm{in}}{} \mathrm{i}$ diameter iron bars, to bolt over a basement window. Similar structures arc often made for the openings in gullies or drains.

GRILLING. Besides heing rapid in its operation, grilling is one of the most wholesome methods of cooking meat, which is exposed directly to the Hame. If the process is to take place over or before the lire, the latter must be clear and free from smoke. A gas or clectric grill should be made red hot before the meat is put undementh it. The bais of the griller inust be greased to prevent the ment sticking. Grilled ment shoukl not be overdone, otherwise it will harden and lose its Ilavour. It shou!d be brushed over with melted lat before grilling. After cooking, rub it on both sides with butter and season it to taste. The most suitable meats for grilling are stenks, chops, cutlets from the centre of a leg of mutton, and small birds, while the best fish for the purpose are cutlets of salmon, mackerel, tmut, and whiting. Fish for grilling should be wrapped in well-buttered thick glazed paper. When birds arc grilled they should be cut in hail and the inner side first exposed to the fire.

GRILL SAUCE. To make this, place a soup plate over a bosin filled to the hrim with hoiling water. Put 1 o7. of butter in the plate and, when it is melted, stir into it first 2 tenspoonfuls of inade mustard. then a dessertspoonful of Fiench vinegar, a teaspoonful of tarragon vincgar, and lastly a tablespoonfol of cream Season to taste with salt, pepper, and cayeune, and pour oves the grilled meat. See Bones; Gravy; Sauce.

GRINDING: Of the Tecth. In children grinding of the teeth during sleep is most commonly clue to indigestion, worms, or some irritaling inatter in the bowels. It also occurs in nervous dispases, such as St. Vitus's dance The treatment is that of the condition.

GRINDSTONE : How to Use. A grindatonc is an implement used for the sharpening of tools. It comprises a circular atone inounted on a spindle which is supported in a frame; it is adajted for driving by hanil or by a treadle. It is an advantage if the frame is enclosed at the hottom to form a trough holding a supply of water to keep the stone wot and to prevent tools from overheating while being ground. The best type of grindatone is one with a cast-iron frame and litted with a self-contained treadle, and is best fitted with a hood to prevent the water from splashing. Such a stonc should he a hout 2 ft . in diameter and 3 or 4 in . in width. Sinaller grindstones can be screwed to the bench, but they have to he worked by hand, leaving only one hand free to hold the tool heing ground.

Grinding Cutlery. Grinding is the prosess by which knives and other cutting implements are sharpened on a grindatone. In grinding. the stone revolves towards the worker, the tonl-rest being adjusted to the proper angle, and set as close to the stonc as possible. This prevents the tool from catching and being dragged down. The stone should never be tonched with the hands while it is revolving.

Fig. I shows how a chisel is ground. The method is as follows: Grasp) the blade in the
left hand, with the fingers uppermost, and grip the handle with the right. Incline the tool so that the angle of the bevel is about $20^{\circ}$. The rest should be set to this angle, and the chisel can then rest llat upon it. The tool is not held in onc place, but moved about across the rest to a void forming a groove in the stone Grinding continues until the bevel on the tool is llat and true. Ordinary firmer chisels are ground on one side only; turning chisels and cold chisels on both sides.

Gouges are ground on the outaide, and are held in a slanting position to the stone, as in Fig. 2. The gouge is twisted or turned so that the hevel is ground to a true curve.

Plane irons are trcated in the same way as chisels, except that, heing broader, they call for more care, especially to keep the edge square with the side of the iron. A spokeshave iron is held in both hands and the face of the iron is ground, very light pressure being needed. With axes and hatchets the head is held in the right hand, the shaft in the left: the head is rocked to and fro on the face of the stonc to produce the requisite curved cdge.

A valuable aid to correct grinding is the device illustrated in Fig. 3 and linown as a grinding rest, consisting of a roller and a tonl clamp. The tool to be ground is placed in the clainp and fastened by the clamping screw, "ith such an nmount projecting that when the tool and the wheel are both resting on the stone the angle so formed is that reguired for the tool. 'I'lic greater the plojection the flatter the angle, and vice versa.

## Gripes. See Colic.

GRIT. Hard, sharp particles of stone, known as grit, are given in kulk to fowls in order to enable them to digest their food. A fowl at liberty instinctively forages for and finds an unlimited supply of suitable material, but in conlined quarters the grit has to be provided. The best kind of stone for the purpose is llint, which must be broken to a hout the size of n pea for adult lowls, and somewhint sinaller for chickens. See Poultry.

Grindstone. Fig. 1. Method of placing bands to control a chisel bladz and obtain deslred cutting angle. Fiy. 2. Grinding back of a Rouge.
Fir. 3. Use of simple tool grinding rest. Fig. 4. Grinding a bill-hook Fir. 3. Use of simple tool grinding rest. Fig. 4. Grinding a bill-book which is beld obliquely across the stong

GROG. The drink known as grog is made liy adding a little cold water to spirits, no sugar being put into the mixture. Sometimes, however, hot water is used. and this nlso is called grog. The spirit most gencrally used in making grog is rum, and as the driflk is useful for maintaining the heat of the body, it is drunk by sailors and others whose duties compel them to face cold and inclement weather. See Rum
GROMWEL̇L. The English name of lithospermunn, a beautiful rock-garden plant (q v.), which is also known as borage-wort. The most useful species, prostratum, is a hardy evergieen trailer, with hairy stems and lance-shaped, hairy leaves, which covers itself with rich hlue llowers in summer. It is a benutiful plant for the rockery, where it carpets spaces between large stones, and looks at its best when hanging over them in broad masses.
There is a variety called Heavenly IBlue,
which resembles the species closely, but is rather lighter in colour. These beautiful trailers like a light, sandy, or chalky soil and a sunny position. They are lime-lovers, and are invaluable for hot, dry banks. Other desirable species are graminifolium, which has grassy evergreen leaves and clusters of blue, drooping flowers; canescens, a hoary herbaceous species with yellow flowers, height 9 in ; gastoni, also herbaceous, blue with white eye, an alpine growing about 9 in . high; purpureo-caeruleum, herbaceous, purplish blue, a trailer; and rosmarini-folium, evergreen, blue, 18 in.

The best of all for the rock garden is L. petraeum, a pretty little bush with greyish leaves, something like the lavender. It is about 9 in . in height, and bears purple flowers from May to July, the blossoms changing in colour to deep violet as they expand.
The gromwells are propagated by seed, cuttings, and divisions. Seed is sown in a frame in spring. Cuttings are inserted in sand soil in a frame in summer. Division should be practised in spring. See Rock Garden.

GROOM. A groom is a manservant who has charge of horses. He should understand the care of horses and be a good rider, as he is often expected to exercise the horses. His duties include, in addition to looking after the horse or horses, the care of the stables and the cleaning of the harness. In Great Britain a licence must be taken out for a groom; this costs 15s. a year. He must be insured under the National Health Insurance scheme. See Harness; Horse; Insurance ; Stable.

GROUND BEETLS. Although there are many kinds of beetles that live chiefly underground, the name is applied particularly to a

Ground Beetle. Oseful garden inseot which feeds on caterpillars group of 10 species of carabus. They are about lin. long, shiny black, in some cases with violet or golden reflections, and all wingless. The ground beetle is one of the gardener's best friends, and seeks and devours the fat caterpillars, such as that of the turnip-moth, which destroy vegetables at night. See Beetle.

Ground Ivy. See Nepeta.
Ground Nut. See Monkey Nut.
GROUND RENT. A ground rent is the rent paid for the land on which a leasehold house or building stands. Its amount is fixed when the land is let to the builder, and cannot be altered during the period of the lease, usually 99 years. The owner of the house, not the tenant, is responsible for paying this rent to the ground landlord, and he should deduct income tax at the usual rates from it when he does so. See Income Tax; Leasehold; Rent.

GROUND RICE. This is a fine flour-like preparation made from rice. Like rice flour, it is much used in the making of cakes, hot or cold puddings, and for thickening soups.

Ground Rice Cake. To make these, sieve together 3 oz . ground rice, 2 oz . flour, and- $\frac{1}{2}$ teaspoonful baking powder. Cream together 2 oz . butter and 3 oz . castor sugar, then beat in 2 eggs separately. Stir in the dry ingredients, mix all thoroughly, put the ingredients into small greased queen-cake tins, and bake in a quick oven for about 10 minutes.

Ground Rice Mould. For this, mix $1 \frac{1}{1} \mathrm{oz}$. ground rice to a thin smooth paste with a little milk. Put what is left of 1 pint milk in a pan on the fire, with 1 in . cinnamon. When the milk boils, add the ground rice together with 1 oz . sugar and boil gently for 15 min ., stirring
all the time. Rinse out some dariole moulds or small teacups with cold water. Take out the cinnamon and fill the moulds with half the rice. Colour the remainder a pale pink with a few drops of cochineal, and fill up the moulds. When set turn them out on to a glass dish and pour custard round. The mixture can also be set in one large mould.

Ground Rice Pudding. Baked ground rice pudding is made by rinsing out a saucepan with water, pouring in 1 pint of milk, and heating until it boils. Then stir in 2 oz . ground rice mixed to a thin smooth cream with a little cold milk. Continue the stirring until the mixture thickens, and then add 1 oz . butter, sugar to taste, and a little vanilla flavouring. Allow it to cool before adding 1 beaten egg. Thickly grease a pie-dish, pour in the mixture, and bake it gently until lightly browned. See Diet; Rice.

GROUNDSELL. The wild groundsel, called Senecio vulgaris, is a common weed which spreads very quickly by self-sown soeds. It should be destroyed by hoeing before it flowers. There are some valuable garden flowers in the genus senecio.

GROUSE. These birds, which are in season from Aug. 12 to Dec. 9, may be cooked in a variety of ways, but the most usual method is to roast them. They should hang for ten days to a fortnight before being plucked. All the methods of cooking described under the heading Game (q.v.) can be used for grouse.

GROWING PAINS. The ordinary process of growth causes no pain, and what in children are called growing pains are really manifestations of acute rheumatism and should be treated as such. If neglected, serious implica. tion of the heart may result. See Rheumatism.

GRUB : In the Garden. Various garden pests ane termed grubs when in the egg or chrysalis state during winter. They are usually just below the surface of the ground, or in the cracks and crevices of the bark of trees and shrubs. Methods of dealing with grubs are explained under the headings of the plants and shrubs which are liable to be infested by these garden pests. See Insecticide.

GRUSL. To make gruel, put into a basin 1 tablespoonful fine oatmeal and a pinch of salt. Pour over it 1 teacupful cold water and 1 teacupful milk. Stir thoroughly and let it stand for $\frac{1}{2}$ hour. Stir again, strain, put the liquid into a saucepan, stir till boiling, and boil for 10 min . Serve hot in a soup-cup.

A little cream added last of all is an improvement, and it may be sweetened with 1 teaspoonful of sugar. If wanted quickly, use 2 tablespoonfuls of oatmeal to the same quantity of milk and water. Stir and strain and make as above. The oatmeal that is left can be used for porridge. See Invalid Cookery.

GRUYERE CBEESE. This is a large flat cheese, distinguished from others by the presence of large holes, some of which are filled with moisture. It has a nutty flavour.

GUAIACOL. Prepared from creosote, guaiacol is frequently prescribed in consumption. It is given in the form of the carbonate of guaiacol. It has also been used successfully in the treatment of rheumatoid arthritis, but it must be taken for a considerable time.

Guaiacum resin is obtained from the wood of a West Indian tree, Guaiacum officinale. also called Jignum vitao (wood of life), on account of its high medicinal reputation in earlier days. The resin has a mild purgative effect. It was an ingredient of the electuary, known as the Chelsea Pensioner, formerly a favourite remedy for the pains of chronic rheumatism and gout.

GUANO. The valuable natural manure named guano is derived from sea-birds; the chief source of supply is the eastern coast of

South America. It is rich in ammonia, phosphates, and alkaline salts. Most of the guano which reaches Great Britain is dealt with in proprietary form, and instructions are issued with it. See Manure.
GUARANTEE. In English law a guarantee is a promise to be answerable for the debt, default or miscarriage of another. Examples are bank guarantees, in which one makes himself responsible for an overdraft or other advance made to another, and guarantees of debts of various kinds. A reference stating that a person is in a sound financial position is not a guarantee.

GUARDIAN : Eis Duties. A guardian is a person to whom belongs the care and custody of an infant (under 21). A father is the natural guardian of his child. He may appoint by his will a guardian to act after his death; but this guardian acts along with the mother.
The high court may always appoint a guardian for a child, though the rights of the father and mother are never interfered with, unless for the infant's benefit. If the father and mother separate, prima facie the father has a right to the custody of the children ; but the court will consider the interests of the child as paramount and may order the mother to have the custody.

A guardian controls the ward's marriage, to the extent of being able to forbid a marriage without his consent. Anyone who takes a ward out of the guardian's control will be severely dealt with by the court. A guardian must not make a profit out of his guardianship; and may not deal with the ward's property except for the ward's benefit. A guardian must render an exact account when the ward attains the age of twenty-one. See Child.

GUAVA JELLY. This can be bought in jars ready for use, or prepared at home from the ripe fruit. Guavas are cultivated under glass in Great Britain, but cannot be imported from the tropics in their ripe state. To make the jelly, peel and cut into quarters about a hundred ripe guavas, wash them thoroughly, then put them into a saúcepan with sufficient water to cover, and boil for about 2 hours or until they are perfectly tender, and will break easily when touched. Strain off the juice through a sieve, pressing the fruit so as to obtain as much juice as possible, and if necessary letting it drip for a day or so. Pour the juice into a preserving pan and boil it well, skimming it frequently. Add gradually enough sugar to sweeten it, boil it for a few minutes, then add the juice of ten large limes or lemons. Boil until all the scum has risen and the jelly looks clear: then pour it into clean dry jars, and cover when cold.
Medlars are sometimes used to make imitation guava jelly.

GUDGEON. A small, well-flavoured freshwater fish that is in season from mid-summer until late autumn. The fish should first be cleaned thoroughly, and the gills removed. Use a soft cloth for drying, then dip the fish in the yolk of an egg beaten up with a little butter, roll it in breadcrumbs, and fry it in hot fat. Alternately it may be dipped in milk, coated with flour and fried for 4 or 5 min . in hot butter. Drain the fish on paper, and serve them garnished with fried paraley. Anchovy or shrimp sauce makes a good accompaniment. See Anchovy ; Fish; Shrimp.

GUDGEON PIN. This is the name given to an axle which turns in a collar. An example is the gudgeon pin which connects the small end of the connecting rod in an internal com bustion engine with the piston. See Big-End; Motor Car; Motor Cycle.

GUELDER ROSE. The popular name of viburnum, a group of leaf-losing and evergreen shrubs of great garden value. The common

Guelder Rose. Flowers of one of the double varieties
GUERNSEY LILY. The popular name of Nerine sarniensis, a beautiful greenhouse bulb which bears rose-scarlet Howers in autumn. The bulbs are potted in August, and come quickly into bloom. The leaves develop in the autumn and winter months, so the soil must be kept moist during that period. The plants are grown in a sunny greenhouse in a temperaturo of about 45 degrees. When, in early summer, the leaves turn yellow, watering must be reduced gradually and finally discontinucd.
GUEST. The greatest compliment which a guest can pay to a host and hostess is to enjoy himself or herself.
When invited to stay at a house a guest should intimate beforehand the hour at which he intends to arrive, and hold to that arrangement. Throughout his visit he should do his best to enter into the ordinary family life, thus making his entertainment an easy matter. Tidiness in an easy matter. Tidiness in which bears roso-scarlet fowers
his bedroom and punctu-
ality at meals will add to his popularity with over the breas ality at meals will add to his popularity with the household. After his departure he should write a letter of thanks to his late hostess.

Guests should arrive punctually when invited to luncheon or dinner. At an At Home or informal evening party the time may be any convenient hour within certain limits set out on the invitation, but at a bridge party or concert a guest should arrive rather before the time named. See Etiquette.
GUILLOCHE. The form of carving known as guilloche is frequently seen on English oak chests of the 16 th and 17 th centuries. It is

Guilloche. Interiaced form of wood araring seen on antique English oak chests 18 another, with the wood cut to make the bands which form the rings go alternately under and over each other. In this way they are bound together in plaited formations of strapwork to simulate braiding. See Jacobean Style ; Tudor Style.

GUINEA. The Englisl gold coin of the nominal value of 21 s . is now obsolete. Guineas were last coined in 1813, and examples are valued by collectors. Pieces of t-guinea, 2 guineas, and 5 guineas were also coined. At the present day, although guineas are not used as coins, certain professional fees are reckoned thercin. A spade guinea is one,
an interlaced

Gaernsey Lily, a greenhouse bulb over the breasts and basting frequenty counteract the dryness. It frequently to I hour's cooking. Celery sauce makes a good accompaniment. See Chicken; Pheasant.

GUINEA PIG. Guinea pigs can be kept comfortably in a more confined space than rabbits, and are generally run in pairs. The period of gestation is 9 to 10 weeks, and the number of young at a birth seldom exceeds five. Little guinea pigs are very precocious. The dietary of a guinea pig consists of any

food a mixture of $\frac{8}{8}$ bran and $\frac{1}{3}$ sharps. They are also partial to bread and milk. Water to drink should always be within reach. Good animals of a prize strain have a fair market value. See Rabbit Hutch.

GUITAR : How to Play. The guitar is one of those instruments which have a fretted fingerboard, and are played by plucking the strings with the fingers. Its parts are, firstly the body, the back and the sides of which are of maple, ash, or cherry wood, and the face or sound-board of deal. The sound-board is pierced with a large round sound-hole in the middle of the narrowest part, or waist, of the guitar.

Secondly, there is the neck, the upper side or fingerboard of which is of some hardwood like ebony or beech: upon it are the frets, arranged so as to give a succession of semitones. This terminates in the head, holding the six tuning pegs, which are now metal screws, three on each side.
The strings are carried from these pegs over the nut to the tail piece, which is fixed at the farther end of the sound-board. They are six in number, the first three being of gut, the ot hers of silk spun over with fine wire, and they are tuned in fourths, except between the 2nd and 3rd, where there is the interval of a third as shown in the diagram. These are the real sounds, but it is customary to write music for the guitar on the treble stave, an octave higher than the actual pitch. Tune the sixth or lowest string to agree with the corresponding note on the piano, or whatever instrument is to be used in conjunction with the guitar, and

Guinea Pig. 8mall animals which are popular pets with children. A great variety of colouring and marting is obtainable in the short-haired breed
from that tune successively the other strings Let the thumb and first finger of the left hand encircle the neck behind the first fret, the other fingers suitably curved being held over the strings. The body of the guitar is kept in position Dy firm pressure with the inner part of the right arm. The little finger of the right hand rests upon the sound-board, midway between the tail-piece and the sound-hole, the other fingers being used to pluck the strings, the lowest three by the thumb, and the 3rd, 2nd and lst strings by the lst 2nd and 3rd fingers respectively.

Initial practice will consist in plucking only the open strings in varying order. When facility in thus finding the strings has been attained, it will be time to proceed to the stopped notes, to produce which the finger is pressed firmly upon the string just behind the
proper fret. A tahle of fingering is given in every tutor for the instrument; it is sufficient to say here that to reach the higher frets it is necessary to shift the left hand up the neck.

When the first finger is in its normal position behind the lowest fret, the hand is asid to be in the first position; when the hand is shifted so that the first finger is behind the second or third fret, it is in the second or third position respectively. It will be found best to shift after playing an open atring.
After use, wipe the instrument with a soft duster, to remove any traces of moisture from the warm hand, and put it away where it will be protected from dust.

GUM. Gum is a vegetable product from trees, which forms mucilage when dissolved in water. The chief gum is that obtained from the acacia tree, known as gum arabic. When dissolved in water in the proportion of gum I oz., water If oz., a thick liquid is ohtained which is employed as an adhesive. When the beat quality gum arabic is used the resulting mucilage is taken internally as a soothing medicine for scvere coughs and sore throats.

In making mucilage cold water is poured over the solid gum and allowed to remain for a few dnys, then, on stirring, the gum readily dissolves. If hot water is employed the mucilage soon becomes mouldy. To preserve mucilage intended as nn adhesive it is necessary to iuld to it a small proportion of clove oil or formalin.

GUMMMING. The formation of a semitransparent exudation upon the bark of fruit trees is usually a sign that the trees have been over-pruned and over-manured. The gum may be scraped away and the affected parts washed with soft water. See Fruit.

GUMS : Their Care. The hone of the jaw forms sockets in which the teeth are placed, and the gum is closely adherent to the outsides of this bone. When healthy it is of a pale pink colour, and its margin is firmly applied to the necks of the teeth. When inflamed it becomes somewhat swollen and deeper in colour, and is liable to bleed on being rubled with a toothbrush.
In ordinary cases trouble with the gums generally arises from neglect of the teeth.

Regular daily brushing and rinsing the inouth with $n$ teaspioonful of alum in $\frac{1}{2}$ pint of uater will somn restore the gums to normal health. In pyorrhoes the gums become chronically inflamed along the margin, the edge of the long sockets of the teeth become carious, and pus is formed.
Gum Rash. A pimply skin rash occurring in infante is known as gum rash, red gum, or tooth rash. It may consist of red pimples, or paler papules somewhat resembling Heabites. or circular patches developing chiefly on the facc, arms, and neck. The rash is usually due to some temporary upset of the digestion during tecthing-time. No trentment is required ot hier than strictest attention 10 the cleanliness of the baby's bottles and to the state of the howels. The child should not be allowed to scratch the pimples.

Gumboil. This is a painful swelling in the gum and generally occurs over the diseased

Gun. Fig. 1. Double-barrel shot gun. Fig. 2. Anson \& Deeley double-barrel hammerless gun Fir. 3 Simple type of sporting run

root of a tooth, and is caused by the exudation of septic matter from the end of the root.

If there is a cavity in the tooth it may be temporarily filled with a piece of cotton wool dipped in strong carbolic acid and well squeczed out. The squeezing should be done with a light wad of cotton wool to protect the fingers. If a gum hoil has formed the matter should be let out. Fomentations or a hot hag to the face may give temporary relief, but should not be persisted in for long. A dentist should be consulted. See Pyorrhoca; Scurvy; Teeth
Gum Tree. This is the popular name of the eucalyptus (q.v.).

GUN : For the Sportsman. The essential parts of a gun are the breech, into which the cartridge is inserted, the lock inechanism, ta explode the charge, the barrel or tube which directs the shot, and the wooden stock, which rests against the shoulder when firing and is held by the hands. Unlike the rille, with its spiral grooves, the barrel of the shot gun has a smooth hore, as scattering shot is generally employed.
Sporting guns arc made in two main types. These are the hammer guns, as in Fig. 1, which have exterior arms, known as hammers, which are cocked, or set in position for firing, by drawing back the hammer until a ratchet device holds it in position. It is releaserl by pulling upon the trigger: a powerful spring then drives the hammer forward and causes it to strike against the firing pin. The latter is driven against the percussion cap formed in the centrc of the cartridge, and thus explodes the charge. The other type is known as ham-

choked. that is, tapcred slightly towards the tip or muzzle. The first trigger on the gun is that of the right-hand barrel; alter firing this at a moving target, the left-hand barrel can be fired at a longer range. the choking of this giving the extra few sards required to make the shnt effcetive.
To prevent accidents, various devices have been adopted These generally consist of a trigger bolt fixed in a vertical position in the frame by pivoting it, and a slide attached to the upper part of the lever on the tang to the hack of the top lever which opens the hreech. As the slide is pushed, the lower end of the lever is brought close up agninst the triggers, thereby blocking them and proventing them moving when the safcty catch is in the safe position. When the gin is to be fired, this slide inust be pushed in the opposite direction an as to hring the lower end away from the triggers. Automatio deviaes are also employed to prevent accidental discharge.

Other types of aporting guns inolude a small rabbit, or salnon gun (Fig. 3), firing a B.B. cap consisting of a single-ball cartridge. These guns are often fitted with holt action. The cartrilge is inserted between the head of the holt (when the latter is withdrawn) and the entrance to the breech, and is placed in its firing position by pushing the bolt home.

When not in use any cartridges left in the gun should be withdrawn to prevent accident. Provided it is properly cared for a gun will last a lifetime. It should be conted with a fine film of oil and stored in a dry place, the nil being wiped off when the gun is required After use it should he taken to pieces. the fore end taken off and the barrels removed from the stock and thoroughly cleaned, taling special care to get the bore quite clean and dry. If the harrela are exceptionally dirty, pour hot water down them from breech to tip, and thomoughly clean and dry them with a pull-through or other availahle meane Gun repairing should be entrusted to a gunsmith

Gun Licence. A licence duty must be paid hy anyone whocarries a gun. The licence, which costs 10 s ., is obtainable at any post office. Certain persons are exempt, e.g anyone who has a game licence or certificate, and the owner or ocouplier of lands who carries a gun for the purpose of scaring birds or killing vermin.

By the Firearms Act. 1920, no firearms or ammunition may be possessed by anybody unless he holds a certificate granted by the chief officer of the police in the district where he resides. The certificate costs 5 s . for the first. and 2 s . 6d, suhsequently. It nust he renewed every three years. It should be noted that the possession of a police certificate does not absolve the holder from procuring a gun or game licence. No one may scll n firenrin to a person who does not produce a certificate for that kind of fisearm, and on any sale the vendor must take his customer's name and address and notify the police, ns well as keep a record in a special book.

A licence to shoot or take game costs a sum varying from £:3 to £1, according to the period for which it is required.

GUN METAL. This is an alloy consisting of ahout $(\mathrm{N})$ per cent of copper and ahout 10 per cent of tin, with small quantities of iron, lend and zinc. Originally liand for ordnance, gun metal is now employed for bearings and other mechanical parts it is extensively used in ships, in the manufacture of valves and other fittings which are exposed to the action of the sen. The amateur will find it of service in the form of small castings and rọls.

In miolel construction, gin metal forms the principal metal of which the amall castings for the different pints are made. It is also utilized in hydraulic fittings such as pumps. Gun motal is deep yellow in colour and is machined, polished or !acquered as for brass.

Gusich. Methods of inserting a piece of material to give strength. Figs. 1 and 20 8quare gusset Fige 8 and 4 Triangular gusset. Fig. S. Portion of leg seam 8quare gusset Diges 8 and 1 Triangular guseot. Pig.

GUNNERA. The two species manicata and scabra of this large-leaved, decorative foliage plant have enormous rhubarb-like leavce. The gunneras are nominally hardy, but it is desirable to cover the rootstocks with leaves or litter in winter. They like a deep, fertile soil, with plenty of moisture. The crowns can be divided in spring if more plants are wanted.
GURNET. This fish needs first to be cleaned thoroughly, and after the fins and gills have been removed it is placed in a pan containing boiling sulted water, and cooked gently until done. An average-sizod gurnet, which is sufficient for 3 persons, requires a bout $\frac{1}{\frac{1}{2}}$ hour's cooking. It may be served with anchoty, caper, parsley, or any other suitable sauce If liked, the fish may be stuffed with veal forcemeat before being boiled.

Baked gurnet is prepared by filling a oleaned fish with veal forcemeat, sewing it up, and then trussing it with the tail in its mouth. Put it into a baking-dish with one or two thin slices of bacon laid over it, and bake it for $\frac{1}{\frac{1}{2}}$ hour or more, acoording to size, in a hot oven. When cooked, it can be served with a sauce prepared as follows : Put 1 tablespoonful chopped onion into a stewpan with the same quantity of vinegar, cook these over the fire for a few minutes, then add 1 pint melted butter, 2 tablespoonfuls of ketchup, and the same quantity of water. Cook the sauce until it is reduced and slightly thickened, then season it with a little pepper and add the fillets of an anchovy cut into strips See Fish.
GUSSET : How to Insert. In dressmaking the piece of material termed a gusset is inserted at the junction of two seams of a garment to give more spring or freedom of movement at this point. It may also be in. serted at the end of an opening in a seam, to prevent any strain from splitting the seam open further.
There are two types of gussets which can be inserted at the end of an opening terminating a seam, such as at the base of the sides and sleeves of men's and boys' shirts, the most generally employed being the square gusset illustrated in Figs. 1 and 2. To make such a guseat, cut a piece of material from 21 to 3 in. square, turn down all the edges to the wrong side about $t$ in., then fold the gusset in halves, trianglewise, and crease the fold well. Open the guseet, set one point to the end of the opening in the seam, and neatly oversew the two sides of one half to the sides of the open. ing, which should first have been neatly

Fold the remaining poin reach the fold of the straight edge just mentioned, and crease the fold well. Open out the gusset, set the point to the end of the seam opening, and oversew the sides to the two edges of the opening as far as the crease; then fold the straight end of the gusset over at this crease, and hem all edges down, as in Fig. 4.

The gusset that is let into the junction of two seams to give more spring and strength is arranged in a different way. Such gussets as these aro often inserted into bathing suits and children's rompers of the combination garment
hemmed, as in type, at the base of the centre front and back, Fig. 1. Fold the where these meet the top of the short seams gusset over at the that run down the inside of the log parts. A crease-line, and hem the remaining two sides down to enclose all raw edges, as in Fig. 2.
The second type, known asa triangular guseet, is shown in Figs. 3 and 4. For this, cut a piece of material about $2 \frac{1}{\text { in }}$ square, fold it trianglewise, and cut through the fold to obtain two triangular pieces. Take one of these sections, and turn all edges down to the wrong side about $t$ in., turning in the cut edge first, then cut away the extend. ing side points of this edge, and turn in these edges.

## GutTers and Gutwering

## Matters of Economic Importance to Owner and Temant

This contribution belongs to a group dealing with the erection and maintenance of buildings. See therefore in addition to Bungalow; Cottage ; House, such entries as Drains : Eaves; Fiashing ; Roof; Water Supply

The purpose of the gutter is to collect rainwater and conduct it to a drain or other outlet. In domestic architecture the word is applied generally to a oast-iron channel fitted round the eaves or edge of the roof and connected by down pipes'to the drainage system. Land or surface gutters are found occasionally in domestio work, more especially in the country. With roof gutters the essential requirement is that the cross-sectional area should be large enough to deal with the water from the roof. A gutter about 4 in . wide is found satisfactory for small property, or where the roof area is small.

The gutter must be rigidly and firmly attached to the roof, and have a regular and steady fall to the down pipe. The ordinary span roof only requires eaves gutters, but where a part of the roof is joined to another roof at right angles to it the joint between the two roof coverings is known as a valley, and the gutter formed in it is termed a valley gutter. Such gutters are to be found round the roofs of many dormer windows, and should receive attention both during construction and, in the case of an older house, from the point of view of repairs. Many of the older houses, both in towns and in the country, are built with curb or M roofs, surrounded on all sides by a parapet. Gutters formed of sheet-lead or zino may have perished in the course of time and become porous. The most appropriate methods of repair will be apparent by studying their construction. Whatever may be the type, the water should flow down the gutter to one or more outlets, which should discharge into an open, cup-shaped fitting known as a
hopper, or rain-water head. This forms a funnel to the down pipe, which conducts the water from the roof to the ground level, where it should discharge from a shoe into the trapped gully connected with the drainage (Fig. 1).
Essential features of the down pipe and fittings include the following (oee Fig. 2) The down pipe should be truly vertical, attached to the wall by screws or rose-headed nails, passed through the holes in the ears or lugs cast for that purpose on an iron pipe. Lead pipe is secured by straps similariy attached to the wall. The pipe should not be fixed close to the brickwork, but project 2 in. to enable the back of the pipe to be painted or attended to at any time, for which purpose packing pieces are placed between the wall and the lugs on the pipe.

The standard cast-iron rain-water pipes are made in various sizes, from 2 in . in diameter upwards. One end is enlarged to form a

Cutter. Fig. 1. Down pipe awan-nook, and stop-ond

Gutter. Fig. 2. Essential components of a gutter syatem. Fig. 3. Fixing a gutter bracket to the fascia board. Fig. 4. Fixing putter bracket to feet of rafters. Fig. 5. Valley gutter, showing tiles cat back
socket, and the other is plain ength is 6 ft ., although shorter or lengths are sometimes available. The pipe hook at the end, or by the removal of the should be set with the socket upwards, the obstruction from the top, and through the upper length having the rain-water head fitted into the socket on the pipe. The bottom length of the pipe fits into the socket on the shoe. The proper size of pipe to use will be determined, as already explained, by the area of the roof, but a 3 in . or 4 in . down pipe is generally fitted to an ordinary eight-roomed house, and is used in conjunction with a 4 in . gutter. The 2 in . pipes are only suitable for amall buildings.
The fixing of eaves gutters should be carried out with care and thorough ness, for the reason that the gutters are naturally inaccessible, and once fitted ought not to call for further attention. Rigidity of attachment is essential to regularity of fall. The gutter itself is usually of cast-iron, halfround, O.G., or rectangular in cross section. The former is cheap, the latter more expensive and, inci-
dentally, more handsome, especially if used in conjunction with square rain-water heads and pipes. The O.G. is used most commonly, as it can be screwed directly on to the fascia board, or to the feet of the rafters, whereas the halfround and other sections have to be supported by the gutter brackets. These methods of applicntion are illustrated in Figs. 3 and 4.
The construction of a valley gutter is shown in Fig. 5, also parts of the roof covering and the disposition of the eaves guttering. It should be made of stout sheet lead, as this has a very long life, and once properly fitted seldom causes trouble. A tiled roof may have the gutter formed by the use of the special valley tiles, which are worked in by the tilers as they cover in the roof. The parapet gutter should be laid with shect lead or asphalt ; the former is the usual material, and was used almost exclusively when this type of guttering was chielly in vogue. The method of constructing such a gutter is shown in the diagram above (Fig. 6).

Gutter. Fig. 6. How the gutter is arranged How the gutter oossibe case of the down pipe, it may be weight, sharpened at one end. Attach this to a cord, and pull it up and down in the pipe. If it fails, the pipe will have to be taken down, the choked section removed, and the obstruction got rid of by driving it through with a heavy bar, or by clearing it with a screw at the end of a drain-rod.

GUY ROPE. The use of a guy rope is to support some upright structure, which may be a tennis-net pole, a flagstaff, the mast of a wireless aerial, or a tent in the garden. As the safety of the structure largely depends upon

| Light mast. Helght in feet | Tarred hemp rojeCircumference In in | Equivalent alze in plough ateel wire. Circumference in in. | Approximate breaking strain in tons |

The tension The tension

is obtained
When the gutters have been cleared out, a jug of water should be poured on the roof at the highest point of the gutter. If the gutter is in correct line and has a proper and continuous fall, all the water will run away. If it is found that the gutter sngs at one of the joints, nad a pocket of water remains, this indicates that the fastenings or the brackets are deficient in strength, and must be remedied. This is done preferably by fitting a new bracket, or, if that is not feasible, by inserting $n$ packing piece between the bracket and gutter, thereby eyebolt. See Aerial accident due to a dazzling light. gutter itself. In so doing, where the gutter has a separate outlet pipe discharging into an open hend, a piece of sack should be placed in the head to prevent dust and dirt falling into the down pipe, as this is very difficult to remove.
the guy ropes, it is important to use a rope of the proper size, which may be of hemp or jute, or a steel wire or stranded steel cable.
The number of ropes varies; for example, a single rope of about 1 in . circumference at each corner post will suffice for a bathing tent, but a Hagstaff requires more elaborate support. It may have one system of ropes from the ground almost to the top of the mast, another separate system from the ground to a point about $\%$ the height of the mast, and a third system still nearer the ground. Thesc are to give a distributed support for the mast, so that it will not bend in the middle. The accompanying table will serve as some indication of the use of guy ropes. In the examples given there are four ropes to each mast.
Guy ropes are set up, or tensioned, in various ways. A simple method is by the use of a tent-peg driven into the ground, and a wooden runner (Fig. 1)

For permnnent work, us in the erection of a flag. staff, the anchorage can be made to $n$ concrete block embedded in the ground An anchor bolt should be fixed in the block, and should point in the direc tion of the line of the rope. The rope can be attached to the anchorage by a turubuckle or wire strainer,
 with a spanner the rope having previously been stretched and tightened by a small purchase tackle hetween the rope and the

GYMNASIUM : In the Home. A simple gymnasium, with apparatus for all necessary exercises, can easily be fitted up in the house if a spare room is available. A suita hle size is a room 20 or 24 ft . long and 14 ft . wide, but a snialler one can be utilized. There should be nothing in it to give rise to dust. A good light is desirable, and one at least of the end walla should be without a window, so that the boys and girls can face this when jumping, and avoid

The apparatus for such a gymnasium should include a portable and adjustable double beam to span the room : this should be counterbalanced in order that it can go to the ceiling and so he out of the way when it is not wanted. Two or four climbing ropes, a small vaulting horse and a pair of jumping stands are other necessary articles, as are three or four sections of wall hars and one or two mats For men and boys a punch drum that can be fixerl against the wall is useful, and the gymnasium should also
contain a pulley-weight machine, boxing-gloves Indian clubs, dumb bells and foils for fencing

As regards dress, the following is suggested as suitable for men and boys when practising in the gymnasium. A tight-fitting jersey or vest, with short arms, a pair of white Hannel trousers, and a pair of canvas shoes with indiarubber soles and no heels comprise the neces sary garments. A jersey of this kind will allow the arms to move frcely. while for a like reason care should be taken that the trousers are not too tight at the seat They can be fastened with a belt if the buckle and strap on them are not adequate. A sweater should also be provided, and should be put on as soon as the exercises are over, or during a pause
Those responsible for the gymnasium should take special care that all the apparatus is properly fixed and fastened and thicrefore safe before being used This is especinlly necessary in the case of horizontal bars and other articles that can be raised or lowered. See Dumb Rells; Exercise; Indian Club; Parallel Bars; Vaulting Horse, etc.
GYMNASTICS : For Health. Remedial exercises mary be usefully employcd in a large variety of ailments either for their heneficial action on the general nutrition of the body or for a disability affecting some particular organ or part. Some involve the use of apparatus, a higlt or low plinth, bicycles, bars, etc., but a large number do not call for anything of the sort These exercises, as a rule, should be supervised by $\Omega$ doctor. General exercises are useful in cases of poor development, convalescence from acute diseases. obesity, indiges tion, etc. and should be done in the open air, when possible.
Breathing exercises are given for the cure of early and slight adenoids, for the develop. ment of the chest, to complete the cure after pleurisy and empyema by expanding the lung and stretching adhesions, and in various ot her conditions. S'ee Beauty Culture: Breathing Dril! : Dumb Bells ; Exercise.

GYMNOGRAMME. This is sometimes known as the golden fern, because of the golden powder on the undersides of the fronds of some sorts. A favourite is gymnogramme chrysophylla. They must be grown in a warm, moist greenhouse and need shade from sunshinc. See Fern.

GYPSOPHILA or Gauze Flower. Of these hardy perennial and annual herbacoous plants the most popular species is paniculata,

Gypsophila. Delicate blooms of Gypsophlla elegans. a rraceful annual very usefol for cutting
n beautiful spreading perennial growing about 4 ft . high. In summer it becomes a gauzy, Iace-like mass of small white flowers which are
in great demand for mixing with cut flowers Although it thrives in most soils, G. paniculata prefers a light, dry, chalky soil and a warm, sheltered site. It can be raised from seed, but the seedlings grow slowly. Once planted it should remain undisturbed The finest variety is one namied Bristol Fairy Gypsophila repens is a charming trailing perennial for the rock garden. Elegans is a dainty hardy annual which blooms in summer from secds sown out of doors in April.

HABENARIA. A family of native hardy Howering orchids, the habenarias are found in meadows in Great Britain and Ireland. The best known, the butterfly orchid, has greenish-white llowers in June and is fragrant it night. There arc other hardy species, which are suitable for the rockery, where they thrive in sandy peat. See Orchid.
HABERLEA RHODOPENSIS. An alpine plant from the Grecian mountains, this bears small, lilac-coloured. gloxinia-like flowers which spring from a rosette of lenves in June. It thrives best in a shady crevice in a compost of peat and sand. It may be raised from seeds in spring.

HABIT CLOTH. Plain, self-coloured woollens in medimm or light weight, suitable for riding habits, coats and tailor-made cos tumes, sell under the name of habit cloth. Some have the surface of wool velours, some are face cloths of a more glossy finish, and others spongy. Made customarily from fine, short wools, they have a softness of touch, with sufticient firmness and suppleness to hang well. See Riding.

HACKING KNIFE. This tool is used to remove old putty from window frames and plaster from ceilings, for the scraping of paint, and similar work in connexion with the redecoration of the home. It consists of $n$ steel blade with a piece of leather or wood riveted on either side of it to form a handle. It is pointed at one end, thick at the hack and tapering to $n$ sharp edge

In removing putty, the point of the hacking knife is inserted into it, held in a horizontal position, and forced downward by trpping the back of the blade with a light hammer. When cleaning the plaster round a cornice or in any corners, the linife can he used as a scraper. If the end of the blade be broken, the knife can he restored to usefulness by regrinding it to a pointed shape See Glass.

HACK SAW : How to Use. A hack saw is used for cutting metal, and consists of a blade carried in a frame. The hlade is made of harder metal than the ordinary saw for cutting wood, and is either of dead hard or glass hard steel. The latter is extremely brittle. The frame of a hack saw is provided with pegs to engage the holes in the ends of the blade, and has a wing-nut so arranged that the blade can be strained quite tight by its use. Frames are made which are adjustable to take any standard length of mau-blade, but a fixed frame to take 12 in . blades will meet most ordinary requirements.

The blades vary in length, width, thickness, and fineness of teeth. The pitch of the teeth varies from 14 per in. to 24 per in or finer.

The coarser saws are used for most purposes, but the finer are essential for cutting tubing and thin shcet metal
The blade is placed in the frame with the teeth facing ontward, and inclined forward so лs $t$ ) cut on the push stroke. The holes in the ends of the blade heing placed over the pegs in the frame, the wing-nut is tightened so ns to strain the saw quite hard. While tensioning the saw, care is needed to prevent the blade slipping off the pegs, and to see that the blade is not slightly tivisted owing to the

 Hack Saw. Fir. 1. Pistol grip back sam frame in use.
Fig. 2. Bench back saw machine, in use, the vice cutting nceded to ensure that the stroke is made along the direction of the cut, otherwise the saw will snap. Another cause of broken blades is allowing the frame to cant over to right or left during tho stroke; the frame should be kept vertical. The full length of stroke should always be used, otherwise the teeth in the middle will get worn before the others.

A drop of oil on the teeth is sometimes a help when cutting mild steel, but the majority of mechanics use n saw dry on all materials. See Saw.

HADDOCK : How to Cook. Hatdocks include the fresh, smoked and dried varieties, and also the specially cured finnan haddocks prepared near Aberdeen. Those caught in Dublin Bry and off the coast of Devonshire and Cornwall are said to be of the linest quality. Fresh haddocks, which may be served in various ways, should be cooked as soon as possible after purchase.

To boil them, place the fillets in a fishkettle or frying pan containing just enough salted boiling water to cover them, and siminer for about 10 min . or until the Hesh is tender. A little vinegar inay be added to the water. If steaming is preferred, cut the fillets into convenient-sized pieces, and place them on a greased plate on top of a saucepan of boiling water. Cover them with a piece of greased paper, and then with another plate, and stean them until the flesh is of a creamy appearance. This should take $f$ hour. The water in the pan must be kept boiling rapidly. Oyster sauce can accompany boiled or steamed haddock, and parsley miny be used as a garnish.

To grill haddock, fillet the fish, cut each fillet into two pieces. "ash them, coat them with. melted butter and dip them into 1 oz . of liuur seasoned to taste. Then place them on a greased
gridiron and cook them for ahout 10 min . turning them once only.

Biaked haddock malics another good dish. To prepare it, wash, clean and scale the fish. and fill the inside with veal stuffing, sewing up the opening with fine string. Then either truss it in the shape of the letter $S$ or put its tail in its mouth, brush it all over with heaten egg and cover it with breadcrumbs. Put it in a haking-tin with a good lump of dripping. Bake it from $\mathbf{3 0}$ to $\mathbf{4 0} \mathrm{min}$, basting it occasionally with the dripping. Serve it with melted butter or anchovy sauce.

To fry a haddock, wash and dry the fish. and with a sharp knife cut the Hesh down the centre of the hack, carefully separating it from the hone. Cut the fillet across into convenient-sized pieces, brush each over with heaten egg and cover with crumbs Fry them a golden brown in hot fat : drain them well, and serve them garnished with fried parsley. Alternatively the fish may be dipped in batter, fried, and then served with a good brown sauce.
Smoked haddock may be cooked and served in a casserole. Wash. dry, and trim the fish and cut it into quarters. Nelt 1 oz . margarine in the casserole, add $\ddagger$ pint milk and the same quantity of water, and lay in the fish. Cover the pan and let its contents simmer for ahout 10 min . or till the fish is cooked through, when it should he taken out. Then mix $\ddagger$ oz. Hour with another gill of milk and pour it into the bottom of the casserole, stirring all the time. Let the whole boil up and thicken, add seasoning to taste, and then serve. The sauce should be of the same thickness as cream.

Haddock Ball. A dried haddock miay he used to make balls or rissoles. Boil the fish in a fish-hettle or frying-pan until it is tender. Drain it, and separate tlesh from bones. Well pound the tlesh before adding 1 or 2 tablespoonfuls of grated Parmesan checse, a little chopped parsley, and seasoning. Bind the whole with one or two well-beaten eggs and 2 teaspoonfuls of Worcester or other sauce. Form it into balls and fry these in smoking hot butter. They may he served on small rounds of fried bread.

Haddock Fritters. These are inade by brating up the boned remains of a cooked dried haddock with an egg. coatting neat pieces with batter and dropping the mixture in spmonfuls into very hot fat.

Haddock Scallop. Melt 1 oz. butter in a small pan over the fire and add to it $1 \frac{1}{2}-2$ gills milk and 3 well-henten eggs. Stir these over the fire until they begin to thicken, taking care that they do not boil; then draw the pan away from the fire and add about 6 oz. cooked smoked haddock, hroken into Hakes, 2 teaspoonfuls anchovy essence, 2 oz. breadcrumbs, a dessertspoonful tomato sauce, the juice of half a lemon, and some sensoning. Heat up the whole thoroughly and turn it into scallop shells, the insides of which have been huttered and sprinkled with hrowned breaderumbs. Cook the scallops in a quick oven until they are of a golden brown colour; then serve them immediately, garnished with small sprigs of parsley. This mixture can be spread on squares of buttered toast if preferred.

HAEMOPTYSIS. Coughing up or spitting of hlood which comes from the air passages or lungs is termed hacmoptysis. It is one of the symptoms of consumption and inay also occur in pneumonin, plastic bronchi$t$ is, and other diseases. When bleeding occurs the patient should lie down and keep quite still until seen by the doctor. See Bleeding; Consumption.

[^5]HAEMOSTATIC. Certain substances used to stop bleeding are known as haemostatics or styptics. Cold, astringent salts of copper, tannic acid, ergot, and the perchloride of iron are all haemostatice, as they encourage clotting or cause the vessels to contract, and thus stop bleeing. See Bleeding.
HAGGIS: How to Prepare. This Scottish national dish is made chiefly from sheep's fry, chopped and mixed with other ingredients. To prepare it, procure the stomach of a sheep and wash the hags in several waters, rubbing them well with salt. Then scald them in boiling water, scrape them carefully with a knife, and soak them in a strong brine for 12 hours, trimming off any sinewy parts or pieces of gristle.

Wash the lights, liver, and heart, and hang them up to dry for 12 hours; then put them in a saucepan with plenty of water and boil them gently. Take the small bag with the windpipe atiached, wash it free from the brine.
put it into another saucepan, with the pipe hanging outside the pan and plenty of water, and boil it slowly for about tivo hours.
Rub about a third of the liver through a wire sieve, and chop rather coarsely thi small bag and 6 oz. mutton suet. Mix these with the liver, adding 1 heaped breakfastcupful of Scotch ontmenl, senson the mixture with salt and pepper, and moisten with about 1 hreakfastcupful of the liquor in which the lights, etc., were boiled. Let the whole stand for $\frac{d}{2}$ hour, then stuff it into the large hag and sew it up securely, using strong thread. Put the haggis into a large saucepan of boiling water, and place a plate underneath to prevent it from sticking to the pan. Boil it quickly for $1 \frac{1}{2}$ hours, pricking the bag uccasionally with a skewer to prevent it from bursting, and add more boiling water as the water in the pan diminishes. Serve the haggis on a hot dish as soon as it is taken out of the pan.

## Hair: Its Beauty and Hygiene

## How to Stimulate the Growth and Preserve the Natural Gloss

For other information about the hair sec the articles on Baldness; Beaurv Culture; Electrolvsis, The reader may also consult the entries on various cosmetics and washes for the hair, e.g.
Brilliantinc; Henna; Shampoo

To keep it in good condition proper care is required for the hair from earliest childhwod. Five ininutea' massage night and morning is excellent. It causes the blood to circulate more freely and brings the necessary nourishment to the hair follicles. It also loosens any dandruff, which is one of the worst enemies of the hair, and properly distrihutes the oily secretions. The last benefit is n particuIarly important matter in the case of fair hair, as any artificial oil at the roots has a darkening effect, and nature provides the necessary gloss. Masange with the cushions of the finger-tips, heginning by placing the fingery under the hair by the ears and with gentle pressure going over the whole scalp until it glows with the friction. Rub in such a mianner that the scalp is moved and kneaded. This daily hair drill is more important even than hrushing. Another method of stimulating the circulation is to take small strands of the hair and give them short, quick pulls, going over the whole head strand by strand. It is interesting to remember that whatever improves the circulation of the scalp will improve the complexion, as the muscles and tissues of the whole head are closely related.

The scalp should he kept scrupulously clean. This prevents blocking up of the hair follicles with dirt or dried schum. Every hair has associated with it a sehaccous gland. 'These glands secrete a greasy substance known as sehum, which is nature's lubricant for the hair. If the follicles are blocked the cscape of the sebum is prevented, and thus the hair is not only deprived of natural gloss, hut the damming up of the secretion in the gland may cause pressure on the delicate hair root and permanently damage it.

The head should therefore be washed regularly, and the hair dried properly afterwards. An infant's scalp requires washing daily and drying with great care. A child should have its head washed once a week, a man usually requires a shampoo as often, and a woman every ten davs to three weeks. Very dry and brittle hair should not he washed so frequently as normal or greasy hair.

Method of Shampooing. To shampoo the head the scalp, and hair should be thoroughly wetted, and then a good lather rubhed briskly on to the scalp, with the tips of the fingers. Cake soap should not be applied, as it is almost impossible to rinse it completely out. Pure castile soap may be shaved and dissolved by pouring hot water over it. This
is a suitable shampoo for voung children, and for fair or white hair. Tar aoap lather js recommended for dark hair. A good herhal shampoo is satisfactory, and obviates the danger of leaving any soap in the hair after rinsing. The importance of complete rinsing cannot be too much stressed. and the final rinse should he with cold water. If the scalp, is tender an cgg shampoo is beneficial. A little horax may be dissolved in the rinsing water. For fair hair the juice of a lemon may he added to the water for the penultimate rinsing, and a little washing blue to the final one for white hair When peroxide is employed to lighten the colour of hair, frequent rinsings in vinegar and water are advisable, as the vinegar counteracts the weakening cffect of the peroxide.

After the thorough rinsing the hair should be dried with warmed towels Artificial methods of drying hair. though difficult to avoid when time is a consideration, are not to he recommended. as they tend to make the hair brittle. A little brilliantine hrushed through the hair after it is dry will inıprove its appearance and replace the natural oil temporarily removed by the shampoo.
The hair should be combed daily with a comh of good quality having rather thickly cut terth. A comb, should not be used to scrape the scalp. and no conib should be allowed to touch a baby's head, as it may darnage the delicate skin.

Brushes and Brushing. The softest brush only should be used for a baby; stronger bristles will not injure the scalp once infancy is past, provided the brush is of gond quality. Stiff-bristled hrushes are good for strong crops of hair, but whalehone and wire brushes are scldom advisable. The hairbrush with bristles embedded in a rubber foundation is a comfortable and healthful type of brush to use for the average head of hair. Such a brush should be frequently cleaned with the smaller hrush usually sold with it for this purpose. The Iatter can he dipped in warm soapsuds, shaken frec of drips, and used to hrush vigorously across the hairbrush. Rinse by applying the cleansing brush dipped in cold water, and dry as quickly as possible in the sun, or in a warm place. hut not too near a fire. An ordinary wooden-backed brush can be washed by dabbing it up and down in hot water containing a little household ammonia. When clean rinse the brush in cold water, or the hristles will soften. As brushes are capable of conveying skin infection, they
should be kept porfectly clean, and each child or person should have his own brush. It is unwise to use other people's brushes. disinfectant, such as a few drops of lysol. should be used in the rinsing water for the brush, should the scalp be troubled with dandruff.

The following method a. stiffening the bristles is said to be successful. Dissolve 2 oz alum in $\frac{1}{2}$ pint of warm water. and then dip in the brush. Leave for a few moments and rinse in plain water. The operation of dipping in the alum may be repcated several times. should the bristles seem to require it.

For older children and adults, unless the hair is very brittle, a good brushing for five minutes at least once a day is beneficial. The scalp should feel slightly warm after this The brush removes particles of scurf, stimulates the scalp, and so increases the blood supply to the hair roots and distributes the natural oil along the whole hair shaft. Brushing enhances the glossy appearance of the head.

Treatments for Bad Conditions. Should hair of any shade have heen allowed to get out of condition through illness or ton much exposure to sun and sea winds, and the scalp be troubled with scurf, a special treatment may be given. The head should be well massaged once a week at night with olive oil which has been heated in a small saucepan. A towel should be placed over the pillow to protect it from the greasy head and the hair shampooed in the morning. Tar soap lather is recommended, a double application being often necessary to get rid of the oil. Rinse afterwards in water to which a little borax has been added. This treatment can he assisted. until the hair is in good condition, by massag. ing into the roots twice $n$ week an ointment composed of 4 oz . vaseline, 80 grains salicylic acid, and 60 grains boracic acid ; alternating with this some lotion such as one made from 6 oz . bny rum, 3 drachma tincture cantharides, and 1 oz . spirit of rosemary, which should be used as a cleansing stimulant. An oil shampoo is not advisable for dyed hair, as it removes the colour.

The natural colour should return to faded hair after a two-montha' course of such treatment, and it is unaise to brighten it artificially heyond the occasional use of a camomile shampono for fair hair and ondinary henna ahampoos for light brown or red hair. Brightening lotions which contain peroxide dry the natural oil out of the hair and thus contribute to premature greyness.

Any lotion or tonic treatment should be atarted just after the hair has been shampooed, and may be applied by means of a tiny sponge or cotton-wool swab on the end of an orangestick, after the scalp has heen thoroughly stimulated hy masrage. Tonics should be left off when the condition of the hair improves. Premature greyness of an hereditary nature seldom yields to treatment, but when due to dandruff, or some similar cause, may be corrected by the following pomade: Hydrochloride of pilocarpine, 2 grains; tincture of jaborandi, $\frac{1}{2} \mathrm{oz}$. ; lanolin, it oz. ; coconut oil, Ifoz.

The value of most hair restorers depends to a great extent on the massage which is given prior to or during their application. The best contain ingredients which increase the flow of the blood to the scalp and thus stimulate growth. The commonest ingredients are some preparations o! sulphur, ammonia, bay rum, pilocarpine, cantharides, capsicum, spirits of mosemary and quinine. A good tonic restorer is composed of liquor of ammonia (strong), $\frac{1}{2} \mathrm{oz}$. ; chloroform. $\frac{1}{2} \mathrm{oz} . ;$ oil of sesame, $\frac{f}{2} \mathrm{oz}$; oil of lemon, $\frac{1}{2}$ oz. ; spirits of rosemary, 2 oz .

Restorers which contain sulphur are useful in cases of loss of hair due to dandruff. They act by destroying the cause and at the same time stimulating the skin. In general terms it
may be said that the use of hair restorers is futile in cases of baldness where the hair papillae (the papilla is the active part of the
hair) have been destmyed : whereas if the hair papillae atill exist the stimulation of a good hair restorer may quicken the local circulation and the papillae may recover anme of their old activity.

Despite every care a child's bair may become infeated with parasites at achool. To get rid of the nits the hair should be thoroughly moistened with equal parts of vinegar and water and carefully gone over with a fine toothed comb. Care must be taken to see that all nits and scurf removed are hurned in the paper in which they are collected.

The simplest preparation for killing lice is paraftin oil. This should be rubhed into the head at night, a rag soaked in the oil placed over the head and covered with n rubber cap. The treatment should he repeatod the following morning and evening, and on the morning after the head should be thoroughly washed with soap and water. Paraffin is very inflammable and naked lights must not be brought near it. If there is any soreness of the scalp an equal mixture of olive oil and paraffin should be applied at night for the next ten days.
Alternative applications are the B.P. ointment of stavesacre, which is obtainable from any chemiat, or the following: white precipitate ointment, 60 grains; zino ointment to make 1 oz .
Brushes, combs and caps must he disinfected by being soaked in lysol solution1 teaspoonful to a pint of warm water-and then rinsed thoroughly in soapy water.

Hair Dyes. Hair dyeing and tinting is best performed by experts, and henna dyes are usually the most antisfactory and also the safest to use. Some of the preparations sold for dyeing hair contain powerful irritants which may cause akin trouble involving not only the scalp but the face and neck. Un. fortunately these dyes include some of the most satisfactory brown colourings. At a reliable hairdresser's an expert will experiment with a small portion of hair before applying such a dye over the whole scalp, in order to see if the customer is immune from possible bad results. Henna dyes for various shades of hair are sold with full instructions for use.
The henna paste is left on the hair for the time required for the particular tint, and then washed off with water. If using any form of hair dye at home it is advisable to wear rubber gloves and protect the skin of face and neck by smearing them with vaseline before apply. ing the dye. The troubles with dyed hair are that it is difficult to kecp the scalp in goorl condition owing to the effect of oil and tonics on the colour, that the white hair growing at the roots shows fairly soon and requires frequent touching up, that it presents a hard and lustreless appearance and that it can rarely be succesafully permanently waved.
Hair can be bleaclied to blonde shades if this is carefully done. The bleaching should be effected gradually or the hair will suffer. Some women go over the scalp after a shampoo with peroxide ( 10 volume solution), applying it with a small toothbrush specially kept for the purpose.
Superfluous Hair. Pernxide is particularly useful for blenching dark supertluous hairs on the face or arms, and rendering them less noticeable. It can be used in a treatment with resorcin soap, a cake of which is dipped in bot water and mbbed on the skin. Water will remove the stain of this soap, but it should be left on at night. After washing the face in the morning apply peroxide of hydrogen and ammonia in the proportion of 10 drops of peroxide to 1 of ammonis. The solution must be freshly mixed each time and applied with a pad of cotton wool. It may smart a little at first, but the skin will grow used to the treat-
ment, which should be persevered with. After some time the skin may be able to stand a stronger solution in the proportion of 5 drops of peroxide in 3 of ammonia. Apply cold cream afterwards if the face feels sore. This treatment should eventually not only bleach but kill the hair roots. For strong, persistent growths of superfluous hair on the face either electrolysis or diathermy is often employed. It is essential to have such treatments performed by a good operator. (See p. 416).

Waving the Hair. Home waving with ourling irons is always a difficult matter and apt to be unbecoming. The simplest method is to part the hair and wind it round rather thick irons. This gives big natural looking waves; but is only suitable for longer hair. Hair with the slightest disposition to a natural wave should be encouraged by being set in combs after a shampoo. Straight hair when beautifully kept to give it a smonth sheen is hecoming to women with well-shaped heacls.

Permanent waving solves many hairdressing prohlems. At the same time it is not a means of lessening proper care of the hair. The scalp should be in good condition hefore the hair is permanently waved, and the process should be considered as a decorative atep towarda a charmingly finished head ratioer than as an end in itself. Cheap permanent waving should not be risked. The best operators-and the operator is of more importance in this connexion than the system employed-are to be found at the hest hairdressing catablishments, or in such departments at well-known stores.

Where disappointment follows after permanent waving it is usually due to lack of experience on the part of the operator or to lack of subsequent care of the hair. If the scalp is dry the permanent wave will make it dryer. The hygiene of the hair, as described in the first part of this article, must be daily practised and foolish prejudices about disurranging the set of the waves by massage and brushing must be discarded if the result is to be worth the expense not only of the initial operation, but also of the aettings, necessary at least once a fortnight, to keep the waves from developing into a mere friz\%.
This setting can be done at home with a setting lotion and by careful adjustment of special combs or metal clips used after a shampon. A not should be worn over the head while the hair is setting. Some women wear a ahingle net over combs at night to keep their permanent waves sct, but the practice is not really good for the hair, which benefits by being left quite loose.
In dressing long hair the amallest number of hairpins, compatible with making the knot securely olose to the head, should be used. Slides for children's hair should be of nonintlammable material.
HAIRCLOTH. Mohair, alproa, camel-hair and other clothe made from hair as fine as or finer than wool are only terhnically haircloths. What are usually known by this name are such coarse fabrics as horsehair or crinoline oloths, used by tailors to stiffen the shoulders of jackets, or the hair interlining for making soft lapels. Haircloth is employed for interlinings because of its resiliency; when bent, it tends naturally to return to its position, thus keeping the garment in shape.
Crinoline cloth lent its name to the style of dress in whioh the skirt was distencled by the stiffness of the horsehair. Tail hairs of horses woven one at a time across a set of cotton or linen threads make both crinoline cloth and the horsehair seating to be seen on furniture. As chair-seating material, haircloth is immensely durable. Crinoline made from real horsohair for hat shapes has been largely replaced by $n$ form of artificial silk.

To make flexible canvas hair interlinings, Chinesc human hair, as well as goat and other
stmang hair, is used; the fabric resem bles a brown flax oanvas, but is more springy. The hair carpet sold for stairs and passages is made in the

Hairpin Work. Fig. 1. Showing how the frst pattern is worked on the prong. Fig. 2. Medallion of coloured raffia, a suitable trimming

Haircloths are made for atrainers for kitchen use, and for belts for driving machinery. In buying haircloth for interlining coats the resiliency may be tested by folding and creasing the sample, and noting how it recovers its Hatness.
HATRPIN WORK. This work is so named because of the fact that it is done on a twopronged fork which resembles a large steel hairpin. It is made in several sizes, and there is also an adjustable fork, the width between the prongs being regulated by a screw. On this implement insertions from 1 in to about 4 in. wide can be worked in thick silk, cotton, or raftia

Fig. 1 shows the first pattern in hairpin work, and it is on a prong measuring $1 f$ in wide. A steel crochet hook is also required of a size according to the thickness of the working thread. Make a loose crochet chain on the hook and draw it out until it is about as long as half the width between the prongs of the pin. Draw out the crochet hook, slip this loop on the left-hand prong, and see that the length of working thread is in front of the fork. Hold the pin with the thumb and middle finger of the left hand and the rounded part in the paln. Pass the thread round the right prong from the front, and put the hook upward, from the front, through the loop on the left prong. Catch the thread and draw it through the loop, thread over the hook and draw it through the loop which is on the hook, making a double emohet.

Pass the thread from behind round the left prong, and turn the latter to the right, so that the thread now surrounds the right prong. As the pin is turned, let the orochet hook pass between the prongs so that it will be in position to work from the front again. *Draw the thread through the loop on the hook, then put the hook upwards from below through the loop on the left prong, draw the thread through and work a douhle crochet as beforc. Repeat from * until the pin is full, then take the lonps off the prongs, and if more are wanted replace two or three of the loops at the top and continue working as before.

IVhen the work is taken off the prongs the little doops twist into a figure 8. To make an insertion, join the silk to the first loop by working a double crochet into it, inserting the hook from right to left all through to preserve the twist or figure 8. After the double crochet possible.
make one chain atitch, and continue all along, alternately working one chain and one double crochet in the loop. Work the opposite loops in the same way to complete the insertion. A ace can be made by working $\pi$ shell edging

Fig. 2 shows the hat trimming worked with raffia, and $a$ No 00 ateel crochet hook, on the small prong $1 \frac{1}{4} \mathrm{in}$. wide. Raflia can be bought in many colours, as well as natural coluur. Before working the raffia it is best to soak it in cold water for about 10 min . to make it more pliable, after which wipe the water off. Proceed as in Fig. 1 until there are 18 loops on euch prong : slip off the pin and cut the raffia, then tie this cut end to the end at the beginning of the work to form a ring. Run a piece of raffia through one mund of lonps and draw up so that it forms a Hat piece; tie and secure the raffia A piece of silk could be uscd for the latter purpose, as it is inside the loops and the ends need not show.
When a sufficient number of these ringa have bcen made in various coloury they can be arranged round the crown of a shady garden hat made of coarse straw. See Crochet : Raffia.

HAIR SPRING. This name is given to a small spring used in conjunction with the balance-u heel staff of n timepiece. Its function is to control the regular motion of the balance wheel. It is a very delicate spring and should never be interfered ith. See Clock; Watoh.

HAKE: How to Cook. Many consider hake to be superior to haddock and plaice, both in llavour, digeatihility, and nutritive qualities. To bake it, out four slices from $a$ inedium-sized hake, wash and dry them, and lay then, in a greased fireproof baking-dish. Dredge them with Hour and sprinkle over them a good seasoning of salt and pepper, a teaspoonful each of finely chopped paraley and onion, and 1 oz. butter cut into small pieces. Bake the fish gently for $\frac{1}{2}$ an hour, basting it occasionally; then place it on a hot dish, strain the liquor over it, and it is ready for the table.

Hake au gratin is prepared in the same way except that the parsley and onion are omitted and a tablespoonful each of browned crumbs and grated cheese used instead. Hake may also be cooked according to nny of the recipes given for cod. See Cod; Fish.

HALATION : Of Negatives. Halation is a fogging of negatives caused by scattering or reflection of light in the film. Thus if a window through which sunlight or a strong light passes is inoluded in a photograph, not
only will the window part of the picture be considerably over-exposed, but all round it a fog of light, without any detail whatever, will appear in the print.
Similarly, halation will appear when trecs against a bright aky are photugraphed. The trouble is largely overcome by coating the back of a glass plate with a preparation which absorbs the light passing through the film and prevents its reflection on the underside of the film. This is known as backing the plate. It has been found that unbacked plates coated with a matt emulsion hardly suffer from halation at all.

Films do not suffer from halation to the same extent as plates, but care should be taken not to over-expose if strong bigh-lights are in the picture. Where moderate halation occurs with over-exposed high-lights, the defect can be overcome to a certain extent by local reduction of the negative. The fngged over-exposed portion is treated with a weak reducing solution applied with a piece of cotton wool on a niatch-stick See lReducer

HALF TIMBER. This term is used to describe those buildings, chiefly houses, in which the framework is of timber, the intermediate panels being lilled with brick, plaster stucco, or other material of that kind. In some of these houses the masonry or brickwork rises through two storeys, and the half-timher work is confined to the gables. Many old examples were covered with plaster or stucco, but in some cases this has been subsequently removed.

This style, which prevailed in England in the 16 th century, when native timber was plentiful, has been much imitated in the 2()th century. Modern half-timher houses, however, differ essentially from the old ones, for in them the timbers are merely on the surface, heing only thin pieces of wood nailed to a brick hacking and lacking the solid look that real half-timber work can produce. See Architecture; Cottage

HALIBUT. Baked halibut is prepared in the same way as hake (q.v.), except that it is cuvered with thin slices of bacon or ham.

To stew halibut, wash and dry 3 to 4 lb . of the fish, put it into a stewpan, and barely cover it with milk. Add an onion with 3 or 4 cloves stuck in it, a bay leaf, and a little salt and peppuer, and bring all gently to bailing point. Mix together 1 oz. flour and 1 oz . butter; add this to the halibut and simmer the whole gently until the bones can easily be separated from the flesh.
Serve it on a hot dish and pour over it some of the liquor, to which has been added a teaspoonful of lemon juice and seasoning. The remainder should be sent to table in a satuce boat. This provides a specially good way of cooking the head and shoulders of halibut.

## Halls: Decoration and Furnishing

## Suggestions for Treatment in Various Styles

## This article concludes with a section on the construction of a hall stand. Sec also the entries on Carpet; Chalr; Chest; Chimncy Piece: Cupboard; Door-i Electric Light Fittings; Flowers: Fricze: Furniture; Grandfather Clack; Landing; Panelling; Settle; Staircase; Table

It sometimes seems as though the ball had colour, flooring and ligiating fittings are somebeen neglec ted in a sc heme of house decorstion; yet, npart from the fact that every corner of the liome should be well and suitably planned, the hall is also important because visitors take their first impressions of the house from the entrance. Therefore it is necessary to give the hall as hospitable and friendly on air as

This is especially difficult with the small narrow hall, which is still too often merely completed with an umbrella and coat atand, a hard wooden chair and $n$ hall table of unpleasing shape. For the larger type of hall it is easier to evolve a good decorative scheme, whether on classical lines or with comfortable lounge furniture; but here, too, details of
times not oarried out to a harmonious conclusion.

In furnishing much depends on whether the staircase opens directly out of the hall or from an inner hall, which may or may not be entirely cut off. A beautiful staircase npening out of the hall directly makes all the difference; it is an architectural feature which can only be molified or disgused at considerable cost if it is not well designed and executed when huilding the house

In some modern houses there is a square entrance hall, of which the fourth wall is left incomplete, leaving an open archway to the back hall from which the staircase ascends. If the hall is to be used as a lounge and living-

Hall. Fig. 1. Panelled and tiled hall, with Jacobean oak furnishing and beavy beams
room, it is convenient to have an inner glazed door, so that there is light and a view on to the garden. as the main door can then be left open. This is desirable, because it is rarely possible to secure more than one window in the hatl. A good example of such a door is scen in p. 37:3. The glass panels and wrought iron work of this type of door look part icularly well in a dignified hall with black and white tiling and one or two pieces of beautiful furniture.

In some houses the hall is converted into a lounge by removing the partition which separates it from the front roon. Here also an inner door is advisable, more for the purpose of keeping out draughts than for giving extra. light. In the absence of such a door, draughts may be avoided to some extent by the use of a leather screen
Suitable Furnishing. If there is a fine pavement, such as a black and white square, this is always effective. A composition paving which simulates stone, an oak plank or a good
parquet flooring, an inlaid linoleum to resemble the last, or rubber-tiled and marble lloorings are all suitable Persian, other Oriental, or modern rugs which introduce brilliant colouring in geometrical designs, give an air of comfort. For the long narrow corridor often met with in a flat, a strip of wide stair carpet in a good design is usually a better choice than intermittent rugs when the boards have to he stained. Plain carpet looks attractive but shows every footmark Hall door mats should fit neatly.

Where there is either an outer hall or a back hall the question of the position of the hall stand is solved. These pieces of furniture are not decorative, and conts, especially when they arc wet, are not henefited by being hung up on them. The cupboard, either built-in or movable, is a welcome alternative and serves also for an umbrella stand, when fitted with a rack for this purpose fixed to the inside of the door. In the small Hat wet coats and umbrellas are often accommodated, while drying, in the bathroom, a row of pegs being provided on the door for the former and the latter being left open till dry. In larger old houses and in most modern ones there is usually a cloak room off the hall where coats
and mackintoshes can he properly hung up.
In old country houses the open fireplace is usually an important feature of the hall. In the modern house, if there is no central heating, the most practical fireplace is the anthracite stove. Radiators can be cleverly hidden behind wiought iron or wooden gilles under the window or at a turn of the stairs.
A favourite style of furniture for the lounge type of hall is the Jacobean, or, if it can be

Fig. 2. Small oak furnished hall with panelled and carved oak staircasa and doors. Fig. 3. Lincrusta panelling to imitate carved oak surmounted by a frieze, suitable for a modern flat

2, Humphrey Joel; 3. Courlesn of Arthur Sanderson a Sons. Ltd.
obtained, Normandy oak Old oak chests for keeping requisites for outdoor games, a big oak cupboard for hanging mackintoshes and coats, a gate-leg table for ten, an oals bureau, high-backed chairs, some ensy chairs and a settce covered in velvet or in a printed linen of Jacobean design, a table for visiting cards, in post and out post, and in the country; should there be no electric lighting, another table by the staircase for bedroom candles and lamps-these are the usual picces of fumiture required for such a hall. As there are often many exits andentrances, n tall draught screen placed where wanted is a uscful addition.

For floral decoration much depends on the type of ha! and the taste of the owner. Formal orange trees in big tulss are picturesque in a

Fig. 4. Large hall, simply furnished, with low pillared archways and windows set near the cailing
hall with paved floor; in a country house such plants as hydrangeas, azaleas or geraniums in tubs or large pots. palins or small flowering trees or Japanese trees can also bo used with good effect. In many country houses a feature is made of this floral decoration of the hall, and it is transformed into a winter garden during the gloomy months. In the summer an arrangement of flowers on the hearth as described and illustrated in pages 472-473 gives a very inviting air.

The colour scheme must be carefully thought out, as the decoration of the hall is the keynote to the whole house. Where this is treated on modern lines, the furniture and decoration of the hall will, of course, fall in with it. Where there are panelled walls and an old wooden staircase the choice of furniture and flooring for the hall will not quarrel with the period. The latter type of hall needs few wall ornaments. Pictures should be scarce and oil paintings look best when let into a panel over the lireplace. Panels of tapestry also give good notes of colour.

The question of lighting is important. The choice of hall lillings is varied and many firms specialize in good designs suitable for various styles and periods.

Our Illustrations. A particularly charming old wrought iron lampl head fitted for electric light completes the newel at the base of the polished and uncarpeted stairs in the first illustration. This hall is furnished in a delightful style. Its dark panelling, leaded casement and heary beams demand plain furniture. The Jacobean table and stools accord perfectly with them, while the early 18th century grandfather clock is equally happy and the red tiled Hoor adds a rich note of colour. This is further enhanced by the azaleas and a few pieces of old brass.

Another inviting but smaller panelied hall is shown in Fig. 2. Here the interest is centred on the carved oak of the double doors into the sitting room and of the staircase. A

Persian rug on the oak boarded flonr makes a connecting colour link between the Oriental design of the silk casement curtain and the pottery on the shelf formed by the architrave of the door. An old settle is visible on the left and there is an attractive gong. This hall is warined by a radiator and lit by a hanging oil lamp.

Although imitations are seldom deceptive, quite a gond effect can be obtained by using lincrusta moulded wall covering, which simulates oak panelling. Made in rolls and fixed like wallpaper, some of the designs are exact copies of old English paneling. In flats or houses rented for periods of a fow years, most people would hesitate to pay the large sum necessary to panel a hall and staircase in real onk. These lincrusta wall coverings are useful in such cases especially when surmounted by an nnaglypta frieze with plasterlike relief, as shown in Fig. 3. The dark oak coloured cornice is a change. Both frieze and ceiling are distempered an old ivory ahade. The carved pedestal with its Chinese jar, the oak chair and the Oriental carpet are all well chosen to furnish this amall hut rather highly decorated town hall, which requires no heavy pieces.
A very different type of entrance is shown in Fig. 4. Here the black and white marbled tiling and pillared archways call for dignified and restrained furnishing. The white painted ataircase with its mahogany handrail has $n$ suggestion of Georgian style. Colour accents are supplied by the pieces of old china and the fowers on the table.
A difficult hall to decorate succersfully is the long narrow corridor type found in many llats. Fig. 5 shows a hall of this kind panelled in simple Georgian atyle in accord with the furnishing of the sitting rooms opening off it. The polished chest just breaks the straight look of the passage, the round mitror also helping to do this on the other side. Wherever an appearance of space is needed light selfcoloured walls should be chosen. A modern

Hall. Fig. B. A narrow hall treated in such a way as to give an effect of spaciousnes:
treatment for such a hall might he pale grey papered walls and a silver ceiling. Colour viould he introduced by the curtains and carpet.
For either Hat or small town house the treatment shown in Fig. 6 is suitable. The

Fig. 6. Wallpaper treatment with applied landscape motil on a varnished and marbled paper Arthur Sandersoll \& Sons. Led

Inndscape wallpaper motif is bought separ ately and applied with the framing of raised moulding. In a tiny hall, one such motif is sufficient, but in the case of a house the landscape night be repeated on suitable spaces on the landing walls. The paper used with the motifs has a marble tiled effect in grey-green colouring which is in pleasing harmony with the sky, foliage and water of the landscape.

Hall Stand in Oak. The hall stand shown in
Figs. 7 and 8 is inade from a set of prepared materials put up by Handicrafts, Ltd. Kentish Town, London, N.IV.5. Joints are already cut, and the difficult prortion of the work has been done.
The diagram shows the method of assembling thic component parts. The back is taken in hand first, the joints being glued up and the whole cramped and put aside for the glue to set. It will be seen that dowels are largely used, this method presenting little difticulty to the worker. The mirror and plywood panel fit into the grooves in the uprights (Figs. 8 and 9 ), a beall being mitred round the front to finish. The mirror is secured at the back as shown (Fig. 9), and is covered in by a plywood hackboard

The front of the stand is glued up, less the shaped brackets, and put aside to set hard. It is connected to the back by glueing up and fixing the top and botton rails. The hoard which receives the two drip pans is supported by slips glued to the sirle rails. The shaped brackets are added afterwards. The methods of fixing the capping and securing the plywood panel are shown in Fig. 9.

Hall Mark. See Silver
HALLOWE'EN. Hallowe'en, or All Hallowe'en, is kept on Oct. 31, the evc of All Saints' Day, and from the customs of pagan times some gamics lave come down to us.

Chestnuts are used for purposes of divination. They are roasted on the bars of the grate by different people in turn. If a girl is in charge slie names threc cheatnuts after men of her acquaintance, and the one that pops first bears the name of the man she will marry. The men name their chestnuts after girls with the same purpose. If two nuts are put on

Hall. Fig. 7. Hall stand, the making of which is described in the tert. Fig. 8. Details lor the construction of this useful piece of fernitury
work, and that the material is 3 in . wide and quantity of common salt, and 2 oz . of aaltpetre; 2 in thick First plane up the materinl on all rub the hams well with this mixture, and put sides, and square off the ends Then at a them in a vessel large enough to hold them. distance of 3 in . from the end square a line Leave them for another three days; then pour around three sides of the material, set the a quart of vinegar over them. Turn them over marking gauge exactly at half the thiokness in the brine once every day for a month, then of the wood, and mark a line on the edges of the pieces of wood, on buth sides, and the end where the joint is to be made

Place the wood horizontally in a vice, or rest it against the benoh hook, and saw actose the wood exactly on the line marked acioss it. and to a depth of half the thickness of the material. Put the material in an the material Put Halved Joint. Method of joining two pieces of wood
the material in an
securing the carefully Btted parts with glue or screws along the line cut by the marking gauge, sawing to the edge of the line. This will remove a square pioce of woud. 1 in thick, from the main portion, and if both are oarefully bavin, the result should bic a neat and accurate joint when the two piecea are put together.
The joint surfaces should he trued up with a sharp chisel, and the two pieces accurately fitted. The joint is completed by glueing, sorewing, or nailing the parta together. The same principle can be adnpted for oblique-angled joints, or for running jointe, as when joining the ends of two pieces together in a straight line.

HAM: Curing and Cooking. When selecting a leg of ham chonse one that has a short shank and a moderate amount of fat. and test its freshness by inserting the knife under the bone. The ham is good if the knife comes out clean and smella fresh, and had if daubed and of a rank. disagrecable nolour.

Hams may he cured at home by rubbing them well with common salt. leaving them to stand for threc days, and then draining of the brine. Mix I Ib. of brown sugar, the same

Halved Joint. Method of joining two pieces of wood
securing the caratully fitted parts with glue or screws
drain them well and hang them up to dry. When sufficiently dry put them in muslin baga to protect then from flies and dust After draining them from the brine, an alternative method is to smoke them over a wood firc, hanging them directly above it
To boil a ham, first soak it for nbout I2 hours, or longer if it seems very dry, wash it thoroughly and trim away all rusty parta. Put it in a pan with enough cold uater to cover it, and bring it gradually to the boil, remuving all scunn as it rises. Then let it simmer gently until tender. A ham weighing about 10 lb . will require 4 hours' gentle onoking. When done, take it out of the pot. strip off the skin, and sprinkle over it some browned crumbs or raspings. If the ham is to be served cold let it reinain in the water until quite cold, as this renders it more mellow.

A ham nay also be halied. To do this, first soak it in cold water for 12 hours, then wipe it dry and trim off all rusty parts. Make a crust of linur and water, thick enough to keep in all the juices, cover the ham entirely with this, put it into a baking tin in a moderately lint oven, and balie it for about 4 hours. Then remove the crust, and skin. Cover the top with raspings, and pin a paper frill mound theknuckle.
A favourite breakfast dish, fried ham and egga, is prepared by cutting the required number of slices and frying them. Cook the ham on both sides and then keep it warn while the eggs are heing prepared. Brenk thesc, one
at a time, into a cup and then cook them in the fat which remains in the pan, adding a little more if necessary Baste the eggs with the hot fat to set the tops. When set take up with an egg alice and lay them on the hana. Ham prepared in this way may also be served with baked or grilled tomatocs. Grilled ham may be cooked in a Dutch oven before the fire or beneath a gas griller.
Potted ham is made by minoing together Ib cold lean ham and 3 o7. cold roast veal, and then pounding them in a mortar with $\frac{1}{\frac{1}{3}} \mathrm{~h}$. butter; aslded by degrecs. When all are well beaten, sprinkle over them a mixture comprising \& teaspoonful freshly pounderl mace, a little less than quarter of a grated nutineg and a good pinch of cayenne. Mix all together, and then press the ment into pots, pouring clarified hutter over the top. If kept in a cool, dry place this ment will remain good for over a fortnight.
To glaze a ham, take off the rind, trim it and, after placing it in the oven for a few minutes, dry it with a cloth. Dip a paste brush into some melted glaze and brush it over the ham, giving two or three coats.

Ham 'Pie. To make this pie, buil 3 oz . of macaroni, allow it to get cold, and cut it into inch lengths. Mince $\frac{f}{2} \mathrm{lb}$. ham, and put a layer

Ham. Boiled bam sprinkled with breadcrumbs and garnished with parsley and a paper frill round the bone of this at the hottom of a pie-dish. Season with pepper and aprinklc over it some minced parsley; then add a layer of macaroni, some chopped onion, and some small pieces of butter Continue these layers until the dish is almost tilleal, and then add a little white sance, a layer of fine breadcrumbs, and some more pieces of butter. Bake the pie in a moderate oven until it is lightly browned.
Ham Souffe. A large cold ham souffić or several amall ones can be made as follows : Chop $\frac{1}{2} \mathrm{lb}$. lemn cooked ham, and pound it in a mortar with $\&$ pint hrown sauce, nfterwards rubbing them through a sieve. Whisk If gills of melted aspic jelly until it begins to set; then stir it into the ham mixture. seasoning it with salt, pepper, ground nutmeg and mace. Whip $\ddagger$ pint eream until it will just hang on the whisk; then stir it in, whisking it for abnut 5 min .

Have ready some small snufflé caser, tie a band of foolsenp paper round each, reaching about 1 in. higher than the top of the case. Put in the mixture, arrange in the centre a atar or other design out from truffle or chilli and pour over a little melted aspic. Leave the souffers until they are set : then draw off the hands of paper. See Bacon; Carving : Chicken: Glaze: etc.

## Hamamelis. See Witch Hazel.

HAMBURG FOWL. One of the most graceful and attractive of fowls, the Hamburg is a fine layer where a good strain is secured. It does better on a wide range than in confinement. The best known colours are the blacks, gold, and silver spangled, and gold and silver jencilled. See Fowl: Poultry.

HAMMER. The commoneat type fot metal-worker's use is that known as the enginecr's hall-peine hanmer, Fig. 1. These are made in all weights, from $\ddagger \mathrm{lb}$. to 4 lb . or more, the weight being that of the hend, or
metal part, of the hammer. which is of cast steel, with an ash or hickory handle. For use in ordinary wood work, a Warring. ton hammer or an Exeter pattern ham. mer is convenient. The former is similar to the engineer's cross peine hammer, but longer in the head. In the Exeter pattern (Fig. 2), the cross peine is set to the back of the head, and not central

## ${ }^{2} \mathrm{H}$ in the former case.

The Kent pattern claw hammer is useful in the house, the claw being handy for the withdrawal of nails. Riveting hammers are made with a small cross section and a long head with a cross peine. The ball-peine pin hammers (Fig. 3) are almost as suitable for riveting, and extremely handy for driving all classes of tine tacks, panel pins, and for suoh purposes as fixing the bead mund a window frame. The upholsterer's hammer (Fig. 4) is notahle for its great length of head, and is made in two forms, one with a claw and the other, known as a cabriole, with a narrow cross peine.
The hide-faced hammers comprise a wood handle, and a cast or wrought iron socket with inserted pieces of raw hide. They are used for sheet metal work, or on parts where hammer marks or bruises would be objectionable. A somewhat similar hammer is made of brass. Jeweller's or watch hammers are small and very light in weight : their use is necessary in this class of work.
Slcdge hammers are outside the scope of amateur work, except perhaps the 3 lb . hand sledge or smith's hammer, which is often useful for small forging jobs worked cold in the vice. A somewhat similar hammer is the mason's club hammer (Fig. 5). The lath hammer has a flat face for driving the nails, and a broad axe-like face for cutting the lath. Chasers or repouzsé hammers (Fig. 6) have a face large in diameter and a ball or other shape peine.

Fitting a Handle. When fitting a hammer head to a handle the end of the handle is shaped to fit tightly through the eye of the hammer. A slot is cut in the end of the handle, and a thin metal or hardwood wedge driven into it. Very often the hammer head and the end of the handle are first dipped into water, as this causes the wood to swell and makes the handle fit tight. Generally speaking, the lighter the hammer, the longer and finer the handle, a more effective blow being struck when the handle is resilient. Claw hammers and some others are provided with forged ears or side plates, whioh are fitted to the side of the handle.

After heavy wear a hammer may require regrinding to restore the smooth and true surface of the face, which is essential to accurate work. If the head gets slack on the handle it should be refitted, otherwise it is liable to fly off. No hammer should be used except when its face is clean and dry. Oil or glue on the face will cause the hammer to slip, and painful bruises may result. See. Amateur Carpentry ; Claw Hammer; Nail; Repoussé; Tool.

HAMMER TOE. In this condition the toe is bent upward at the first joint and downward at the second. The second toe is most commonly affected. It may be due to wearing short and narrow boots, and is often associated with hallux valgus, or displacement of the great toe towards the middle line. . Claw foot is usually accompanied by some degree of hammer toe. Corns form on the parts pressed on, with resulting pain and discomfort. In the early stages the condition may be rectified by

Strong ropes are fitted to the extremities of the rods, an eyelet or thimble being worked into the bight of the rope. The hammock is suspended by chains or ropes hooked into or passed through these eyes. Another style of hammock is made from separate strips of webbing, such as is used in upholstery work; a good plan is to make the stretchers first and to fix them on to the back of a chair, so that they are at the deaired distance apart. A sufficient quantity of webbing having been obtained and out off to the proper length, the outer pieces are applied to the stretchers, putting a double thickness of webbing at each side and securely sewing them together.

Other long pieces of webbing are then spaced about 1 in. apart, folded round the stretchers and sewn together at the joints. Those in the centre should hang down a few inclies helow the line of the side picces. The cross pieces should be placed underneath the long-way pieces and sewn to each of them. They may be spaced about 2 in apart. The hammock is suspended by ropes

Fig. 1 shows a netting hammock suspended between two apple trees. Any good-quality twine or string may be used, picture cord or stout cotton cord. The hammock can be miade like a net with shuttle and cord, and another method is to tie the cords together, using a reef knot. To make a hammock about 12 ft . long, which is the usual length, will requirc a set of cords each measuring 18 ft . long; these arc arranged in pairs, and 24 pairs are required. Work is com. menced in the centre by looping the pairs of atring round a stick such as a broom handle,

Hammock. Fig. 1. Hammock ot netting bunk between two trees. Fir. 2. Tying the frat row of knots in netting a bammock. Fig. 3. Close view of first stare in tying a knot. Fig. 4. Second stare, showing how reef knots are made. Fir. 5. Second row of knots in process of tying. Fig o. Simple stand for use with the hammock shown above
wearing well-fitting boots and perhaps a splint; but generally an operation is necessary. See Boots; Clawfont; Foot.

HAMMOCK. In the domestic sense, the hammock is a swinging seat fixed up in the garden, and may serve on occasion for a bed. There are numerous types, varying from the simple article made of cord or canvas and slung between two trees, to elaborate devices fitted with specially constructed stands, spring mattress and cushion beds, wind shields and awnings. Simple hammocks vary in prices from 10s. to 50s. A padded couch hammock with an adjustable canopy, and upholatered in gaily striped canvas, is considerably more expensive, especially a model with a patent adjustable tea tray.

A simple form of hammock may be made by taking a piece of stout canvas and turning a very strong hem at each end, inserting through each a 1 in. dianeter hardwood rod.

supporting this at each end on the hacka of chairs so that the stick is at a convenient height; the loose ends are hung up out of the way while the first half of the linotting is in progress, as in Fig. 2.

All the knots have to be made at the same distance apart, and to do this it is necessary to make a mesh aticl or post. The latter has a foot-piece that enahles it to be kept upright with the foot while the hands are inee to effect the knotting. Fig. 2 shows the first stage. The mesh stick is simply a post of wood about 30 in . high, $3 \frac{1}{2} \mathrm{in}$. wide and about 1 in. thick. The upper end is shaped to an
oval form, and half of it cut back to n depth of $\frac{1}{2}$ in. to serve as a guide for the first row of knots ; the other knots are tied around the thicker part. The shape of the top will be clenr from Figs. 3 and 4
Commence at the left-hand side of the centre post, and place the mesh stick against it, with the outer pair of strings separated by the mesh stick. The outside cord $A$ is taken in the left hand and placed behind the smaller notch on the meshistick. The cord B to the right is taken in the right liand, passed over $A$ and held by the left hand. $A$ is passed over and under B, then under and over $B$, and the result is a reef knot that will not slip. Figs. 3 and 4 show how all the cordsare tied with this knot.
After tying the first pair of cords the mesh atick is removed and the next pnir tied, and so on until all the 24 pairs have been tied once. The mesh stick is then used at its full width for all the remaining knots on the first half of the hammock, but instead of starting by tying the outer pair together, only tho inner one of the outer pair of cords is used, na the outer cord has to remain straight. The inner cord of the outer pair is tied to the outer cord of the next pair, and so on, as in Fig. 5, continuing to the other side of the hammock, thus leaving a single cord on the outside.
The knots that niake up the thind row are then tied in the same order as the first, and this procedure is continued until the netted portion is nhout 4 ft . long. The centre har is then removed by sliding the cords off it and the loops smoothed out; the stick is then placed through the original second row of knots and the other half of the hammock is tied as before, starting the first mow of the knots with the full width of the mesh stick. When all the cords are knotted in this way the ends are brought together and worked around the end rings, and the hammock is ready for usc, but can be embellishicd with n pendent fringe, if desired, attached to the sides of the hamnock. The hammock is suspended by chains or ropes, as shown in Fig. 6, or can, ns before stated, be slung between two trees See Garden Furniture; Knot; Netting.
HAMPER. A hamper is a large basket usually made of wicker or cane and fitted with a lid. It is used by laundries for conveying clothes, and also by many persons for carrying food to race meetings, picnics, and the like. See Basket: Picnic.
HAMSTER. Tlis fur, obtnined from the rodent of the same name, is clienp and of hard wearing quality. Short and shading from yellow to grey, with curiously shaped black markings down the back, it is used chiefly in the form of linings for winter coats. See Fur.
HAND. The utility of the hand mainly depends on two factors, namely, the power to oppose the thumb to the other fingers so that we can grasp implements, and the large amount of brain surface devoted to its surface.
A wound of the upper part of the palm may
free bleeding. It may be arrested by putting a firm pad of moderate size over the wound and making the hand into a fist over this; then applying a firm bandage nod supporting the liand, well elevated, on a lesser arm sling. If some difficulty is experienced in cheching the bleeding, the brachial artery sloould be compressed, an improvised tourniquet being applied if necessary
Care of the Hands. Well-shaped, supple hands with long, smoothly jointed fingers. nicely kept nails, and skin which retains its softness and delicacy of tint in all weathers are a rare but inportant ploint of beauty culture. Ilthough atructural shape cannot be altered, much can be donc to improve appearance and render defects less noticenble, but it is the constnnt everyday attention which counts ; spasinodic treatment is of little use
Unsightly hands are a drawback, causing a feeling of discomfort which renders their possessors self-conscious. Those who suffer from red, swollen hands in cold weather should pay particular lieed to general hygiene, as well as to local care. Regular massage and electrical trentment are beneficial in many cases. Vigorous scrubbing with a soft nailbrush when washing stimulates the circulation. and it is a good habit, after the use of hot water, to run the cold tap over the hands before thomoughly drying.
A pure toilet soap-that is, one which docs not contain frec alkali and is made of the best quality of fats-should be used to clennse the hands. A night treatment is started by washing and kneading them well in the soapy lather, drying on a soft towel, care being taken to press down the cuticle of each nail in turn, massaging a hand balm into the skin and leaving a liberal allowance of the emollient on the hacks of the hands, to be protected during the night by a pair of loose wash-lenther gloves from whiclo the tips of the fingers have been cut.
An excellent balm for this purpose, adapted from an old French prescription, is made by mixing 2 oz hydrous

Hand : stares in manicure. Fir. 1. The nails are first fled and the edges bevelled with an emery board. Fir. 2. The cuticle is then pressed down with an orange stick dipped in peroxide of hydrozen or lemon juice. Fig. 3. Polishing the nails by painting with simple tincture of benzoin. Fig. 4. Final treatment of the hands by rubbing in vanishing cream, working from the wrist upwards
olive oil and $\frac{1}{2}$ oz almond oil in a warmed mortar or in a basin placed over hot water; beat in 2 drachms zinc oxide and 1 drachm boracic acid until quite smooth, and then, while continuing to beat the cream. slowly add $\frac{1}{2}$ oz orange flower water with which 2 drachms of glycerin have been mixed

This balm has a smoothing and whitening effect on the skin, and should be applied at least three times a week. A little glycerin jelly may be massaged into the hands on other nights, or a bleaching lotion made of 4 oz . rose water and $\frac{1}{2} \mathrm{oz}$. each of hydrogen peroxide and atrained lemon juice may be used when it is desirable to reduce redness or tan from exposure, or freckles. Warmed buttermilk is a good and soothing bleach.
For chapped hands, clarified mutton fat, perfumed to liking, is a simple but efficacious remedy. Great care should lie taken, especinlly in cold weather, thoroughly to dry liands which are liable to roughncss. I little fine ontmeal rubbed over the skin after drying absorbs any moisture

Lnose gloves should be worn when doing mugh work, and nfter laundry or washing-up glycerin jelly should always be npplied. Stains are best removed by pumice-stone, which is also helpful for rubbing down hard skin on the finger-tips or palms of the hands. Lemon juice is of constant use. Half a cut lemion should always be kept on the wash-hand stand or by the sink. Rubhed over the liands and washed off with cold water, lemon juice tightens up wrinkled skin and removes dirt from nails when each finger-tip is thrust into the pulpin turn, and then thenail is carcfully cleaned by means of an orange stick, its point wrapped in a shred of cotton wool.
Before starting any work which may soil the nails it is a good plan to dig them into white

powder-corntlour will do-leaving it under the nails until the work is finished and then removing the powder with an orange stick, when the nails will be perfectly clean.

Perspiring hands are a great nuisance and a source of expense in the matter of gloves. Washing with formalin soaj: at night is often recommendell, or steeping them its a diluted solution of a reliable antiseptic. The following powder may be dusted over the palms after wash. ing, or before putting on gloves: Powdered starch, 2 oz ; powdered talc, 1 oz ; powdered alum, 15 grains.
If hands are kept in good condition, ten minutes devoted to them will further improve
their appenrance when deaired. The nails should first be filed and then nicely shaped by means of an emery hoard, cleaned and the cuticle pressed back with an orange stick dipped in peroxide of hydrogen. The hands are then washed and rubbed over with lemon juice, loose pieces of cuticle being removed with cuticle scissors after drying. The quickest method of polishing the nails is to paint them with simple tincture of benzoin, using a small camel-hair hrush and allowing the tincture to dry on, but a liquid enanel or paste and nail powder may be used if preferred. A little greaseless vanishing cream is then massaged thoroughly into the hands, working upwards from wrists to fingers until it is quite ahsorbed. See Bandage.
Hand. This measure of length, which is used for measuring horses, is one of 4 in . See Horse.
HANDBAG. Small hags that can be carried in the hand are of two main types, those carried by women for purses, travelling or shopping, and those carried by men. The former are made in a great variety of atyles and materials, and some are beautifully ornamented and fitted.
Handbags as carried by men have been largely supplanted by attaché or despatch cases, hut bags are still seen. These are mainly of leather, and are provided with a lock and key. When purchasing one care should be taken that the fasteninga are sound and the bag well lined and finished. The leather is cleaned as are other leather articles. See Attaché Case: Bag; Leather.

HAND BELL. Hand bells are still used to some extent in the home, although they have been largely supplanted by electric hells and gongs. The better ones usually are made of brass, either genuinely antique or reproductions of old designs. See Bell: Gong.

HANDKERCHIEF. Fine handkerchiefs are of pure linen with hand embroidered initials. Coloured varieties may be of linen, but are more usually of some thinner fabric, such as cotton cambric or a silk that may be boiled without losing the original colour. Women's fancy handkerchiefs are made of crēpe-deChine, silk, ninon, floral chiffon, or are lacetrimmed. Men's handkerchiefs are 16 in . to 18 in . square, and may be of silk, linen, or various cotton fabrics, white or coloured. Contrasting borders are frequent.

All handkerchiefs except the purely decorative varieties should wash readily and without losing colour. White handkerchiefs should be boiled or, if that is not possible, sonked in wnter and lemon juice for several hours to keep them white. Coloured ones need washing in moderately warm water. All kinds should be ironed damp. The hems, which are of doubled materinl and hold the damp longer, should be ironed first, otherwise the noisture from them will penetrate into the already ironed centre portion and spoil its appearance. When ironed llat they ahould be folded, and each fold ironed down.

Machine-made handkercluefs for everyday use can be bought so cheaply that few people make their own. Real silk and linen handkerchiefs, however, are worth the trouble. The following method involves the use of a very easy drawn-thread work, and is consequently only suited to materials with a thread that draws readily.

For a woman's handkerchief take a 12 in . square of linen, drawing threads to make sure the edges are straight. An inch from each edge draw a thread straight across, then draw the thread immediately inside this one just far enough to get an end long enough to tie. Take a strand of filoselle silk or stranded cotton at least 24 in . long, double it, and tie the end of drawn thread to the looped silk.

This done, draw the thread out gently and gradually from the opposite end. As the thread is pulled out from one end it draws the douhled coloured silk tied to it into its own place at the other, leaving a line of perfectly woven coloura
 stretchedncross the handker. chief. Two or three coloured threads $\frac{\hbar}{d}$ in. apart along each edge miake a charming decoration to the handkerchief, which is then hemmed down very nently to the
adapted for cutting or ripping timber in the direction of the grain, the teeth heing larger. The handle is held with the first finger of the right hand cxtended along the right-hand side of the handle and the right thumb along the left-hand side of the handle, as in the illustration. For ordinary household work, the crosscut saw will answer most requirements.

Another type, known ns the farmer's saw, is made with teeth of a different shape, a number of notches heing cut at regular intervals along the edge of the hlade, thus enabling the saw to cut wet timber. This type is indispensable where rough loga have to be sawn up, as for firewood. See Cross Cut Saw; Saw.

HAND SCREW : Its Uses. Hand sorews аге a useful form of cramp, used by wood and metal workers. They consist essentinlly of two blocks. which are drawn together by the rotation of two long screws fitted with hand grips. Those favoured by woodworkers are usually made of hardwood throughout. An improved pattern is made in pressed steel, and adapted for grasp. ing work that is tapering or of irregularshope. Hand acrews intended to lo used for metal work are generally smaller in size. These tools are employed on work such as holding one part to another to act ns a drilling jig or

Hand Saw : three types. Top, London pattern; centre, skow back: bottom, farmer's saw. Above, left, method of holding: note position of thumb and forefinger outermost line of colour, and may be embroidered in one comer if desired. Men's linen or silk handkerchiefs should be made in the same way, choosing suitable colours, and may have an enibroi. dered monogram in one corner.
Various methods of trimming coloured handkerchiefs are employed. Sometimes the whole handkerchief is coloured, with the merest line of white at the edge in the ashape of a rolled hem; while in other cases the guide piece while preparing a duplicate order is reversed, the handkerchief being white, bound with a colour. Wi,lely striped borders are used as well as veining edges in a pale colour, with small initials or monograms to match. Cross-stitch is introduced in others for ornamental corner designs.

The fragrance of fresh violets may he imparted to handkerchiefs without the use of scent. Tie a few pieces of orris root in a muslin bag and put the latter into the water in which the handkerchiefs are boiled. When dry they will be found to be delicately perfumed. See Hemstiteh; Initial; Laundry.
HANDKERCHIEF SACHET. The most servicenble sachets are those mide of fine white lawn, muslin, or linen embroidered or trimmed with drawn-thread work, as they can be washed repentedly.

More elaborate sachets are made of fancy and plain silk, crêpe-de-Chine, sstin, velvet and ribbon. These are usually padided and ornamented with embroidery. Silk cord and ribbons are utilized to form fastenings.

A simple sachet can be made by folding in half a padded length of satin 18 in . by $10 \frac{1}{2} \mathrm{in}$. The outaide can be made of embroidered satin, of talfeta, or of a tinsel brocade, and the lining of some pale self-colour. Gold or silver cord is sewn round the edge, and is also used to make fastening loops. See Drawn Thread Work; Embroidery.

## Handle. See Door.

HAND SAW, There are many types of hand saw, the straight-backed pattern illustrated being suitable for most work. These are made in various lengths, from 20 in . to 30 in ., with teeth of different shape. Saws with ratchet-ahaped teeth are preferable to those of the pyramidal shape, and the 26 in . size is handy for general use.

Hand saws in general are intended for two classes of work. The oross-cut saw is for cutting across the grain; the rip saw is better
'The woodworkers' hand screws are invaluable to the home worker. They can be employed to hold together the corners of a light frained building in course of erection. They serve as a clamp when glueing up joints, and another use is clamping a piece of work down to the work hench. They should always be kept in a dry place, otherwise the wood serews are liable to swell and work stifly; this can be remedied by coating the thread with blacklead. Unless they turn freely, much of the strength of the grip will be lost, and there is a risk that the screw will be twisted asunder.

The diagrann clearly illustrates the action of the appliance. A and B are the two blocks whose movement is controlled by the two screwa $C$ and $D, A^{1}$ and $B^{1}$ being the jaws or gripping faces. The serew $C$ passes frecly through a plain hole in A, but screws through B; 1) also screws through B, but the end of $D$ works freely in a hlind hole in $\mathbf{A}$; both screws are right handed.
In order to bring the jaws $A^{1}$ and $B^{1}$ closer together while keeping their faces parallel, C is screwed up while 1) is unscrewed by an equal amount. When the jaws have thus

Hand Screw: method of action. A key to the lettering will be found in the text
been brought near enough together the clamp is put in place and $C$ is screwed up and $D$ unscrewed at the same time, so that the jaws are home on the work. If the jaws are biting tighter at the throat than at the tips, C must be unscrewed a little and $D$ screwed up by a larger amount; if, on the other hand, the jaws are alack on the job at the throat and tight at the tips, D must be unscrewed a good deal and C screwed up a little. This method of adjustment also enables the tool to be used to hold jobs whose opposite faces are not parallel.

When the clamp has been adjusted to press evenly on the work, it is tightened by first screwing up $\mathbf{C}$ quite tight and then screw'ing up D as far as it will go; this order is adopted because $D$ has a bigger leverage on the job than C. To release the clamp, first unacrew (1) till it is quite free, and then unserew $C$.

HANDSPIKE. This is a long bar of wood about 3 in . in diameter, tapering at one end, the other shaped in the form of a shoe and

Mutton keeps better than beef, and all meat keeps longer in the carcass than in joints; but it should always be hung up in the larder and never laid on a dish on the shelf. Always remove the kernels if meat is to be hung, also the marrow, as both have a tendency to become tainted and infect the meat. The ilesh of young animals cannot be hung so long as that of older beasts. Foreign meat should not be hung. as it will waste; it is supposed to come from the butcher ready thawed and in condition for cooking. When the weather is frosty, however, all meat is better for lianging some hours in a warm place after being exposed to the frosty atmosphere during carriage. Pork and veal should not be hung longer than is necessary before cooking, us they taint very quickly.

The time varies for hanging poultry. In warm weather fowla can be hung only for a day, and that must be in a cool, well-ventilated place. In winter hang them for about 4- 6 days. Turkeys in very cold weather may hang as long лs a fortnight, but the time must be regulated by the weather. Geese should hang some days, pigeons for a few days only. In oold weather venison clothed with iron. Its general appearance is may be hung for 14 days, but it must be illustrated, and the implement has many ures examined occasionally. An old hare can be in the handling of heavy articles. The shoe should be inserted underneath the sack or other object, and it can be raised slightly by depressing the handspike.

For domestic purposes a useful implement can be made from ordinary deal about 4 in . wide and 3 in . thick, shaped on the lines illustrated. The iron shoe should be fitted if possible, as it adds greatly to the effective strength of the implement, and can be bent from a piece of wrought iron $1 \frac{8}{7} \mathrm{in}$. wide, $\frac{\downarrow}{}$ in. thick, and 18 in . in length. It may be secured by screws, or preferably by riveting with long rivets. See Lever.

HAND VICE. A small vice that can be held in the hand is a very adaptable tool that can be turned to many uses in the home. It is useful for a great many small filing operations, as it can be turned about in any direction. The ordinary black pattern is shown in the illuetration. Another type with wooden liandle and a parallel action to the jaws is useful for fine work, suchas model maling or clock repairing. In choos-
 ing a hand vice note that the jaws close up evenly, that they are free from shake, and that when closed they are quite true and level on the upper side, the faces in close contact See Amateur Carpentry; Vice, etc.

HANGING: Of Meat. The length of time required for lianging ment depends mainly on the weather. English beet and mutton, if kept in a well-ventilated larder gnd the weather is cold, may hang for - or even 3 weeks in carcass. In summer, on the other hand, meat should not hang more thais a week.
hung for 10 days, but a young one not more than a week, and neither should be paunched before 4 days have elapsed. Game may hang any time from 10 days to 3 weeks if the weather is cold, but neither venison nor other game is now eaten very high. Birds keep better if the feathers are left on and they are undrawn. It should be remembered that poultry is hung by the feet, game by the neck See Food; Game.

## Hanging Cupboard. See Cupboard ; Corner

 Cupboard.HANK. A hank is two or more skeins of woo!, thread or silk tied together. Silk, both real and artificial, as used for knitting, is often sold in hanks. See Knitting; Silk; Wool.

HAPPY FAMIIY. For this card game, which is best played by four persons, a specially prepared pack is necessary. A pack consists of 44 cards, each containing a fantastic figure representing a member of one of the eleven families. Each family has four members, Mr., Mra., Master, and Miss, and each is pictured with the implement of the family trade, e.g. a bone for the butcher. The names given to the families vary, but the most popular are as follows: Block the barber, Bones the butcher, Bun the baker, Bung the brewer, Chips the carpenter, Dip the dyer, Dose the doctor, Grits the grocer, Potts the painter, Soot the sweep, and Tape the tailor

The game consists in each player in turn asking any one of the others for a card he himself has not got, but he can only ask for a member of a family which is represented in his own hand. The player to the left of the dealer begins. If he asks for a card which the person aslecd possesses, it is handed over and heasks again, continuing until he aske for a card which the player asked does not possess. The latter thereupon answers " not at home," and it becomes his turn to ask. Each player aims at getting the four members of one family into his hand, and each family counts one trick. The player who secures the most tricks wins
The game may be continued as follows: The players in turn ask for whole families instead of for single cards, under the same conditions as before, and continue until all have passed into the possession of one player.

HARDBAKE. Hardbake is a simple form of toffee, its chief constituents being rugar and butter. Almonds or other nuts may be used to give it a Havour. Sce Almond Tolfee ; Toffee.

## HARDENING AND TEMPERING

 Tough though it is, tool steel in its soft or annealed condition is not hard enough to resist hard wear. Tools must therefore be hardened, after being made, by lieating them to the correct hardening temperature and plunging them into a quenching bath. Tool steel so hardened has the defect of extreme brittleness; this can be overcome by tempering, raising it gradually to the appropriate temperature and then plunging it in cold water. The process of case hardening is quite different, and is dealt with in a separate article.The art of hardening and tempering tool atcel consists in getting the correct hardening temperature for the particular steel, choosing the right liquid for the quenching bath, having in view the use for which the tool is intended. and getting the distribution of tempering temperature in the tool so arranged that the different parts of the finished article are all of suitable hardness and toughness for their particular work.

Tool steels vary considerably in composition, and ench has its own special colour of red heat for hardening Each steel that is used for thaking tools loses its magnetic qualities entirely at and above a certain temperature, whioh is identical with the ideal hardening temperature in every casc This fact enables the hardening operation to be carried out with certainty by the use of an ordinary pocket compass; but attention must be paid to avoiding complications from the presence of such iron articles na atoves, fenders, fire irons, etc., near the compass. In particular, iron or steel tongs or pincers must not be used for handling the red-hot tool.

The procedure recommended for hardening a tool is to hold it by tying a piece of stont copper wire round the middle, and place the pocket compass on the floor a yard or so away from any iron, but within convenient reach of the fire and the quenching bath, rernembering that if the bath is of tin or enamel it must not be too close to the compass. Any lire will do for the work if it is hot enough; a hot coal fire or a paraffin blow lamp is satisfactory, or even a gas ring if the tool is not too big. Then the tool is to be made red hot in the fire and tested from time to time by withdrawing it by the copper wire, and holding it close to, but at one side of, one end of the compass needle.

If the needle responds by a movement, the steel is not yet hot enough, and must go back in the fire; but when the steel is so hot that the needle disregards its presence, the tool is to be plunged at once into the quenching bath and moved rapidly about in it till it is cold enough to handle, when it may be withdrawn and wiped dry. When transferring the tool from fire to compass and from compass to batli, the movements must be smartly carried out to avoid any unnecessary cooling of the red. hot metal.
In heating it is essential that the tool should be of a uniform temperature all over. Evenness of heating is readily secured by tuming the tool about so that any part that is noticed to be at a darker red than the rest comes in a hotter place in the lire and so catches up to the general a verage temperature.

In quenching, a rapid agitation in the bath is necessary to secure even and rapid cooling. The bath is simply any kind of vessel containing enough of the quenching liquid to ensure that it does not get much heated when the red-hot steel is plunged in it.

Various liquids are in use. Cold, fresh water, soft, not hard, is satisfactory in most cases. If, however, it is found that a tool quenched in water cracks, oil should be tried, and any lubricating or other heavy oil will be found to overcome the difficulty.
Tempering. After hardening, the tool has to be tempered. This is done by raising it
slowly to a temperature which depends on the use to which the too is to be put, and then quenching in cold water. Stecl has the property that when it is clean and heated slowly in air a thin film of oxide forms on the clean surface, and the colour of the film changes progressively ns the temperature rises. First a pale strair colour appears and gradually deepens to brown, then the brown gives place to a purple, which presently clarifies into a clear violet; next the violet turns dark blue, and finally the blue fades out.

After hardening, therefore, the tool is first rubbed bright with emery cloth, taking care not to touch it with the hand, as tho slightest trace of grease prevents the proper formation of the temper colours; then, if it is required to be at the same temperature throughout, it is laid on an iron plate, which is placed over a flame. The succession of colours is watched, and the tool is quenched at once when the desired colour is reached. If by accident the colour changes have advanced too far before quenching, the tool must he hardened and correctly tempered all over again; but if the colours have not gone far enough, it may be repolished and retempered without hardening.
Most tools require to be of a certain hardness on the point or working end, but to be softer in the shank and at the handle end. This result is obtained by taking the tool by the middle in a pair of priers and holding the butt end in a flame such as a blow lamp or gas ring; the series of colours then passes along the tool, which is quenched when the desired colour reaches the point. If it is desired to keep the hard region near the point as much as possible, the butt end must be put well into a hot flame, when the successive colours follow each other so closely that the bulk of the tool is soft.
To obtain the reverse effect, i.e. a tool which is of progressive hardness over a considerable length of the point end, the tool is caused to warm up more slowly by occasionally withdrawing the butt end from the llanic; the colours then follow down the tool at longer intervals so that the hardness extends for some distance from the point. Slow tempering is preferable to fast tempering, as it is ensier to carry out accurately, and tools so teinpered are more satiafactory in use.

When tempering, a very pale straw colour is used for reamers; light straw for twist drills and tools for turning metals; dark straw for woodworking tools in general and for taps and dies for screwing metal; brown for hatchets and chipping chisels; and dark purple for springs. See Case Hardening.
HARDENING-OFF. This is the process of treating plants grown under glass to render them tit for planting out of doors; it is carried out by gradually inuring them to cooler conditions. They are transferred from greenhouse to frame; the frame is at tirst kept closed, and after a week the ventilation is increased gradually until finally the top of the frame is removed.

HARD STOPPING. Usually a mixture of resin and beeswax, hard stopping is employed to fill up small holes and defective places in woodwork, being first warmed and then worked into the cavity with a warm knife. I superior variety is known as beaumontage (q.v.). Various proprietary mixtures can bo purchased ready for use from the oil and colour shops.
HARDWARE. This is the name given to all kinds of houschold and other articles that are made of the baser metals, especially iron and copper. Among them arc the ordinary cooking and kitchen utensils, fire irons and tools of all kinds. See Baiking; Copper; Hammer; Ketfle; Lawn Mower; Nail; Poker ; Tool Chest, etc.

Hard Weter. See Water Softener.

HARDWOOD. The various woods are divided into two classes, hard and soft. Of the former them is a great varioty, but the softwoods are few in number and belong to coniferous trees. Those in common use are pine, spruce, fir, and pitch pine, the first threc coming under the general head of deal.
Chief among the hardwoods are oak, mahogany, walnut, elm, ash, birch, beech, greenheart; teak. They are moatly heavy "oods compared with ordinary deal, and more power is required to cut them with chisel or plane. The grain is often more curly than that of the soft varieties, and the cabinet maker has to linish with a scraper, hecause a plane tears up the grain in some kinds.

Hardwood of some particular kind may be selected because it is hetter adapted for the purpose required, or its appearance may be the main consideration. Colour or the ligure of the grain may make it desirable, though, as far as utility is conoerned, it nay be no better than cheaper woods. This is the case mainly in furniture. Hardwood costs more than soft, and some varieties of it cost far more than others. It is usually sold according to size, at so much per foot; in a few cases, where the wood is heavy and scarce, it is sold by weight. See IBeech: Elın; Oak; Walnut ; Woord. etc.

HARE. Caught in the leveret stage, hares, though by nature timid, are easily tamed, and will appeal to those who like a pet out of the common. They require a large roomy hutch, and may bc fed principally on greenstuff, such as lettuce and cabbage tops, and bread. The hare docs not breed in confinement.
How to Cook. It may be ruasted, jugged, braised, or cooked in other ways. After cleaning, wash the hare quickly in lukewarm water and dry it with a cloth.

Braised Hare. To braise a hare, skin and clean it, and line the inside with slices of fat hacon. Chop the lieart, liver, and kidneys, adding to them $1 \frac{1}{2}$ oz chopped calf's liver, the same quantity chopped fat bacon, 3 oz . breadcrumbs, a small chopped onion, and 2 teaspoonfuls each of chopped herbs and parsley. Season these to taste and bind them with 2 beaten eggs. P'ut the stuffing inside the hare, sew the latter up, and cover the back with a piece of raw fat bacon. Wrap the whole in buttered paper.

Cover the bottom of a long braising pan or fish-kettle with some bacon trimmings, 2 onions, 2 sticks of celery, a carrot, and a turnip, and lay the hare on these, adding a bunch of herbs, a pint of good stock, season. ing, and, if liked, 2 glasses of sherry. Cover the pan closely and braise its contents over a low fire for 3 hours, basting the hare ocensionally with stock and renewing the latter whenever necessary. When alnost cooked through, take out the hare, remove the paper from the back, and strain off the stock, at the same time skimming off any fat. Pour a pint of good brown sauce into the pan, put hack the atrained atock and the hare, and finish cooking. Serve the hare with the sauce poured over it, garnish with thin rolls of fried bacon, and hand round some red currant jelly.
Jugged Hare. A hare that is to be jugged should he cleaned, cut into joints, and the blood reserved. Wash the head, heart, and liver in cold salted water, and put them into a sancepan with the blood and bones. Idd 4 pints of cold water and a teaspoonful of salt, and bring the stock to the boil. Remove the scum, add a few mixed herbs tied in a piece of muslin, a little powdered mace, and pepper to taste. Scrape and wash a carrot. and add it to the stock with an onion, yeeled and stuck with 3 or 4 cloves. Simmer the whole for 3 or 4 hours, keeping it well skimmed.

Dredge the joints of hare with flour and fry them to a light brown colour; then place them in a large brown jar or casserole Mix 6 oz flour to a smooth paste with water, and add it to the stock previously strained into another saucepan. Stir thesc well, boil them for a few minutes, and, if necessary, add a little browning. Strain the gravy over the hare, just covering it, and reserve about pint in which to cook the forcemeat balls (q.v.). Put the casserole in a noderately hot oven, bring its contents to the hoil, and then sinmer it for about 2 hours.
The forcemeat balls sliould lirst be rolled in llour, then fried, and afterwards put into a saucepan with the remainder of the hot gravy and simmered for about $\frac{1}{2}$ hour before the hare is ready to be served. Just before sending the lattor to table add a wineglassful of port wine.

Roast Hare. For roasting, a young hare is best, preferably under a year old First press some forcemeat inside, and sew it up with a trussing needle and fine string. Trusa as for ronst rabbit, tie n few pieces of fat hacon over the top, and cover with greased paper. Cook the hare in a moderately hot oven, hasting it frequently with milk and dripping. When it has almost finished cookilig take off the bacon and preased paper. dredge the back with llour, and continuc roasting. Untruss the hare when done, and serve it with the gravy thickened with Hour and flavoured with port wine and red currant jelly. Red currant jelly may also be served separately, and bacon rolls used as a garnish.
Hare Forcemeat. This is made by part boiling the liver, heart, and kidneys of a hare, and then adding an equal quantity of grated breadcrumbs, twice as much fat bacon. chopped finely, and a picce of butter a bout the size of a walnut. Mix these well, scason them with salt, pepper, nutmeg, a tablespoonful each of chopped thyme and parsley, and a little grated lemon rind, and bind the whole with a well-benten egg.

Hare Pie. To make this pie, soak a hare in warm water for 15 min ., then wipe it dry, cut it into joints, and season it with salt and pepper. Fry these until they are golden brown on both sides, reserving the head and any other inferior parts for the making of jugged hare, etc. Line the edge of a pie-dish with short-crust pastry, and arrange in it the joints of hare, the minced liver, a sliced onion, a teaspoonful each of chopped paraley and hyme, and seasoning to taste. Lay on these four rashers of bacon and pour over all $\frac{1}{2}$ pint of gravy to which $\frac{1}{2}$ glass of claret or prort wine has been added. Cover with some more short crust, and bake the pie in a moderately hot oven until the crust is brown. Then reduce the heat and continue cooking. In all, tho pie requires about $1 \frac{1}{2}$ hours. It is sufficient for about six persons.
Hare Soup. Half a roast hare may be used in tho preparation of soup. Cut the meat into small joints and slice 3 or 4 onions, 2 carrota, and a little celery, putting these into a pan with a bunch of mixed herbs, a bay leaf, "2 or 3 rashers of fat bacon, $\frac{1}{2}$ gallon of stock, and seasoning to taste. Boil the soulp for 3 hours before adding a tablespoonful of red currant jelly, and then put it through a fine sieve. Re-boil it, adding more stock if necessary, and pour in a tablespoonful of Worcester sauce or sance and ketchup mixed. Add also a few forcemeat balls and a glass of claret or port wine. Serve with fricd croûtons. See Game; Pastry.
Hare Fur. This fur, though not hard wearing, has soft, long fine hair and formas a favourte trimming for evening wraps. Generally it is dyed to imitate the more costly kinds of fur. The pure white variety is imported from Russia and Siberia Hare fur
may be c.eaned according to the directions givell in the article on furs See Fur.

HAREBELL. The common name of Campanula rotundifolia, a perennial herl of the order Campanulaceac. It is a charming wild plant with blue, bell-shaped fowers. It grows 10-12 inches high and is suitable for planting in the rockery

HARELIP. Children are sometimes born with this deformity, which consists of one or two splits or fissures in the upper lip. In about half the cases there is a cleft palate, a fissure in the roof of the mouth. Generally a child with harelip has a broad, flat nose.

A child should never be allowed to grow up with this disfiguring affection. The surgeon will advise an operation, and the best time to perform it should be left to his decision. In the case of strong, healthy children the operation is usually performed at the nge of six or eight wecks, but if the infant is delicate it may bic deferred a little longer. After six months, teething interferes with the success of the operation

HARE'S EAR. The popular name of bupleurum The chief kind of garden value is Bupleurum fruticosum, a shrub from Spain, 3-5 feet high, which bears umbels of yellow flowers in late summer. It should be grown against a wall except in mild districts. Propagation is by cuttinga in a frame in August.

HARE'S FOOT FERN. The best known hare's-foot fern is Davallia canariensis, whosc long creeping roots or rhizomes grip the sides of the pot or pan in which the fern is grown, and resemble or suggest the foot of a hare. I). bullata is sumetimes oalled the squirrel's foot fern. These ferns should be grown in pots or pans containing a mixture of peat, sand, and sphagnunı moss, in a warm greenhousc. A Japanesc variety of the hare's foot fern consists of roota, or rhizomes, of D. Mariesi, fashioned into the shape of monkeys, birds, crosses, coconuts, and other deaigns The planta arrive in Great Britain in the wintertime, when they are brown and dormant; in early apring, if they are hung up in a warm greenhouse and liberally watered with tepid water, they are apeedily covered with masses of delicate, vivid green fronds. See Ferncry.
HARE'S TAIL GRASS. This is the common name for lagurus, a hardy annual flowering grass, growing about a foot high. It grows in ordinary soil in a sunny border, and is useful for mixing with cut flowers. Seed miny be sown outdoors in March or April

HARICOT BEAN : In Cookery. Certain sorts of French and kidney beans which liave white pods and secds are known as haricot beans. They need no special culture, but, instead of being consumed when fresh, are usually dried and stored for future use, as they are highly nutritious, and are much used in cookery, either ns a vegetable or for soups and curries. They require to be soaked for ahout 24 hours before being cooked.
To prepare haricot beans as a vegetable, after being sonked they are put into a pan of cold salted water, brought rapidly to the boil with the lid on the pan, and then allowed to simmer alowly until they are tender. Strain them and return them to the saucepan to
dry, placing the latte at the side of the firc Add a small lump of butter or margarine and seasoning to taste; shake the whole over the fire for a minute or two, and then serse the beans in a bot vegetable dish, with a little fincly chopped parsley sprinkled over them

Haricot beans make an excellent addition to stews and other made dishes, for they serve both to thicken and to Havour. They also make an appetizing dish when curried and form the basis of vegetarian cutlets or rissoles.

Bacon and Haricots. Stewed with bacon, Stewed with bacon, haricot beans make an excellent dish. Soak Haricot mutton cooked in a hay box is and hoil a pint of beans as already directed, prepared in the same way except that aimmerand, while they are draining, cut $\frac{1}{2} 10$. of bacon ing continues for 10 min . only, instead of 2 into dice. Over the Intter pour some boiling Lours. The whole is then boiled quickly for water, let them stand for 2 or 3 min ., and then 2 min ., with the lid on the pan, placed in the drain them also. Put the bacon into a pan and hay box and left there for $2 \frac{1}{2}$ houra. See shake it over the fire until it is slightly brouned; Hay Box; Mutton.
then add to it $\frac{1}{2}$ pint of good brown gravy, previously thickened with a little flour, and a large, finely minced onion. Add seasoning to taste, and let the stew simmer for about 20 min . hefore putting in the beans. Continue simmering for another 20 min . or so , and then serve the stew hot. See Butter Beans; Parsley Sauce; Tomato Sauce.

## HARICOT MUTTON. This dish is

 generally prepared with a neck of mutton which has the breast attached, but the acrag is not used. If the dish is designed for an entre, only the cutlets are to be used.To prepare the haricot, cut about 3 lb . neck of mutton into neat pieces, removing all superfluous fat. Fry the meat till it is a nice brown colour, using a little good dripping to start it. A briak heat will be required. Re. move the meat and lay it in a stewpan, then pour off most of the fat and sprinkle over the hot pan about 2 tablespoonfuls of llour. Stir this over the fire until the Hour is well coloured and cooked, but do not let it burn. Moisten the whole by degrees with a quart of wellflavoured stock or water and keep atirring until the liquor boils. Pour the gravy thus prepared over the meat and set the atewpan on the fire, then add $\frac{1 b}{}$. carrots and turnipa, previously washed, peeled and cut into dice

$\underset{\text { Rare's Tail Grass. Ornamental }}{\text { Rrass bearing soit furry beads }}$
or neat slinpes, also 2 moderatesized onions and a bouquet garni. Searon well and let the whole simmer for about two hours.

Before dishing, skin off the fat, remove the bouquet, and place meat and vegetables neatly. If the liquor is too thin, dish the meat and boil thegravyquick. ly to reduce it. Haricot beans, ronked nind blanched. are sometimes added to this stew.

HARMONICS: In Wireless. These arc frequencies which are multiples of another frequency, called the fundamental. Thus frequencics of two, three and four times the fundamental frequency are known as tho second, third and fourth harmonics respectively See Frequency.

HARNESS : Its Care. A set of single harness, i.e. harness for one horse, comprises a bridle with blinkers; a collar, with hamea and traces nttached; n saddle, with turret ringe, back strap; crupper and breeching. The breeching is unnecessary, excepting in billy districts, though it always forms part of a set of harness, together with the reins. Its usc is to prevent the hind-quarters coming in contact with the vehicle. It is better to have a breeching atrap attached to the back part. of the ahafts, as this gives the animal more freedom of movement, and annoys it less. Moreover it only comes into operation when it is neciled.

The bridle is composed of a throat-strap, a brow band, cheek straps, and a bit, either single or double ringed, called a snaffle, or bit and chain. All the bridle straps bave keepers, so that they can be adjusted to fit properly. The proper adjustment of the bit and the curb requires to be carefully attended to. Many horses have had their mouths and manners permanently ruined through faulty bitting; the so-called hard mouth niay be produced in this manner. The curb chain ought to be so fixed as to allow it to lie looscly in the curb groove beneath the lower jnw.
The collar necessarily forms an important part of the harness, and unless it fits pmperly, its movement is very liable to bruise and chafe the skin, resulting in the production of the collar gall, just as a badly fitting suddle produces saddle gall. Leather-lined collars nre preferable to those lined with cloth; the carthorse's collar, lined with felt, is often used, but cannot be recommended. When a horse comes in from work the hames should he removed from the collar, and the latter allowed to remain in position for half an hour until the skin beneath the collar has had time to cool. Neglect of this precaution favours sore shoulders, owing to the sudden cooling of the skin. The same remarks apply cqually to the saddle.

The driving saddle is, prefernbly, lined with leather, and it ought to combine lightness with
strength. In addition to the turrets for the occasion arises. The thorough understanding reins to pass through, the stout shaft band forms part of it, and so does the belly band. In fitting on the suldle the belly band must not bo adjusted too tightly, whilst the shaft band is adjusted so as to sllow the points of the shafts to lie in a straight line just below the level of the points of the shoulders, nnd not tilterl. In the latter case the power of draught is greatly diminished and the appearance of the equipage unsightly. Sometimes a breastband is used in place of a collar, especially for trotting purposes. For n pair of horses double sets are sold.

Neither harness nor sarldlery should be kept in the stable, as the odour from the latter rots the leather. To clean harness, remove the mud by sponging, and as soon as the harness is dry rub it over with either black or brown harness paste, and then polish. Damp leather will not polish, themfore the harness must be thoroughly dry. Soft soap should not be employed as a substitute for paste, as it rots the leather. Take purticular care to have the lining of the collar and saddle clean and dry. Unfasten all buckles and keepers to facilitate cleansing of both. Every horsekeeper should insist that leathers and bright parts are kept polished and burnished with regularity, and repairel immediately if damagerd. See Horse.

HARP: How to Play. The harp has 47 strings. All but the 11 longest are of gut, each C being generally coloured red, and each $\mathbf{F}$ blue; the others are of steel wire wound over. The compass is from

and every note stands in the major scale of C flat.

The harp is now as it always has been, an easentially diatonic instrument, and the difficulty of making it available for use in keys other than that in which it atood was partially overcome by the invention of the single action, in which by means of seven pedals it became feasible to raise the pitch of the strings by a somitone Erard's invention of the double action, however. made $a$ tone us well as a semitone possible, so that notes of any pitch becane available.

The mechanian by which these modifications of pitch are effected is contained in different parts of the instrument. That part which stands upon the floor is the pelestal, or pedal box, which holds the pedals Rising from this, but in divergent directions, are the vertioal pillar in front, and the inclined soundbox at the back. These are united at the top by the curved neck.

Each of the pedals acts upon all strings having the same alphabetical name; consequently there are seven of them, $B, C$, and $D$ to the player's left, and E, F, G, and A to his right, the orler boing away from him. In the frame of the pedal box are two notches for each pedal When a pedal is fixed in its first notch, the pitch is raised by a semitone ; when in the second, by $n$ whole tone. A spring enables the pedial to return to its static position.

It will readily be seen that as each atring can thus supply the flat, natural, and sharp pitches of its alphabetical name, the key of seven flats was the obvious one to be selected. The mechanism by which the strings are shortened is placed within a portion of the neck called the comb, the connexion between it and the pedals consisting of metal mds concealed within the pillar. The tuning pegs are fixed in the neck, and it is very important to bear in mind that as the harp requires constant tuning, the performer needs always to have a tuning hammer handy for use when
of the pedals is of primary importance, as the harp can not only be set thereby in any key. but also so as to make it possible to play certain chords scale-wise or even glissando. Within the limits of space available, the possibilities cannot be fully set out here. Onr or two simple.examples must suffice.

Remembering that the fundamental key is C llat, it is evident that in onder to play in the kcy of C it is merely necessary to depress all the perlala to their first notches. To get the key of D flat or C sharp, it would be possible to fix them in their second notches, but it would be preferable to fix only the $\mathcal{F}$ and $C$ pedals in their first notches. Accidentals and modulations, if not too abrupt, can also be effected by means of the perals.

The tone of the harp is full and rich through. out the greater part of the middle compass, but the extremely high notes, owing to the shortness of the atrings, are dry and brittle in character. The Hat keys havo a more re sonant tone than the aharp leys, the reason being that in them the strings are more npen
Changes of tone
colour can be got in different ways. By damping the string with either the hand or the fingers Res soon as it has been plucked, a somewhat dry. sounding pizzicato, like that of the violin, is produced By plucking the

hollow sound-box agninst his right shoulder, the instrument being tilted back to allow of this. The little fingers are not used in playing, but, owing to the closencss of the strings, a greater range of notes lies under the hand than with the pianoforte. Instead of an octave, a tenth may be regarded as the normal stretch. The perlals required to be set are indicated by their names heing given in brackets. For example, to set the harp) in D flat the indication would be
 ataves, as in piano forte music, are re quired for the notation, the F and G clefts being used.

Almost invariably chords are slightly spread; when that effect is not desired, the French word sec (dry) is used. The playing in suc. cession of two constituent notes of a chord is so characteristic of the harp, that it gives rise to the term but to chorde
The old single action harp in $E$ flat was at one time extremely popular as an in. strumont for ladies but the double action harp, which specdily rendered. it a predecessor obsolete, was never such a favourite
fingering was con cerned, however, it was certainly not more
difficult. It is rare now to meet with it in the drawing room, though it is atill an indispens able meniher of the orchostra. To those whn can afford its purchase as well as the time necessary to nvercome its diflicultios, the harp offers undeniable attractions, if only by way of change from the piano and the violin.

HARPSICHORD. The harpaichord was never atandardised Some had two keyboards, and stops whereby differences of quality were obtainable The harpsichord differs radically from the piano in almost every wry. The strings are plucked by quills attached to the jacks which rise from below the wires when the keys are depressed, and the action also is entirely different, so that the performer must employ a distinct kind of touch, firm but light.
The instrument has but $a$ very limited dynamic variety of tone, this deficiency being partially compensated for by the second keyboard and stops sponken of ahove, the effect of which on any individual instrument must

Harpgichord. English 17th century ingtrument in walnat case. It has cut and engraved brass hinges, two keyboarda kiving a range of five octaves, and lour dram stops. It originally atood in the chapel ol Ightham Moat, Kent $B_{\nu}$ permission of the Director, Vietoria \& Albert Museum

robust character are still inanufacluicd for those who indulge in the cult ol old world music played on the kind of instrument for which it was originally composed

HARRIS TWEED. This cloth is detined by the Harris Tweed Association as tweed hand spun, hand woven, dyed and finished hy hand in the islands of Lewis, Harris, Barra. and their several purtenances. and all known as the Outer Hebricles.

In working the wool before spinning it the crofters apply an oil, the effects of which are ton penetrating to be entircly removed by any subsequent process: the oil retains the characteristic odour of peat smoke. The tweed is woven mostly with a diagonal twill, which gives it a bulky appearance. Similar cloth, know"n as kelt, has long been made in the Hebrides from wool dyed with vegetable colours obtained from plants and blended into heather moorland tints.

Harris tweeds ure made in rather soft. handling wool not very fine spun or hard twisted and from single-ply yarn. They are about 28 in . wide, and 7 yd . are needed for a man's suit. Being hand-made and finished, they vary from piece to piece of what is nominally the same pattern, and some are heavier and more densely compacted than others A favourite pattern is the cassimere :will.
The pattern most to be recommended for wear is the herring-bone, or chevron formed by short zig-zag opposed twills.
Harris tweed is especially suitable for shooting, fishing, and golf suits. It makes good overcoats and cajes, because it sheds water better than tweeds of some other kinds
HARSLET. An alternative name for pig's fry, the word harslet is also used to describe a country dish prepared from the whole fry or a mixture of fry and pork. To make the latter, wash the liver and blanch the siwectbreads and pound $\% \mathrm{lb}$. pork to make it tander. Season all highly and flavour with a small chopped onion and $B$ sage leaves, chopped if fresh, and rubbed through a sieve if dricd. The liver and sweetbreads may be cut into slices or minced finely or left whole.

Mix these ingredients together with 3 oz . tinely chopped suct, place them in a cleansed bladder and sew up the end securely. The harslet may be either boiled or roasted, but if roasted it should be well basted and served with a rich brown sauce. The cooking must be gentle and will take from an hour to an hour and a half. When the whole of the fry is used, omit the rork, and use 4 oz suet. See Fry.
HART'S TONGUE FERN. There are many pleasing forms of this hardy fern, Scolopendrium vulgare, which will thrive in ordinary soil and prefers a damp shady position. If grown in pots they are useful for the cold gicenhouse and window. Ainong the best named varieties are crispum, cristatum, an.l laceratum. See Fernery.

Hart's Tongue Fern. Hardy fern with undivided
fronds, grown as a pot plant for house decoration

HARVEST BUG. The minute reddish. hinged the clasp, bent to shape from stout coloured beetle known as the liarvest bug is iron wire. Sitronger patterns are made like a often present in immense numbers in fichls butt hinge from stout wrought iron plate. and gardcns, especially in chalky districts. It Those of ornamental shape are more appromostly attacks the lega, childien lwing the priate for the door of a garage or for any greatest sufferers. Red pimples or wheals like those of nettlerash aprpear on the skin, and there is intense itching. As a preventire, cucalyptus ointment rubbed on the legs and fect some. tines is successful. When the insects succeed in attaching themselves, the rubbing in of weak sulphur ointment will destroy them. On the following morning after applying the sulphur ointment a hot bath with plenty of soap should be taken. The itching and irritation may be relieved

Harveat Bug. Minute beetle, sue bites is here highly magnjifed
by smearing with carbolic
HASH: How to Prepare. Bef hash is prepared by melting 1 oz good dripping in a stewpan, stirring in $\frac{1}{2}$ oz flour and frying it till brown. Add $\frac{1}{2}$ pint gravy or stock, and stir it over the fire until it boils: then put in a tablespoonful of Worcester sauce, a teaspoonful of made mustard, and, if liked, $\frac{1}{1}$ wineglassful port wine. Season well with salt and pepper. Cut $\frac{1}{2} \mathrm{lb}$. cqoked beef into neat slices, put them in the sauce and heat the hash very gently, without letting it approach boiling point. Serve in a hot dish, garnished with sippets of toast and small heaps of red currant or rowan jelly

To make mutton hash, cut 1 lb . cold mutton into neat slices, putting the bones and trimmings in a saucepan with pint water to make stock. Let them cook steadily over a moderate fire, and in the meantime wash and prepare 2 or more carrots and potatoes, sconping them into neat balls with a round vegetable cutter. Boil these until tender in salted water, then peel and slice an onion and a carrot, and fry them in a saucepan containing 2 oz . butter. Sprinkle in 1 oz . Hour, fry that also, and then add t teaspoonful vinegar, stirring all over the fire for 2 or 3 min . Strain in the stock and continuc stirring until it boils. Season the whole carefully, adding a tablespoonful of ketchup: then pour it over the inutton previously placed in a casserole. Put in also the potato and carrot balls, place the casserole in the oven and let the neat heat through very gently. Serve in the casserole. Cold veal or pork may be hashed in much the same way with the addlition of a bunch of herbs instead of the ketchup or sauce.

A rabbit makes a good hash when enriched with red-currant jelly and port wine. Cut the flesh from the bones, and season to tastc. Put the bones into a saucepan with a pint of water or stock, a slice of ham, a bunch of herbs, an onion, and a little seasoning, and let them simmer for about 1 hour before straining.
Melt a luinp of butter about half the size of an egg in a saucepan over the fire, add a heaped tablespoonful of Hour, and mix the I wo smoothly. Pour in the stock, stir the whole until it boils, and then put in the pieces of rabbit and cook it very slowly for $10-20 \mathrm{~min}$. Nmall forcemeat balls added shortly before it has finished cooking make a good garnish. The port wine and jelly, a wineglassful and a tablespoonful cach respertively, can be added before serving. See Casserole ; Stcw.

HASP : How to Fit. The hasp is a hinged fitting passed over a staple and secured by means of a padlock or other fastening. The usual pattern, as fitted to doors of out buildings, comprises a shect of metal plate, to which is
prominent position.
For security the hasp and staple should always be fastened from the inside of the cloor by passing a bolt through from the front, and securing it by a nut at the back of the door. A metal plate or washer is interposed between the nut and the surface of the door. To a void rusting, the joint should be well oiled when fitted, and lubricated from time to time. See Door.
HASSOCE. Froma remnant of carpet or felt a hassock or round or oblong footstool can be made at home and stuffed with shavings, the bottom being covered with coarse canvas. A small, semicircular tab of the felt or carpet, lined inconspicuously with a strong material, should be attached to either side to allow of the stool being easily handled. In certain districts of the north of England a hassock is known by the namo of buffet.

HASTX PUDDING. To prepare the cheaper variety, boil a pint of milk, salted to taste, in a pan over the firc. Immediately it boils sprinkle in gradually enough four to makc a stiff batter, stirring and beating all the time. Let it boil for a few minutes so that the Hour may cook; then put it into a dish with a few lumps of butter, a little grated nut.meg, and, if liked, some sugar. Golden syrup, jam, or any other kind of preserve may accompany this pudding. If a richer pudding is desired, two or three eggs should be added after the flour and milk have been mixed. The batter must be allowed to cool a little first, and must not be brought to the boil again, otherwise the eggs will be certain to curdle.

EAT : Choosing and Wearing. Although the best French designs for women's hats are acknowledged perfection in style, many English women cannot wear them without adaptation. Such modcls arc, thercfore, bought by inilliners in advance of cach season and copied in their workrooms; the original models are frequently obtained at sales for less than the prices charged for the adaptations and are, therefore, bargains for those who are lucky enough to be able to wear them. Expert nilliners are, however, employed in the workrooms to design and adapt models in order to give individuality to their productions, which are of the best inaterials and high-grade workmanship.
Straws and Felts. Straw hats are mainly manufactured at Luton in Bedfordshire. The kind of plait used depends on fashion, and much millinery straw is imported either ready dyed or natural. Crinoline or tagel plaits are classed as straws, though the former is usually mado of artificial silk and the latter of hemp. Pedal straw is largely manufactured in Italy. From Italy also are imported large quantities of straw hoods. A hood is the material of a hat, cither straw or felt, formed into an unstiffened, roughly shaped piece, ready for making into the required style. This piece may be woren as in Panama fabric and its imitations, or made of straw plait machined into shape, of felt, or of velours.

Felt hats are made from the fur of rabbits, hares or beavers in the better qualities. Cheap grades are of wool, sometimes finished with a fur veneer. liur felts are lighter and more pliable than wool felts; also, they retain their gioss owing to the bright hairs of the fur fabric. Although there are brushed wool
felts they cannot be said to initate velours successfully. Real velours is an expensive material, composed chiefly of hare's fur with sometimes a slight nixture of rabbit's fur. Many velours hats are imported, both finished and in the form of hoods, from CzechoSlovakia, Austria, Germany and Italy.

Hats for Men. The hats chiefly worn by men and boys are silks, stiff and soft felts, and straws.
The silk hat has a cylindrical crown made from several layers of muslin stiffened with shellac, covered with a silk plush, and sewn so neatly that the seam is invisible. From time to time hat manufacturers make slight alterations in the height and shape of the crown, or size and curl of the brim, so that a wearer should ascertain if his silk hat is of the style in vogue.
The most popular hats are the soft felts and velours, although the stiff black felt or bowler enjoys a very big sale. The cheapest varieties are those made from wool; they lack the finish and wearing capabilities of the fur hats, and are harsher to the touch. Quiet tones of grey, brown and fawn are generally fashionable in soft felts, which can be bought with wide or narrow brims, flat set or curled, bound or unbound.
Velour hats originally were made only from hare's fur. For a cheaper hat rabbit's fur is used extensively, but it is distinctly inferior, and anyone can detect the difference between velours made respectively from hare's and rabbit's fur by the feel. It is not possible to obtain the pile of the real velour made from hare's fur if inferior material is used. The velours is made on the same principle as the soft felt, the pile being obtained by repeated brushings during the stage of manufacture known as planking. Straw boaters are made with a saw or cable edge to the brim, and usually finished with a broad black ribbon.

Practically all hats have a sweat band of leather or other suitable material sewn into the crown, and this is the only part of the hat actually coming in contact with the head. This band should allow perfect adjustment to the head and at the same time permit ventilation.
When buying a stiff felt or silk hat obtain it from an establishment where care is taken in fitting. With a soft felt or velours fitting is a much simpler matter, but it is well to remember that all felt hats stretch slightly in wear. Hats of all kinds should be frequently brushed, and if possible kept in hat-boxes when not in wear. As a matter of economy it pays to buy a good quality hat, be it velours or soft felt, as it will stand the renovating process, whereas a low quality hat scarcely pays for the trouble. Most natters undertake the pressing of silk hats and the renovation and re-blocking of others, whether of felt or straw.
The sizes of hats are calculated by their circumference, measured just inside the crown, divided by $3!$. A ready way of reckoning is to add the length to the breadth, and divide by two. Thus, a hat measuring 8 in . by 6 in . is size 7. The sizes run in eighths, and the usual range of sizes for men is $6 \frac{1}{2}$ to $7 \frac{1}{6}$, the middle sizes predominating.

Hats for Children. Children's hats, except for their size, are almost identical with those worn by adults. Caps in the winter and straw hats or basin-shaped felts with pliable brims in summer are worn by boys, while for girls, berets may be of knitted or crocheted wool, and hats of felt, straw or velvet. Trimmings should always be simple.

Hat Bands. On men's hats black bands are noost usually worn. In the case of grey and other light-coloured velours or felts a band of the same colour is sometimes worn, but here, too, many persons prefer black.

Black loauds are ulso often seen on Panama hats and on straw ones. Many men, however, like to have on a straw hat a band of club or association colours.

With school children, of both sexes, hatbands striped with the school colours and completed by a badge in front are worn. Hat bands can be bought separately from most hatters.

Hat Box. Hat boxes arc of two kinds : the large square or oval boxes of stout cardboard in which hats are sent home from hatters and milliners, and the strong fibre or leather ones with handles in which they are carried in travelling.

A travelling hat box, if of fibro, has the merit of lightness over a leather one ; but it should be finished with leather corners for greater durability. For women more popular are the round hat bags made of American cloth, with soft lids, and straps which make them easily carried on the arm.

Hat Brush. Silk, felt, cloth, or real velours hats all require the regular use of a brush. A good hat brush, like the clothes brush, is everlasting, being similar in make and quality. but the shape is narrow, and curved to meet the requirement of rounded brims.

To brush silk hats, a soft mixture of bristle and horsehair will not disturb the even surface of the silk, which should then be finished with a plush pad. For all other hata, including ladies' hats, a pure bristle brush is the best, soft substitutes being less durable, and coarse adulteration like fibre may depreciate the quality of the hat. Both single and double brushes are made, the former having wellfinished backs of polished satin-wood, walnut, mahogany, etc. See Brush: Clothes Brush ; Headlining

BATCB. In one sense a hatch refers to a small gate or door, and especially to the lower part of a divided door. Hatches are put in houses, inserted in the dividing wall between the kitchen and the dining room, in order to facilitate the service of meals. See Dining Room: Service Hatch.

BATCRET : Varieties and Use. The hatchet is a small, short-handled axe, adapted to be used with one hand. Several varieties are obtainable, each comprising a steel head. or blade and a wooden handle or helve. For household use the Canadian or hunter's hatchet is handy for splitting firewood ; the carpenter's or Kent hatchet, slightly different in shape, is used for heavier timber. The shingling hatchet, with its broad cutting edge and short steel poll or hammer head, is useful for cutting timber for rustic work, one part of the head being employed for cutting, and the other for drivine nails. Apart from the preparation of

Eatchet. Showing how the tool is held when in use
not be damaged. The method of use is shown in the illustration.
The edge should be kept sharp and free from notches. This may be accomplished by grinding the blade on a grindstone and whetting with a whetstone, using this with a circular rubbing motion. The cutting edge is variously formed according to its purpose. Ordinary varieties are ground uniformly on each side of the face, and the cutting edge becomes central, but on the Kent squaring hatchet the grinding is restricted to one face, bringing the cutting edge to one side of the head, and is thus like the chisel. By this means work can be cut more square than would otherwise be practicable. See Adze: Chopper.

HATTER'S PLUSE. Specially made for hat coverings, hatter's plush is a light silk fabric with a laid, glossy pile which can be smoothed down by brushing in one direction. The support of a firm foundation is required to show off the principal feature of the material, which is made principally in black; brown and other colours are obtainable for millinery. Hats made of this plush need frequent brushing.

Haunch. The haunch of an animal is the fleshy part of the hip and buttock See Beef: Mutton; Venison.
havana rabBit. The Havana rabbit excels as a flesh producer, weighing, when fully grown. from $5 \frac{1}{2}$ to 7 lb ., and its ineat is

Havana Rabbit. Prize specimen ol a rabbit Largely bred for its beantiful fine brown far
of first-class quality. It is also bred largely for its fur, which is of a deep rich chocolate colour with a purple sheen. It is very hardy and does well cither indoors or in outside hutches. See Fur: Rabbit.
HAWK: For Plastering. The plasterer's hawk is a species of board with a handle projecting vertically downwards from the centre. It is held in the left hand, to support the plaster or mortar when carrying it from the inortar board. The diagrams show its parts, and give the necessary dimensions and details of construction. Although deal is generally used for this tool, a closegrained wood such as birch or beech is preferable, as neither is so liable to warp. Moreover, harclwood will stand rough usage much better than softwood such as deal.

The board picce, Fig. I, may be made from 9 in . by I in wood, and should be planed up, on both surfaces, and on all the edges. A tapered groove, with a $V$ :shaped undercut, is cut across the centre of the underside of the board, this being done with a tenon salw, by cutting the sides or shoulders and then chiselling out the surplus material. Into this groove is fitted a piece of 1 in . hardwood, planed and bevelled, so that it fits firm in the groove. This can be fitted by the aid of a plane, end to ensure proper contact the sides of the groove may be rubbed with blacklead or

Hawk. The correot way to hold and to use a plasterer's hawk
chalk, the wedge piece inserted, and on its remuval the high parts will be in dicated by the black. lead.

A perfect fithaving been obtain ed aty in. dinmeter hole is drilled into the centre of the wedge piece, Fig. 2, the hole slightly tapered, and a wooden handle, Fig. 3, prepared to the shape shown in the illustration. It is tapered at the end, slotted to take a hardwood wedge, and the whole glued and wedged into the hole in the tapered piece, any surplus that projects upon its surface being removed with a chisel or plane

The use of the hawk will be ap. parent from the illustration. The board slinuld always be kept clean and free from hard lumpe of plaster or mortar. These are scraped off with a trowel every time the supply of material is replenished, and at the end of the job the wcdge piece is knocked out of its place and the buard washed clean, the wedge replaced, and the hawk stood aside until it is again required. See Plaster; Trowel.

HAWEER. Enylish law does not distinguish very clcarly between a hawker and a pedlar, although one Act of Parliament defines a hawker as a man who goes about with a vehicle in which to carry the wares he has to sell, and a pedlar as one who goes on foot. In practice, however, there is no difference between the two.

A hawker, therefore, may be defined as one who trades by going from house to house, having with him, either on his person or in a vehicle, the grods he wishes to sell. He may be, too, one who seeks to secure orders for the ssle of goods to be delivered immediately, or who offers for sale his skill in any handicraft ; for instance, repairing chairs or grinding scissors.

Under an Act of 1871 a hawker or pedlar must take out a licence before he can carry on his trade. These licences can be obtained from the police authorities at a charge of 5s. each. The licence only lasts for a year, and must be renewed at the end of that time. An applicant for a hawker's licence must be at least 17 years old, and must have resided for at least a month in the district where he makes his application. He must be of good character, and must show that he really intends to tradc as a hawker. If he goes about with a cart or truck the words 'licensed hawker' nust be visibly and legibly inscribed upon it.

A hawker must show his certificate to any person on whose premises he happens to be, or to anyone to whom he offers his wares, if requested to do so. The police have also the right to examine the goorls he is offering for sale. If a hawker acts contrary to the
provisions of the law concerning hawking he may be punished by a fine or by the withdrawal of his licence. The latter penalty usually takes effect if a hawker is convicted of begging.
Dealers in certain commodities can sell their wares from dorr to door without a licence, and so in the eyos of the law are neither hawkers nor pedlars. Such wares inclucle fish, fruit, vegetables, and other victuals which, by their nature, are perishable. Coal can also be sold without a licence, while commercial travellers, canvassers, and others who seek orders for cluthing, books, etc., are also free. Hawkers, therefore, are chiefly confined to men who sell notepaper, matches buttons, boutlaces, needles, cotton, cheap jewelry, and other articles of that kind. Gipsies form a large proportion of the hawker class, offering for sale baskets and other articles of wicker, as well as lace curtains and rarious household requisites.

Many hawkers, especially in the ponrer neighbourhoods, do useful service by catering for legitimate wants, conferring a benefit on the busy housewife by bringing to her door the articles she needs. Others, however, are little more than beggars in disguise. They will offer some worth. less article for sale and when the goods are declined will beg for old clothes or a copper.
Housewives should firmly decline to buy frum hawkers goods they do not need and on no account should allow themselves to be intimidated. If a hawker refuses to gu away when told his wares are not wanted the police should be informed. See Hire Purchase System.

BAWE MOTR. This is the name of a group of twilight-flying moths, so called because their method of flight is similar to that of the hawk. They cannot be regarded as pests of serious importance in the garden. although one of their number, the death's head hawk moth, is sometimes the cause of damage on the potato plot. This member is not oflen seen, but may be identified by its large size, black and yellow hind wings, blackish brown marked fore wings, and the curious semblance of a skull upon its thorax. Its caterpillars appear from midsummer to autumn, measure about 5 in . in length, and have fat yellow bodies with violet stripes No special remedy is necessary beyond destroying the larvas and pupae if they are found when lifting crope

RAWEWEED. A hardy perennial of the daisy order, the hawkweed (hieracium) is not particular as to soil, but prefersasunny position on banks or ruckeries. The best is aurantiacuin, 12 in. high, with orange coloured Howers, easily grown from seeds.
RAWTHORN. A group of harly ornamental trees of which the commonest is Crataegus oxyacantha (hawthorn, whitethorn or "may"). There are many varieties of this
species, some with double, others with single Howers which are beautiful in May. The variety praecox is the Glastonbury thorn. The whitethorn or quick forms an excellent hedge Some of the hawthorns introduced from other countries are splendid garden trees, valued for their flowers in May and their ornamental fruits in autumn. Two of the best are the scarlet haw, coccinea, and the cockspur thorn (crus-galli). The firethorn (Crataegus pyracantha) is deecribed under its correct name.

## Pyracantha.

HAY. Apart from its use as food for cattle, hay is of value for other purposes, both in the house and the garden. In the poultry yard it is common as a nest lining for sitting hens, although its tendency to turn fusty perhaps reduces its value when compared with short, broken straw. Whichever may be used, either for nesting or as litter in house or run, it must not be allowed to get damp or dirty, and the poultry-keeper should scattor hay or straw loosely, so that grain may sink into it, and thus compel the birds to scratch about for food. Hay, especially clover hay, may also be used as a substitute for fresh areen food, being steamed for some hours until it swells to something resembling its uriginal state.

The keeper of small livestock should, without trespass, endeavour to secure free hay from lane and hedgerow, gathering clover, grass, and herbage, and exposing thens to sun and wind until dry and swect for use in winter. Cutting is best done when the majority of the grasses are in Hower, and should always be completed before seeds begin to ripen, otherwise the stems become tough and dry.

Hay also has its use in the garden, being handy as a mulching medium ; stuffed into a small flower-pot as a trap for earwigs, especially throse attacking dahlias; or as a substitute for manure in making mild hotbeds for plants such as vegetable marrows. In the latter case it must be very firmly trodden and damped before use. In the home, pillows stuffed with hay are esteemed as a soporific for insomnia, while hay boxes are used for cooking purposes.
HAY BOE: To Use and Make. In using the hay box, if it is intended to cook two dishes at the same time, the pans must be put in and taken out together, or two separate cushions made so that one pan can be removed without causing loss of heat to the other. Soups, stews, ןorridge, puddings, etc., may all be cooked by the hay box method. Suet puddings are best cooked in a basin with a screw-down lid, and put into the hay box in a pan of boiling water. For stews prepared in a hay box the meat must be perfectly fresh

All food must be actually boiling when put into the box, and most will require to be partly cooked in auddition. The pan must not be uncovered until it is to be removed, and its contents must be reheated before serving. The main advantage of a hay box is that it effects a great saving in fuel and gas, and needs no attention during the cooking process.

A rough and rearly hay box can be prepared at a cost of a shilling, or less. Procure a wood

Hawthorn. Plowaring apray of this fragrant wild tree which, under the name of whitethorn or quick, is used for bedge planting
box, say a sugar case, and line it with seven or eight thicknesses of newspaper to keep out all draughts. A useful size, which will allow of two divisions, is about 22 in . by 15 in ., and 15 in or 16 in . deep. A box for only one stew-pan will do at ahout 14 in . cuhe. The size depends on the cooking vessel used. At the bottom of the box there should be an allowance of 6 in. for hay, and a minimum of 3 in . of hay at each side. Above the pan it is necessary to allow 4 in for a cushion filled with hay.
About sixpennyworth of hay will fill the larger-sized box. This should he paoked as tightly as possible. Cushions to place above the stewing-pan can be made of linen. These are tightly stuffed with hay, and should be of n size to fit the divisions closely. Any ordinary saucepan can be used, hut as beginners find the handles in the way, it is better to commence with either aluminium pans with a small handle on either side (aluminiam holds the hest well), or enamel cans with a handle over the top. An ordinary brown stewing-jar will serve equally well. These jars can be hought for a few pence, are cleanly and can be placed over a low gas flame.
The stew-pan, with the food, is hrought to the boil over a gas-ring (or a fire) and is then placed in the box. It rests on the hay; hay is all around it, and the hay cushion is put above, being held down either with a weight or with the lid of the box. The water remains practically at boiling point for many hours, and in this way food may he cooked without requiring the usual constant attention. In many cascs it may be cooked over-night.

HAY FEVER. This is an acute inflamma. tion of the mucous membrane of the nose, eyes, and air passages. It usually appears in Gieat Britain between May and August and affects about twice as many men as women.

The cause of hay fever is the pollen of certain grasses and other plants, the pollen containing a poisonous principle. The pollen of rye is particularly rich in this poison. But pollen or any other irritant is capable of producing the affection only in certain susceptible subjects. In some people dandruff from horses or other animala, in others some particular food, and in others still the inhalation of a larger variety of substances, is the exciting cause.

The symptoms are much like those of a severe cold. There is violent sneczing, and a copious watery discharge from the nose and eyes. Itching of the palate and the back of the mouth hecomes troublesome, and therc is not infrequently a hard, dry cough, and perhaps anthmatic pasoxysms with wheezy breathing. The sense of smell may be lost, taste impaired, and hearing more or less affected. The patient suffers from depression and low spirits. There is usually loss of appetite, a feeling of lassitude, and often sleeplessness

When practicable, a person who suffers much from seasonal hay fever should go to live at the seaside or some mountain resort during the summer. As the specific irritant varies in each case, an effort must he made to find out which is responsible. The patient's own observations may be very helpful in such an investigntion. Where it is not possible to ascertain the cause, inoculation with pollen extracts or vaccines may be successful in preventing or mitigating the severity of the attacks.
The general health must be kept up. Locally a simple spray miny he used, such as weark boric acid solution, 3 gr . to the oz of water; a solution of 2 gr . bicarbonate of soda and 2 gr common salt in 1 oz . of water; a 1 per cent solution of protargol. Very often some defect within the nose favours the occurrence of hay fever. Sufferers should therefore be examined by a surgeon. See Asthma.

HAZARD : A Card Game. This is a game for four plnyers, two being partners against the other tivo. The pack consists of 25 cards, all the cards below the nine in an ordinary pack being thrown out, and the joker added for the 25th card. Playery cut for partners, the two lowest playing against the two highest, nces counting high in cutting. The player cutting the loweat card deals.

The joker is the best truinp, then the jack of the trump suit, then the jack of the samc colour, and then the ace, king, queen, ten, and nine. The cards of suits not of the saine colour as trumps rank ace, king, queen, jack, ten and nine.
Six cards are dealt each player, three at a time. The last card is placed by the dealer on the table face downward, and must not be looked at till the game is over. Eldest hand has first bid, and he names or hazards the number of the tricks he thinks he can make, without, however, naming any suit as trumps. Each player in turn either passes or bids higher, the highest bidder naming trumps and leading the first trick. Each trick counts one point, and for each trick he fails to make on his bid the player is set back a point. Ten points constitute game.

In the double-pack game, two, three, four or six players may take part. The pack consista of a double pack of ordinary cards from which all cards below the nine have been removed. The joker is not used in the double-pack game. If duplicate carda are played on a trick the first one played takes the trick. With two or three persons playing, each plays for himself, with four, two against two, and with six, three ngainst three. Four cards at a time are dealt. The lowest hid allowed is six tricks. If a hidder thinks be can win all tricks he may name the trumps and discard two of his own cards, asking his partner for his two best cards. The bidder then plays a lone hand.

If the game is four-handed his side scores 24 if he succecds, and is set back 12 points if he fails. In a six-handed game his side scores 26 for the win or is set back 8 points. Normally each trick counta 1 point, and 62 points constitute game.

HAZEL. The hazel is a native British tree that grows plentifully in the home counties. The timber, which is a reddish white in colour, soft and highly elastic, is not sufficiently durable for good cabinet making, but it is employed for crates, barrels, and fencing stakes. Charcoal is also made from it, and the water diviner uses a hazel twig.

Hazel Nut. The hazel nut is the fruit of the hardy shrub Corylus avellana, which flourishes in ordinary soil. The golden-leaved varicty, aurea, is ornamental. The purple-leaved varicty of another hazel, Corylus maxima, is also showy. Propagation is by setting the nuts in autumn out of doors or by layering in summer.

HE. This name is sometimes given to the popular children's gaine known also as touch, tag, or tick. See. Touch.

HEADACHE : Its Treatment. An occasional headache is due generally to some purely temporary cause such as overwork or stomach disorder, but if it is persistent medical advice should be sought, as more serious troubles may he involved. In children especially a headache requires attention. Women always suffer more

Hazel Nut. Fruit and leaves ol a decorative tree which can be trained to form a garden hedge
than men and very often do harm to them selves by the excessive use of drugs which produce temporary relief.
Eye strain, decayed teeth, adenoids, ear rouble and disense in the nose are all possible sources to be considered Headaches due to cye strain are common in children. The eyes should be examined by a reputable oculist. and suitable glasses provided. The commonest causes of the condition in women are constipation, neurasthenia, and anacmia In men, overwork, work done at high pressure, and particularly when distracted by noise or poisoned by bad air, excessive smoking and drinking, with its usual consequence, catarihal dyspepsin, are very common causes Heavy indigeatihle meals, drinking strong ten or coffee, wearing tight and heavy hats, sleepiun in ill-ventilated berlrooms, sleeping too long, using heavy impervious bedclothes. any kind of inental strain, may, any of them, give rise to troublesnme headaches.
Where disorders of the stomach are at the root of the trouble the pain is felt towards the front of the skill and equally on both sides. The pain of the anaemic headache is most severe on the top or at the hack of the head The congestive form in which the brain is overloaded with blood, is accomprnied usuilly by throbling in the head and it flushed face Alcohol and strong tea or coffee should be avoided. Aperients such as 5 grains of hlue pill inay be taken twice a week at bed-time, and the diet should he light and digestible. To relieve an attack, put the patient's feet and legs in a hot mustard bath, bathe the forehead with ice-cold water or put an ice-bag tos the head The safest remedy for a nervous headache is to rest in a darkencd room.

Certain drugs are much used, to the great injury of the patients. The doclor whould be asked to prescribe, as harm may resull from frequent resort to headuche powders.
HEADER: In Brickwork. The word healer is used to describe a hriok that is set horizontally with its greatest length at right angles to the face of the wall. The proper arrangement of hricks, and the relative placing of headers across the wall and bricks laid in the sance direction as that of the wall and called stretchers, is known as bond, or bonding A hender course is a row of bricks set at right angles to the face of the wall. See Bond: Bricklaying.

HEAD-LINING. Material shaped to fit the inside of a hat is called the head-lining. Such things are usually of silk and are quite simple to miske, hut a correct fit is important as they wear or tenr quickly if too tight, heaidea being uncomfortable on the head.

A strip of material, cut on the cross or straight as desired, measuring $23 \frac{1}{2}$ in. or 24 in. long and about $6 \frac{d}{d} \mathrm{in}$. wide, must be cut, and an oval-shaped picce, as shown in Fig. I, is necessary to line the top of the crown Place the oval piece into the crown, catching it through with long stitches to the outer part (Fig 2). Pin the straight piece round the inner edge of the hrim so that it fits exactly. Leave 1 in for turning at the ends. which must he joined up. Run a slot, $\frac{1}{2}$ in. wide, along the outer edge, leaving eyelet openings on each side of the join so that $a$ China ribhon may be threaded through; this enables the lining to he drawn up to fit the head. Should the hat he of a soft material the
head-lining may vcry easily be sewn in as shown in Fig. 2, leaving a gond 1 in margin in case the material shuild fray: but if the hat is straw, the needle should be pushed right through to the outer side, making very tiny stitches on the outside and long ones inside, which will not show when the lining is turned over them.

EESALTE: Its Essentials. Speaking broadly, health consists in all the organs and parts of the body performing their functions quite comfortably and with such vigour as to allow of our doing the day's work, including reasonable strain without undue fatiguc.

In addition to the sudden and great danger frum infectious disesses and footious diseases and physioal injuries, suffer no great health may be undermined by personal habits works his heart. which are hygienically wrong. Amongst the many things casential to bodily and mental welfare, there are three which aro ton frequently inadequate, viz. fresh air, exercise, and sleep.

Lack of exercise is usually associated with a lack of fresh air. and the results may be rickets in young children, anaemia, constipation, a sluggish digestion, and an inelasticity of mind and spirita, partly due to the bodily state and again reaoting upon it. Late hours, especially when too many of them are filled with feverish excitement, are also undermining factors, and as life becomes more strenuous a sufficiency of slecp becomes all the more necessary.
Much ill health is due to want of knowledge and judgement in the use of food. It is now recognized that vitamins play an essential part in nutrition and that the foods containing thesc, such as fresh milk. butter, meat fat, eggs and fresh vcgetables, cannot be neglecterl with impunity. Almost as important for our nutrition is the possession of sufficient teeth and propor habits of eating and drinking. The abuse of alcohol, tea, tobacco, and other drugs are dangers to be avoided.
It has been noted that most people who live an unusually long span of years have been characterized by cheerfulness of dis. position. See Breathing Excrciscs: Diet; Drill ; Exercise ; Insurance ; Ventilation ; etc.
HEARING. When anyone finds his sense of hearing becoming in the least defective, he should at once consult a doctor. There are some affections of the ear which can be cured when treated at an early stage, but which, if noglected. may result in onmplete loss of hearing The ear is one of the most delicate and complicated of our organa, and when affected in any way it is imprudent to practise self-treatment. See Deafness; Ear.

Hicart: Structure and Disease. The main organ of the circulatory system is the heart, which is divided into four chambers, the two upper ones being termed auricles and the two lower ones ventricles. The two great veins, through which passes all the blood returning from the body, open into the right auricle. From this chamber the blood flows into the right ventricle and passes along the pulmonary artery into the lungs. Having been recharged with oxygen in the lungs, the blood is carried into the left auricle, then to the left ventricle and, passing into the sorta, is then distributed to the body. The heart being s group of four pumps, each of which is emptied
in the same way as is a rubber bulb when it is squeezed, valves exist at the openings to maintain the flow in one direction. The sounds audible when the heart beats are made chiefly by the closing of these valver. The average number of bents per minute in an adult is 72 .
Diseases of the Heart. The great majority are valvular diseases, and these are of two main kinds, stenosis, or narrowing of the valve, which obstructs the blond flow, and incompotence through leaking of a valve. In the treatment of ralvular disease the main objects aro to lessen the work of the heart by remoring resistance and avoiding strain as far as possible, to strengthen the heart itself and to relieve distressing symptoms when they appear in the later stages. Valvular diseases may, for this purpose, be divided into two main classes, those in which compensation is maintained and those in which it is failing or has failed. In the former the patient will discomfort unless he over-

## A boy or girl suffering from valvular disease

 cannot safely join in violent games such as football. The clothing should be warm, the diet nutritious, and everything indigeatible should be strictly avoided. At schonl study should not be carried to the point of mental exhaustion, and excitement must be avoided. With adults similar precautions should be taken. Slight ailments such as colds, bronchitis. etc., must be taken more seriously than in people with healthy hearts. It is of great importance that the mouth be kept clean, carious teeth being removed, and pyorrhoes dealt with energetically: the same applies to sopsis anywhere.Functional or nervous disorders are very common, and are frequently referred to as D.A.H., or disordered action of the hcart. They are not duc to organic disease, but to some outside influence acting usually through the nerves. Thus excessive use of tobacco, tea. or other drugs, as well as hysteria, ncurasthenia and dyspopsia, may give rise to irregular heart action. The condition may follow acute disorders such as influenza, rheumatism. trench fever, malaria, etc. A septie mouth or sepsis elsewhere in the body may also cause the symptoms, or these may be due to ansemia The treatment of D.A.H. will vary to a large extent with the cause.

Angina pectoris is a disease due to morbid changos of the heart muscle, and is generally characterized by agonizing paroxysms under the breast-bone, accompanied by a feeling of suffocsation. No person who has suffered from angina should ever bo without the small glass phials of amyl nitrite (two to five minims each), which any chemist oan supply. At the first sign of an attack he should break one of these phials in his handkerchief and inhale the fumes. The doctor should bo summoned at once, and meanwhile a lot-water bottle may be placed over the heart and sips of hot water and brandy should be given. After an attack the greatest care must be taken to avoid physical and mental strain.

Like any other muscle, the heart may be weak without being actually diseased It then gives rise to distressing symptoms and often causes needless siarm. Tobacco smoking, drinking strong tea, and other habits may cause weakness of the heart, which is always curable by removing the cause. After an attack of inlluenza or any of the infectious fevers the heart may be weak for come time, but this passes away as the patient grows well
and strong. It sometimes occure that the hoart becomes weak in middle-aged people, solcly because they eat and drink ton much and do not take sufficient exercise.

BEART: In Cookery. The heart of $n$ bullock, calf or sheep makes a savoury dish if properly flavoured and masted. Two or three shocp's hearts are generally required. Wash them in soveral waters, warm for proference, removing any clots of blood remaining in the oavitios. Cut off the lobes, remove any cartilage or gristle and separate the cavilies iuside the heart. Then stuff it with a wellliavoured forcemeat, skewer or stitch up the opening, and tie greased paper over it.

Roast or bake the heart in a tin with plenty of dripping, and baste it well, but do not let it cook too quickly or the flesh will be hard. As soon as the stuffing is set remove the paper so that the surface of the heart may brown evenly, and turn it over in the tin from time to time. Serve it with brown gravy, to which should be added the sediment left in the tin after the fat has been poured off. Remove skewers or thread.

A bullock's heart takes from $2 \frac{1}{2}$ to 3 hours to roast, a sheep's heart about. I hour, and a calf's heart if to 2 hours See. Forcemeat.
HEARTBURN, A burning sensation in the gullet and stomach behind tho lower end of the breast bone is known as heartburn, but it is in no way connected with the heart. It results usially from the presence of excessive quantities of acid in the stomach. When some of this is forced up the gullet it causes a scalding sensation in the throat.

Relief can usually be obtained by using one of the following remedies, but none of these remove the cause, to which sppropriate trestment should be directed. Perhaps the best remedy is a powder of menthol, of gr., carbonate of magnesia, $10 \mathrm{gr} .$, and bicarbunate of soda, 12 gr ., taken in tumbler of hot watcr. Another uscful remedy is a powder composed of 10 gr . subnitrate of bismuth and 10 gr . of the compound tragacanth powder, three times a day. One or two sodamint tablets $\frac{1}{2}$ hour after meals often give relief. See Gastritis: Indigestion.

HEARTH : Its Construction. Literally the hesarth is the firepromf flooring immediately in front of the fimplace, of which it is a part, and various forins of decorafive treatment are applied to it. On the ground flowr level, if the floor is solid, the hearth may be built up with concrete, coverod with tiles, stones, or brickwork, but is mostly constructed of one material.
In most small houses the ground floor is built up of timbers, and to protect this woodwork a little wall of bricks is built around the fireplace opening, filled with rubble, and ${ }^{\circ}$ con creted to a level surface. This terminates about 1 in. below the flow, so that when faced with tiles the hearth will be level with the floor.

Hearth. Construction of a hearth on an upper loor, showing how the trimmers are arranged to furnish the necessary support

In a cheap, construction, the hearth may be floated off with granolithio concrete and worked to a smooth, trowelled surfnce
On an upper Hour the floor joists are trimined to form a framework about 2 ft awny from the fireplace opening and extending to the sides of the chimney breasts, or to the width of the mantelpiece. A fillet of wood is nailed round on the inside of this framework, near to the bottom of the joists, and the uperture temporarily closed by rough boarding supported on props to the ground floor. The box-like structure thus formed is filled with concrete strengthened by reinforcing bars of iron about $? \mathrm{in}$. in diameter, disposed according to the structure of the building. The concrete is then allowed to set thoroughly hard, and finally the wooden props are removed. The surface of the concrete is left about 1 in . below tloor level, flonted over with granolithic concrete, and trowelled to $n$ smooth surface, tiled or otherwise finished.
When it bccomes worn or cracked a concrete henrth may be repaired by chipping off the surface and floating off with new concrete composed of one part of Portland cement and one part of fine granite chips.

To clean a hearth, remove the cinders with a shovel and brush up the cshes that remain with a hearth brush. If it is tiled, wash it with warn, soapy water; then rinse and dry it, and finally polish with a suft cloth or chamois leather. Stone hearths should be washed with warm, soapy water and then rubbed with hearthstone. See Chimney Piece : Concrete; Fireplace ; Floor ; Grate, etc.

Hearth Brush. Brushes of this kind are emploved to sweep up the ashes from the hearth and to remove the soot and dust from the back of the grate. They have handles which are usually minde of brass or of oxidized metal to match the fire irons.

A neat type of hearth brush is fitted with a cylindrical brass case which slides up and down the handle according to the position in which the brush is held. When the latter is hang up, the case slips to the bottom of the handle and so acts as a covering for the brush. Hearth brushes aro sometimes included in sets of fire irons which hang on small stands nnd are con veniently placed beside the fire. See Fire Irons; Grate

Hearth Cloth. Employed to protect that portion of a carpet surrounding the fire. place when the latter is being cleaned, a hearth cloth can be made of any coarse material such as sacking, felt, etc. While the cleaning is being done, the fire irons, sticks. and cleaning materials mny be placed on the cloth. Care must be taken in laping the latter that the clean side is always placed underneath.

Hearth Stone. This is a preparation sold in block form for cleaning stone hearths, steps etc. It is made by mixing equal parts of whiting and plaster of Paris with enough water to turn them into a stiff dough-like mixture. The latter is then placed in moulds to set.

## Hearth Rug. See Rug.

HEARTSEASE. This lovely old-fashioned Hower may be treated as an annual, biennial, or perennial. It may be raised from seed sown in July in light, leafy soil, in pots or pans, and placed in a cool spot. It may also be increased by cuttings or by layers. See Pansy.

HEATH. The botnnical name of heath or heather is orica, a genus which contains many beautiful hardy flowering and greenhouse plants. By planting a collection of hardy heaths it is possible to ensure flowers almost all the year round. They prefer peaty or lealy soil but will Hourish in lime-free ground to which mould has been added freely: they do not thrive in limestone soil. Planting is best done in early autumn. Cuttings placed in pots of sandy peat in a frame in August provide

Heatb. Greenhouse variety bearing spikes of white fowers in Rreat profusion
the beat means of propagation. The only proming needed is to cut off faded flowers, but the tips of young plants should be pinched off to make them branch out.

These are the best hardy heaths for general cultivation-carnea, reddish, spring; darleyensis (mediterranca hybrida), rose red, Novem-ber-May: maweana, red, August-September ; cincrea, the common hillside heather, purplish, Septemher; vagans, the Cornish heath, pinkish, August-Sieptember. Arborea and lusitnnica, the so-called tree heaths, grow 5 fect or more high, bear white flowers in spring and need a sheltered place.
For cultivation in the greenhousc the fol lowing are some of the most attractive heaths : caffra, white; Cavendishiana, vellow: gracilis reddish: hyemal is, red and white ; and melanthera, white. They must be potted in welldrained sandy peat and grown in a temperature of about 50 degrees. After llowering the shoots should be cut hack lightly. Heaths in prots must be watered very carefully; the object should be to keep the soil uniformly moist. If it becomes sodden or is allowed to get dry the plants will fail. In summer they should be placed out of dours or in a cold fraime.
HEATHER. This name is usually given to Erica cincrea, which covers large tracts of country in various parts of the British Isles and is very beautiful when in bloom in September
HEATHER MIXTURE. Cloths, usually tweed, in colours closely resembling the heather of the moors, and known as heather mixtures, are employed in the making of sports and other outdoor costumes and lints. Stocking wools in heather mixture are made by blending in differing proportions wools which have been dyed brown, red, green, and purple. See Tweed
HEATING: Some General Directions. In this work the various methods of heating a house are described in such prinary articles as Central Heating, Electricity, Gas, and Oil Reference should be minde also to Anthracite, Coal, Coke, Fireplace, Grate and Stove.

An open fire radiates heat from the incandescent coals, coke or logs useri as fuel. The heat travels out in rays from the glowing sur. face, heating only the solid bodies upon which
the ray's impinge and pasoing through the in tervening atmosphere. Such heat is analogons to that given off by the sum Modern well designed gas fires furnish nost of their heat by radiation, nud in clectric fircs the same end is aimed at. the fircelay back plate being shaped so as to reflect into the room the heat emitted by the glowing element

Here it miny be pointed out that the term " radintor," used loosely for tubular warming appliances heated by steam or hot water, is not a good onc, as these function mainly by convection, not radintion it is true that the casing radiates heat. but owing to its shape only a comparatively small purtion of its surface area can effectively send out heat waves into the npartment. A steam or water-heated appliance, or an air warmer, of the electrio type illustrated on page 413, heats the air in contact with ite walls or casing This heated air expands and rises, giving place to colder air, which in turn becomes warnied, so setting up a circulation of heated air in the apartment. This is walming by convection

Another type of convection heater is the cylindrical slow combustion stove. The fireclay lined iron walls become heated and thus warm the surrounding air. Disadvantages of convection heating are that the air in an apartment may hiccome stuffy, and the air currents set up tend to cause draughts. There are difficulties also in suitably ventilating the room without unduly cooling it.

Radiated heat, on the contrary, passes through the air in rays (i.e straight lines), and after impinging on walle, furniture and other solid bodies, is partly absorbed and partly reflected It does not warm the intervening air to any great extent, although air in contact with the walls, etc, which have absorbed radiant hent, gradunlly becomes heated by convection

An apartment warmed mainly by radiation is generally more comfortable than one in which a convection system is employcd. The contrast can he renlized by comparing the enervating heat of a Turkish bath, provided entirely by convection, with the bracing warnith of sunshine (radiant heat) on a day when there is it slight but coul brecze -blowing.

If it is desired to heat uniformin throughout. particulnrly if aconstant hot-water supply is to be maintained, the merits of central heeting should be considered. The economy of labour and finel effected by this method is considerable, and the atmosphere of the housc is kept at a uniform temperature throughout On the other hand, central heating exhibits a total lack of those cheerful qualitiee nssociated with the open coal or log fire. The chief objection to open lires is that they cause a certain amount of extra houscwork as well as smoke and dirt ; but these factors have been reduced practically to a minimum by the modern forms of slow combustion grates.
Those who, while insisting on the cheerful effect and other qualities of the open lire,
dislike the extra labour and absence of scrupu. lous cleanliness agsociated with coal and other solid fuels, should investigate the claims of the gas fire and the electric fire. If neither of these is available, there remains the oil stove: it is seldon realized what strides have been made in the design of heating apparatus for consuming oil.

HEAT STROKE. Fsposure to cxeessive heat may cause heat stroke, a condition having some resemblance to an apoplectic seizure. When following exposure to the rays of the sun the condition is described as sunstrolie, or insolation, but exposure to the sun is not the only way in which heat st roke may be caused. it may occur in stokers and others similarly placed. Its occurmence is faroured by alcoholic habits, innbility to sweat frecly, and by ton heavy clothing.

The patient may suddenly fall unconscious, or there may be preliminary symptoms, such as headache, giddiness, romiting, and sickness Usually the face is flushed, the pulse bounding, and if the temperature is taken it will be found to he very high, perhapa $107^{\circ}$ to $110^{\circ} \mathrm{F}$.

The immediate treatment for heat stroke is to take the patient into the shade, or the coolest place available, strip the clothing from the trunk, and souse the trunk and head with cold water. As sonn as possible he should be taken home or to a hospital, where an effort witl be nade to lower the temperature by rubbing him over with ice or giving an iced pack or bath, and possibly an iced enema. See Fever.

HEDGE. Certain leaf-loaing and evergreen shruhs are suitable for planting as hedges.

In ellsure satisfactory growth. In the spring following planiling che shrubs ought to be cut back to within 8 or 10 in . of the base to make them branch out. In future years it is wise to keep the top narrower than the basc Clipping is usually done in spring and early autumn. Privet requires to he cut frequently to keep the hedge neat.
Holly and yew are the best evergieen hedge shrubs. but they grow rather slowly. Plants not more than $2-3 \mathrm{ft}$. high become establiahed most quickly and surely. April and September are the best times to plant evergreen hedges. Clipping should be done in April and August. The pliznts may be set 15 in . apart in a single row, or if necessary in a double row. A comparatively new hedge shrub that is strongly to he recommended is an evergreen honeyanckle named Lonicera nitida: it bears clipping well, and can be kept low or allowed to reach a height of f it Cupressus lawsoniana, Cupressus macrocarpa, common laurel, Portu. gal laurel, and thuya (arbor vitap), are other evergreen hedge shrubs, and box may be planted though it grows slowly. Cupressus macmearpa makes quick progress and soon forms a tall hedge.
Escallonia macranthn, tamarisk nand hardy fuchsia, make aplendid hedges ir mild dist.ricts, especially those near the sea. Berberis Darwinii, and Berberis stenophylla, two Howering evergreen ahrubs, make attractive informal hedges, so do the Penzance briars and other vigorous roses. The best dwarf hedge is provided by lavender.
The Legal Aspect. The ownership of a hedge is frequently a matter of dispute, but in strict law where a hedge separates twin ficlds it

Among the former are privet, whitethorn or quick, beech, hornbeam and myrobalan plum.

Beech makes $\Omega$ first rate boundary hedge, for the dead leaves remain on the branches most of the winter. Planting may be done at any time from November to Mnreh, though early autumn planting is to be preferred. A uscful herlge results from planting n double row, the plants in one row alternating with those in the other and being set at 12-15 inches spart. Thorough soil preparation is essential
belongs to the owner of the field on whose side there is no difech. Where there is no ditch on either side. the ownership of the hedge is established by evidence of acts of nwnership, e.g. where one owner's family has tended it throughout a long period.

A liedge which has a ditch on Unth sides is the property of the owners on each side, who are equally responsible for ita upkeep. A person must not cut a herlge or any portion of it that does not helong to him.
Hedges in town and suburhan gardens

Hedze. Cut gew hedge, a feature of great beauty in the formal type of garden. Above, evergreen bedges which make an effective background to flower borders
should be kept well pruned. Failure to do so may lead to a passer-by being injured by straggling branches and to consequent liability for damages. Where a garden adjoins pasture land care must be taken that the trese or shrubs forming the hedge are not of a noxious nature. Yev trees, for example. ahould never be planted under these circumstances, as cattle may eat the leaves, with injurious and perhape fatal consequences, and the owner of the hedge may be held liable.

A tenant is not permitted to grow a herlge that will damage the landlord's pmperty, as for example, loo near a window-sill, blocking out light from a window, or allowing its ronts to develop so as to onuse settlement, and so on. Overhanging leaves and branches of a hedga in a neighbour's property may be lopped by the person whose land they overhang, though it is usual first to request the nwner to cut them. On the other hand, fruit growing on branches averhanging a neighbouring garden is the property of the owner of the healge See Box; Concretc: Fence; Garden: Holly: Privet; Yew.

HEDGEROG. There is no pet that is less trouble to keep than a hedgeliog. Housewives who are troubled with black beetles or cockroaches in the kitchen will find in the hedgehog a valuable ally, for he will effert a speedy clearance. Young hedgehogs can be bought at bird and animal shops

HEDGEHOG CACTUS. Mont kinds of echinocactus require cultivation in warm and dry greenhouses, but one species, Simpsoni. can be grown in a sunny position out of drors in gravelly or sandy soil if protected from rain in winter. Propagation is by cuttings or offsets taken with a sharp knife and placed in n sunny spot until cuts heal and ront growth begins. At this stage they may be potted in a mixture of fibrous loam, finely broken lime-rubble, and sand.

HEDGEHOG CAKE. A hedgehog cake ís so called because of its shape and the numher of browned and halved almonds used to decorate it. The ingredients and method of making are the same as those described for almond cake, but a morc rounded appearance is given. When cooked, the cake is coated with almond paste, brushed over with a little yolk of egg, and placed in a hot oven till of a golden brown colour. The almonds are then stuck into the paste to suggest hedgehog spines.

HEDGING TOOL. This is a tool adapted for cutting hedges, and especially for hedges of considerable size and not easily trimmed with an ordinary hedging knife or bagging hook The tool comprises a long handle, or shaft, 3 ft or more in length, and has a steel blade lixed to the end, shaped in much the same form as a billhook. See Billhook

HEEL BALL. A composition of tallow, or beeswax, and carnauba wax, coloured with drop black, is employed under the name of heel ball in the repair of boots and shoes, for colouring and polishing purposes. It is also used for taking impressions of coins, brasses, and other incised decorations. This is done by placing a piece of white paper over the object, and rubbing upon the surface with a lump of heel ball, with the result that the high parts of the design are reproduced in black, and the incised lines appear on the paper in the form of white spaces. See Boot Repairing.

HEIRLOOM. This word is used for articles, e.g. plate, furniturc and pictures, which go with a settled estate. Since 1925, these may be settled in the same way as land so as to make it diflicult, if not impossible, to dispose of them apart from the land to which they are attached More generally the term is employed in order to denote articles of value which have been for some time in possession of the same family.

HELENIUM. Hardy perennials which are of great value in the Hower border in summer nnd autumn. They flourish in ordinary soil, are easily propagated by division in spring and autumn and bear large. daisy-like flowers. The best kinds are Crimson Beauty, 2 ft., July, crimison-brown: pumilum magnificum, $2 \frac{1}{2}$ ft., July, golden ycllow; Riverton Beauty. 4 ft., Aug. Sept., yellow, and Riverton Gem, 4 ft., Aug. Sept., reddish.

HELIANTHEMUM. The name belongs to a pretty family of dwarf flowering planta, popularly known as the sun roses. The flowers of different varieties are white, yellow, pink and crimson in colour, ind the plants a verage ahout 12 in . in height. Sun roses ane useful for the rock garden; they thrive beat in light soil. They are raised from seed in spring. The conmon kind is helianthemum vulgare, of which there are numerous varieties, some with single, others with clouble flowers, in many showy colours.

Relianthus. This is the botanical name of the sunflower (q.v.).

Helical Gear. See Gear.
HELIOPSIS. Of the small genus of hardy derbaceous plants known as heliopsis and

Reliopsis. Flower head and leaves
of a single form of the scabra variety sometimes as orange sunHowers, which they much resemble, only laevis and its varieties pitcherinna and acabra are much grown. These arc showy plants with rough. toothed leaves and large yellow flowers in summer; height 4 to 5 ft . The method of propngation is either by seed or by division of the root-atock in autumn or apring. Heliotrope. See Cherry I'ie.
HELLEBORE. This group of hardy plants contains the Christmas ruse (Helleborus niger) and the Lenten rose (Helleborus orientalis), whioh are valunble winter and spring Howers. They flourish in partially shady places in deeply dug and manured soil which does not dry out in summer. The best time to plant or transplant is in July. Small pieces hecome established quicker than large ones.

There are some beautiful varieties both of the Christmas and the Lenten rosc. The finest Christmas rose is one named altifolius (maximus), which bears large white flowers Of the Lenten roses some of the most henutiful are Isolde, pale rose; Faerie Queen, blush marked with crimson; Snowdrift, white; and Robert Froebel, crimson. Propagation is most easily effected by division of the clunips in summer.

HEM : How to Make. A hem is made by folding over an edge of material on to the wrong side to any required depth, its extreme

Helenium. The dalsy-like flowers
make effective indoor decoration
cdges turned in and prevented from fraying by being sewn down to the outer part. The line of sewing slould hardly show through on to the right side, if the stitches are small and evenly made. Hems which are made to neaten the raw edges in lin. gerie, or in scwing very fine silk, should be as tiny and llat as possible, while hems to answer the same purpose in heavier materinls are usually made $\}$ in. wide so that they can be pressed down flat.
The depth of a hem varies according to the demands made upon it, and the material. A very deep hem several inches wide is often used to give weight, helping to make the part of the garment upon which it is placed hang evenly and well. If the material is too heary to be turned up to any depth, or if not enough material has been allowed to make a deep hem, 1 in. or more may be turned up and a facing or false hem made with oome lighterweight material of the same shade, to give the appearance of a deep hem.

The edges of a hem made in very thick material should not he turned in, but one edge of a Paris binding should be sewn well over the part which is likely to fray, the outer edge of the binding being firmly liemmed down to the outer part of the garment. The hem will then press quite flat with no unnecessary thickncss. In turning up the hem of an unlined coat the edges are usually bound by a crossway strip of material or binding before heinning to the outer part The hein of a lined garment is kept in place by the lining, and is not sewn down to the outer part at all. Hems made in cloth which is not likely to fray are sometimes turned up and herring-bone stitched flat.

To hem the material, which is done from right to left, hold the hem over the forefinger of the left hand and under the middle finger, holding it down with the left thumb, and keeping the inner fold towards you; then, pointing the needle outwards, pick up a few threads of the inaterial just below the inner fold and push the needle up through the edge of the fold itself. Draw the needle through, and repeat. All the stitchea should be made uniform in size, slant and space. If the innterial is not too thin, the needle can be passed through the upper aurface of the fabric, so that practically nothing is seen from the right side.

HEMLOCK : The Drug. Both the fruit and the leaves of the hemlock, or conium, are used in medicine, but the drug and its preparations arc not officially recognized by the medical authorities. The diug is rarely prescribed to he taken internally, as its action is uncertain. Conium ointment has been found of much use as a cure for itching and fissures about the anus.

The chief symptoms in hemlock poisoning are heaviness in the legs, staggering gait, and finally complete loss of power over the muscles. The eyes become fixed, the pupils dilate. the breathing becomes more and more difficult, until finally death ensues from asphyxin. After an overdose of hempock an emetic should be given at once, and then strong warm tea freely The patient should be kept warın with hot water bottles and blankets. If the heart tlaga. or bnenthing becomes very laboured, atimu. lants should be given and artilicial respiration should be carried out. See Emetic.
HEMP AGRIMONY. This is a hardy perennial suitable more particularly for a large
garden, owing to its coarse growth There is one species, however, which may be recom mended for smaller gardens, namely, Eupatorium ageratoides This makes a fairly compact huah about 3 ft . in height bearing pure white flowers and requiring a sunny position in ordinary aoil. Propagation is by division o! ronls in spring or autumn, or by seeds sown outduors during April.
HEMSTITCH. This is used chielly on house- linen, when it actually holds down the hem, but it is employed also on dresses and lingeric
On a teacloth a hem is turned. usually about 2 in. wide, tacked down, and scveral threads drawn just under the cdge of the hem: the number of threads to be drawn depends on the texture of the linen or other material in use for the cloth. The stitch then proceeds as in drawn thread (q.v.).

HENBANE. This is the popular name for hyorcyamus. It grows wild, especially on and around licaps of old rubbish, hut in sone places it is cultivated becauso of its use medicinally Every part of the plant is poisonous, particularly the root, which is often mistaken for chickory or parsnip. The leaves are oval, lobed or toothed, the upper ones clasping the stem The flowers are large, shaped like a funnel, and in colour a dull yellow veined with purple. The fruit is a many-sided capsule with a dis. tinct lid. The whole plant has a somewhat unpleasant amcll.

The leaves and flowering tops of the plant are used for maling its various medicinal preparations, the leaves being of most value in their second year, or in the autumn of their first. Its actions resemble those of belladonna and atramonium, and it is frequently used as a sedative in bladder affections, and combined in pills with purgntive drugs to prevent severe griping.

HENNA : For the Hair. Henna is a small shrub, the lenves of which, when dried and powdered, are used to make a reddish-hrown dye In small quantities it makes an admirable shampoo for brunettes, giving brightness to the hair after washing.

In using the hair dye ahout 7 oz of powder are required for one application. This quantity is divided into two portions The first part is mixed with a pint of hoiling water, allowed to stand for a short time, hut whilst still hot applied to the hair by means of a brual. The second portion is made into a moderately thick paste with water and applied to the hair, being kept in place for about half an hour by wrapping a towel round the hair. The hair is then rinsed in tepid water. Re-colouring is necersary in abnut a month See Hair

HEPATICA. Belonging to the anemone family, hepatica is a spring-flowering primiroselike plant which loves the slinde.

There are single and double varieties of white, blue, and red colouring. Hepaticas need rather light

Hemp Agrimony (Eupatorium) which bears large heads of whlte flowers in late summer leafy soil in a partinlly ahaded place and should be left undisturbed for years ns they dislike being moved. in time they may become overcrouded and bloom sparsely then lifting and replanting as soon as the lcaver have died down is recommended.

HISPPLEWETITE: The Style. This style in English furniture is named after George Hepplewhite, a cabinct maker and designer who worked in London until his death in 1786. The general lines of his furniture, like those of Sheraton, show the Adam influence, and the pieces are in good taste, with the ornament dignified and restrained

Hepplewhite used carving to ornament his chair backs where Sheraton generally relied for decoration upon marquetry or painting. His wheat-ear shield-back chairs, those with the Prince of Wales's feathers, and others with carved festoons of drapery, or a vase forming the centre, to which the husks or drapery were attached, are now highly valued by collectors.

HERACLEUM. Also known as the giant parsnip. Heracleum gigantcum is only suitable for the wild garden or shrubbery, by reason of its exceedingly robust growth. It bears very large lobsd leaves and umbels of creamywhite Howers; under suitable conditions it will reach a height of 10 ft .
Heracleum can be grown in any ordinary soil, and is best planted in autumin. Prc.paga. tion is by seed sown in spring, or by division of roots in October or March. The plant is sometimes called the cartwhecl flower because of its huge heads of bloom. Pron. He-rak-le-um.

HERB : In Cookery. Herbs are omployed in cookery for flavouring many dishes. The best flavouring is afforded by freshly gathered powdered herbs, but thero are one or two special mixtures of preserved herbs on salc. The ordinary sweet herbs sold by grocers contain about two parts parsley, the remainder being made up with thyme, and occasionally marjoram.
The herbs most fre. quently employed include sage, thyme, marjoram, mint, parsley, hyssop, chervil and coriander, the cultiva. tion and uses of which will be found described under their separate headings.

Among all the herbs marjorant may be said to excel in flavour. Marjoram is an excellent addition to soup, meat and fish, and can be used in stuffing.

Like Sheraton, he favoured square, tapering legs, but these were ornamented by flutings or grooves, into which he often introduced carved husks. The friezes of his sideboards and the console or pier tables of the time he ornamented with carved paterae of rosettes, which sometimes were alternated with vases and scrolls: occasionally the masks of lions, rams or guats were introduced. Some of his mirror frames were designed for gilding, and these are generally sinilar to those of the Adam style.

One of his specialities was enamelled or painted furniture, and for this he used beech or birch, which was first covered by an enamel lacquer, generally black, white or ivory colour, and then decorated with painted flowers, or occasionally with camco-like medallions. Some of the titles of his furniture now strike us as peculiar, e.g. cabriole chair, which in his casc meant a stuffed back and did not refer to the curved form of leg; bar-backed sofa, which was a settce for three or four people, formed likc chairs joined together side by side, with an arm at either end; tea chests; knife urns and some other terms which have since gone out of general use.
The knife urns are distinctive and attractive accersorics, sometimes in the form of Etruscan vares, often made of richly figured Spanish mahogany. They stood upon the pedestals which, together with a side table, formed in combination the sideboard of the period. Some of Hepplewhite's oval trays are inlaid with marquetry, generally having a centre ornament surrounded by festoons of husks. Like Chippendale and Sheraton, whose books of designs furnished the patterns for contemporary makers, Hepplewhite has got the credit for a great deal of furniture which actually was made by his contemporaries. See Antique Furniture; Armchair; Knife Box; Mahogany ; Settee; Sheraton; Sideboard.

Hepplowhite. Chairs in walnut, with gilk apholstered seata, and backs showing desigas characteristic of this maker's style By permisation of the Director. Victoria and Albert Museum, S. Acnsington
once established the herbaceous border needs only superficial attention, provided it has been well prepared in the first instance. The border should be dug out to a depth of 2 ft . and enriched with manuro.
The best periods for planting perennials are spring and autumn, the more robust plants during October and November, and the choicer kinds in March and April.

By planting a careful selection of kinds and varicties it is possible to ensure a brilliant display of bloom throughout the summer and autumn months. It is usual to place the plants in groups of three, five or seven, according to the size of the border, rather than to set them singly. Charming colour schemes can be arranged by grouping the plants according to the colours of the Howers. The most effective arrangement is to start at each end of the border with white and pale blue, and follow with pale yellow, rose, mauve, and purple, working up to crimson and scarlet in the middle of the border.
Some of the chicf hardy herbaccous peren. nials are the following: Lupin, delphinium, Shasta daisy, phlox, paeony, pyrethrum, oriental poppy, sea holly (eryngium), globe thistle (echinops), heuchera, Michaelmas daisy, golden rod (solidago), Japanese anemone, purple sage (Salvia virgata), day lily (hemerocallis), and summer starwort (erigeron). To fill spaces between the permanent plants, annuals are sown and gladioli, lilies, and montbretias are planted in spring and dahlias are put out carly in June. See Border; Flower Garden.
HERB GARDEN. The cultivation of herbs on account of their medicinal properties and as a flavouring in cookery is one of the oldest forms of gardening, and herb gardens are still to be found in many parts of Great Britain. Herbs most usually found in gardens include mint, thyme, marjoram, hyssop, peppermint, borage, dill, fennel, angelica, sorrel, tarragon, chervil and coriander. Although strictly not an inhabitant of the herb garden, lavender is often to be found therein. The best position for the herb garden is between the flower and litchen gardens.

The majority of herbs are propagated by slips taken in the autumn, or, in the first place, by sced sown in the early spring. They may be arranged in drills or patches, and the plants should remain undisturbed, except for thinning.

HERMITAGE: A French Wine. There are three variet ies of hermitage, which is a highclass French wine of the Côtes du Rhóne, and is cither red, white, or straw colour. The red wine, when it is of the first quality is not bottled until it has been four or five years in cask. It has a bouquet recalling the raspberry, and has a remarkably clean, fresh, full vinous Havour, great firmness and softness, and a rich deep purple huc.

White hermitage, which is made of white grapes only, has been described as the finest white winc France prodnces Its colour should be a pale yellow. Its bouquet is like that of no other known wine, tich and

HISRBACEOUS BORDER. The herbaceous border consists say, plants the foliage of which dies down in the autumn, but which comes up again season after season. The plants may be left permanently where first estab. lished, but many benefit by being dug up and transplanted every 3 or 4 years.
Plants which in crease too rapidly may be separated in the spring. When

Hepboceous Borders which provide a display of bloom in summer and antumn
spirituous in flavour and perfectly dry The straw colour hermitage is rare and expensive It is noted for its freedom from all acidity, its smoothness, and marrowy richness of flavour.
Hernia. See Rupture
HERON'S BILL. A plant somewhat similar to the hardy geranium, and sometimes called stork's bill: its hotanical name is

Heron's Bill. Geranium-like flowers of a plant asefal in the rock parden
erodium It flourishes in light, sandy soil in the rock garden. Some of the best sorts are guttatum, white, $(\mathbf{i}$ in. ; Reichardii, pink nnd white, 2 in ; and macradcnum, white and violet, 6 in.
HERPES: A Skin Disease. Simple herpes, fever blister, or cold sore is an acute inflammation of the skin, accompanied by the development of small blisters. Beyond lightly covering over the spot or sore with cold cream or a little zinc ointment, no treatment is required, the eruptions tending to heal themselves spontaneously. See Shingles.
HERRING: How to Cook. The usun way of cooking herrings is to fry them. After it is cleaned the fish can either be slit open or can be cooked as it is. Heat a little dripping in $n$ frying-pan, and fry the herring in it, turning it when one side is done.

To broil the fish, gut and clean them, but dry them well. Score the fish across each side, seasorr them, and dredge a little flour over them ; then cook them on a well-greased gridiron. Before dishing, brush the fish over with butter, which shonld be ready melted in a small pan. Sprinkle them with lemon juice and a little coyenne pepper, and garnish with fricd parsley.
Another method is baling. Remove the heads and tails, gut the fish and clean them. Grease n pic-dish with good dripping and lay the fish in it. Add one or two chopped shallots and a little chopped parsley, thynie and marjoram; a bay-leaf may also be laid in the dish Scason well, and put more dripping on the fish Cover the diall with greased paper, and bake it in a moderate oven for 15 to 20 min . Each lish should be laid separate, not one on top of the other. Serve with mustard sauce.
To souse herrings, clean and bone them, roll them up with a sniall piece of onion in each, and pack in an enamel or fireproof dish. Cover with vinegar and water, adding 2 or 3 cloves, 3 bay-leaves, some black peppercorns, and salt. Bake in a hot oven 20 to 30 min . Serve cold These are known as " Mops" in some parts of the country.
When cured, herrings are known as bloaters and kippers. Blonters are salted whole, then strung on thin piles and amoked with wood smoke until dry, and the curing process is completed. Yarmouth bloaters have always been considered the best. Kippers are herrings salted and smoked, but before curing they are split open and gutted. They can be cooked by the same methods as bloaters.
Roe of the Herring. The roc of the herring, either fresh or salted, can be served in a variety of ways, and makes a savoury or a breakfast
dish This is one method of cooking soft roes: Fry lightly in butter 3 or 4 roes from fresh herrings, lay them in a greased pie-diah with two tablespoonfuls of chopped mush. rooms, 1 tablespoonful of chopped paraley, and 2 shallots. also chopped Bone and fillet 3 anchovies, add these with a gond squeeze of lemon jnice, nnd season well. Pour over the roes the butter used in frying, and cover with brown sauce Put a greased paper over the dish and bake for 5 min

The roes may also be served plain. Blanch them, cut thein in convenient pieces, cook them a fow minutes in butter, and serve on crouttes of tonst. A better Havour is given if, before serving. a little lemon juice is sprinkled over the rocs and they are seasoned with salt and cayenne. The roes may be left whole

Hard roc may be boiled, pounded, and made into potted ment if mixed with butter, flavoured with mace and well scasoned. See Bloater : Cod's Roe; Fish; Kipper

HERRING-BONE STITCH. This stitch is chiefly used for seams on Hannel and similar materials that are too thick to be turncd under, the raw edge being herring-boned on the wrong side. It takes the position of the ordinary hemming stitch. It is sometimes called Figure 8 work, and reference to the illustration vill show the similarity.
W'ith a little care nad a good eye for measurement., it is not necessary to space out the

Herring-bone Stitch, used for catching down the raw edge of a seamin a thick material
actual places for the stitches, but, for the beginner's guide, dots can be placed along an innaginary top and botton line, which will decide thic depth of the stitch For an ordinary hem this is $f$ in., and each stitch is $\ddagger$ in. apart on the rame line. Dots can be marked with a lead pencil at equal distances a part, or on loosely woven materials a thread can be drawn at the top and bottom of the space to be covered, and an even number of threads taken up and missed on the material, The work proceeds from left to right, and thie stitch is taken up on top and bottom lines alternately, as shown in the illustration.
HESSIAN: A Canvas. Common canvas, or jute hessian, employed for packing bnles and making a foundation for oilcloth and linoleum, is sometimes known as burlap. The material has sundry household uses, such as making coarse aprons, ovencloths and underlays for mattresses to preserve the ticking from contact with the wire springs of the bed Hessian can be used for wall decorations; for example, in making panels or friezes. The natural colour is buff, but it can be dyed a deeper shade, black, dull green or blue quite successfully. Pictures look well ngainst n background of burlap or hessian, and advantage is often taken of this at exhibitions.

The material is cheap and obtainable in different widths and qualities. It is often stencilled or embroidered in simple designs and used for short curtains, garden cushions, blotters and work bags. It is effective, when dyed black and enibroidered in bright coloured wools, for a writing table set and in buff for cushions. See Woolwork.

HETERODYNE. When alternating currents of two different frequencies flow together in $n$ circuit they combine to form a new
frequency (called the " beat " irequency) which is equal to the difference between the original frequencies.

The superimposing of two sets of alternating currents or oscillations of different frequencies is known as "heterndyning," and the method may be used in wireless for the reception of continuous wave (C.W.) transmissions (heterodyne reception) and also for the measurement of wave-length.

The formation of a "bent" frequency in the manner described ahove constitutes the principle upon which the superhaterodyne receiver is based

Heterodyne Interference. This is the interference caused by the carricr-wnve of a broadcasting station beating with that of another atation working on a slightly different wavelength or frequency, this producing an audible heat note in the receiver. The interference can be remedied by spacing the stations farther a part in wave-length. See Oscillation: Superheterodyne; Wave-mcter.

HEUCHERA. Alum root is the popular name of this invaluable hardy border plant, which produces long, graceful sprays of bloom in rose, crimson, blush and other colours in May and June. These add to the charm of the garden in early summer and are most useful for cutting. The plants, which form low, leafy tufts, may be planted in spring or autumn; it is wise to leave them undisturbed They thrive in ordinary well-drained soil in a sunny place. Propagation is by division of the plants in nutumn, or by seeds. There are now many beautiful varieties with long flowering stenis Some of the best of thesc are Enge Hal!, rose-pink; Rose Cavalier, rose-cerise; tiarelloiden, blush; and Pluie de Feu, red; sanguinea, coral-red, which is an old sort, is also a beautiful and useful variety.

HIBISCUS (Mallow). This is the name of $\pi$ group of shrubs and her baceous perennials some of which are hardy, while others are suita ble for the greenhouse. The Syrian maliow (Hibiscus syriacus) is the best of the hardy kinds; it is a shrub 5 ft. or more high which bears inallowlike Howersof various colours in Aug. ust There are double and single varieties. For cultivation in the warin greenhouse, cocoineus, red, manihot yellow, and rosa sinensis, red, are to be recommended. They may be grown in large pots or planted in a horder of a soil of loan and peat

mallow (Hibiscus syriacas)
HICCOUGH: How to Check. The commonest exciting cause of hiccough is indigestion. Children who bolt their food are especially subject to it. Drinking very hot or very cold liquids inay cause it. It occurs in hysteria, gastritis, appendicitio, alcoholism, sleepy sickness, etc.
There are many ways of bringing an ordinary attack to $n$ close, among which are the following: (Give a teaspoonful of raw whisky, a teaspoonful of lemon-juice in which n pinch of salt is dissolved, or a teaspoonful of sal volatile with very little water. Put a pinch of salt on the back of the tongue A tablespoonful of peppermint water or of cinnamon water, or a few drops of apisit of
chloroform in $\frac{1}{2}$ tablespoonful of water, are also good remedics.

In the case of children with overloaded stoniach an emetic, such as $\frac{1}{2}$ teaspoonful of mustard in a tumbler of warm water, may be very useful. When the hiccough is severe and prolonged, a doctor should always bo consulted

EICKORY. This wood resembles English ash, and is used for much the same purposes. It is slightly superior to ash in hardness and toughness, and also heavier, but it is not very durable in moist, warm, and exposed condi tions, $n$ it is liable to be attacked by insects and worms. Hickory is close-grained and nearly white in colour. In boards it shrinks and warps. Its flexibility adapts it for bending and for purpoees where it will be subjected to shock and vibration. Hickory is used for hammer, axe. and agricultural implement handles, for the hoops of casks, in vehicle building, for the spokes of wheels and backs of chairs, for oars, etc. See Wond

## High Chair. See Baby Chair.

HIGR FREQUENCY (B.F.). This is a term applied to alternating currents or oscillations having a frequency above approxi mately 10,000 cycles per second, as distinct from alternating currents of low or audible frequency. High frequencies (radio frequencies) are employed for broadcast transmission purposes. See Amplifier; Choke ; Low Frequency: Resistance; Transformer; Wave-length.

HIGRILAND FLING. In the Highland Fling the dancer, while hopping on one foot, inakes a series of rapid movements with the other, and finishes with a complete turn. The arms may be held akimbo, but it is usual to raise one arm above the hcad, and this is invariably done in turning.

The dancer begins by pointing the right foot to the side while hopping on the left. The next motion is to bring the right foot behind the left leg, then in front of it just below the knee, and again behind it. These noveinents are repeated with the left foot while hopping on the right, theu again with the right, and again with the left, finishing with a complete turn to the right. The whole series of steps is repeated, beginning with the left, and finishes with a turn to the left.

In the second step the dancer hops on the left foot and points with the right, brings the right up behind the left leg, points with the right again, then brings the right up in front of the left, just under the knee. This is repeated three times, with alternate feet, finishing with a turn to the right, and the whole is again performed beginning with the left, with a turn to the left.

The third step resembles the first. $1,2,3,4$, fling movement 3 times with the right foot, finishing complete turn to the right. Repeat over again, beginning left. In the fourth, while hopping on the left foot, the right is pointed as before, brought up behind the left leg, pointed in front, and kicked out in front, then the dancer rocks from leg to leg, beginning on the right. The step is repeated three times, on left, right and left feet alternately, each of the four steps taking eight beats instead of four.
The other steps are similar, but the hecl and toc movement is introduced as a variety, the dancer touching the ground first with the toe, and then with the heel, instead of bringing the foot up before and behind the leg. There are variations also in the times and number of turns. Each step takes 8 bars, or 32 bests of music. In the first, second, third, and sixth steps the turn is on the fourth and eighth bars, while in the fifth step it is on the second, fourth, sixth and eighth bars.

In the seventh step the first four beats are the same as the second, then the right foot is slipped behind tho left leg, brought to the ground, and as the weight is transferred to
the right leg the left foot is passed in front o right shin. 'This back step is repeated with the left leg, then the right, then the left, and the whole is then repeated from tho beginning, with left, right. left. Like the fourth step, this stop is done four times only, and with no turning.
In the eighth and last step after the first four beats as in the lirst stop, left toc and heel are pointed in front, and the same movements are made with the right fort and repeated with left and right, turning round to the right with tho left foot working round the right leg The movements are then repeated, toe and heel once only this time, finally turning round 10 the left twice on the left leg.

HIGH TENSION VOLTAGE. This is the voltage which is applied to the anode (riate) of a wireless receiving valve, and may be derived from a battery of dry cells or accumulators, or from the mains by way of an climinator. Tho high tension voltage necessary depends upon the type of valve and its position in the set.

Hinge: various types. Pig. 1. Back-tiap. Pig. 2. Parliament or
shutter hinge. Fig. 3. Bkew or rising butt. Fig. 4. Trestle-joint hinge

Suitable values are given on the leatlet supplied by valve makers.

High tension batterics of either the dry cell or accumulator type comprise a number of cells connected together in serics. Tappings are provided to enable the required voltages to be obtained H.T. dry batteries employed with receivers utilizing three or more valves should be of the large capacity type. Hatteries of the ordinary type, having smaller cells, require more frequent replacement.
H.T. accumulator batteries are equally suitable for small or large sets, but inust be re-charged at regular intervals. Sulphation will rapidly occur if the cells are allowed to remain in a discharged condition. Care should be taken never to short-circuit the high tension battery. Sce Accumulator; Battery; Eliminator.

## Himalayan Poppy. See Mcconopsis.

HIMALAYAN PRIMROSE. This is the popular name of Primula denticulata, a beautiful hardy plant which bears lavendermauve blooms in spring. It is suitable for the rock garden or Hower border, and should be planted in luamy soil in partial shade.

## HINDQUARTER. The

 hindquarter of meat consists of the leg and loin either of beef, veal, mutton, or lamb. That of beef is always divided into joints. ()f these the shin is used for boiling and stewing ; the topside and silverside for roasting, boiling, or pic meat; the aitchbone for roasting; the rump for roasting or steaks ; and the sirloin for roasting. l'art of the thin Hank also belongs to the hindquarter of becf, and this piece is suitable for braising.The hindquarter of veal, like beef, is cut into joints.

Eimaiayan Primrose. Bosette of leaves and lavender-mauve fiower heads of a beautifal rock plant

The top portion of the leg is divided into the fillet and cusbion, which is the part used for roasting and cutlets, and the lower half is the knuckle, suitable for boiling or stewing. The loin is usually roasted, but sometimes, is braised in a casserole.

The hindquarter of mutton is either cooked whole, when it is called the haunch, or it is divided into the leg and the loin. The leg can be boiled or roasted, the loin roasted, braised, or divided into chops. The hindquarter of lamb is frequently cooked whole, and is called hindsuarter, not haunch; it can be cut into leg and loin, and trented as for mutton. See Aitchbone; Becf: Joint; Mutton; Veal.

HINGE. A hinge is a movable joint, whereon a door turns, in relation to a frame or other fixed portion. Types vary from a tiny ntetal litting to one weighing several lb. The form in common use is the butt hinge, made in brass, cast iron, or stecl. The kinds here illustrated include back-flap hinges (lig. 1) made of steel or wrought. imon with welded butts, and useful for an object that is long in proportion to its breadth. CounterHap hinges have two scparate centrea about which they turn, so that the hinge is Hush with
 hinges (Fig. 3!, are those
in which one
element of the hinge is adapted to rise and fall upon the hinge-pin, by cutting the faces of the butts at an angle instead of having thein square. As the door rotates the hinge lifts, and the door with it. This enables the door to clear the carpet, and where the floor is not quite level it may obviate the necessity of cutting a part off the bottom of the door. Where it is desired to remove the hinged member from the fixed portion or frame, the lifting butt is of service ; one part of the hinge may be lifted from the other.

Parliament or shutter hinges, shaped as in Fig. $\because$, are made so that when the shutters are open they fall Hat against the surface of the wall. Trestle-joint hinges (Fig. 4) are in malleable iron, for stepladders or trestles Cranked chest hinges of wrought iron are specially for the lids on chests or boxes. 'T hinges (I'ig. $\overline{\text { J }}$ ) are for hanging dours, as are the cross-garnct, similar in pattern. 'The tumbler ' I hinge, or cellar-1lap hinge (Fig. (i), is for hanging the Hap of trapdoor: the trap can rest upon supporting battens and relieve the
linges of their weight. Large doors, as in stables nnd garages, are made with a gnte hinge or hook and ride. Collinge's patent spherical gate hinge is fitted with a hall-shaped pin, and the hinge or ride has a cup which forms a hearing for the ball, furnishes a receptacle for oil, and is fitted with a leather washer, which renders it watertight. Ballandeuparespecially hardened, and this type is very useful for heavy doors or gates.

Table-finp hracket hinges are handy forsupporting llaps or hinged hrackets; they act as n supporting bricket, and cant be folded hack with the flap. Draught-screen linges (Fig. 7) are used for fokling draught screens and similar pur. poses: by their nid the hinged niember can turn in two directions. Brass centic hinges (Fig. 8) the pain increasing and the leg hecoming are used for atruts and similar supports.

Fitting Hinges. When fitting hinges the pins minst be true and in line The llap should sit fair and square in the recess cut for it in the frameworl:. This recess must be so shaped as to preserve the alinement of the hinge pin, otherwise the hinges will quickly bind and break away, even if the door can be induced to turn umon them. When hanging a door or a casement window, it should be placed in the frame and wedged up off the ground, the positions of the hinges being marked on door and on frame, and from them the outlines of the hinges are marked upon both, squaring them off A recess has then to be cut in the frame and in the door for the flanges of the hinges, which may be fixed temporarily in place. The door is then tifed, and if all is correct the remaining screws are driven home. It is important when screwing the hinges in their place that the door be wedged up, otherwiso its weight will cause the hinges to sink, and the door will jam at the hottom It is also imporiant to see that the door is plumb and upright, or, in the case of refitting the duor, that it fits closely against the door stopping.

To reinove old hinges when the screws are rusted in is often troublesome. The difficulty may be met by tapping the hinge itself, especially round the parta where the screwheads are countersunk. This will often free the head of the serew and allow it to be withdrawn l'aint should be chipped away, or hurned off with a painter's blow lamp, which will lonsen the screws. When all elso fails, the pins may be punched out and the llanges of the hinges chipped out with a cold chisel and hammer Inother plan is to drill out the heads of the screws and then cut them away with a countersink. See Casement ; Cross Garnet Hinge : Door.

HIP DISEASE. Generally hip discase means chronic tuberculous disense of the hip joint. This is not uncommon in children. In the early stage the affiected leg is apparently longer than the sound one, the muscles show wasting, and the buttock becomes Ha!tened. The jcint grows stiff and the child limps,

Hinge. Fig. 8. Brass centre binge. or HIPPEASTR Tuberculosis. in in the greenhouse, where it hlooms in latc bloumg and early summer. The lauge lily-like blonms are very handsome, and the modern
varietics are of brilliant colouring; they vary from white through rose to crimson. The best time to make a start is in winter or early spring. The dormant bulhs are then potted singly in 5-inch or 6 -inch pots in a rich soil compost consisting of loam two-t hirds and leafmould and decnyed manure one-third, together with a scattering of sand. I temperature of $50-55$ degrees is suitable. Watering must be carried out very carefully until the bulbs start into growth, so that the soil does not become sodden.

When the Howers are over and the leaves begin to turn yellow, "atering must be discontimued gradually, and, finally, when all the lenves have fallen, the soil is kept quite dry. The pots of bulhs are placed on their sides in a greenhouse or frame, where they will be safe from frost. When in winter or early spring the bulhs start to grow again, some of the old soil should be removed and replaced with fresh compost. It may be necessary to repot some of the largest bulbs, but annual repotting is not necessary.

HIPPED ROOF. In building this is the name given to a roof in which the adjacent sides are inclined and form salient angles. It is a more diflicult construction than the
ordinary lean-to or span roof, and is used in gable construction or where a more ornamental roof is required than the ormal span roof See Roof

HIRE PURCHASE SYSTEM. The hire purchase agstem has to day taken the place of the old tally trade and has increased enormously of recent years it is now very frequently adopted not only for the purchass of luxury articles, such as motor cars, gramophones, furniture, and wirelcss sets, but also for the supply of lusiness machinery and plant I'robably 50 per cent of motor cars soles, 50 per cent of lurniture sales and 10 per cent of jewelry salos are made under hire purchase ngreements
The system enables the purchaser to obtain the use of goods on payment of a small deposit, the rest of the price being paid in instalinents out of his future earnings If properly used it is undoubtedly of gient value, hut the temptation to acquire some article at once for a small prayment is apt to lead the hirer to incur liabilities in the way of future instal ments beyond what he can casily pay. A period of illness, bad trade, or lors of employment may then follow and the hirer will be unable to keep up the payments; the goonds will be scized and the payments forfcited

The Agreement. A hire purchase ngrecment is in form an agreement by which the owner agrecs to let goods on hire for a period to the hirer, who agiees to pay a rent. If the hirer punctually pays the rent and keeps all the terms of the agreement, he is ultimately given the right to purchase the goods by payment of a further nominal amount (c.g. one shilling). The hirer is usually able to terminate the agreement at any time by handing hack the goods and forfciting the instalments prid. He may also buy thic goods before the end of the period by paying the instalments in advance On any breach of the agrecment the gourls may he scized and the instaliments paid forfeited. In addition the hirer may be liable for any loss in value in the goods since the commencement of the ngrnement.

Until the linal payment has been made, the goods remain the property of the owner and the hirer cannot sell or pledge them in any way. If he attempte to do so he automatically terminates the agrecment and the persons to whon he hands the goods acquire no right to them. Persons should exercise great care in purchasing second-liand cara, gramophones or furniture, for if the goods have been held on hire purchase they will lose both the goods and their money Goods held under a hire purchase agreoninnt may he raken by a landord on distress for rent.
Ithough, as stated, the law allows a firm when a hier is unable to keep up his

Hipneastrum. Brilliantly colonred flowers of bippeastrum of amargllis, a favourite rreenhouse plant
payments, to take back the goods, without making any allowance for the sums already paid, in practice many firms act in a more generous manner. If a hirer is unable to keep up his payments, they take back the goods, but allow him a certain proportion of the money he has paid for hire. A practice adopted by somc firms in this business is to give an insurance policy with the furniture or motor car purchased. In such cases, if the hirer dies before he has completed his payments the articles become the property of his wife or children without any further payment. See Agreement.

Bives. See Nettlerash.

## hoarseness. Com-

 monly due to laryngitis (q.v.), hoarseness is readily produced in some people by exposure to dam $\mu$, cold air, by fogs, loud talking, or living in damp houses. Those subject to it should keep the fect warm, and should be careful to breathe only through the nose. Inhaling steam gives relief. A hot bran poultice or a cold compress may be applied to the neck at night, precautions being taken next day against catching cold.Gargles are sometimes of use, but less so than inhalations and sprays (q.v.).
HOB. In the house the hob is a part of the fireplace; in the workshop it is a tool used for shaping gears, chasers for screw threads, and other mechanical purposes.
Some of the older houses are fitted with register stoves made of cast iron with hobs at the side. They are picturesque, but uncconomical compared with the modern barless fire. An example is the Sussex grate, having two hobs with a fire basket between them.

In many cottages the hob grate or fire is a central feature, being either constructed of bricks or tiles, or cast in concrete and coloured. An existing fireplace with an iron register stove can be removcd, and a modern hob fire constructed of brickwork, and fitted with a dog grate or barless fire, can be fitted. A typical example is illustrated in Fig. 5, p. 459. The hob provides space whereon to rest the kettle or saucepan. See Fireplace; Grate.

HOCK: The Wine. The generic name for a number of Rhine wines, mainly white, is hock. It is derived from Hochheim, a town in Germany in the Prussian province of HesseNassau. Johannisberger has the reputation of being the finest Havoured wine in the world. Other well-known hocks are the Steinberger, Rauenthaler, Geisenheimer, Rudesheimer, Marcobrunner, Niersteiner, Hocheiner, and Liebfraumilch. There are also various makes of sparkling hocks. A few red hocks of the Aar district have some reputation, and are recommended for insomnia. French hock is procurable from Alsace-Lorraine.

Hock Cup. There are several recipes for hock cup. It is particularly good for garden or, tennis parties, and should be served in a laige glass jug. The following is an excellent recipe: Put a large lump of ice in a big jug. and add 1 liqueur glass of curacao, 2 liqueur glasses of brandy, I bottle of hock, and 1 bottle of soda-water or Perrier. Stir well and add borage and a few slices of cucumber. A simple form of hock cup is made from a bottle of hock, one of soda-water, 2 tablespoonfuls of castor sugar, and 2 slices of pineapple. Put these into a glass jug and place it on ice for an hour or more. Just before serving put some small pieces of ice in it. See Cup; Dinner; Glass; Ice; Wine.

HOCB: In Cookery. The term hock is usually applied to the fore end of a side of bacon, and represents the shoulder. It weighs about 10 lb . The gammon hock, which is the next cut, is of higher value. The hock is suitable only for boiling. See Bacon; Gammon.

HOCKEY STICK. The choice of a hockev stick is not a difficult matter, since its size and other properties are defined and limited by the rules of the game. The few details which can differ, such as a let-in rubber grip for the hands. etc., are a matter of personal choice, and must be considered when buying the stick, together with the most suitable weight and various nther details.

HOE: In the Garden. The gardening implement known as a hoe is used for breaking and loosening the surface soil of growing crops, in order to admit air and warmth to the roots, and also for eradicating weods. Hoes are divided into two sorts, draw and thrust.
The draw hoe is pulled towards the operator, and in travelling the sharp edge of the blade not only breaks up the soil, but cuts through any weeds it encounters. The hlade is solid. The Dutch or push hoe lias a flat blade, attached to the handle by two metal arms which together make the shape of a horseshoe. The edge of the blade goes into the earth with a cutting motion, and removes the weeds, leaving them lying on the surface.

Hoes are made in all sizes, from 3 in . to 10 in . acruss, and the handles are 4 ft . or 5 ft . in length. See Gardening: Weeds.
HOGMANAY. The night preceding New Year's Day is known in Scotland as Hogmanay. It was formerly the occasion of widespread festivities in the north of England, as well as across the border, and it is still customary to give parties on this night, the guests remaining to welcome in the New Year with song and dance. On the stroke of midnight the dancing is interrupted, and all join hands and sing a verse of Auld Lang Syne.

The custom of exchanging gifts has been superseded largely by the Christmas observances, but it is still a feature of many gatherings. Another old custom which is widely practised is for children to go at night from door to door singing and receiving presents of money and fruit, after the fashion of the carol singers in England. They are known as guisers, and usually wear masks or blacken their faces, wear borrowed clothes nad otherwise disguise themselves.

HOLD ALL. In form this is a straight length of waterproof canvas, lined with some strong material and bound with leather. The lining has various pockets in it, designed to take sponge,
etc., slippers, and all the small things which have to be packed at the last moment. getting mellow, and has Hoo. Fig. 1. Dutch hoo. It should periodically A strap with a handle is then adjusted to be unwrapped, and, if the wood shows signs of secure the whole, and the parcel is complete. becoming too dry, a little oil should be rubbed in. Ses Luggage.

## Holidays and Holiday Making <br> Touring Abroad and Seaside and Country Vacations

For further interesting information on this subiect see Boarding House; Furnished House ; Lodgings ; Packing; Tent, etc.
Apart from the question of expense, several cases mentioned is attained by the combinaconsiderations enter into the choice of a tion of lake and hill. Much of Scotland forms holiday resort. Persons with young children a popular holiday resort of this nature. The will usually select one that does not involve Trossachs, the islands of the west coast, the a long railway journey, while they.will want glens of Perthshire and the border country to go where the sands are good and safe. afford sone of the finest holidays that the Personal tastes largely determine the choice. active body and brain can desire. In addition An increasing number of persons play golf to these special areas, there are all round the on holiday, so they will look for a place with coast, as in Enyland, watering-places varying in good golf links.

Of those who go into the country for a Scotland, and there the tourist is less amply holiday, many simply seck change and quiet, catered for, but the scenery in the west, both and as long as these are secured the exact spot in Kerry and (ialway, as well as in Donegal chosen matters little. Others will select an and elsewhere in the north, is not inferior to area which is pre-eminently a holiday ground. that of Scotland.
such including N. Wales, the Iake District and Holidays Abroad. A continental holiday Dartmoor. These attract the lovers of wild is becoming increasingly attractive. Switzerand beautiful scenery, which in two of the land, mainly but not solely loved by the
mountainecr, has long been visited by thousands. Others go to see the architectural and other glories of the cities of France, Italy and the Netherlands. The beautics of the Rhine and Tirol attract others, while an excellent holiday can be spent in the Ardennes, or in Brittany. Apart from these holidays, which are rather in the nature of tours, people can take their families to French and Belgian resorts, where are all the advantages of the ordinary seaside holiday, and gain in addition some insight into the specch and customs of a foreign land Such visits cost little or no more than holidays at home.

As regards accommodation, holidays may be divided into tours, where one journeys from place to place, and those passed all in one spot. In the former case some persons go from one town or village to another, trusting to find board and lodging when they arrive. Many of these are motorists, for whom the hotels cater, but others are walkers who may desire humbler and cheaper quarters for the night. The addresses of such quarters can usually be obtained from the police and the post office, while many will turn to a village inn.

## Motoring and Foreisn Tours

Motoring tours are arranged by companies for an inclusive fec. These holidays involve constant movement and staying at a different hotel every night, during the period of the trip, but enable persons to see a great deal of the country at a minimum of trouble to them selves and in a very short space of time. One drawback is that as seats must usually be booked some time in advance, the holiday may be taken in unfavourable weather.
The advantages of personally conducted tours arranged by various tourist agencies for an inclusive fee are more obvious when they are taken in foreign lands than when they are taken at home. In both cases the tourist is as ved trouble, but in a foreign coun try this is much greater. He may be ignorant of the language, or at least imperfectly acquainted with it; he probably knows little or nothing of the charges made by the hotels and pensions, or of their suitability or the reverse; while the business of getting from place to place presents other difficulties. Moreover, he need only carry with him a comparatively small amount of foreign money.

Under the direction of qualified conductors tourists can go in parties to the lakes and cities of Italy, the cities of the Loire, the Rhine land, Belgium, Holland, Provence, Brittany, and many ot her districts further a field. The fees for these tours are paid in advance, a small sum being required when the tour is booked and the balance just before leaving home. The fee does not include the cost of travel to Indon, or wherever the trip starts from. The intending tourist should acquaint himself with the conditions, and will be justified in assuming that the fee only provides for those items that are specifically atated as covered by it. For instance, on some tours teas are not provided.

Holiday Accommodation. For persons who take their holidays at the seaside or in the country there is a choice of accommodation, but this depends largely on the money avail. able. Many persons go to hotels, where the charges are usually so much a week, and for those who can afford it there are many advan tages in this kind of accommodation. The names of hotels can be obtained from a railway guicle, or the advertisements in the newspapers. It is well to write beforehand and inquire the charges and also to book the rooms required.

Many persons go to boarding houses where they are accommodated at a fixed price per week. These are usually less expensive than hotels. Hydros, turned from their original purpose, cater especially for visitors who wish for social life. In these cases, as with hotels,
charges should be ascertained beforehand and the rooms should be booked, especially if the season.
The majority of visitors to the scaside, how ever, go into furnished rooms or apartments Here the usual method is for the visitors to pay for rooms and attendance, but to ן,rovide their own food They pay according to situation, size and ot her matters, usually so much a week. The local paper and also papers circulating in large towns generally contain the addresses of persons who let apartments, and the railway companies issue lists in their guide books. Most watering places also issue guides, obtainable from the town clerk.
Persons taking apartments should see that the terms of the contract are clearly stated in writing so that they may know what to expect from the landlady. Farmhouses arc specially attractive to some persons who like a country holiday, and some of them take in visitors, much as boarding-houses do: but their number is not large. Such addresses can be obtained from the guides issued by the various railway companies.

Another inet hod is to take a furnished house. This has some advantages, especially for a large family, but it entails much work upon the mistress of the house and her assistants, who have not only to do the catering, as in apartments, but also the cooking and other houschold duties as at home. On the other hand the fainily can do as they like, being free from the restraints of an hotel or boarding. house. Furnished houses are usually taken through an agent at so much for the week or month Here particular care should le taken about the contract. The person taking the house should know exactly what is provided and what is not, while the understanding ns to breakages and the like should be clearly set out. Furnished cottages and bungalows can be taken on similar lines. They can be obtained through the advertisement columns of a newspaper or from a local house agent.
Safeguarding the Home. Before going away for the suminer holiday the householder has to arrange for the security of the house during his absence; the longer he is away the more necessary it will he either to shut the house up or put in a caretaker. Caretakers are usually married conples of the working class, but of late years many ex-service men have undertaken this kind of work. They receive a fixed sum per week and very often gas and coal in addition.

Sometimes two families living in different parts of the country exchange houses, to thair mutual advantage, particularly if one house is at the seaside and the other in some inland town. Such arrangements are not confined to friends, but are carried out through the medium of advertisements, which bring people living in widely separated areas into communication. The result is a holiday for both parties on more economical terms than is possible under ordinary conditions.
If the house is to be shut up during the absence of the family, the chairs can be assembled with other articles in the centre or in a corner of the various rooms, and covered over with dust sheets. Carpets and linoleum are seldom touched even when the holiday is a long one, and mats also may be left to protect the carpets, although sometimes these are beaten and put a way, sheets of paper being laid over the carpets.

Curtains need not be taken down, as a rule, nor are blinds always drawn; hut in rooms that get much sun the blinds are better drawn, if only to save the carpets. This, however, has the disadvantage of indicating to those who may be on the wateh to rob an empty house that it is in that condition.

It is when clearing up prior to a holiday that the housewife realizes the value of cup boards. Into them will go the vases and
ornaments that need not be left out to collect the dust; they also talie in the glass and china, together with a miscellaneous collection of other goods. Cooking utensils should never be left dirty, but be thoroughly cleaned and dried so that they are ready for use when the family comes back. The bright parts of the kitchen range and the gas cooker, as well as the grates and fenders in the other rooms, may be rubbed with vaseline to prevent rusting.
Where poultry arc kept it is usual for a neighbour to undertake the task of feeding in return for the eggs Another plan, which many prefer to make, is a business arrangement with some trustworthy person living in the neighbourhood who for a weekly sum will take charge of the birds, and dispose of the eggs at the market price. When all these things have been attended to, turn off the gas and water, and see that doors and windows are securely fastened. The post-oflice should have been apprised already of the new address, which is also commmicated to the police when the keys are entrusted to their keeping; and they should be informed of the time during which the house will remain without an occupant. Any specially valuable plate or jewelry is sent generally to a bank for safe custody, but if in a safe at home, this fact should also be made known to the police.

HOLLAND. Made chiefly for use as window blinds, hollands are medium-weight linens or cottons, plain woven, stiffened and glazed in finishing to fill up the texture of the cloth, the hetter to exclude light and prevent the lodgment of dust. Unglazed, plain brown linen sold for children's dress, overalls, etc, is known as holland. Holland may be washed according to the directions given for white cotton goods, and if of a yellow-brown colour. a little tea should be added to the final rinsing water. Holland should be atarched and ironed in the same way as prints.

HOLLANDAISE PUDDING. To make this, is custard, Havoured with ratalia, is poured over 4 small sponge-calies and $15-20$ ratatia biscuits broken into sinall pieces After this 3 oz of mixed preserved fruits cut up finely and $1 \frac{1}{2}-2 \mathrm{oz}$. of sweet almonds. blanched and shredded, are stirred in and the pudding poured into a mould.

HOLLANDAISE SAUCE. To prepare this 3 tablespoonfuls white vinegar, 2 oz. butter. 2 yolks of eggs, and salt and pepper are required. Boil the vinegar to reduce to one tablespoonful. then add two tablespoonfuls water and pour over the egg yolks. Melt half the butter in a small basin and add the egg mixture. Put the basin in a pan containing boiling water and stir until thick. Add remainder of the lutter away from the fire and stir unlil smooth. If too thick add a little hot water.

HOLLY. This, the finest native evergrees is invaluable for herge planting, and the

Holly. Berry-bearing twig of the
common British holly tree ornamental varicties are admirable lawn trees. It grows slowly and is long lived, therefore it pays to dig the ground deeply and to fore planting Plant holly at the correct season, otherwise it mayfail, especially if theplants ste large.

May and September are the proper times for larity is imparted tu any clothes made from this work. If the weather is dry the soil them. Hence homespun has become a name mugt be kept thoroughly moist by watering. and it is beneficial to spray the leaves with water in the eveninge of hot days

As the male and female flowers of holly are on separate trecs it is neccsaary to plant trees of buth sexes to ensure a crop of berries. The correct time to clip holly, whether grown tas a herlge or as a specimen tree, is in April or carl! May and in August. In order to preserve tho symmelry of isolated holly irees, long atraggling shoots should be cut out in summer Propagation is by cuttings inserted in sandy soil in a frame in August or by seeds sown out of doors in autumn. There are many fine varicties of the common holly (llex aquifolium). These are some of the best: Golden Queen, aurea marginata, Silver Queen and Handsworth Silver (all of which have coloured leaves), camelliaefolia and altaclarensis

HOLLY FERN. This is the popular name of a British fern (Aepidium fonchitis). It

Holly Fern grown as a pot plant for indoor decoration
makes an excellent pot plant for a room window or may be grown out of dloors in shade.
BOLLYEOCE. This stately old plant, of which the botanical name is Althaea rosea, is a general favourito and invaluable for planting towards the back of the herbaccous horiler, where its tall spikes of bloom are conspicuous in summer. It needs rich, reeply dug soil to be seen at ita best. Planting inay bo done in autumn or in spring, preferably at the latter neason, on heavy soil.'

Although the hollyhock is a perennial it is usually most natisfactory when treated as a biennial and grown from seedn sown each year out of doors in June : the seedling are planted finally in October or if necessary aro potted and kept in a frame during the winter. Both single and clouble varieties may be raised from seeds. If it is wished to perpetuate any specially fine variety, cuttings of basal shoots may be inserted in pots of sandy suil in a frame in August If hollyhock seeds are sown in a heated glasshouse in Janu. ary and the scedlings are planted out in May they will be in full bloom in August. The fig-lcaved hollyhock (Althaea ficifolia). with ornamental leaves and yellow flowers, is not commonly seen.

chicfly for woollens of a rough character.

Wool and Hax are the two materials must capable of being homespun, but whether cloth is any better, apart from its rasitu, in being homespun is to be doubted.
I)issatiafaction has been expressed with the durability of cloths admittedly homespun, and too much should not be expected of them The fact that they have been made by hand does not neccssarily gualify them for good service Tho quality of the raw wool, the fineness of the thread. and the tightness of its twisting decidle the question of durability. Homespuns rightly command a higher price than machine-made articles, and are valued for their individuality more than for any other feature.
HOMINY. The coarse kind of flour known as hominy is prepared from the inner portion of the maize : it is not considered so wourishing as preparations made from the whole grain It is used principally for the making of porridge.

Some recipes allyocate cooking nearly all day after soaking it over night in boiling water. But if well soaked and boiled slowly it should not take longer than an hour to cook. Add salt before boiling, and more water if necessary After the grain is conked drain away surplus water and add a lump of butter, salt or sugar, and cream-some people prefer selt and pepper to augar. Hominy cooked thus will make a good pudding for children, and it can be served with iam, honcy or treacle. Siee Flour.

HONE: Its Uses. The word hone is often applied to an oilstone, which to a large extent it resembles, except that a hone is a fincr-grained stone, and adapted to the sharpening of the keenest tools. It is made from a block of compact stone having a smooth surface, or very fine grain such as novaculite. Other varieties are made from a soft. smooth, yellow slate known as German hone. The oarborundum is made from the finest hand-washed abrasive powders, and produces a very keen edge. For general instrument sharpening the carborundum is good ; for razor work the yellow, er Belgian rock, hones are preferred.

HONESTY. This is the popular name of a hardy bicnnial plant (Lunaria biennis) with purplish Howers in spring which are followed by the silvery seed pods so much valued for vase decoration in the home. Honesty will flourish in poor soil and in sunny or shady places : it is grown frum seeds sown out of dours in May cach year. Once it has been grown in a garden there are usually numerous selfsown seedlings to be found. The white varicty, alba, is very attractive

HONEY. The honey produced by the bee consists chiefly of levulose and dextrose, the former being the Huid portion. Its Havour depends to some extent upon the Howers visited by the bee when a particular section of the comb was being filled.

The finest iliquid extracted honey is bright and clear, of a light amber colour, and delicate in flavour and aroma. Extracted honey, when granulated, should be of fine, even grain, creamy white

Havour There are many grades of medium and dark-coloured honeys which fail to rearh this standard, but which are excellent in Havour and aroma ; and in some localities these will sell more readily than the lighter samples. Colour does not affect the cating qualities. For instance, heather honey commands the highest price of all. It is in a class by itself, dark amber in colour, gelatinous in consistency, and redolent of the moors buth in aroma and Havour.

Honey Cakes. The ingredients required are 4 oz. honey, 8 oz . Hour, 1 tenspoonful ground cinnainon, it teaspoonful carbonate of soda, 4 oz. sugar, 4 oz . butter, 1 egg a little milk.

Sieve the flour with the ground cinnainon and carbonate of soda. ('ream the butter and sugar. Separate tho egg yolk from white. and beat the yolk into the creamed fat and sugar. Then add the honcy gradually. Stir in the flour with a little milk as required to make a fnirly stiff inixture and mix all together lightly Whisk the egg white to a stiff froth and fold into the mixture. Half fill some small baking tins with the mixture, dredge the top of cach with castor augar, and bake in a hot oven. They will take $1{ }^{i}$, to $2(0)$ minutes.

Honey Pudding. Four cggs, ipint milk, a tablespoonful honey, and some slices of bread are required to make honey puilding. Cut the bread into cubes, put these intc a buttored mould, and pour over them a custard made with the milk, eggs, and honey. Allow it to soak for 15 min ., and then steain the pudding gently for I hour. When set, turn it out of the mould and dust it with eastor sugar.

Medical Uses. Apart from its use as a foorl, honey is employed medicinally. It serves as a demulcent and a laxative, but large doses

Honeaty. The flat, white seed pods used for indoor winter plant, much used for indoor winter decoration should be a voided, as they may cause flatu. lence and griping. It is frequently used as a vehicle for administrationof drugs. as an addition to gargles and an external a pplication to ulcers. Because of its soothing propertics. it is excel. lent for relieving a flections of the throat, and, mixed with lemon juice, forms a cure for coughs. ()ne recip? for this preparations is as follows: lour the juics of a lemon over two terspoonfuls of honey and mix well. A teaspoonful of brancly in addition is useful as a corrective, and assists in cutting the phlegm. Honcy is also employed to make soaj, and in cookery. See 13ce; Bechive.
HONEY SOAP. This is made by cutting 2 lb . of common yellow or white somap into thin shavings, and puiting them in a pan over the tire with just enough water to keep them from louruing. When they have melted, adl $\& \mathrm{lb}$. of honcy, and st:r the misture till it buils. A few dropas of any perfume may then be added, and the soap poured into a deep dish to cool. See Soap.

HONEYSUCKLE. There are both climbing and non-climbing honeysuckles, but the former are the chief favourites The climbing honeysuckles are first rate summer-flowering plants for covering arches and trellises.
 climbing plant
planted against a hot sunny wall they often become disfigured by the attacks of greently: The plants should be pruned when the llowers are over by cutting out some of the oldest shoots : if this work is neglected overcrowding and sparse blossoming will result. Propagation is hy cuttings inserted out of doors, or in sandy soil in a frame in autumin. Plants set in autuinn or spring in deeply dug and manured soil grow quickly.

The common woodbine or honeysuckle (Lonicera periclymenum), with reddish-yellow, fragrant llowers, and its varieties belgica and serotina. which bear reddish blooms, are valuable climbers; so, too, is Lonicera caprifolium, creann white and scented. Two evergreen varietics of the Japanese honey suckle (Lonicerar japonica), named Hexnosa and halliana, which have pale vellow Howers, are other good climbing plants: the variety nureu-reticulatn is grown for its pretty green and vellow leaves. The scarlet honeysucklo (Lonicera sempervirens) is less hardy than the others named, and except in mild districts is better sulted to greenhouse cultivation. Ionicera fragrantissima, with white swect scented Howers, and Standishii, with creamcoloured blooms, are two of the best shrub honersuckles: they blooh in carly spring and should be planted in a sunny place.
HOOK: In Dressmaking. The hooks used in dressmaking are usually sold on cards, together with an equal number of eyes to match. They can be had in black or white and in various sizes Hooks and eyes aro frequently replaced by patent fasteners, which are neater.
HOP. The common hop (Humulus Lupulus). which is perennial, and the Japanese hop (Humulus japonica), an annual, are vigorons, quiok-growing climbing plants for covering arches and arbours. Both thrive in ordinary well tilled soil. The perennial hop, which may be planted in autumn or in spring, is decorative when laden with its fruit clusters late in the summer. The stems are cut down in winter. The variegated leaved variety
of the Japanese hop is more ornamental than the green-leaved one and is usually grown in preference to the latter. Seeds of the Japanese hop are sown in the greenhouse in March, tho seedlings being planted out of doors in May.

HOPSACK. Hopsack cloths are nimost invariably wool and of a single colour, though they may be striped or checked, presenting ia neat dranght-board or chequer appearance. In a perfectly plain cloth the threads go under and over each other one by one; in ia hopsack squares of four, six, or eight threads go alternately over and under. Hopsack woven in sma!! squares is stronger and firmer than when the cheyuers are large. The cloth feels rather fuller than if the same materials had been plain woven.

HOP SCOTCH: The Game. The children's game of hop scotch can be played on any Hat stretch of ground, provided the sulface can be marked with chalk or a similar substance The only implęment required is a Hat stone, an oyster shell, or something of the kind, called the clipper. It can be played by two or four: players. The space is marked out into squares or oblongs, the number, arrangement and size of which varies to a considerable extent. Scven oblongs make a simple gaine. They are numbered I to 6 , the top one being known as the pudding. More nest-building.

lines. The clipper must not lie across a line when it is kicked. The player must kick the clipper in proper order through all the compartments. If any one of thesc rules is broken, the player who is placed ncxt in turn takes up the game.

HOREHOUND. The dricd leaves and Howering tops of Marrubium vulgare, or horehound. contain a volatile oil which is utilized in bronchial affections mainly as a constituent of lo enges and cough syrups. and also a bitter principle which has tonic properties. See Bronchitis: Cough

HORN: In Decoration. Handlos for sticks, umbrellias, knives, and other cutlery articles are sometimes made of carved horn. It is also occasionally used for beads and pendants and freguently for spectacle frames in place of tortoiseshell.
A cement for horn consists of shellac dissolved in methylated spirit to form a mixture of the consistency of thick cream The horn should be warmed, thinly coated with the cement. and the parts bound together and left until the cement has set hard. See Spectacles.

HORNET: Its Sting. A member of the wasp family, the hornet is not: common as a depredator of gardens, but sometimes it strips the skin from dahlia shoots to use as material for ment may be used. The ground plan is called the scotch.
Standing a little way from the first compartinent, the players decide who shall play first by throwing the clipper to the pudding. The one who lands it neinest a circle in the centre of the pudding plays first. Each player in turn takes the c!ipper and throws it from the point marked $A$ into the first compartment. He then hops to it, and while hopping kicks it with the foot which he has on thic ground back towards $A$. 'This done, he pitches it into the second compartment and, again hopping. kicks it again towards A. This process is repeated until all six compartments have been reached and the clipper kicked back each time compaitment by coinpartment to A, provided the player has not lost his turn for one of the reasons given later.

When compartment 6 , or whatever is the highest number in the gime, has heen reached, the player pitches the clipper into the pudding compartment. Then, hopping to it, he sends it with one lick straight down to $A$. A turn may be lost in various ways. The clipper when pitched must not lic across a line. It must not he pitched into the wrong compartment. The player when hopping must not put down the raised foot until he has kicked the clipper out of the compaitment. His foot when hopping must not touch one of the

Bop. Spray of the common hop. shoiving leaves and scaly green fruit. avoiden, as the bites are rery painful. When be extracted. and if solution of alin it should be extracted. and if solution of ammonia or bicarbonate of soda is at liand it should $b$ : applied, the latter as a paste Pain may be relieved by fomenting with a hot solution of bicarbonate of soda. See IBite.

HORNET MOTH. This insect is usually seen about the beginning of June, and its larvae, whitish-yellow with blackish-brown heads, during
autumn and winter fecd on the stems and roots of poplar trees. Sughested remedies are spraying in February with a caustic soda wash

Hornet Moth. Insect pest which made of $2 \frac{1}{2} \mathrm{lb}$. of caustic soda and 10 gal . of water. Uncovered portions of the body should be smeared with vaseline and gloves worn, dusing use, to avoid hurns from the solution. Juring autumn spray the infested trees and dig in deeply around them a mixture of one part naphthaline to tivo parts of fine ashes. Sce Insecticide; Spraying.

HORS D'OEUVRES. Savoury small dishes are served under the name of hors d'ocuvres at lunchion and dinner before the soup, with the obicct of giving a zest to the appretite. These dishes are prepared from various fancy sausages, smoked lish or lish, preserved in oil, choice salad herbs, olives, gherkins, foic gras, caviare, oysters, and hardboiled eggs, which serve as cases, the volk of the egg being stuffed and the white forming the case.
The snusages are skinned and cut in very thin slices, and the fish, if in oil, must be dressed: that is, the oil should be strained off, the tish wiped, nud fresh ail poured over, with ą little white wine or thavoured vinegar and a seasoning of salt and cagenne. Anchovics are soakod in cold water to remove the salt, and they should be boned. Sardines also should be boned. Smoked fish is served

Bors d'Oenvres. Typical dish of hors d'oeuvres, six favourite varieties being
served in separate compartments
in alices or small portions, according to the character of the fish Russian and mayonnaise salads are always popular. Beetroot or potato for salads ahould he diced. Cucumber is aliced and dressed with oil, vinegar, and seasoning. The yolk of hard-boiled eggs is pounded with anchovy butter and chopped gherkin to make fillings for the halved whites.

Scalloped rounds of fried bread make dainty hors d'ocuvres with either a teaspoonful of caviare clecorated with savoury butter or a fillet of anchovy wrapped round a ball of egg yolk which has first been moistened with tomato sauce placed on them. Celery may be dressed with mayonnaise sauce. Tomatoes may be dipped in boiling water, skinned, sliced, dressed with equal quantitics of oil and vinegar, and sprinkled with finely chopped party, comprising potato salad, sliced bcetroot marinaded in vinegar and oil and sprinkled with minced parsley and onion, prawns (excellent tinned prawns are obtainable), truffled liver sausage thinly sliced, stuffed olives and sardines. An equally good choice would be Russian salad, egg mayonnaise, fillets of sinolied herring. Spanish olives, tomato salad, smoked salmon on buttered canapés. Grape fruit and melon are also served as hors d'oeuvres.

Butter should be attractively made into sinall pats, balls or curls, placed in a glass dish on the table. Kolls, crisp bread, and toast should be also offered with this first course at luncheon or dinner. Special scts of knives and forks are obtainable, or fish cutlery can be

## Horses for Driving and Riding

## Hints on Buying a Horse and Its Maintenance

Our work contains ortic.es on Bit; Groom; Harness; Stable and other subjects assosiated with the horse, and also entries on the several vehicles drawn by horses, eg. Landau:
Victoria. See also Curry Comb

The horses that are chiefly in demand to day are saddle hacks and ponies used for riding A horse of this kind should stand still when being mounted, possess a snaffle mouth and be easy to ride. For general utility, the best horse is the hackney, but this is more suitable for the harness than for riding. A good hackney can be of any colour, but bay and chestnut are the most favoured.

Buying a Horse. Perhaps the heat method of purchasing a horse is to write to one or two studs and state requirements, or to insert an announcement in one or other of the stock breeders' journals, stating the wants in the advertisement as to age, sex, colour, pedigree, and whether perfectly broken to harness and frec from any form of vice or ohjectionable habits, either in the stable or in traflic. The best age to buy is five or six years, and the best colour is dark bay, but this is a matter of individual choice.

Do not let colour prevent purchase if the animal is sound and suitable in all other respecta. Previous to purchase have the animal examined by an experienced veterinary surgeon; the fee ranges from one to two guineas for each horse examined. The intending purchaser should satisfy himself first of all as to the suitability of the horse in all other respects. Many buyers purchase at the horse repositories either in London or in the provinces, and some high-priced horses are bought and sold through these channels.

The animals can be examined prior to sale, but the opportunities for examination and trial are not always very satisfactory Anyone visiting a repository should read the catalogue carefully, as many of these announcements are liable to deceive the unwary buyer Many animala carry a specific warranty, such
as sound in wind and eyes. In some instances these two fentures are about the only qualitications that the animal does possess.
If a horse purchased does not comply with the catalogue description, the buyer should proceed to have it examined and ocrtified by a veterinary surgeon. The horse, together with the veterinary surgeon's certificate, should be inmediately returned to the auctioneer, accompanied by a letter from the buyer stating the reason for its return. The horse repositories have regulations providing for the return of an animal that does not conform to description; thercfore if the buyer complies with stipulation he should have no trouble whatever concerning the return of his money, together with any reasonable expenses incurred
The foregoing remarks apply to all classes of horses, both light and heavy, ponies, cobs, hunters, etc., purclased at repositories Horses bought at farnıs, markets, repositories, eto., without any warranty are purchased under the legal rule of caveat emptor (let the buyer beware). and cannot be returned unlass the transaction has been a fraudulent one. If buying from a private person the buyer should endeav our to obtain theanianal
lection for $n$ small
parsley and onion Salads for hors d'oeuvres can be made out of any left-over vegetables, such as caulithower, beana, carrots, peas and potatocs, and dressed with salad cream or with mayonnaise.

How to Serve. Long glass or china dishes arc obtainable for hors d'oeuvres with separate compartments for from 4 to 10 varieties. The one illustrated contains a good sc-
 time. The shoeing of heavy draught horscs in winter, especially if there is ice on the roads, necessitates roughing or sharpening the toe and heel caulks. Shoeing with pads and leathers should be avoided if possible, as they are liable to damage the feet.

Care of the Horse. Regular exercise, good Care of the Horse. Regular exercise, good
grooming, and a liheral allowance of food and water, with a comfortable bed of straw and well ventilated, properly drained stables, are necessary for the health of all horses. When in the stable a horse requires feeding three in the stable a horse requires feeding three
times and a liberal amount of hay between meals.

Oats, either whole or bruised, should be the staple food, but these can he mixed with dry bran, chaff, beans, peas, lentils, etc. Punies
thrive well on 6 lb . of oats per day if these arc thrive well on 6 lb . of oats per day if these arc mixed with chaff, and $\frac{1}{2} \mathrm{lb}$. of some other cereal such as maize. The amount of oats per day ranges from 6 to 15 lb ., the latter for heavy drauglat horses. The condition of the animal and the work it has to perform must be taken into consideration. If turned out to graze, it is an advantage to give 2 or 3 lb . of oats daily, and a little linseed cake, say, 1 lb ., as grass flesh is much too soft for working purposes.

Horses with long coats require clipping several times a year. The whole of the body and limbs may be clipped, or the hair corresponding to the saddle and that on the limbs may be left untouched. In the winter a heavy woollen rug or two should be put on whilst the animal is in the stable, after it has been clipped, with or without bandages on the lower part of the limbs. Never put rugs on a horse directly it comes in from work, but allow its body to cool tirst. Again, do not allow its body to cool first. Again, do not for the same reason. A couple of quarts of

Horse. Prize-winning hack, with names of the various parts
on a week or ten days' trial, this being a reasonable request when the parties are known to eacli other. When a warranty is given, it is better for the buyer to have it in writing, though a verbal warranty and the presence of a "itness is quite good in law. The price paid for a horse, no matter how high, has nothing whatever to do with its soundness or otherwise
Necessity of Shoeing. All horses require to be shod regularly, say, every three weeks, but some carry their shoes several weeks longer than others, whilat the same animal may wear out two sets of fore shoes to one set of hind ones, or the converse. The feet should never be allowed to become long, as this predisposes to stumbling. Shocs must be removed every three weeks to prevent this.

During frosty weather frost cags should be fitted to the shoes, but the farrier will usually see to this matter if instructed at the proper and limbs may be clipped, or the hair corres-
cold water will help to cool the body, and this never does any harm.
The general-purpose horse is generally kept steadily at work, and is therefors stabled and not run at grass. But an animal that is well and carefully fed and driven will stand an immense amount of work without suffering. It must be fed according to the work it is doing. Enforced rest and rich feeding will produce swollen legs and other troubles. It must be remembered that the stomach of a horse is small, and that it works best with its stomach about two-thirds full. It is not well to leave a horse for more than five hours without a feed. In any case, it must never be worked hard on top of a full fecd, as that treatment invariably results in brolien wind A horse should be watered before it is fed, but it is a great mistake to allow it to drink freely of cold water when it is sweating. Ifter severe exertion warm gruel should be given

After a horse is taken in from grass the ration of oats should be small at first. Oata nnd beans are the strongest diet, and a horse of 15 to 16 hands which is in steady work will require 12 lb . of oats daily besides hay. But no rule can be laid down, for horses vary considerahly in the matter of appetite. When a reduction of dict is necessary bran mashes should be given instend of oats.

Next to feeding, good grooming is most important, and it tnkes a man an hour daily. The implements required are dandy brush water brush, curry comb, mane comb, and hoof pick. Many grooms use the curry comb on the horse's hody, but this is a mistake; as the curry comb is for cleaning the dandy brush. When a horse comes in hot it must be rubbed down first with $\pi$ wisp of twisted straw, afterwards, if necessary, with a cloth. No attempt must be made to use the brush until the animal is quite cool. The feet of a horse are usually its weakest point. If a horse's feet are neglected, or if it is allowed to stand on wet bedding, cracked heels and the ailment called grease will supervene. The feet should be cleaned with the hoof pick three times a day. In the harness-mom a bottle of antiseptic should be kept for cuts or galls.

Good bedding is essential, and wheat straw is the best material. If moss litter is preferred, 1 cut. should be put down to begin with, and it must be renewed at the rate of about 6 lb . per day. If sawdust be used, the depth over the stable Hoor must be 4 in. Jracken makes good bedding, but the stiff stalks should be removed.

HORSE CHESTNUT, The common horse chestnut (Aesculus hippocastanum) is a native of Greece, though it has been largoly planted in Great Britain. Chestnut Sunday is the day on which the famous chestnut trees forming an avenue in Bushey Park, Hampton Court, are in full bloom. This leaf-losing tree attains a large size and grows quickly. Propagation is by seeds sown out of doors in antumn: named varieties are increased by hudding in summer or by grafting in Maroh The red-flowered horsc chestnut (carnea) is to be, recommended for planting on a lawn. Other chestnuts are flava, yellow-flowered (the American sweet buckeye), and parviflora, which grows only 10-12 feet high and bears white flowers in August

HORSE FLY : Its Bite. In cases of this kind bleeding should be encouraged, and then a solution of ammonia, bicarbonate of soda, washing soda (weak) or permanganate of soda (strong) applied. After, a dressing of moistened boracic lint covered with gutta-percha tissue or oiled silk may be used. See Bite.
HORSEEAIR : In Upholstery. This is the best stuffing material for furniture and inattresses. It is procured from the tails and manes of horses, that from wild horses being the most highly prized. Very little is
obtained from England, the greater proportion containing jusl enough vinegar to cover them. used in the upholstery trade in Great Britain Keep the jars air-tight and in n cool, dry place. being imported from the Continent, China, the Argentine, Australia, etc. It is the shorter hair that is used, and of this there are several qualities, judged according to springiness, length, and curl The curl, or spiral form imparted by the manufacturer, emphasizes the buoyanoy which makes horschair so valuable in upholstery. Adulteration with other hair often takes place.

Besides its resilienc!, horsehair is light in weight, and when made up with skill it enables furniture to preserve its shape and comfort for many years Even after half a century's use, when renovation may be essential, the horschair stuffing can be reteazed or carded, and replaced almost ns a new material. The cost makes it an expensive medium, but the buyer will be repaid by the comfort and durability of the furniture in which it is used, and by a good return of capital so spent in case of re-sale.

Articles upholstered entirely with hair are necessarily more expen sive than when made up with $\Omega$ mixture of hair and other materials. In the latter case, the first stuffing of the piece of furniture is either of fibre or wood-wool, or a mixture of hair with these or with Hock, the second stuffing, or that which comes immediately under the outer coverings, being alone of pure hair. It should be borne in mind that although quite serviceablc, articles atulfed.in this way cannot he expected to equal in ease or durability those made up with horsehair jet, and an attachment to connect to the alone. See Mattress; Upholstery.

HORSERADISH. The way to grow good horseradish, which is so much liked ns a Havouring, is to plant a few roots each year in January or Fehruary in deeply dug soil; they should he set at 10-12 inches apart, the tops 6 inches below the surface. The only trentment required during the summer is to keep down weeds by hoeing between the rows. In autumn and winter the roots may be lifted ns they are wanted, or all can be taken up and stored in sand, ashes or soil. For replanting, choose some of the straight pieces of root. The horseradish bed is often left undisturbed for years, with the result that it becomes a very difficult matter to get rid of the roots

Uses in Cookery. In cookery, the horse radish, with its atrong, mustard-like taste, is used mainly as an accompaniment to roast becf. When required it should be washed and scrubbed, left to sonk for an hour in cold] water, and then scraped into shavings with a sharp knife. It may be served separately in a glass dish or used to garnish the meat. Horseradish inay be atored in powder form in tightly corked bottles. The sticks should be sliced and dried in a cool oven before being pounded.

To make horseradish butter, clean and scrape a stick of horseradish, and pound it in a mortar with a lump of butter ahout twice the size of an egy, $\frac{1}{2}$ teasponnful of chilli vinegar, a few drops of lemon juice, and cayenne. Pass the mixture through a fine sieve before spreading it on a dish to set. Serve with grilled stenk.

Horseradish Pickle. A pickle may be prepared by scraping off the outer skin firmm some horseradish roots, cutting the latter into short lengths, and then putting them into jars

Horseradish Sauce. To a grated stick of horseradish add $\frac{1}{2}$ tenspoonful of made inus. tard, a teaspoonful of castor sugar, a tablespoonful of vinegar, and a pinch of salt. Slightly whip $\frac{1}{4}$ pint of cream mix it in and keep in $\pi$ cold place until required
HOSE PIPE. The term hose pipe is applied to rubber, canvas, and other tubing adapted for watering purposes Varietics include the ordinary ruhber pipe, made from india-rubber, and a similar type made with an internal lining of canvas A stronger pattern has an extemal nrmouring of coiled wire, that acts as a protection. Suction hose is so constructed as to be non-collapsible Hose pipe for fire extinguishing purposes is made of canvas or leather
The ordinary garden hose is made in three sizes, $\frac{1}{2}$ in., $\frac{8}{8}$ in, and $\frac{8}{4}$ in in diameter. The usual stock length is $\mathbf{6 0} \mathbf{f t}$., with a branch and

EOTBED: In Gardening. A hotbell is used looscly to describe the top portion of a made by heaping up fresh manure which stove where conking is donc. Plates usel for provides "botton heat" and so helps the covering food to keep it warm at meal-times development of plants grown in the soil are also sometimes known as hot plates. placed on it. The usual proceduro is to make up a bed of manure about 2 feet deep and of

An electric hot plate is a useful table appoint-

Hotbeds of various types. 1. Base plan showing hotbed extension and frame. 2. Economical manure compost : a, grass or leaves ; b, horse manure. 3. common hotbed. 4. How to baniz with fresh manure. B. With covering of soil (a) lor planging or outside forcing. 8. Brick frame with interior hotbed $B y$ apecial arrangement will Amateur liardening cooking accommodation is limited. It can be used in any room by fitting the plug into the nearest lamp socket and switching on the current. This stove will fry bacon and eggs, toast bread or crumpets, boil the kettle, heat an iron or sharing water, and also conk vegetables. On a double-burner hot plate, two vessels can be used at once. See Cooker.

HOT POT. The following is a winter recipe: Soak $\frac{1}{2} \mathrm{lb}$. haricot beans overnight and half cook them. Butter beans, lentils, or dried peas might be used. Cut up $1 \frac{1}{2} \mathrm{lb}$. middle neck of mutton into neat cutlets, cutting off some of the fat, if there is too much of it. Then cutinto slices
such a size that it projects 12 inches all round beyond the garden frame placed on it. Sifted soil to a depth of 9 or 10 inches is put inside the frame. Numerous vegetables and flowering plants can be raised in spring by sowing seeds in the sifted soil.

To make the hotbed, fresh stable manure is neceasary : this material must be turnerl several times to allow some of the rank stcam to escape before it is heaped up to form the bed: the manure nust be trodden down fairly firmly. Seeds should not be sown until a few days after the soil has been put on the manure and during that period the frame must be ventilated slightly. In a few weeks the temperature will decline, but it can be maintained by adding fresh manure outside the frame. Hotbeds are also made with manure and dry leaves, the latiter being used in the proportion of one third of the bulk. See Frame.

HOT CROSS BUN. This is a special bun eaten on Gool Friday. It is a spiced bun, made as described in the article luun, and on it a cross is marked with a knife or made in candied pee! before cooking.

HOTHOUSE. This is a glasshouse in which a minimum winter temperature of ifo degrees is maintained to allow of the cultiva. tion of tropical plants, or for forcing plants into early bloom. See Greenhouso.

HOT PACK. The merlical treatment known as a hot pack consists in stripping the patient and rolling him in a blanket wrung out of water at a temperature of about $110^{\circ}$. Two or three other blankets are wrapped outside this, and the patient is kept in the pack for 20 to 30 min . He is then quickly dried with soft, warmed towels, and put in flannel night clothing. A warm drink may be given while the patient is in the pack. The mat tress should be protected by a waterproof sheot, over which a blanket has been laid.

The hot pack is often prescribed as a means of inducing free perspiration in conditions such as Bright'sdisease and otherkidney complaints. See Cold Pack; Nursing.
HOT PLATE. A short-legged iron cooking table or stove with one or more burners is known as a hot plate, but the term is also
$1 \frac{1}{\mathrm{~L}} \mathrm{lb}$. potatoes, 2 moderate sized carrots and one turnip, and chop $\frac{1}{2} \mathrm{lb}$. Spanish onions.
Put all these ingredients, in layers, in a casserole, or fireproof baking-dish, with a layer of potato on top, and cover with stock or water. Cover the dish and bake the hot pot in a good hot oven for abut 3 hours, adding seasoning $\frac{1}{\frac{1}{2}}$ hour before serving, and removing the cover of the dish so that the potatocs may brown. This should be served very hot in the dish in which it was cooked.
For a summer hot pot: Cut 2 lb . neck of lamb into chops, put it in a casserole with enough water to cover it, bring it to the boil, and bake for about 1 hour. Then add a little salt, $\frac{1}{2} \mathrm{lb}$. new potatoes, $\frac{1}{2} \mathrm{lb}$. young carrots, $\frac{1}{2} \mathrm{lb}$. young turnips, $\frac{1}{2} \mathrm{lb}$. spring onions, some sprigs of caulithower, and it lb. green peas. Do not cut the vegetables unless they are large. lake the stew gently until every thing is tender, then add more seasoning if necessary and serve with the meat in the centre, the vegetables round it, in the casserole. See Casserole; Mutton; Stew.
HOT WATER BOTTLE. Hot water bottles are made in a variety of shapes and sizes and in several different materials. Of these the two most commonly in use are rubber and atoneware, while occasionally they are found in copper, aluminium, or tin.
Stone bottles should be heated before they are filled. This inay be done either in the oven, providing that it is not too hot, or with hot water. In very cold weather only the latter method is suitable, and the water should not be too hot or the bottle will crack. Boiling water should be used for the final filling, and should be joured in until it runs over the toll. This will ensure the exclusion of air and cause the heat to be retained as long as possible. If the bottle is only partly filled, the resulting steam may cause it to

## HOT WATER SUPPLY IN THE HOME

Comparative Advantages of the Various Up-to-date Systems
The article on Central Heating may he consulted in this connexion, since some heating systems
are arranged to furnish domestic hot water. Reforence should also he made to Anthracite;
Boiler; Geyser: Grate; Oven; Range; Water Supply

A cood supply of hot water is one of the essential domestic services. A common method is to draw hot water from a boiler nssociated with a fire in the kitchen range (sec Boiler), or from one of the many types of combination ranges The heated water is conducted from the boiler to a reservair or container at a sufficient beight to supply the highest point at which it is desired to draw off the hot water, this being taken to the various points by means of ordinary piping.
A combination boiler of the type illustrated on page 213 , designed primarily for a central heating system, will also furnish hot water for domestic uses, a very convenient arrangenient for a sinall house. Fig. 1 shows a useful type of combination cooking range and boiler for hot water supply. Another system employs a separate aud independent hot water boiler

Hot Water Supply. Fig. 1. Combination cooking range and hot water boiler Courtes, of National Radiator Co
heated by a solid fuel fire, which is kept a light day and night when a constant supply of water is desired. Boilers of this kind are illustrated on pages 20 and 115 . For really ample supplies of hot water at a low cost the coke or anthiacite fired independent boiler is without equal During the cold months it will help to warm the room in which it is installed.
In warmer weather the nerits of a gas or electric system are more apparent, a voiding as they do the need for stoking, and the unpleasant warining of the kitchen. There is no reason, however, why the householder should not install a dual system, using a gas boiler or an electric immersion henter for summer service, when the coke fired boiler or the cooking range is shut down.
Gas-heated Systems. Gas provides a medium for heating water ly two miain methods. In one of these the gas bumer is kept constantly alight and hents a small boiler known as a circulator. A heater of this kind is illustrated at Fig. 17 on page 521. In another type, shown at Fig. 2 on this page. the heater is combined with a storage tank and forms onc complete unit. Heat losses are prevented by lagging the cylinder with insulating material, so that a relatively sinall consumption of gas at the burner suffices to maintain the water at the desired temperature, once the contents of the cylinder have heen heated up.
two-thirds of the total water tap automatically sctting the geyser in operation A small pilot burner remains alight under the geyser and this ignites the larger heating burners as the automatic gas valve is caused to open by turning on the distant water tap. The in stantanenus henter shown controlled by a thermostat.

For a small house tho thermal storage heater, as this type is named, might have a capacity of 12 gallons, the size being governed by the proliable maximum demanc at one time. By menns of a device known as a thermostat the gas llame is raised or lowered by the temperature of the water The mani num consumption of gas is 10 cu . ft . per hour, and when all the water in the cylinder has been heatel up the thermostat automatically cuts lown the consumption to ahout one.fifth of the maximum. The temperature of the water is raised to about 140 deg. F. For a warm bath ahout half water from the cylinder and half cold water would be needed; for a hot bath the cylinder would he called on to yield

The other system of water heating by gas is represented by the instantancous type, commonly known as gcysers, from which n steady llow of nearly hoiling water is obtained within a fow minutes of lighting the burners. These are dealt with in detail in a separate article They are available hoth for local use (i.e. over a single basin or a bath) and for multi-point service. In the latter arrangement hot water may be drawn fiom a number of taps in different parts of the house, the opening of any

Fig. 4. Electric immersion beater for ftting into an existing bot water tank Courlesil of Belling \& Co on page 531 is suitable for multi-point service. A small water heater titted nver a sink is illus. trated at Fig 16 on page 520 . This may be had in sizes to hold \& gallon to $2 \frac{1}{2}$ gallons, and is

Electric Water Heaters. Water is heated electrically by means of a heating 'element' enclosed in a tube. The element is fixed in the tank so as to lie inmersed in the water, so that all the heat generated is utilized.

hold requirements. from the small $1 \frac{1}{2}$ or 2 gallon water henter, useful for supplying a washhand basin or sink (see Kitchen), to an installation of 30 or 40 gallons capacity capah!e of providing ali the hot water required in the largest house. Fig. 3 shows an electric storage heater fixed in a hathroom.

In sina! houses where there is no unduc length of hat wnter piping. it is possible to convert the present hot water tank into an electric water heater by fitting an electric: thermostat and heater into it ( Figs 4 and 5) and by surrounding it with suitable packing of cork or other non-conducting material so that the heat is not wasted when no water is being used. If the capacity of the hot water tank is at least 20 gallons, and the conversion work is carried out by explerienced engineers, satisfactory results should be obtained.

The installation of an electric heater is a simple and inexpensive matter. Only a small amount of plumbing is necessary, and the heater itself can be fitted at the most con venient point in the pipe line. In some cascy the old heating systein may be retained $\mathrm{F}_{1}$ ) that during the winter months when the fire or coke builer must he lit the water heating is done by this method, the electric heater heing automatically switched un when the fire dies down. This is a very economical method

Oil-flred Boilers. When neither gas nor electricity is available, and it is not convenient to use solid fuel, it is possible to utilize an oil-heated geyser Most of thesc employ

Hot Wator Sapply. Fig. 5. Diagram showing dual installation comprising coke-Ared boiler and electric immersion heaters. Ejithor may be used at will. A. expansion pipe. B, cold water storage tapl. C. cold water inlet. $D$, hot wator servioe pipe. E , hot water tank. F, immersion heaters. $G$, cold water foed to solid fuel Are. E, hot water retarn from Are. J, solid fuel Are Courtesy of Belling $\&$ Co.
motor and shuts off the fuel. Conversely, when the temperature falls the pump is set working again and the oil spray is ignited by an electric spark. The apparatus is entirely automatic and is silent in action.

Choice of System. The re!ative merits of the various systems must be determined by individua $/$ circumstances, but points for consideration are, that when the solid fuel system of the cooking stove is used, the fire must be adequate to meet all demands, irrespective of the temperature of the kitchen or the cooking requirements. The system works well when used in conjunction with a inodern portable range, if only intermittent supplies of hot water are needed for baths, etc., and will furnish at other times plenty of water for washing up and similar purposes. The range may be
adapted to burn coke or anthracite coal, or otherwise arranged to remain alight over very lengthy periods.

There are several reasons why the older type of kitchener soldom functions satisfactorily or economical!y as a source of hot water supply. The boiler at the back of the fire absorbs a great amount of heat whether hot water is being used or not, and it has been catimated that this wasted heat may be as much as one third of that given out by the firc. The reader is referred further to the article on Range.
In choosing a water heater it should be borne in mind that, although yas and electric systems when properly installed cost little if any more to run than a coke fired boiler, it is important that heat losses by radiation from tank and pipes should be prevented. Unless the pipes, etc., are lagged with insu'ating material the cost for gas or electricity inay be very largely increased The hot water storage tank should be enclosed within a casing, and the insulating material packed in the space betwcen tank and casing. Where the tank is situated in and heats an airing cupboard, the top of the tank may be left cxposed, as this purtion will give off enough heat for airing purposes. The space between tank and walls of airing cupboard may be filled with the insulating material, and no casing is necessary.
Tank or Cyllnder. Fig 6 shows the arrangement of a hot water system as fitted to a solid fuel cooking stove of the ordinary portable type with a side boiler. This is known as the tank system, because a storage tank is situated above the higheat level of the taps. In the cylinder system, the storage tank is below the level (Fig. 7).
Most hot water systems comprise a flow and return pipe, and to ensure that the hot water should rise always up the same pipe, the flow pipe is situated at the top of the boiler and the rcturn pipe at the bottom. When a tap is turned on some of the hot water ascends from the boiler and some descends from the cistern, to flow out of the tap.

It is not difficult or expensive to convert a system utilizing the kitchen range to one employing gas or independent heating. It is merely neressary to disconnect the flow and return pipes from the cylinder to the boiler of the kitchen range, and connect them to those on the new heater. The boiler should be removed from the range and the space filled

Fig. 6. Tank system of hot water supply fitted to a portable caoking
Draw off for Boiler emptying Cistern
in with firebrick This arrangement will be found to overcome most of the difficulties associated with the failure of the ordinary system as installed, otherwise immediate attention should be given to the How and return pipes of the boiler and the hot storage tank. If the circulating pipes are choked up

Fig. 8. Indireot eylinder ased on combined central heating and hot water systoms Courtean of National Radiafor Co.
they will have to be cleared by one of the solutions sold for the purpose, or in bad cases the whole of the pipes must be taken down and cleaned out with a scraper.

Comblned Heating and Hot Water Supply. As mentioned earlier, it is often possible to combine these services. There are several points to notice, however. If water were drawn direct from the central heating system (after circulating through distribution pipes and radiators) it would probably be found to be discoloured by the corrosion of the latter. In a systern primarily designed for hot water supply, it may be possible to attach a couple of small radiators, and so warm rooms from the hot water boiler. The arrangement will only function properly in districts where the water is hard and does not corrode the interior of pipes, radiators, etc.

A central heating system intended to furnish domestic hot water also should have a boiler designed to that end (see page 213). The water for radiators is drawn from an inner cylinder enclosed within the storage cylinder and connected to the boiler. The domestio hot water does not mix with that used to heat the radiators, but comes from the outer cylinder, being warmed by heat transmitted through the walls of the inner cylinder (see Fig. 8). $A$ is the hot water flow, and $B$ the boiler How. C is the cold water feed and D the boiler return. E is plugged.

HOUR GLASS. An hour glass, or sand glass, as it is sometimes called, is an old form of timepiece, being planned to measure time. The early ones wore made to measure an hour, hence the name, but afterwards others came into use for shorter periods of time. One consists of two glase bulbs fitted to each other at the narrow ends and having a tiny passage between them. Glasses used for eggs contain sufficient sand to pass from one bulb into the other in the time which is required to boil an egg. Hour glasses are sought by collectors, and good specimens are valu. able. Some of the most coveted examples formerly stood in churches. being used to mark the length of the sermion. The glass gilt stand, c. 1590 bulbs were usually en- Brilish Museum closed in a frame of wood. in some cases curiously and beautifully carved. Glasses of the same kind, known as log glasses, were used on board ship for measuring time. See Egg Boiler.

## The House: Its Planning and Construction

 With Important Legal Points Clearly ExplainedOther important aspects of home-making are considered under Architecture: Bungalow . Cottage ; Flat Several hundred articles also deal with the building, repairing and furnishing of the heme. These include Brick; Carpet; Colour; Decoration; Dining Rocm ; Drains; Lease; Paperhanging: Roof

A broad classification divides existing houses then become very much more a matter for into three types, detached, semi-detached and terrace house. The first of these is only possible for most penple where land is comparatively cheap. The semi-detached and terrace houses are the ones most frequently seen in towns, whether in the poorer or the richer quarters. The structure of terrace houses, even in the best neighbourhoods, shows at a glance that there land is costly. They usually have a basement and a comparatively narrow frontage.

The semi-detached house is a compromise between the two. The fact that one side is exposed enables the house to have a certain amount of land, even if it is only sufficient for a passage at the side, while there is an economy in building two houses together The arrangement is convenient, too, where it is desired to build a garage beside the house

A growing artistic sense leads more people to desire houses that are attractive to the eye, both externally and internally. To a large extent homes to day are planned to save labour. Gone are the basements and some of the long llights of stairs; gone, too, are many forms of lloor and window coverings and other furnishings that demanded constant attention, or, if left alone, were harbourers of dust. Light and air are allowed to penetrate to the fullest extent rooms designed to take advantage of them

Period Styles. The builders of old days adopted ways that were always direct and real, arising out of local conditions and suited to these. Thus, when timber was plentiful there amse that manner of building which is cafled half-timber, i.e having a stout oaken framework, with a filling of plaster, brick. or other material. This is essentially constructional work; modern imitations of the style fall far short of the original, the apparent timbers being merely on the surface, thin pieces of wood nailed to a brick hacking, and having none of that solid look that real half-timber alone can produce.

In a later age, when brickwork came into general use, particularly in the eastern and southern counties of England, there was a new expression of building, exemplified in the Tudor atyle, and much later in the Georgian. Tudor houses were largely the product of craftamen working in traditional ways of building; they were not houses built to any precise drawings, but rather the outcome of individual fancy and free craftamanship. That is a point to bear in mind when a Tudor house is attempted to-day.
The old work has all kinds of variations in it; for instance, the brick walling is not meticulously exact, either in its surface or in its jointing, and the bricks themsolves are full of variation and colour, and have a texture quality. These variations are often copied to-day with auccessful and artistic results. Window and door openings in the front of the house may vary in shape and size quite appreciably, while maintnining a general balance. To-day these are set out on the drawing-board, and while it is pure affectation to imitate some of the vagaries which sprang from tha original craftsman's fancy, it is equally true that anything like mechanical precision in the work will inevitably produce a hard, unsympathetic-looking house. The quality of craftsmanship in house building cannot be too strongly commended

In the Georgian style of building that was common in England thrnughout the 18th century it is seen that though design had
the architect than for the craftsman $t 0$ deter mine, the huuses of the perind still exhibited a marked sense of cinftsmanship. Within the last half century there has been general appreciation of the qualities which constitute the charm of our old houses. Anyone proposing to build a house to-day should have at least some little perception of these qualities, and so long as the essentials of good house design are kept in viel and sound work is demanded in every case, there is the basis for satisfactory results.

Choice of Site. Soil and aspect are two important factors. Tho former is discussed at some length in the opening paragraphs of the article Architecture, which should be read in conjunction with the present one.

As regards aspoct, an endeavour should always be made in the placing of the house and in the planning of it to get as much sunlight as possible into the rooms. A room that gets no sun is not necessarily unhealthy, but it is distinctly less healthy and less pleasant than one that has been planned to get abundance of sunlight.

A living-room which is used for the best part of the day should have a sunny aspect, preferably facing south and west, while in a kitchen a north-easterly aspect is suitalile. Bedrooms should be placed so that they not only secure sunlight, but also cross ventila tion. In this connexion it may be noted that where ventilation through openings in outside walls is not possible, good results can be obtained by the provision of fanlights, which enable cross currents to pass from the outside air into the landing, staircase, and hall.

The combining of the kitchen and the scullery, provided that the room thus made is of a goord size, making it into a proper donestic worksliop, is a modern expedient that has
great merit when a maid's sitting room is provided. Above all things space should not be saverl on tho kitchen quarters in a house, however necessary this may sometimes be in a flat. A kitchenette for family cooking is inadepuate. The inclusion of a service hatch, with handy store cupboards adjacent, saves a great deal of walking to and fro in the serving and clearing away of meals. Consideration may also be given to the inclusion of built-in fitments. This applies both to rooms upstairs and down. In the dining room such features as a built-in sidehoard and cuphoards may lie included; while upstairs commodious built-in wardeobes are excellent fatures.
Very desirable in the equipnient of the herlrooms are fitments with hot and cold water services These also can be huilt-in, preferably in an enclosed recess having a small outside window Fitments of this kind involve a good deal of expense, as plumbing is always a big item, and they mean long runs of piping. There can, however, be no question of their convenience and merits

Dealing with the Architect. Some hazy notions exist as to what an architect actually doen and what his fees are. Anyone desimous of getting precise and full information about this matter should apply to the Secretary of the Royal Institute of British Architects, 9, Conduit Street, London, W.1, for a copy of the institute's profossional scale of charges, the price of which is 3d. ; but it may be of service here to sct down hrielly the chiof items.
An architect's fees are 6 per cent. on the total cost of building on jobs of $£ 2,000$ and over, and on a sliding scale varying from 10 per cent. to 6 per cent. when from $£ 100$ to $£ 2.000$ is spent. This sum includes working out the acheme, making an estimate of tho cost, preparing detailed drawings and specilica tion, arranging malters with the builder, issuing certilicates, and generally supervising the erection of the house, assuming this is within a rcasonable distance. If the job is far away, extras must he incurred for travelling, out-of-pocket expenses. and time occupied.

The henefits of calling in an architect are

House. Charmingly designed house at Byfleet, showing the modern use of thatch in conjunction with weatherboarding and plastered brick walls. The upper afores projects over the lower one

Bottom, north elevation, showing front entrance and kitchen premises, leaving the southern aspect for the living-rooms
site and that many labour-saving ideas may himself that the work hal heen carried out to shall be exposed on the face, then it is inperabe introduced into the building that are his drawings, would approve these payments tive to use a good brick, one with not too practical and inexpensive in themselves and to be made indue course by the client. The smooth a surface, and with a play of colour
the ultimate means of saving cost of living and ensuring comfort.

The remarks on page 35 regarding builders tenders and the arrangement of contracts may usofully be referred to. Assuming the joh to bo procceding normally, the builder would ask for payment on account from time to time and the architect. having ratisfied
drawings, specifications, and other documents
relating to the house remain the architect's property, but it is a customary arrangement for the client to have copies of the drawings for his own private use on payment of an agreod fee

Brick or Stone. The question of the materials to be used for the construction of a house is influenced by local conditions. The golden rule is that what is native to the soil is right ; that is to say, a stone house is right in a stone county, as, for example, in the Cotswolds or in the York. shire dales, just as brick and tiles. or wentherboarding and thatch are of the soil and right for many districts A well-(lesigned house that would quickly look st home in old. world surroundings where thatched roofs are to be found is shown in our first illustration. There nre two or three points ahout a brick house that should be noted. If it is proposed that the brickwork
smooth a surface, and with a play of colour
in it. Attention should be given to the jointing. In some kinds of houscs, more especially those which follow the frecr style of the Tudor, walling with thick mortar joints looks best, the mortar being wipod off llush with the trowel: but in a house of Georginn character a finer joint is more suited to the design, and if struck in cement it gives a thoroughly watertight result.

Exterior Details. The details of houso design aro so numemus and diverse that no attempt to denl with even a tithe of them can he made here. A few points, however, may be noted. Take, for example, the front entry. It is most desirable that this should have some solt of protection either in the form of a hood or of a porch. Neither of these structures need be cumbersone.

There are old houses up and down the country dating from 100 years and more ago which have quite slender hoods, lead-coverod, and supported on delicate brackets, and the fact that they are still sound today after so many years of exposure is proof that a cumbersome hood is not needed.
The colour used for painting outside woodwork and plaster is another point worthy of remark. Drab and dirty colours should be eschewed. For a house in the country nothing looks better than decp cream for plaster work, and the colours chosen for the front door gate. window frames, stc., should he in pleasant contrast to the surrounding landscape. V'ivid shades arc more suitable for town terrace houses, where the surroundings are dull. Thus, if a stucco house is painted cream the door and windlow frames may be painted light green, red, orange or

House. South elevation of a well-planned modern bouse. It is of oblong House. South elevation of a well-planned modern bouse. It is of oblong shape and the exterior is oi brick, the upper balf being fnished in roughcast. Casement windows form square bays on the ground floor continuous with the
rool of the brick-floored logia porch. The upper windows have deep-cut sun louvres which keep the rooms coal notwithstanding their southern aspect Designed b" 11 . M. Poller. L.M.I.B.A.
blue without risk of providing a violent or unpleasant contrast, provided that it is in some harmony with the houses on either side.

Painting is a considerable item in upkeep, and it may he considered desirable to eliminate it as much as possible ; as, for instance, in a house which has brick-framed windows filled with lcaded lights in steel frames that are built-in: oak doors that can be safely left to look after themselves; and enves forined of tiles in projecting courses set in cement. Such a house involves practically nothing in the way of paint cost for maintenance.
Interior Design. As with the exterior, so with the interior: there should be gool design and sound workmanship. Above all, it is essential not to attempt make-believe. not to introduce features which, however appropriate in a haronial hall, are ill-suited tu, a little place perhapa not 10 ft square. Take. for example, the matter of fireplaces. These are frequently incongruous. In the majority of cases a simple mantel enclosing a hearth fire is all that is needed, with perhaps a panelled picture or a mirior on the chimney breast above. In a room of average size this will be a far more satisfactory arrangement than the introduction of a pretentious chimney piece.

In this matter we suffer from the exploita tion of what is callerl the Jacobean style. It should he realized that many things perpetrated in that name are not Jacobean at all, and even if they were they would have no proper relation to our onfi day. The Jacobean style, if we may so call it, was coolved in the first half of the 17th century, and was a mingling of the then new Italian manner with the lingering Gothic tradition. In the original work it is interesting, as any genuine old work is, but to copy all its quaintness. and to do so in a mechanical way according to standardized factory inolels, is often merely to produce travesties. Something simpler and more direct, as indicated above, is what we should seek to attain.

As a finish to the house walls, distemper is excellent, especially for a house that has been newly built, for every house must have its time to dry out, and this may take the best

Dining room, showing the brick-arched freplace and the panelling effect produced by Lroad oak-stained splats, which also serve in place of a frieze banding, running in an unbroken line round the room
part of a year For this reason it is always preferable to distemper a new house, even though the walls may ultimately be papered. Floors offer a wide range of choice, from deal boarding to parquct, and from jointless composition floors to tiles and rubber floorings. For the service quarters and passages there is linoleum, which should be inlaid and not surface printed, to withstand long wear. The following point, however, should be noted ahout linoleum: if ground-Hoor rooms are tight-covered with it, there is a risk of dry not being sct up. The risk is small, however, when the floor is well ventilated underneath.

House. Dining room and living-room of the house described in the previous pages, showing bow sliding partitions run into the bookshelves and thus avoid the disadvantages of clumsy folding doors

The Plan. The house shown in the plans and the accompanying photographs is an example of the excellent icsults that can be ohtained lyy intelligent and close co-operation between owner and architect. It has some intercsting and ingenious features, a number of which were worked out by the architect at the owner's suggestion. It occupies to full advantage a comparatively small site in a seasidc town. As the plans show, it is of an ohlong shape, a form which has many advantages in a house of moderate size. This shape involves a some"hat large frontage, but the present relativo cost of land and building, especially in the smaller country towns, makes larger fiont ages more economical than formerly. In a house of this type an extra outlay upon land of $£ 25$ would, hy reason of the more attrac tive planning thus jermitted, add quite $£ 160$ to its ultimate value.
The basis of the design is the continuous dining room and large lounge living room, separated by sliding doors which run into hook. shelves. The two rooms can thus be thrown into one without the disadvantages and a wh ward appearance of folding doors, while the dining room portion is easily and completely separated from the living room in winter. or at any other times when desired. On either side of a built-in sideboard in the dining room are service hatches, one opening directly into the kitchen, and the other into the scullery, so that the dishes are in one movement placed ready for washing up immediately the monl is tinished The fireplaces in both iooms are set in brick arches with raised brick hearths. Both rooms are well lighted with tive leaded case ment lights, built out to make roomy and comfortable window seats, the proportions being carefully dosigned. The space between the two bays is utilized for a brick-floored loggia porch, supported on two concrete columns with a fat lead roof continuous witl the roofs of the two bays.
An excellent panelling effect is ohtained by the usc of broal splate tieated to give the effect of dark oak. It will be noticed that the splat which is carried round both rooms in the place of a frieze runs exactly along the tops of the square window bays and of the lireplace, so that a continuous and unbroken line is given This idea of panelling with broad splats and
continuous frieze lines is carried out through out the house, the obvious difficulties in hall and staircase being ingeniously overcome

A warm colour effect is obtained throughout the interior by the use of sunny-coloured distemper for panels, and a lighter shade for ceilings and friezes. The staircase is particularly well designed, having a very easy rise There are 16 rises 7 in wide with II in treads in a total height of 9 ft .3 in . from hall to upstairs landing: the treads are 3 ft 2 in wide The main flight is kept down to 10 rises by disposing of the remaining steps as follows, two reaching the landing at the hottom, onc on the half landing, and three in the thickness of the upper floor and beams.

The Bedrooms. Four bedrooms, including a maid's room, are provided, with a bathroom and a boxroon. Each bedroom has two ample cuphoards built-in on one wall, with space hetween, which is occupied by a hand basin with hot and cold water; a convenience which great/y reduces the amount of work to be done by the maid in the bedrooms. On the opposite wall two wardrobe cuphoards are built-in to provide recesses for casement windows, which open inward for easy cleaning All windows are casement with leaded lights Those in the hedrooms have outside shutters with exceptionally deep louvres, giving wider spacing and effective shelter from rain and light Two of the rooms liave brick built arehed fireplaces similar to those downstairs.

As will be seen from the plans, practica!ly all the rooms, both ground Hoor and first floor, face south, only hall and kitchen downstairs, and bathroom and one hedroom upstairs, being on the north side. The kitchen has no range, but in its place are supplied a large gas stove and an independent stove for hot water supply to hedrooms and bathroom Both these are placed under a canopy communicating with the chimney, an arrangement which ensures the removal of all fumes from the kitchen Spare heat from the back of the independent boiler may be allowed to pass into the hall through a low arched opening.

Legal Considerations. He who proposes building a house must first of all secure the land. He may either purchase or rent a picce of freehold or leasehold land. In either case the contract should be in writing signed by the seller or landlond.

It is usual on the sale of land to have a formal contract drawn up by solicitors, and the solicitor for the vendor inserts many provisions by which the purchaser, to save expense, is to waive his objections to various points in the title.

When anyone is about to purchase land, whether frechold or leaschold, and the solicitor for the vendor asks him to sign a contract containing a number of clauses about the title in advance, he should take it to a solicitor for investigation After the title has been investigated the land must be conveyed by a deed under scal

Building sites can also he secured on lease for a ground rent, particularly in the neighbourhood of London. Sometimes, in addition to the ground rent, a lump sum or premium for the land will have to lic paid. In some cases the landlord renta the land to the lessee, who covenants that he will put up a house within a certain time. In other cases the lessor enters into an agreement that if the lessec will put up a house on the land named a lease shall ve granted to him after the housc is put up.
There is a great deal of difference between these methods if the lessee is unable to carry out his bargain, for if a person partly huilds a house on land of which he has not yet got a lease, and then is unable to carry on, the owner of the land can take possession of the land again and confiscate whatever has been put upon it. If, however, the lessee has actually got a lease of the land, he will prob. ably be ahle to get somebody else to finish the house on terms, or to transfer the land with the house partly built at a price sufficient to cover most of what he has spent upon it.

In nearly all cases the lease contains a clause that the lessee shall erect the house or houses of at least a certain value upon the

Honse. View of hall and stalrs in the house illustrated In the previous pares. The staircase, which is in oak, is cleverly designed to give an easy rise, and is a decorative feature. Like the rest of the bouse. the ball is beamed and the panelled effect of the walls is carried out here also
site, such value to be prime cost of labour and materials. In very many cases also, the plans must he passed by and the work done to the satisfaction of the Inndlord's architect and surveyor This means that it is to be done to the "reasonable" satisfaction

The purchaser of a site should make sure what restrictions there are upon the usc to which the land may be put. For instance, he may be prohibited from building $\Omega$ shop.

The next thing is to make a contract with a builder The -intending house-owner may get an estimate from the builder and submit it to an architect: He will do better still to employ an architect to make a plan of the house and obtain tenders from several huilders. Builders almays make specifications, i.e detailed estimates of huildings, showing what they intend to put into them, and conclude with a statement of the prices to be charged If something which is not in the specification is required, it will become an extra, for which the builder may charge a reasonable sum.

## Payment of the Builder

When a tender is accepted, it should be subject to the builder entering into a written contract drawn up by a solicitor or by the architect. This ought always to contain a clause that the builder is not to he paid unless and until the architect certifies that the work has been properly done. An architect who has to certify in this fashion must give his cortificate honestly. Most building contracts stipulate that the builder shall he paid by instalments: so much when he has cleared the site, so much when he has put in the foundations, so much when he has huilt the walls, and so on, the amount generally heing calculated at, roughly, two-thirds the value of the work done.

A date for the completion of the work may be fixed and for every day beyond that time during which the building is not finished the huilder may be required to pay a penalty. Other clauses ought to be that if the builder is unable to carry out the work to completion, the employer may take it over and employ another builder to finish it, and only pay the lirst builder for what he has actually done

Care should be taken not to order extras, for this will get rid of any stipulation as to time of completion. It is best to have a clause that no extras shall be put in by the builder unless they are ordered in writing If a substitute of one thing for another is anggested, and the owner does not intend to pay extra for it, he should make it perfectly clear to the builder in writing that the substitution is to be cffected without extra charge or delay in the work.
No house can be built except according tu the requirements of the local authority with regard to the matcrials to be used, the drainuge system and the like. All plans have to be passed by the local council, and once passed the building-owner must not deviate from them without the consent of the council. The drainage system must also lee inspected before it is covered up.

When building, the owner should he very careful not to interfere with his neighbour's ancient lighte, or he may find himself involved in legal proceedings.

When a person builds upon a plot of land which is his freehold. the land and the building are his for ever; but if he builds upon leasehold land, at the end of the lease the house and everything on the land revert to and become the pinperty of the freeholder from whom he held his lease. Moreover, building leases usually contain stringent clauses that the lessee shall he responsible for the repair of the house and for painting and the like. These covenants are not very strictly enforced by the landlord for the first part of the lease,
but as the lease draws near to its conclusion the holder of the lease will find himself frequently subjected to requisitions by the landlorl to carry out considerable repairs.

Buying a House. Every contract for the purchase of a housc, whether freehuld, leasehold, or copyhold, must be evidenced in writing signed by the party to be charged. To this rule there is one exception, that is if a contract for the sale of a house has been partly performed in such a way that the parties cannot really be put back into the saine state again.

In making a contract to buy a house, it is well to employ a solicitor, because such contracts very often contain clauses which have a bearing upon the title which is to be accepted by the purchascr. Particularly is this caution necessary when buying a house at an auction sale. There is always a set of conditions of sale, which are sometimes printed and circulated in the auction room. Anyone who purchases a lot has put in front of him what amounts to a contract to buy the house subject to the conditions, and it is well to have a solicitor to sce these conditions.

Contracts for the purchase of $n$ house in. variably contain a stipulation that the completion of the purchase, i.e. the execution of the conveyance and the payment of the money, shall take place on a certain date. If, however, the venclor or the purchaser is not ready on the exact date the contract does not go off, but an allowance must be made always of interest to the vendor and sometimes of the rent and profits of the land to the purchaser.

When the contract has been made, the next thing to do is to invertigate the title of the vendor, which is done exactly as in the case of a sale of land, and should always be done by a solicitor. The next thing is the conveyance, which should also be prepared by a solicitor, and is always by deed.

The lense should be exainined. If there are repairing covenants, it should be observed whether they are vary onerous or fairly light. Notice should be taken of any restrictive covenants. Suppose that Brown contracted to sell Jones a leaschold house. Jones is not obliged to take it if, on looking at the title, he discovers that there are any restrictive covenants upon the use of the house or the land-e.g. forbidding it to be used as a hotel or boarrling-house-unless Brown told him beforehand that there were such covenants.

## Oblisations of the Leaseholder

The purchaser of a leaschold house is bound to covenant in the purchase deed to indeminify his venclor against all breaches of covenant. This means that he undertakes to pay the rent and carry out the covenants contained in the head lease, and that if he does not do so, and the lessor compels his (the purchaser's) vendor to make it good, the purchaser will in turn make it good to the vendor: The original lessee of a leasehold house for, say, 99 years is responsible to the landlord for the payment of the rent and the performance of the covenants during the whole 99 years of the lease. although he may have assigned (i.e sold) the lease to someborly else, and it may have pussel through some fifty hands.

But an assignee of a lease is only liable for such breaches of covenant as occur while he is the holder of the lease himself. For cxample, X grants a lease for 99 years to $A$ in the year 1900. In 1910 A assigns it to B . In 1915 B assigns to C , and so on until in 1998 the then owner assigns to $\%$. The lease contains a covenant to keep the house in repair, and in 1998 X finds the house in disrepair. He can sue A and A's heirs and executors or he can sue each person who has held the lease in respect of the disrepair during his period.

Before buying a house, whether freehold or leaseho!d. it is well to have the drains examined
by the sanitary inspector or to employ a surveyor to do it
On the conveyance of a house stamp duty must always be paid on the conveyance, varying according to the amount of the purchase money.

Taking a House. A tenancy may be either under a lease for a period of yeary fixed or a tenancy from year to year, or from quarter to quarter, month to month, or week to week. A contract to let i house must be in writing; but the letting as apart from the contract to let need not be in writing, unless it is for three years and upwarl. This means that if A goes to a landlord or a house agent, and he verbally agrees that he will let him a house on a yearly or monthly tenancy. and afterwards refuses to carry out the contract, A cannot sue unless he has some acknowledgment of the contract in writing signed. But if he lets $A$ into the house, and an actual tenancy has begun, A is not obliged to have any writing to prove what the terms of that tenancy are.

At the same time, it is hetter to have the main terms written down. These main terns are: the rent, the nature of the tenancy, whether quarterly, monthly, or weekly, and the notice required to terminate same

In entering into the more formal agreements of tenancy by written agreement or by lease, the householder should always be careful to sec that the document really contains all the terms, for otherwise the landlord will not he bound by them. This should be specially noted with regard to repairs, for it is one of the peculiarities of the English law of landlord and tenant that nohody is hound to do any repairs except by agreement.

Grounds for Annulling a Lease
Another thing a tenant should always he careful about is to stipulate that if the house should be accidentally destroyed, or rendered uninhabitable, except by his (the tenant's) own fault, he, the tenant, shall not be bound to go on paying rent for it. In the absence of alleh a stipulation, a tenant is bound to go on paying rent for the house so long as his tenancy has not come to an end hy lapse of time or due notice, even if not one brick should be left upon another.

In leases for more than three years, it is usual for the tenant to agree to do the repairs. The nost reasonable kind of repairing covenant is a covenant to keep the house in good and tenantable repair and condition. This means that the house is to be kept in such a state that a reasonably minded tenant would accept it to live in. What is reasonable in this connexion depends upon the class of house, neighlourhood, and the sort of tenant who might he expected to want a house of that kind.
If a tenant agrees to keep a house in repair and does not do so, the landlord may make him paty whatever it would cost to put the house in repair according to the covenant. It is also usual for landlords to insist upon the insertion in their leases of a proviso for for feiture and re-entry. This means that if the tenant breaks any of his covenants, the landlord can put an end to the lease and forfeit the remainder of the term which has to run. A landlord cannot enforce such a forfeiture without first giving the tenant notice of the breach of covenant complained of, and requesting him to remedy it, and to pay compensation for the breach if compensation is required.

To this rule there are some exceptions. For instance, if the landlord is entitled by the terms of the lense to forfeit the tenancy if the tenant does not pay his rent, he can forfeit the lease without notice. But in this case the tenant can always esenpe the forfeiture by paving his rent and the costs up to date.

So also, if a Inndlord has given a tenant notice to do certain repairs and he has not done
so, and the landlord consequently brings an action to recover possession of the house, the tenant can at the last moment come to court, offer to do the repairs, and have the case stayed for a. certain time to give him an opportunity to perform his obligation. Then, on paying the costs to which the landlord was put. he is relieved of the forfeiture.
Subletting. Unless there is an agrecment to the contrary, a tenant may always assign his tenancy or sublet the premises or any part of them. But it is quite common for Iandlords 10 insist upon a clanse in the lease that the lenants shall not assign or sublet without the landlord's consent.

No tenant should ever enter into such a covenant as this unless it is qualitied by the words : which consent shall not be unreasnnnbly withheld in the case of a respectable and responsible tenant. The tenant who encounters an unreasonable refusal can bring an action asking the court to declare that the lindlord's refusal is unreasonable, and if the tenant proves his case the landlord will have to pay the costs It is not reasonable for a landlord to refuse his consent to ant assigninent or subletting on the ground that he, the landlord, happens to want the premises for himself.

HOUSE AGENT. House agents are middlemen who bring together those who have hunses to let and those who wish to rent them. Many of them are also auctioneers and valuers. A house agent charges a fec or cominission for the work done. If he lets a house, he charges the owner a percentage on the first year's rental, 5 per cent being the usual charge. The tenant pays nothing.
The house agent lets furnished flats on about the same terms and collects rents for persons on commission, 5 to $7 \frac{1}{2}$ per cent on the amount collected If he is an auctionecr and valuer he will sell and value goods, 5 per cent on the amount collected being usually charged House agents also sell houses by auction or by private treaty. Sce Agreements: Furnished House.

HOUSE DOG. Some breeds of dogs are suitable only for the house. Among these may be mentioned most of the loy varictics and all which come under the heading of lap dog Sporting brceds, however, often make excel lent house dogs provided that they are given sufficient exercise and otherwise kept in good condition. The smaller terriers are universal favourites, English, Scottish or Aberdeen, and Irish. Their house manners are admirsble, and they enjoy their privileges as family pets ; but persons adopting them as such muet be prepared to give the dog at leavt one goorl walk a day, and must not imagine that it is suflicient for him to be taken the round of the shops.

Most of the larger brecds have excellent qualities as house dogs, but their size is a drawhack except in the larger honses. Great Danes. wolf-hounds, setters and St. Bernards occupy considerable room in a sinall house. and even the Airedale is at a disadvantage in this respect, though as a family pet he is a grent success It is, however, not diflicult to make a house pet of any breed. See Airedale; Dog, etc.

## House Fly. See Fly.

HOUSEHOLD BREAD. This term is used to describe loaves that are moulded in two parts like cottage loaves. They differ from the latter, however, in that both parta are the same size, or the top slightly larger than the bottom. They are packed closely together in the oven so that there is orust on top and hottom only. See Bread.

HOUSEKEEPER : Her Qualifications. There are various openings for the trained housekeeper whotakes up this work as a means of earning a livelihood. A great advantage of
this calling is that it a gir marries she reap. the full benefit of her truining and can always return to the work in case of adversity or widowhood. It is also often the best openiny for the woman no longer young, and proficient in running a house

This last type of woman untrained but with years of practical experience behind her, will most easily find a post in a private family rither supervising a maid or maids, or in many enses undertaking the conking herself

For housekeeping work on a larger scale, such as that in a hotel. boarding-house hospital, school or other institution, training is almost always necessary to give the requisite knowledge of catering and cooking, the soience of domestic economy. the management of staff, accounts, and the care of linen. Eisen
if thr lonurckepper has no conking to do as is probably the case in an institution. it is casential she should know the subjoct in orler to be able to supervise the conk and check waste-a very important point in a large place. Cookery and domestic management generally may be learnt at manly domeatic science centres in all parts of the country courses varying from 6 to 12 months. Salariep are now excellent in this kind of work

The woman who intends to earn her living as a housekecper, besides having the technical qualifications mentioned, must be willing to take responsibility. should be enough of "t teacher to direct assistants clearly. and must have sufficient tact and personality to get on well with the variety of people who live under one roof in any institution. See Servant.

## Housekeeping: Modern Methods

## Advice on the Management of the Eome

The reader may also consult the articles Accounts; Clothes; Cooker; Diet; Food; Furniture; Kitchen ; Labjur Saving ; Larder; Laundry ; Llinen ; Mending. Refrigerator; Servant ; Spring

The woman who has to save her pennies usually gnes out marketing herself. The economy of buying over the counter and paying on the nail is undoubted, and she obtains the advantage of variety for the daily menu. All large stores have bargains in food just ay they have in dress. An abundant supply of salmon, a large consignment of asparagus or of strawberries or orangea, sufficiently inexpensive to encourage jam and marmalade making, lobsters, ducklings, and other luxuries at the price of commonplace foods, are the reward of those who look for them.
If there is room in the home for a store cup. board, it will prove an economy. Soap and candlea, for instance. harden with keeping, and do not waste as new soap and candles will when put into use; rice and other commodities of this kind are cheaper if bought in bulk, and in all such and other cases, as there are several prices for different grades of the articles, personal shopping tells advantageously. It is well to have in reserve a few emergency commodities of which the kitchen may run short at a critical moment.
In these days of informal entertaining it is also most useful, whether living in town or country, to have an ample provision of bottled or tinned soups, fruits, and vegetables. Those who are fortunate enough to possess large kitchen gardens are sure of supplies, either fresh or home-bottled, for the extra vegetable or fruit course that will supplement the menu in the event of an unexpected guest; others should have no difficulty in doing this if they keep a certain number of tins of vegotables and fruits in the store cupboard. Such vegetables are easily and quickly prepared, ana if reliable brands are purchased they make safe and varied additions to meals. Beetroot, tomatoes, asparagus, peas, beans, and corn are a most useful selection of tinned vegetables. Pineapple, grapefruit, cherries, loganberries, peaches, aprioots and pears, either bottled or tinned. will furnish the chief ingredients for many kinds of sweets. Sardines and other tinned fish, tongue, sausages and potted meats may be stored at the housewife's discretion according to her likely requirements.

## Importance of Early Training

A point that the really capable housewife who likes to do everything herself often overlooks, and that the undomesticated mother minimises the importance of, is the value of early training for girls in gond housekeeping It does not matter what a girl is going to be or do in after life, she is handicapped unless she really knows how to keep house. This does not mean a return to domestic slavery, but the emancipation of taking a live interest in the thinga she ought to know. On no account
should good housekeeping be presented as drudgery, but as a real and exciting achieve. ment. Nearly all children, often boys as well as girls, delight in a cookery afternoonarranged for them preferably when the eook is out-and not only to be allowed to make toffee and other aweets, but to concoct a whole menu or propare the dishes for Sunday supper.

Pleasure in doing this is chiefly a matter of clever suggestion. Many girls have been turned against domestic accomplishments for life by being forced to do housework, needlework, or cookery as very dull lessons, instead of having all these things made to appear so interesting that they ask to be allowed to do them, as they will ask to do gardening or painting. Just as children are taught to put away their playthings, so ther can be taught to clear up after cookery or any other domestic pursuit. Equally important is it to see that things arc clone in the right way from the beginning instead of allowing wrong or slipshod habits to be acquired.

Well-balanced menus are the aim in good housekeeping. Diet is now a matter which is more scientifically considered, and the old haphazard method of choosing meals no longer satisfies the careful housewife, who wishes her family to live on a dietary capable of producing the best results of physical fitness. The most important dopartment in housekceping is the provision of proper food, which includes not only its purchasing and cooking, but also its serving in an appetizing way.

Business-like Methods. If there are books to pay, it is better to have them sent in weekly than monthly. All the slips sent by the butcher and fishmonger with their goods, stating the weighte delivered, should be kept for reference after the goods have been weighed and the books checked.

Women who like to manage the family exchequer in a business-like manner prefer a certain sum of money to be placed quarterly or monthly to their own banking account, and it is generally understood that any surplus that accrues goes to pay for breakages, to renew the stock of household linen, and so forth. The sums for servants' wages and the dress allow. ance of wife and children, if paid to this account, simplify matters considerably. When it is neither possible nor desirable to follow this plan, so much a week may be paid to the housewife for marketing and current expenses. Every item should be entered in a book as paid for and the money made to balance daily or weekly.

In domestic management a time for everything and everything at its proper time is a good rule. Kitchen orders given at the same hour each day and regular supervision in cleaning processes create between mistress and
maid the reciprocity that makes for harmony and efficiency in the home Any labourarving inventions that have been tested and approved will help the smooth running of the establishment The mistrese who takes pains when changing servants to engage those with a good personil character is the one who, in the long run. saves herself trouble It is well to remember, however that oven the least ex. perienced of maids may be trained, if willing intu a valuable help when the mistress is herself an adept at conking and domestic economy: in gencral.

House pride goes naturally with good house keeping The woman who possesses it in full measure takes a personal joy in cleaning and polishing, in making her glass sparkle and her silver shine. There is, again, a great feeling for beauty. and an orderly, well-arranged home is one of its best expressions

It is good economy to replace glass and china as it is broken, thus proventing the necessity of buying a complete outfit in course of time, or of using pieces that do not match. The wiso housewife to-day does not hoard. She has ton great a sense of the value of space-saving to lumber up the home with useless articles

A periodical attention to the linen cupboard and personal underwear of the household is another necessary duty, so that gaps in sup. plies can be filled as they occur. In this connexion a careful scrutiny should be kept of what goes to and what is returned from the laundry ; and the plan of putting away all napery and lingorie at the bottom of its pile, instead of at the top, should be observed, so that each item may be used in its turn, thus preventing the premature outwearing of one or two.
The housewife who prides herself upon all. round efficiency makes a point of being a good hostess. This can be achieved without much expense owing to the simpler standard of entertaining. Short meals and light are the rule. costly wines are not looked for, but attractively laid tables, good cooking, wellmade tea and coffec, appetizing little extra dishes, and the consideration of individual tastes are what constitute successful housekeeping from the angle of the visitor

EOUSELEER. The houseleeks, of which the botanical name is sempervivum, form rosettes of thick, fleshy evergrcen leaves: these when well developed produce spikes of flowers, chiefly of reddish or yellowish colouring. After having flowered the rosette diea, but propagation is easily effected by detaching small pieces or offsets, which develop freely. Houseleeks will flourish in rock crevices, on house roofs, and in walls, and need little or no soil, though when planting a little soil should be pressed round them.

Some of the houseleeks have most orna. mental leaves; the most distinct is the cobweb houseleek (arachnoideum), with a white cobweb-like covering to the leaves. which ought to be protected in winter by a covering of glass if the plant is grown out of

doors; it makes an excellent pot plant for the cold greenhouse. Others are the redleaved houseleek (triste), hen and ohickens houseleek (globiferum), calcareum, with reddish brown leaves, and the common houseleek (tectorum). The Madeira houseleek (tabulaeforme) is sonietimes used as a summer edging to flower beds: the plants must be lifted in autumn and stored under glass for the winter.

BOUSEMADD. The most important part of a houremaid's duty is regular sweeping and dusting, as well as the periodical turning out of rooms. This includes the cleaning of the grates and the lighting of the fires. She is also responsible for calling the household, distributing hot water, early morning tea, etc., making the beds and doing up the bedrooms, and preparing the bedrooms at night.
In large houses where a first, second and perhaps third housemaid are kept, they will divide these duties between them, as they will where there is a housemaid and an underhousemaid. In smaller ones the housemaid may be expected to lay the table and do some of the washing-up. In many households the two servants kept are tbe cook and the housemaid. In such cases they divide the household duties between them, the housemaid doing practically all outside tbe conking and the care of the kitchen. In many situations she will be expected to do some of the mending, and may also have charge of the linen; but such duties should be stipulated for when she is engaged.

Housemaids, like other servants, should be insured under the national health scheme, and also against accidents that may happen to them in the course of their work. See Insurance : Parlourmaid.

HOUSEMLAD'S BOZ. This receptacle for brushes, rags, polishes, and other things necessary for cleaning up ashes, laying fires. polishing grates and eimilar work can be carried from room to room, and the lower part of the box is reserved for the ashes, which can thus be conveyed to the dustbin, or wherever else the refuse is put. The top of the box is fitted with a tray in which there are compartments for brushes and other utensils.

Fig. 1 shows a box with a movable tray. The main box is made from $\frac{\mathrm{s}}{} \mathrm{in}$. deal, and the tray from $\frac{1}{2} \mathrm{in}$. deal, and involves no elaborate iointing. The four sides of the box should be first cut from a $10 \frac{1}{2} \mathrm{in}$. wide board to their full length, and as the slope of the box is the same in both directions, there need be no waste at all in the cutting. Notice that as the short sides fit into a rebate, Fig 4, they will be cut short the thickness of the lap left on the long sides. This rebate is now cut to a depth equal to the thickness of the stuff, and having trued up the ends the four sides may be glued to. gether and nailed, the nails being driven askew to form a dovetail grip. When dry, plane down top and bottom edges square, and screw on the bottom. All sides are then oleaned up.

The handle is made from two pieces of 1 in. by $\frac{1}{2}$ in. stuff, with a piece of $\frac{8}{8} \mathrm{in}$. dowel

Housomaid's Boz Pig. 1. Compact receptacle with tray for grato-oleaning requisites. Fig. 2. 8ide of box, with measurements. Fig, 8. End in section,
showing method of attaohing tandle. Fig. 4. Sides joined by a rebate showing mothod ol attaohing randle. Fig. 4. Sides joined by a rebato
parts rubbed off with sandpaper, or preferably left clean from the plane The depth of the groove is marked on each edge of the upright with a marking gauge. and the exact width of the groove scribed across the face of the upright with a sharp cutting point. Two saw cuts are made with a tenon saw, keeping very closely to the lines, made with the scriber, and the material between the saw cuts is removed with a chisel. working first from one side and then from the other, and levelling the bottom of the groove with a router. The board should fit tightly intes this groove and may be secured with glue. by screws from the outside, or by fine nails driven from the inner anglo.
The stopped hous. ing is similar to the plain, but instead of

Housing Jointe in course of constraction. Fig. 1. Plain joint. Fig. 2. Stopped dovotall housing joint the groove passing right. across the upright, it gtops short of the front face, the board being notched out the corresponding amount The groove in this casc is cut out with a chisel or router, as the saw can only be used at the open encl.
The dovetailed housing may be stopped as shown in Fig. 2, or plain : either of these definitely resists any tendency for the upright to separate from the board. The latter has a dovetail formed kneecap and khe condition may disappear after painting with strong tincture of iodine and firm bandaging with a woven elastic bandage. In severe cases the bursa must be tapped.
ROUSING JOINT. This joint is one in which the breadth and thicknoss of the one part is recessed into the other part of the two members, which together form the joint. The simplest example is found in the construction of a bookcase, where upright side pieces are grooved acmss to receive tho ends of the board forming the shelf.
To make the plain joint for a bookcase, the end of the board for the shelf is first cut square across, the ends planed up true, and any ragged
 and iske it fit tightly. box by means of screwn (Figs. 2 and 3). The tray is made in a similar way, except that grooves are cut across the sides to take the divisions, the centre one of which forms a handle. They are glued in and nailed. Small slips should be screwed to the main box to support the tray. See Box.

BOUSEMAID'S KNEE. What is popularly known as housemaid's knee is a swelling of the bursa, a small sac or bag of fluid situated on the kneecap. The medical term is bursitis. It occurs in occupations which involve much kneeling. A kneeling pad or mat, with a cavity for the knee, relieves the prossure on the d

Housing Joint. Fig. 3. Diagram showing details of a draw-bolt joint ased in framed timber work on it by sawing across and carefully chisclling out the surplus material. The groove is cut in the upright with a tenon saw. except that instead of making two cuts. at least three are required. two to form the sloping sides of the dovetailed edges, and the third between these two. The wood is cut nut with a chisel not wider than the narrowest width of the groove. If this precaution is not taken, the overhanging part of the wood at the dovetail side is liable to be torn as the chips come away, but by cutting down the centre of the groove the chips are better able in free themselves.

A type of housing joint that is of use in framed timber work, such as is required for outbuildings, etc., is the draw-bolt housing, Fig.3. The horizontal member is grooved into the upright as already deacribed A hole is drilled through the upright, and lengthwise into the horizontal member for a distance of at least three times its minimum thickness. The dis. meter of the hole is slightly larger than the brolt to be inserted in it.
Another hole is then drilled at rigbt angles in the horizontal nember, until it meets the bolt hole. This second hole is cut out square and deep enough to admit a square nut. This is dropped to the bottom of the hole, the joint put together, the bolt pushed through the bolt hole, screwed into the nut, and tightened up tightly with a spanner. See Joint.
ROVER FLY. One of the gardener's friends is the hover Hy, so named because it hovers above plants during bright sunshine,
seeking a spot infested with aphides or plant-lice, among which it deposits its eggs. These produce larvae of a whitish colour which feed on the aphides. The method by which the aphides are killed is by means of hooklets in the mouth, with which the larvae pierce the bodies of their prey, afterwards suck. ing them dry. The parent Hies are of yellowish colour. shining and metallic, marked with bands of a. different shade of ycllow, or orange. They live upon the juices of flowers, and are perfectly harmless See Green Fly : Insect.

HOVIS BREAD. To make this bread it is necessary to use Hovis patent Hour Take $3 \frac{1}{2} \mathrm{It}$ of the Hour and over $1 \frac{1}{2} 0 \%$ of yeast. $\frac{1}{2}$ teaspoonful of castor sugar, and about $1 \frac{1}{2}$ pints of warm water. Warm the mixing bowl before putting in the flour, cream the yesst with the sugar, and stir in sufficient water to make a thin liquid.

Make a well in the centre of the Hour and pour in the remaining water, which should be hotter than that used in making white bread. Add the liquid yeast, and make up into a smonth soft dough. Well Hour the hands and board when moulding the bread as this dough is inclined to be sticky. Make four loaves out of the quantity, place them in greased tins, and rise them for half an hour. Bake them from $25-35 \mathrm{~min}$. No salt must be used in this bread. See Bread ; Dict ; Food.

HOW. WHEN AND WEERE. In this indoor game one player leaves the room while the others decide upon a word, preferably a noun with several meanings, such as chest. This done, the person outside is asked to enter the mom. He has to find out what the word is by asking queations of the company in turn. These must take the form of. How do you like it? When do you like it ? and Where do you like it $\boldsymbol{y}$ He continues this until, aided by the answers, he is able to gucss the word. when another player leaves the room.

HUB. The central part of a wheel is the best known form of hub. That part of a lock through which the spindle passes is also termed the hub, and the word is applied to the peg on to which the rings are thrown in the ganie of quoits. The hub of a wooden wheel is generally of hardwood, shod with iron or steel hoops; a bicycle wheel has a tubular type of metal hub. Sce Ball Bearings ; Bicycle; Brake; Coaster Hub; Wheels, etc.
HUB BRARE: For the Bicycle. Thesc take two forms, the coaster brake, operated by back-pedalling, and another type operated from the handle bar of the machine. The latter resembles the internal expanding brake used on motor vehicles, in which two shoes are forced outwards against the inner surface of the brake drum. See Brake; Coaster Hub.

Hub Gear. See Three Speed Gear.
EUCEABACE. A favourite material for towelling, huckaback has a thick, spongy texture which makes it more absorbent than plain, smooth fabrics. Linen huckabacks are to be preferred both on the grounds of absorbency and strength. See Linen; Towel.

HUMANIZED MOLR. For the purpose of infant feeding humanized milk is propared from cow's milk by many of the large dairies. In cow's milk, as compared with human, there is about the same amount of fat, about twice the quantity of proteins and of salts, and only ? the amount of carbohydrate, in the form of lactose or milk sugar.

In a mixture of equal parts of cow's milk and water tho protein will therefore be right, and also the salts, but the fat will be halved
and the sugar will be further desired amount. To rectify this, as much good cream should be added to the mixture as is obtained from the amount of milk used, cg. $\frac{1}{2}$ pint or more as the case may be in making up the mixture, and milk sugar should be added in the proportion of rather less than $\frac{1}{2} \mathrm{oz}$. to a pint of mixture. Even then there is a difference from human milk, notably in the relative proportions of the two kinds of protein found in milk, viz. from that which is coagulated by heat and that coagulated by rennet. But the method described, though rough and ready, is easily done at home, and the results are usually good. Strict cleanliness must be observed. See Baby; Milk: etc.

HUMEA. Humea elegans is a vigorous greenhouse plant which has large fragrant leaves and in summer produces panicles of amall reddish blooms on stems 5f. or so high. It is raised from seeds sown under glass in June and will bloom the following summer. When the seedlings are large enough they must be potted in small pots, using a compost of loan, leaf-mould and sand: repotting must be continued as becomes necessary until in spring the plants are put in 8 in . or 9 in . pots. During summer they are grown in a cold frame. Decayed manure should be mixed with the compost for the final potting. During winter the plants should be kept in a temperature of 50 degrees. After having flowered, the plants are use!ess.

## Hump Back. See Curvature: Spine.

HUNDREDWEIGET. This measure of weight, used for coal and other heavy substances, contains 112 lb .; 20 hundredweight make a ton. The usual abbreviation, cwit., is used thmughout this work

HUNT TEE SLIPPER, For this children's gaine, more suited for indoors than for outdoors, the players, who may number 20 or more, though 8 or 10 can play it, sit in a circle, except one who stands out. They sit with the feet drawn up and the knees raised,

Eyacinth Cultare. 1. Water culture: $\boldsymbol{a}$, charcoal ; $\boldsymbol{b}$, height of water. 2. Too much water. 3. Shading to encourage root growth. 4. When to
 6. Roman hyacinths in a pot : $a$, compost $; b$, aand ; c. crocks. 7. Potted
bulbs planged in covered box of abre: $a$, ibre ; $b$, shingle. 8. Pot of bulbs excluded from light by means of another pot
so that the slipper can be passed from under the knecs of the participants.

The object of the game is to pass the slipper from one to another in such a way that the odd player who is on the outside of the circle does not know in whose hand it is. His object is to find that person and to touch him when in possession of the slipper. When he does this he takes his place in the circle and the person touched becomes the hunter.
HUNT TEE TRMMBLE. For this game an ordinary thimble is produced, and one member of the party undertakes to hide it, while the others leave the room. It may be hidden anywhere in the room. provided that it is visible without necessitating the removal of anything. When it is hidden the party is summoned into the room, usually with the formula :

## Hot beans and inelted butter : <br> Talles and gentlemen, come to supper.

They enter, beginning their search from the moment they are inside the door. The hider may direct them when they are warm. hot, or cold, according to their proximity to the thimble. When somebody secs it, lie or she moves quielly away and sits down, taking care not to betray its whereabouts by word or gesture. The game continues until each member of the party has discovered the thimble, when the first finder becomes hider.

HUSBAND : In Law. In all matters of property a hushand's interests arc now separate from a wifes. He has no more claim to her property than she has to his, He is not liable for her debts, except that he is bound to provide her with necessary food, lodging, apparel and other things according to his position in life ; if he does not provide them, or give her the money to buy them, she can order them on his credit. This right vanishes if she runs away, or if he is obliged to turn her out for misconduct.
A husband is liahle for the consequences of his wife's torts, i.e. wrongs, such as libel and slander, negligence and the like. A wife may, for her benefit, insure her husband's life.

In Scotland a wife is entitled to a life interest in one-third of her husband's property in land and a husband to a life interest in the whole of his wife's property in land. In addition a surviving husband (or wife) has a right, which cannot be taken away by will, to one-third of the movable estate if there are children of the marriage, or one half if there are no children. In Eng. land a husband (or wife) may make a will completely disinheriting the surviving spouse and children of the marriage. See Divorce; Intestacy: Separation; Wife.

HYACINTB.
The hyacinth is a favourite spring. Howering bulb suit. able for planting in Hower beds and borders out of doors, or for cultivation in pots of soil in the greenhouse and in bowls of fibre in the home. The bulbs should be planted out of doors in October, 3 inches deep and 8 inches apart. If several
varieties hre grouped in one bed, care should be taken to choose those that llower at the same time The follow. ing groups of varicties bloom together: Queen of Pinks, pink. I vanhoe, violet hlue, L'Inno. cence, white, Primrose Per. fection, pale yellow, and Gertrude, rose pink. Grand Lilas, palc lilac blue, Schotel, pale blue, Lady Derby, salmon pink, Duke of Wink, Duke of

Hyacinth. Bloom of one of the large-flowered hyacinths grown in fibre in a bowl
purple, Marie, dark bluc, and City of Haarlem yellow. Hyacinths in pots of soil are invaluable for the greenhouse in spring
The bulbs should be potted separately in carly autumn in 5 in. or 6 in. pots in a compost of loam with which sand, some leaf-mould and a scattering of bonemeal have been mixed. The bulbs ahould be just covered with soil, which must not be made ton firm, or the bulbs will be forced upwards. The pots of bulbs should be watered, placed on asphalt or somc other hard hase out of doors, covered with old sifted coal ashes and left there for 6 or 8 weeks: by then they will be well rooted Ashes fresh from the fire must not be used. After the pots of bulhs are taken from the ashes they should he shaded for a few days before being exposed to full light in the greenhouse.
The earlicst hyacinths are the Roman, hulbs which have been specially prepared for forcing, and the cynthelia or small-fowered sorts. Bulbs of these should be potted in August and September, those of the large-flowered varieties in October, to ensure a succession of bloom. They must he grown in a greenhouse heated sufficiently to keep out frost. The same sorts are suitable for cultivation in howls of fibre indoors. They should be kept in a cool dark place for 6 weeks before being set in the room window. Care must be taken that the fibre does not hecome dry.
Hyacinths may also be grown indoors in wide-mouthed glasses filled with water; there should be a space of $\frac{d}{}$ in. or so between the base of the hulb and the water. They must be kept cool and dark until roots have formed. See Bulb; Flower Garden: Galtonia.

HYDRANGEA. This splendid flowering shruh (Hydrangea hortensis) is hardy in southern counties and in other mild districts, wherc in sheltered places it forms a large hush. It is also a great favourite for cultivation in tubs and large flower pots for the greenhouse, veranda and terrace; it flowers in late summer
The normal colour of the flowers is pink; there are also white varieties. Bluc hydrangeas, which are the most popular of all, are obtained by the application of a blueing powder to the eoil; this can be obtained from nurserymen with directions for use. Some varieties, when treated with blueing powder, produce true blue flowers; others turn mauve or mauve blue. In some gardens, where the soil is ferruginous, hydrangeas bear blue flowers without any treatment.

Propagntion is by cuttings of Howerless shoots taken off in August, inserted singly in small pots of sandy soil and placed in a frame. If grown in a heated greenhouse and repotted
in 5 in pots in January many of these small plants will blonm the same year.

Hydrangeas are easily spoilt by incorrect pruning. When the bloons of pot plants are over, thin weakly shoots should be cut out; the tips of other slionts may be cut off if they are unduly long. Big bushes of hydrangen planted out of doors need little pruning.

Hydrangea paniculata grandifiora striking liardy shrub which bears large heads of creanl white bloom in September. This needs quite different pruning; in spring the past summer's shoots should be cut back to within 3 or 4 in . of the base.

HYDROCEPHALUS. Popularly known ns water on the brain, hydrocephalus is a condition in which a large amount of fluid collects within the brain through blocking of the drainage channels.

In children the disease is recognized easily. The head enlarges, sometimes to such a size that the child cannot raise it from the pillow. The eyes are sunken, there is inflammation of the optic nerve, sometirnes followed by blindness. Convulsions are common. As a rule the child is mentally weak or imbecile. Death usually occurs before the fourth or fifth year. Pron. Hy-dro-sef'-al-us.

HYDROCHARIS. A native water-plant, also known as frog-bit, the hydrocharis has white flowers and leaves, horne on the surface of pools where there is no flow or motion. It may be collccted in the spring and introduced into cultivated water-gardens, and is propagated by division. It is of value in collections of aquatic plants. Pron. Hy-droch'a-ris.

HYDROCFILORIC ACID. Strong hydrochloric acid is known as spirit of salt, and if swallowed acts as a corrosive poison.
The acid is used in medicine in the form of the dilute hydrochloric acid, dose 5 to 20 minims after meals. This is frequently prescribed in sluggish indigestion where the natural hydrochloric acid secreted by the stomach is deficient in amount.

In the type of indigestion accompanied by heartburi and acidity, when the acid is due to an excess of the natural hydrochloric acid, dilute hydrochloric acid given before the meal tends to check the abnormal pouring out of acid into the stomach, and so relieves the disagreeable symptoms. See Indigestion.

HYDROPHOBIA. The infectious disease known as hydrophobia, or rahies, is communicated to man mostly by the bite of a rabid dog. The poison travels up the nerves

Bydrangea Culture. 1. Saitable culting, properly trimmed at a. 2. Same, correctly potted. 3. Sec-
tional diagram of cuttings plunged in frame, with tional diagram of cuttings plunged in frame, with
to the spinal coid and hrain, and produces spasm of muscles, particularly those of the pharynx and larynx, paralysis, and generally death if not properly treated. It has been said that only 15 per cent. of those bitten by mad dogs are attacked by hydro. phobia. The incubation period usual. ly is one to two months. Children are the most common victims. On being bitten by a suspected dog immediately tie a cord round the limb above the wound to promote bleeding. Suckthe wound and squeeze as much blood as possible out of it. If hot water is at hand bathe the wound with it to encourage bleeding. Send for the doctor, or go to him immediately, as the wound should be cautcrized at once.

This cauterization should be done as soon as possible: if not done within twenty-four hours after the bile it is probably useless.
The patient after this first-aid treatment should be sent as soon as possible to an institution where the Pasteur treatment can be ohtained. In Great Britain this is carried out at St. Thomas's Hospital, London. Unless a bitten person comes under Pasteur treatment before the disense fully develops, the case is generally hopeless. The dog should not be destroyed at once, but should be shut up and kept under observation to see if it is really rabid. If it is suffering from rabies it will be dead within ten days; if it survives this period, a bitten person need have no fear of hydrophobia.
HYDROQUINONE. Quite a slow-acting developer, hydroquinone is particularly useful when negatives with maximum contrast are required, ss in copying drawings in line, lettering or similar hlack and white subjects. For ordinary purposes it is usually made up with another developer, metol, as describrd under metol-hydroquinone. A one-solution formula is made up thus :

> Sodium sulphite
> 50 gr .
> Sodimm silphite
> Winter to make
> $10^{\frac{1}{4}} \stackrel{0}{\circ}$

Dilution with water up to 20 oz . will give softer results. The following two-solution formula with caustic soda gives a more quickly acting developer:

For use take 1 oz. of each so!ution and add 2 oz . water. Where pure black and white results are wanted the uddition of formalin gives excellent results, as in the following formula :

| Hydroquinone | $\cdots$ |  |  | 65 |
| :---: | :---: | :---: | :---: | :---: |
| Sodium sulphite | $\cdots$ |  |  | 3 |
| Fornalin | . | $\cdots$ | $\because$ | dr |
| Water to ninke |  |  |  | 10-oz. |

The Watkins factor for hydroquinone in the first and third formulas given above is 5 ; ic
the second it is $4 \frac{1}{2}$ In all developers containing hydroquinone the temperature must not be allowed to fall below $60^{\circ} \mathrm{F}$. or action will cease almost entirely. The solution must be fresh and contain the full quantity of sulphite, or stains will result. Between developing and fixing, negatives should be well rinsed. See Developing: Metol-hydroquinonc: Quinol.
Hymenocallis. This is a bulb plant suitable chicfly for cultivation in a hothouse The correct name is pancratium (q. $\mathrm{v}_{\mathrm{i}}$ )

HYMENOPEYLLUM. This is one of the filmy ferns. It must be grown in a closed case in which the atmosphere is kopt thoroughly moist. See Fcrn.
Hyperacidits. See Acidity : Indigestion
HYPNOTIC. Drugs used to induce sleep are termed hypnotics. All, while useful when taken under the direction of a doctor, are more or less dangerous if self-prescribed. The patient in many cases becomes so dependent upon the drug in order to get a night's rest that finally he cannot slecp without resort to it. Hypnotic drugs lose their efficiency as the patient becomes used to them, so that larger and larger doses are taken, until finally the safety limit is passed. See Insomnia.
HYPO : For Fixing Negatives. Hypo or hyposulphite of sodium is used for fixing negatives and prints in photography, and should not be less than the average strength of 4 oz . to 1 pint of water; it may be more, up to 8 oz . to the pint. For bromide and gaslight prints it may be half strength. Too strong a solution will blister some bromide papers.

A convenient and rapid method of dissolving hypo is that described and illustrated under the heading Developer. Solution is further hastened by using warm water.

Hypo solution kceps reasonably well, particularly if an acid solution such as the following is used :
Hypo
Potasslum metablsulphite $\qquad$ . 20 oz.

This bath should not be used for the P.O.P papers printed by daylight Fresh hypo solution should be used for every batch of plates or prints fixed. It is very cheap, and prints and plates are then certain to be properly fixed. A strong stock solution which can be diluted for use is a very satisfactory way of storing hypo Dissolve $\mathbf{l} \mathrm{lb}$. of hypo in a pint of hot water. When cool add water to make it up to 32 oz . Then every 2 oz . of the stock solution contains 1 oz . of hypo, and any strength of solution required for use is readily calculated.

Do not allow drops of hypo sulution to fall on the dark-room table or floor without mopping them up, or particles of the dried chemical float in the air of the dark-room and cause spots and blemishes on negatives and papers. See Film; Fixing; Washing.

HYPOCELOROUS ACID. The name is given to a liquid with a penetrating odour which is used for removing ink-stains from paper or white fabrics. In ink-erasers hypochlorous acid is generated by adding acetic acid or vinegar to a solution of chlorinated lime. To prepare a liquid ink-eraser mix chlorinated lime or bleaching powder, 4 oz ., with water 15 oz ., shake together for an hour and strain. To the strained liquid add acetic acid 6 oz ., and bottle at once. For removing ink-stains the liquid is sponged on the stain, repeating until the stain has disappeared, then rinsing the spot with clear water. See Stains.
HYSSOP. The hyssop is a hardy evergreen herb, the shoots and flowers of which are used for medicinal and perfumery purposes. The common hyssop, Hyssopus officinalis, bears blue-purple flowers and grows to a height of 2 ft . It thrives best in well-drained soil. Planting may be done in April or May, 1 ft .
apart each way. Propagation is by secd sown outdoors in April, cuttings of shoots in summer, or by division of roots in spring or autumn. For distilling purposes flowers should be gathered when opening.

As Medicine. The dried flowers and shoots are infused for medicinal purposes. The infusion forms an aromatic bitter, and is taken as a tonic and for flatulence. It may also prove beneficent in cases of chronic bronchitis See Bronchitis; Flatulence.

HYSTERLA. The symptoms are many and varied. A person may be potentially hysterical without ever exhibiting any symptoms. If, however, a person is subjected to some exceptional degree of stress or strain, his normal element of control may become weakened, and then the hysterical condition develops. Very many examples of severe hysteria were seen among soldiers in the Great War. In civilian life grief, fright, disappointment in love, anxiety, prolonged overwork and sudden unexpected physical shock may be the immediate cause of hysteria.
In cases of hysteria paralysis of one or more limbs is not uncommon. Disturbance of sensation is frequent. Twitching of muscles or groups of muscles may be seen, leading to spasmodic movements of the face or limbs. The special senses, hearing, seeing, tasting, smelling, may all be abnormal. Stuttering is frequent. Some patients exhibit convulsive seizures or fits which may lead to a diagnosis of epilepsy. Mentally, there may be depression, emotional instability, as evidenced by frequent outbursts of tears, nervousness, irritability, dreamy atates, unreasonable fears, and attacks of acute anxiety.

Treatment. The treatment of hysteria may be palliative, i.c. directed towards relieving the obvious symptoms, or radical, which aims at discovering the fundamental psychological cause of the condition. In mild cases simple measures such as rest in the country, a sea voyage or change of occupation may be sufficient to restore the normal degree of selfcontrol. Paralyses, loss of voice, stuttering, and similar symptoms may be removed by a course of treatment consisting of physical exercises, which are, however, in effect a vehicle for suggestion.

This treatment, however, while removing the physical symptom, is not likely to improve the mental condition, which may indeed become worse after the physical symptom has disappeared. The extreme form of suggestion is hypnotism, and in certain cases this line of treat ment has been known to be of great benefit.

Undouttedly, the most satisfactory and radical treatment of hysteria is an investigation of the patient's subconscious mind, with the object of finding out the suppressed motives which, in conflict with the conscious mind, are really responsible for the condition. One of the chief methods of investigating the subeonscious mind is by psycho-analysis (q.v.). This method of treatment usually gives the best results in the casc of persons below middle age. It is not suitable for elderly people or for those of poor mental development.

HYSTERICS. The fits or convulsions which occur in hysteria are popularly known as hysterics. They occur most commonly in young women, and are usually preceded by emotional disturbances, bouts of weeping. alternating, perhaps, with wild and unnatural mirth. Sometimes patients complain of feeling a ball rising in the throat, as if it wou!d choke them. There is great restlcssncss, or the patient may fall down and have a fit which has a close resemblance to an epileptic one.
The patient should be laid comfortably on her bed, all tight clothing being loosened. The room should be cleared, as the presence of a crowd of excited and sympathizing friends tends to foster symptoms of hysteria. A douche of cold water on the face, and an intimation that this is to be frequently repeated, sometimes has a good effect in hysterical attacks. The ammoniated tincture of valerian in dram doses, every 3 or 4 hours, is a good remedy.

BERIS. This is the botanical name of the popular hardy perennial and annual tlowers that are better known as candytuft ( $q$ จ.)
ICE : Domestic Uses. Ice is often impure, and may contain germs of disease, especially of typhoid fever. When used to allay vomiting, to cool beverages, etc., it should be obtained from a reliable sourcc. 'lo keep ice from melting roll it in thicknesses of llannel. It can be chipped with a strong needle or ice pick.

Iced water and other iced drinks should be used moderately, otherwise dyspepsia may result. A sinall piece of icc allowed to dissolve in the mouth is a good remedy for thirst, and proves very grateful in fevers.

Ice is used largely for keeping food cool in hot weather It should not be placed in direct contact with fish, but may be used with advantage if the latter is first placed in paper bags and fastened down. See Frozen Food; Refrigerator.

## ICES AND ICED DIShes

## Recipes for Plain and Fancy Varieties

## See also the articles on Coffee; Custard; Freezer; Genoese Pastry; Icing; Mould; Refrigerator

Generally speaking, ices can be divided into cream scoop should be used for serving the ice two classes, cream ices and water ices. Cream cream in neat portions (Fig. 1). ices form the foundation of many dessert dishes such as mousses, coupes, sundaes, ice puddings, moulded fruit ices, etc.

To be correct cream ices should consist of equal parts of sweetened cream and fresh fruit purée; or flavouring essences, such as coffee, chocolate, vanilla, orange or lemon, can be used. In winter, when fresh fruit is not obtainable, jam or bottled fruits can be substituted. These should be made into a purée before adding to the ice. As cream is often highly priced a good rich custard may be substituted, wholly or in part.
The necessary equipment for making ices consists of a freezer and a wooden spatula or bone paper knife. There are many inexpensive freezers on the market for making small quantitics of ices. (See Freezer.) The vacuum freezers freeze the mixtures without the usual churning. Ices can also be made in electric or gas refrigerators without churning. An ice

To make ices in a freezer a freezing mixture is necessary. This consists of seven pounds of rough ice to one pound of freezing salt. Table salt is no good. The ice should be broken up very small. Pack the ice and salt in layers in the ice container, very solidly, and fix in the freezing vessel while packing, so that a tight fit is obtained. When pressed for time the mixture may be frozen more quickly by increasing the proportion of salt, but when this is done the ice melts more quickly and must be renewed.

Make the ice cream mixture as directed, put it into the freezing pot and close the lid firmly. Then rotate it in the ice. After a few minutes wipe the lid carefully, take it off, scrape down any mixture frozen to the sides of the pot, and beat the mixture until smooth. Use a wooden spatula, or bone paper knife, for this. Put on the lid, churn the freezer again and repeat the whole process until the mixture

Ice. Fig. 1. Ice cream scoop, a simple device used for serving small circular dortions of ice cream. Fig. 2. Ice pudding mould, which may also be used for moulding ice cream into a lancy shape
is evenly frozen all through. Keep the mixture in the freezer until needed and cover it with a piece of wet flannel. Irain off the water now and again, and, if necessary, pack in more ice and salt. If using a vacuum freezer this churning will not be necessary

A substitute for a freezer can be made with a pail and a vessel with a well-fitting lid to contain the mixture. A two pound golden syrup tin with a lever lid is excellent for the purposc. Put the mixture in the tin, cover securely, stand it in the pail on a bed of ice and salt, pack the ice and salt well around it, and with the handle of the pail twist it round for a fow minutes Repent the process as described for the proper frcezer. When the mixture is thoroughly frozen, cover it tightly and put a piece of blanket, or felt, over the top of the pail, with the ends resting on the ice to absorh the brine. Repack with ice and salt, if necessary, and allow it to stand at least an hour hefore using.

Facts to Note. Here are a few rules that will make the ices n success :

Never put warm mixtures into the freezing veasel: they take longer to frecze and melt the ce surrounding it.
Too nuch gligar makes the mixture slow to freeze, sonctimes preventing freczing altogether: on the otlicr hand, too littic rugar calases the lee will take to congeal.
Take take to congeal.
Tom comery possible care to keep the freezlang salt ronl coming in contact with the fer mixture
Use peevter br be blended with the custard
Use netvter or aluninitum vesacla whenever use coppier moulds for ice puldings as they give an unplensant tlavour and are dangerous to health.
For dessert, cream ices are often packed into fancy moulds of pewter to represent fruits The ices should then be coloured to correspond with the fruits they represent. If no moulds are available the ice can be made into oblong blocks and served on glass plates (Fig. 3), or the ice can he formed into halls and rolled in chopped nuts or coloured desiccated coconut (Fig. 4). Serve ice cream wafers or petits fours with all forms of dessert ices.

Sponge cakes, or Genocse cakes, are often given a filling of ice cream. The cream is shaped ira high round tin, either fluted or plain. The centre is scouped out and just hefore serving it is filled with well-Havoured ice cream A round uf cake is placed on the top, and on this is piled some kind of firm fruit which has been previously cooked and kept on ice Pour sume of the syrup around the cake and serve at once.

Vanilla Ice Cream. For this take one pint of rich custard. half pint whipped cream, vanilla to taste Allow the custard to get cold. and favour it with the vanilla, put it in the freezer and half freeze it. Then add the cream, heat it well in, and continue the freczing as directed. Fur an economical ice crean the cream may be omitted or less used
Strawberry or Raspberry Ice. To a pound of fresh strawberries, or masplocries, allow half n pint of cream, four ounces castor sugar, lialf tablesponinful lemon juice and cochineal to give gand colour. Ruh fruit through a sieve; mix puree with lemon juice and castor nugar. Whip cream and stir int: add cochineal. Freeze as directed. Apricot cream ice is made in the same way, using fresh or tinned apricots
Coffee Ice. Take half a pint of strong goffee, half a pint of good custard, quarter pint cream and quarter pound loaf augar. Mix the coffee, hot custard and sugar. Half frecze when cold: then add cream and finish freezing. Serve in separate glasses.

Neapolitan Ices. These arc composed of various kinds of icc cream frozen separately and then packed into oblong moulds in equal portions. When these are hard they are removed from the moulds and served without cascs on small glass plates, as shown in Fig. 3. Mloulds can be bought for inaking these ices The Neapolitan misture can also he made into an ice purding.

Mousse. The mousse is a light ice crean mixture usually composod of well-flavoured fruit symup, or puree, with crean that has been highly whisker. It is then fmzen in plain large or small moulds lined with paper. The ligh whisking makes it light and frothy in appearance. The top should lee decorated with berries or pieces of fruit and chopped nuts.

Fir. 3. Ice cream tor dessert shaped into oblong portions and served on glass plates, with wafers
Sundaes. Cream ice and fruit sundaes are served in individual glasses. These are almost filled with the cream ice and freah or tinned fruit in small pieces added The fruit syrup is then poured over and chopped nuts sprinkled thickly over all. If fresh Iruit is used, such as strawherries or raspberries, it should be aprinkled with sugar and allowed to atand for a time. The syrup thus formed can then be poured over the ice cream

Coupes. The coupe is another form of fruit ice, made from either water or cream ice. It is usually served in glasses.

Coupe à la Milanese is a lemon-water icc Havoured with cherry brandy, and mixed with enough brandied cherries to allow a hout threc to each portion of ice. Another form of this fancy icc. known as coupes d'abricots, is
prepared in this manner. Mix a pint ol apricot cream ice with 4 tablespoonfuls of tinned apricuts cut into small cubes. Flavour them with ome liqueur and serve in glasses, putting in first a small spmonful of the ice, then a light layer of powdered ratafias, then more ice, and so on until sufficient ice has bren used for a portion. A layer of the ice sliould be put in last and the top decarated with shreds of hright green pistachio nuts

Coupes aux marions are prepared by aoaking some brokan marrons clacés in a little liqueur, and putting small tablespoonfula of them into some glasses Fill them up with vanilla ice cream, and decorate the top of each :vith a marron glacé and a little whipied cream
Another similar swect, known as coupes Jacques, is prepared by half-filling sume elass cups with fruit anlad, flavouring it with kirsch, and then covering it with one layer of vanilla and annther layer of strawherry ice cream Decorate tho top with a grape or cherry Nome slight variation can be provided bv using different liqueur for llavouring.
Pêche Melba. This is nother form of fancy ice, made with ciram ice and peaches The peaches are divided in halves and stoped and stceped in liqueur and a sprinkling ol sugar added, or tinned peaches can be used They are served with a surmounding of rich ice cream and garnished with whipled crenm arranged in the centre A little syrup is boured over. Other Melhas are made in the same way, substituting pincapple. strawherrics or pear's for preaches.
Lemon Water Ice. This requires carc to be successful. In lemon water ices the juice of the lemons must he added after the syrup of sugar and water is made and must be perfectly incorporated. Take ${ }_{3}$ pint water, the juice of thrce lemons, a teacupful of lonf sugar, and the whites of two egge. Wipe the lemons, then rub some of the lumps of sugar over the outer parts of the pecl to get the essence of the lemons. Boil the sugar and water for ten minutes till it forms a thread hetwcen finger and thumb. Allow it to cool, then add the strained lemon juice. Pour the mixture into the freezer and half-frecze it, take it out and add the beatell whites of the eggs and beat thens well in. Return to the freczer and freeze to the desired consistency. In all water ices the chicf point is to draw out the particular Havour of the fruit usell. Orange water ice is made in the same way as lemon water ice, substituting oranges for the lemons.

Sorbet. This is a water ice flavoured with liqueur and with fruit added. It is served in a goblet in the middle of a formal dinner just before the roast. Russian cigarettes are usually handed round with it.

Ice Pudding. Half freeze one pint of rich custard and add 2 oz mixel glacé fruits.

Fig. 4. Ice cream tormed into balls and rolled in chopped nuts or coloared desiccated coconat
cherries, apricots, oranges, etc., a few finely chopper almonds, pistachio nuts, a dessertspoonful chopped preserved ginger, 2 teaspoonfuls maraschino and half a pint whipped cream. Half freeze as before. Wet the ice mould (Fig. 2) and decorate it with nuts and fruit. Pack in the frozen mixture, put on the lid and cover all the joints, cracks, lid opening, etc., with lard to prevent any salt coming into the mixture, and then wrap the mould in two or three thicknesses of paper. Bury it in the ice and salt and freeze for two to three hours. To unmould, first remove paper and lard, dip mould in cold water, remove lid gently and slip the pudding on to the dish.
Iced Food and Drink. Certain foods and beverages, though not ices in the accepted sense of the terin, are subjected to a freering process and are therefore said to be iced. White coffee may be ioed by placing it in a jug resting on ioe, and lenving it until it to icy cold. Black coffee is similarly iced, except that the jug is put deep into the ice, a little brandy added, and a lump of ioe put in just before serving. Tea that is to be iced should be freshly made and poured off the leaves as soon as it is ready for drinking. Leave it to $\mathbf{c o o l}$ and then pour it into a glass containing some frozen ice, a thin slice of lemon and a little sugar to taste.
ICS BAG: Its Medical Uses. A con. venient means for applying continuous cold to any part is provided by the use of an ice bag. Ice is broken up into very small pieces and put in an india-rubber bag, so as to half fill it.
In typhoid fever, in the presence of pain or haemorrhage, an ice bag may be ordered to be placed on the abdomen. It proves useful also in early appendicitis, and as the weiglt of the bag would tend to increase the pain, the bag is slung from a bed cradle so as just to rest on the skin, but no more. An ice-cap or bag to the head is often of great use in lessening the pain in severe headache, such as migraine. Care has to be taken against leaving an ice bag ton long in contact with the skin, especially in the old, as a sore may be produced. See Cold Pack.
ICELAND MOSS. This lichen may be cooked in the same way and used for the same purpose as Irish muss. It has a somewhat bitter taste, but this may be partly remedied by adding a pinch of soda to the water in which it is soaked. See Irish Moss.
ICSLAND POPPY. This very beautiful hardy plant (Papaver nudicaule) has longstemmed Howers in orange, yellow or white, which appear in May and June. In recent years new and improved types with large and more richly coloured bloome have been raised, e.g. the Sunbeam and Coonara poppies. In the latter the flowers are of salmon, fawn, biscuit, apricot, etc. All these varieties are treated as biennials : they are raised from seeds sown out of doors or in boxes of soil in May to produce flowering plants next year. Before the seedlings become crowded they must be sot on a reserve border at 6 in. apart until finally planted in October where they are to bloom.

wine cooler. In the shape of a pail, it was made in silver and Sheffield plate, as well as in the cheaper metals. After a time pieces were de.
o make the who die one piece, lid and hen included. Screw the whole together, box and saw of to this line, the meeting corated, ornament surfaces being planed up true and flat.

The zinc lining, Fig. 7, may be made from separate pieces, riveted at the ourners and soldered. If a large sheet of zinc is obtainable the lining can be made in one piece by bending up the bottom angles, the vertical edges being Hanged, riveted, and soldered. The upper part is turned over at right angles, mitred at the corners, and soldered. In the centre of the bottom a tap, Fig. 5, is fitted by soldering a bush piece into the bottom of a brass cup, such as can be made from the top of a bedstead knob. This is soldered on to the bottom of the zinc lining, and the tap into the bottom of the recoss.
The zinc above the brass cup should be pierced with small holes about $\frac{1}{8}$ in. in diameter, so that it will act as filter. A hole is cut through the bottom of the wood casing to allow the tap to pass through, and fillets are screwed to the inside of the wood case for the zinc lining to rest upon, as in Fig. 3. The space between the zinc lining and the outer case should be packed with insulating material.

To make the zinc-lined lid, fit a fillet round the opening at the top of the zinc case and round off the edges; then make a plain wooden inner lid that will just fit into the space inside the fillet. Prepare a zinc lining similar to the casc, but smaller and only 2 in. deep. Turn a Hange on to it and temporarily screw it to the underside of the inner lid (see Fig. 4). Hinge the lid to the top of the outer case, and see that packed with slag the lid to the top of the outer case, and see that
wool, sawdust, or the lining on the lid closes into the case and taking the form of reeding, usually round the body about a third of the way from the top. The best specimens were made in the 18th century and the early part of the 19th.

ICEPLANT. This is another name for Mesembryanthemum crystallinum, a showy annual for hot, dry places. mesemoryanthemum is known also as fig marigold.

ICE SAFE. Un. cooked foods may be stored safely for several days in an ice box with about $\frac{1}{2} \mathrm{cwt}$. of ice. It consists of an outer case enclosing a zinc box, the space between them being
sonse other material that is an equally good non-conductor of heat
The example illustrated shows the component parts and variousdetails, the dimensions being suitable for a small household, but may be increased or diminished to suit requirements, and the form of the box can be modified. The ice can be obtained from any good-class stores, or sometimes by arrangement with the fishmonger or hutcher, who will deliver supplies regularly.

The outside wood case can be made with 1 in. tongued and grooved boards dovetailed together at the comers, or nailed together and reinforced with little straps of iron screwed over the corners. The bottom is of similar material, screwed to the sides. The dimensions are given in Fig. 2. The feet may be turned or made of 3 in . square deal planed to a alight taper, so that they are about $2 \frac{1}{2}$ in. square at the bottom. These are screwed to the bottom of the case with wood-screws passed through from the inside. A plinth of deal, 3 in . wide and 1 in . thiok, is glued and sorewed round the outside of the bottom, the corners being neatly mitred and the edges chamfered.

The lid of the case, Fig. 6, is floor-board and a framowork of deal, 4 in . wide and 1 in . thick, screwed at the corners or dovetailed. If they aro acrewed, they can be reinforced with iron angle plates screwed to the outside. The lid is hinged to the baok of the box. An alternative method is
lits closely The meeting surfaces round both inner and outer lids can be covered with a good close-grain cloth, as this assists in keeping the joint tight The interior of the lid lining has to be filled with non-conducting material, for which purpose it must be removed, packed tightly, and replaced

Internal fittings will be determined by in dividaal requirementa, hut one or more shelves of perforated zinc on a framework are essential. These are readily made by cutting the parts to size and maling soldered joints. The shelves are supported on anyle pieses soldered to tbe sides of the inner lining Sufficient space must be left for the ice, and a practical arrangement is to have the shelves just a little less than onethird the width of the lining so that they can be arranged in the most advantageaus way, omitting the centre one if the block of ice is at all tall and narrow The whole interior has to be cleaned thoroughly with warm water to remove all traces of the soldering acid.

A good way to finish the exterior is to enamel it, as a coating of paint is an effective method of protecting the woodwork from the effecta of the relatively conl interior and the hot, dry exterior. Another advantage of the enamel finish is the ease with which the whole can be kept clean. The ice aliould be wrapped in a piece of clean sacking or cloth, as this is of nssistance in protecting it from the effects of the rush of heated sir when the lid is opened. Sep Refrigerator
ICHNEUMON FLY.
This insect is beneficial in the garden, as it is des tructive to caterpillars and other pests. Actually the flies deposit their eggs in the bodies or eggs of other insects, hatching out larvae which devour the body or egg in which they were developed The tlies may be readily iden tified by their long, slender, blackish-brown bodies, and are about $\frac{1}{2}$ in in length. See Caterpillar; Insect

achneumon Fly. Usesui дasuen insect which belps to keep down the cater- pillar plague fringed paper. and other designs
coats лne aumetimes used in cakes of all elnbor. ate character, but one coat must always he allowed to dry before anotlier one is put on Large cakes are sumetimes iced only on top, the sides being tastefully decorated with ribbon or
leing on birthday or party cakes may he of one, two, or even more colours and Havours, but if intended for children it should not be ton rich. Additional decorations on iced cakes niay be supplied by birthday, Clıristmas, New Year, or other greetings, or any appropriate design, carried out in icing of a contrasting sliade Forcing pipes will be necessary for this process, which, though more difficult than ordin ary icing, merely requires careful practice.
The Forcing Pipe. These are made in the form ol syringes with detachable lunnels of different sizes and designs 11 it is desired to ornament the cake with words of greeting, a funnel is placed on the mouth of the syringe. which has a small round hole. If piping o coloured icing is desired, or a lattice or scroll design, the same funnel is used. A funnel with a serrated edge is used for making rosettes or roses of icing, and a funnel with a Hat opening for making ribibons of icing, bows, garlands

The icing, which should be of a firm, creamy consistency, not thin enough to run nor stiff enough to stand, should be placed inside the syringe, the handle of which is unscrewed at the top The syringe is about half filled The handle, with the pump pulled out as lar as possible, is screwed on, and then sently pressed downward The ioing is forced out through the funnel, and cakes the shape for which the funnel is designed A revolving stand is supplied with some icing sets, and chis is a great help in icing a cake evenly The syringe should be held immediately over the spot where the decoration is to fall if roses
ICHTHYOL. The drug used in medicine or rosettes are desired It should be slanted under the name of ichthyol is a dark substance obtained from a bituminous quartz containing the fossil remains of fish. The dose internally is 10 to 30 gr ., and the drug proves useful for rheumatism, bronchitis, etc. A convenient way to take it is in tablets containing $2 \frac{1}{2} \mathrm{gr}$.
Ichthyol ointment, 5 to 10 or more per cent, spread on Hannel is a soothing and heatreducing application in sunburn, burns, and other inflammatory conditions of the skin.

ICING. There are various kinds of icing, differing somewhat in make and consistency They include almond paste, butter, or Vienna icing, and fondant, glacé, and royal icing. In some of these the method of application varies, both glace and fondant icing, for instance, being usually poured over the cake ; while butter icing, which is used sparingly because of its richness, is allowed to get hard and cold before use, and then apread over the cako, smootbly and evenly, with the that of a knife.

If glacé or fondant icing is not used in the manner auggested, the cake is dipped into it and coated in this way. Almond paste or icing is used in a thick layer, which is shaped with the hands before being smoothed with a wetted knife. A little marmalade is used to make the paste adhere to the cake.

Royal icing, for which almond paste frequently serves as a base in rich wedding cakes, is hard and white. It can be coloured pink with a few drops of cochineal, or other colours with vegetable colouring extracts. Only one drop at a time must be used, as these are very strong.

Instructions for making royal icing are given under the heading Cake Two or three
for writing or ribbons of icing.
If a forcing bag is used, the icing mixture is put into the bag, half filling it, and the fummel pressed through the bottom The icing is then squeezed by the band through the opening into the funnel Royal icing, butter icing, or whipped and Havoured cream, can all be used for ornamenting dishes in this way Entries and savoury dishes are sometimes decorated with savoury cream by means of a forcing set

Glacé Icing. This is made with $\frac{1}{2} \mathrm{~b}$. of icing sugar and about half a gill of tepid water Crush the sugar and put it into a basin, add the water slowly and atir sanoothly but de not beat The icing should coat the back of a spoon and settle smoothly into that in the basin If necessary, add a little extrawater Colourings andfla vourings, such as vanillaor almond, call be added if it is desined
Furan
orange or

lcing. Forcing machine used for lancs iclng. Dpon the syringe is a lunnel for making ribbons of icing, Of the two detached funnels, that on the left is for rosettes, etc. ; that on the right lor greetings
lemon glace icing use the strained juice of lemon or orange instead of the water, and colour if necessary with a few drops of saffron colouring.

Feather Icing. This is used when a rough surface is desired on a cake to give the effect of snow To make it, prepare 8 syrup trom $\frac{1}{2}$ pint of water and 2 lb ol loaf augar and hoil it to $240^{\circ} \mathrm{F}$ Then pour it on to the slightly whisked whites of 4 eggs, add any colouring required, and whisk the mixture until it thickens A smaller quantity can be made provided that the same proportions are naintained This icing is sometimes known also as mountain icing. See Almond Paste; Cake; Chocolate Icing: Coffee lcing; Decoration; Fondant, etc.

## Icterus. See Jaundice

Idiocy. Idiocy is extreme mental deficiency which shows itself after birth or develops in very early childhood See Insanity

ILLEGITIMACY. An illegitimate child is one burn out of wedlock Such children are made legitimate if the parents marry after their birth, provided that the parents were free to marry at the time of the biath. This bas long been the law of Scotland and in 1926 it was made the law of England also.

An illegitimate child usua!ly takes the name of the mother, but has no legal right to any name Apart from social disadvantages illegitimate children are in a somewhat peculiar position before the law They cannot inherit anything from an intestate relative, and must pay legacy duty at the wame rate as strangers in bluod On the other hand illegitimate children are recognized as dependents under the Workmen's Compensation Acts

The mother of an illegitimate child can compel the father to pay towards its maintenance A child of a married woman is regarded as legitinate even it the tather is not her husband, the law being that auch is born in wedluck. The law, however, can declare such a child illegitimate if the husband can prove that it is not his See Affiliation Order: Child : Father: Income Tax; Mother.
1 LOVE MY LOVE. This is an old game, and can be played anywhere with any number above two. It consiats mercly in filling in a form of words with the necessary epithets, all of which nust begin with the same letter. T'lie form runs as follows: I love my love with an A because he is amiable: I hate him with an $A$ because he is argumentative He took me to the aign of the Arrow and fed me with anchovies and asparagus His name is Archibald and he lives at Angmering

When one person has done this satisfactorily the next takes up the tale, either repeating it with A and aupplying a different word for each epithet, or, if pre ferred, continuing with B The game goes on until the entire alphabet has been exhausted. X is omitted, and $\%$ will seldom last for more than one player It can be played either in the masculine or feminine gender. IMARI WARE. The Japanese porcelain shipped from the port of Imari was at first painted in underglaze blue on white, and afterwards in enamel colours and gold. This old porcelain was freely copied in Delft ware, and then in English china, esprcially at Bow, Derby, and Worcester Chrysanthemums, peonies, and other boldly drawn and richly tinted blossoms, often highly conventionalized, with dragons, birds, and diaper patterns, are favourite styles They are painted in
grass-green, dull red, lilac-blue and gold. Modern Imari does not equal the old ware, which fetches very high prices, but it is an effective foil to other Eastern furnishings, especially the beakers, square vases, and shallow dishes. Imitation Chinese marks are sometimes used. There is much inferior work, both old and new. See China.
Immortelle. This is an alternative name for rhodanthe. See Everlasting Flower.
IMPEDANCE. This is the opposition offered to the flow of an alternating current round a circuit, and is dependent upon the values of resistance, capacity, and inductance. Impedance varies with the frequency of the alternating current, except in cases where the circuit constitutes only a pure resistance. Impedance is expressed in ohms.
IMPERIAL DRINE. For feverish patients a beverage known as imperial drink is often prescribed. One simple method of making it is to add cream of tartar to freshly made lemonade in the proportion of a teaspoonful to the pint. The following is a usual recipe :
$\begin{aligned} & \text { Saccharin } \\ & \text { Oll of lenion }\end{aligned}$
Oll of lenion
Potasslum tarirate
.. $\quad .-1$ dram
$\begin{array}{lllll}\text { Bolling water to make } & \cdots & . & 1 \text { pint } \\ \text { Another recipe consists of } & \frac{1}{2} & \text { oz. } & \text { cream of }\end{array}$ tartar, the rind of a lemon, a heaped teaspoonful of sugar, and 3 pints of boiling water.

IMPETIGO: A Skin Disease. Impetigo is a highly contagious inflammatory skin disease, characterized by the formation of scattered blisters on the skin, which become filled with matter and dry into crusta. The face, particularly about the mouth, is the commonest site of the disease. There is little or no itching. The disease is chiefly noted among poor and dirty children.
The crusts should be softened and removed with soap and warm water, or, if necessary, by soaking with oil or applying starch poultices, after which the following ointment may be applied to the patches:

Ammoniated mercury . $\qquad$ .. | 5 gr. |
| :--- |
| 1 oz |

Pctrulatum
To prevent new crops of blisters appearing an antiseptic lotion should be frequently sopped on the affected skin and adjacent areas, e.g. saturated boracic solution or corrosive sublimate lotion ( 1 in 3,000 ).
INARCEING: Of Plants. This is a form of grafting which is not often practised in gardens. It is useful, for example, if it is wished to replace a worthless grape vine with a better variety without disturbing the roots of the former.

The method is as follows. A vine in a pot of the variety wanted is purchased. When growth has started in spring the pot must be raised so that the fresh green shoot can be brought into contact with another green shoot on the old vine. A piece, $\frac{1}{1}$ in. to $d$ in. deep and

Inarching. Lett, young and old plants joined toRether : $a$, bandaged junction i $b$, where to divide
when cohesion is established. Right, showing at $a$, preparation of stock and scion
about 2 in . long, is cut out of the side of each
green shoot, the two shoots are tied together with raflia so that the cut surfaces are in contact, and finally the raffia is covered with moss, which must be secured in position.

The moss is kept moist by syringing. If the work is successful the two shoots will unite. When it is obvious that union has taken place, during the summer the stem of the young vine should be severed very gradually just below the green shoot. Subsequently, as the new variety of vine makes vigorous growth, the shoots in the old vine can be rubbed off gradually, and eventually the branches may be cut away, leaving the new variety firmly established on the old stock.

INCARVITLEA. This plant has thick brittle roots, large leaves and trumpet-shaped flowers in sunımer. The favourite is Incarvillea

Incarvilles. The rose-red trumpet-shaped flower of this hards herbaceous plant
Delavayi, with rose-red bloome. It should be planted in well drained sandy, loamy soil in a sunny place. In cold districts the soil over
the roots should be covered with old ashes in autumn, when the leaves have died donn. If an increased stock is desired it is best to sow seeds in a frame in spring.
INCR. For ordinary purposes the inch is the smallest measure of length, though for special purposes, scientifio and other, it is divided very considerably. Twelve inchen go to a foot, and the standard inch of the United Kingdom is $3_{3}^{3}$ of a yard. 144 square inches make a square foot and 1,728 cubic inches make a cubic foot. For it the usual abbreviation is in., which is used throughout this work.
INCINERATOR. The best method of dealing with household refuse, which is usually placed in the dustbin, is to burn it on the kitchen fire. In the hot weather the range or independent boiler may be out of use, so that some other way of consuming the refuse must be arranged. In such a case the best way is to destroy it in an incincrator. In one type, which may be installed in kitchen or scullery where a thue is handy, the heat is provided by gas. An incinerator of this kind is perfectly safe to work, and needs no attention beyond feeding in the refuse, giving it an occasional poke, and afterwards emptying the ash. By this agency refuse, wet or dry, tea leaves, egg-shells, vegetable stalks and scraps, rags, cooking waste, etc., can be converted quickly into a relatively minute quantity of ash. This can be deposited in the dust bin or used in the garden as a fertilizer. The use of the appliance for half an hour daily will dispose of all the domestic refuse and the cost for gas is negligible.

A galvanized iron incinerator is handy for use out of doors. It is a cylindrical structure resembling a dustbin, and having a grating, lid, and central thue. A fire is kindled with pajer, etc., and the refuse is placed inside See Dustbin; Gas; Rcfuse.

## INCOME TAX: THE LAW EXPLAINED

## How the Tarpayer can Compute Bis or Ber Liability

By the help of this articie Income tix payers can ses for themselves he amoun's they are liable to pay. Other aricieles that deal wilh the financial liabilities of the householder Include Emp:oyers' Liability ; Rates. See also Insurance ; Surtax

This is a tax of so much in the $£$ on every $£$ of income, with certain allowances intended to relieve small incomes. In addition to the income tax proper a surtax or super-tax is levied on larger incomes, i.e. those over $£ 2,000$ a year.
In Great Britain the existing scheme provides for a certain amount of inoome being free from tax: for the payment of a lower rate on the next $£ 250$, and for the payment of the full rate on the balance. In addition, there are various allowances and abatements, so that the actual rate of tax varies, not only with the income but with the responsibilities of the payer. In fact it can be said that each payer has his own rate of tax.

The tax is in most cases payable in two instalmenta, due on Jan. 1 and July 1 during the year following the one in which the return is made. By a change introduced in April, 1931, three-quarters of the amount due on earned income is payable on the former date and the remaining quarter in July. Weekly wage earners can be assossed half-yearly and pay the tax every half year. This concession does not, however, extend to journalists, clerks, typists, and others, even if they are paid weekly, but is confined to manual workers. If the income for the year in question cannot be ascertained exactly, a provisional return should be made and the matter adjusted at the end of the periorl, or as soon as possible.

The Procedure. To ascertain his liability the taxpayer must know the rate of tax and the amount of his taxable income, this being his total income less certain deductions. In

1930 the rate, the standard rate as it is called, was raised from 48. to 4s. Bd. in the £, and at this figure it remained in 1931. The first $£ 250$ of taxable income, however, is only charged at the rate of 2 s . in the $£$, but the balance bears the full or standard rate.

In April or May the taxpayer should ascertain his total income for the year ending March 31 and fill up the form which is sent to him. If this is accepted as correct by the authorities, he will receive a demand note for the amount, which he must pay during the following year. If his return is not accepted, the authorities may ask him to make another one or to present them with certain explanations. They may, too, assess his income at a figure higher than the one he returned and leave him to prove that it is incorrect. Persons who are not liable to tax must also fill up the form if one is sent to them.
The Five Schedules. The income must be entered under one of the five schedules or classes shown on the form. Of these A relates to income from land and house property in Great Britain and Northern Ireland, and includes the annual value of the house in which its owner lives. B relates to income from the occupation of land and is charged on the annual rental value. This chiefly concerns farmers, who, if they prefer, can be assessed on their actual profits for the year preceding. C relates to income from war loan and other securities, the interest on which is paid out of public funds.
The majority of taxpayers prohably pay, as far as the bulk of their income is concerned,
under the two remaining headings. I) relates to profits from every trade, profession or rocation, farming excluded, and also to bank interest, loan interest, interest froin foreign and colonial securities and on stocks and shares. In this class, therefore, fall the incomes of all who are in business for them. selves, and of those having holdings of stocks and shares in public and private companies. In E fall all ealaries, pensions, etc., whether paid out of public funds, or by public and other companies or by private firms.
Reliefs and Allowances. The income ascertained and ontered, the taxpayer should next find out what relicfs and allowences ho can clain, and by deducting these from his total income he will oltain what is known as his tavable income.
The taxpayer can get relief for the pait of his income that is earned, earued in this sense including pensions. This is an allowance of onesixth of the income in question: but the totnl relief must not exceed $£ 250$.
No income tax is payable on the first $£ 135$ of assessable income in the case of a single person or on the first $£ 225$ in the casc of a married man living with his wife, or wholly maintaining her This makes all incomes under these amounts free fiom tax. No tax is payable on wound and disability pensions granted to persons who served in the forces during the Grent War, or on war gratuities, or on cllucational scho!arships and exhibitions, even if they exceed the limit of $£ 135$. Casual and occasional profits and gains, such as that from a swocpstake or from a deal in shares, arc not liable to tax, ncither are gifts and ammities that are not payable under a deed. In the case of gifts of this kind the tax is home by the payer, who gets no a!lowance for such.
For purposes of income tax the reparate incomes of husband and wife aro added together; but there is one moditicntion of this. If a wife earus an income she is entitled to an abatement thereon of a sum equal to fivesixths of the amount of such carned income, but the reliel is limited to $£ 45$. In other worde, a married couple in this pusition can claim relicf up to $£ 270$ instead of $£ 225$.
The next relief is for children. There is an allowance of $\mathbf{E} 60$ for the first child and £jo for each other. Such. children, however, must he under the age of 16 on April 6 of the year for which the claim is made, except in the casc of those who arc in full time attendance at school or college, for whom there is no agc limit. This allowance cannot be claimed for any child who has in his or her own right an income of £60 a ycar or over. Child in this sensc includes a stepehild and an adopted child, if such child is maintained by the taxpayer.
Allowances for Dependents. Allowances are also made for dependent relatives. One of $\mathfrak{£}: 5$ is granted in respect of any relative who is dependent on the taxpayer or his wife, prorided that such dependent is incopacitaterl by old age or intirnity from maintaining himself or herself and that his or her income from all sources does not exceed $£ 50$ a year. If two or more sons or daughters join in maintaining a dependent they are entitled to divide the relief of $£ 25$ between them. Whien the dependent relative is a widowed mother the condition of incapacity is waived. The anme relief is granted for a danghter on whose services the taxpayer depends by reason of old age or infirmity.

Allied to this is the allowance granted to widows and widowers for a housekeeper. Re. lief to the extent of $£ 60$ is granted to a widower in respect of a female relative or some other fenale who resides with him for the purpose of looking after his children. $\Lambda$ widow in n corresponding position can also clainn it. If an unnmaried person has living with him a widowed mother or any other female relative
main:ained by him to look after his brothers nd sisters ho can chaim an allowance of f 60.
An allowance is also granted tor prenniums on life assurance pulicies. This amounts to an allownace of 7 per cent on the capital sum insurcd. up to one-sixth of the total net in. come from all sources on all sums paid in premiums on his own life and on that of his wife. It is also allowed in enses where a wife takea out a policy on the life of her hushand. There are, however, certain limitstions on this form of allowance

Trade and Professional Expenses. Allow. ances are also granted in respect of certain trades and professions. Ordinary tralesmen and other business men are allowed to deduct all the expensos wholly and exclusively incurred for business purposes. The auditors will usually decide what expenses can rightfully be included in this category, but their decisions may be questioned by the Inland Revenue authorities, who mny call for the production of the hooks of the business. In these cases much depends upon the nature of the busincss and sperial circumstances of all kinds; but the authorities will certainly question heavy expenditure that is not proved to he purely for business purposes.

When an individual reaides on the premises at which he earries on his business he is entitled to charge againat his protits a proportion, not exceeding two-thirds, of the rent, ratos and other outgoings incurred in connexion with the said premiscs. Other traders, e.g. painters and joiners, who conduct their business from their homes are also entitled to all allowance of the same kind.
Medical men, dentists, and those solicitors who do part of their business at home, are also allowed to deluct from their incones something for that part of their house that is used for professional purposes. In the case of a clergyman or minister of religion an allownace not exceeding one-eighth of the rent or annual value of the house in which he lives is allowed.
Journalists are allowed an amount up to EfO in respect of professional expenses such as the cost of typew riting and stationery. Artisans and othery can obtain allowances for expenses on the touls necessary for thicir livelihood. Expenses incurred in getting to and from anc's work are not allowed as deductions from the amount liable to income tax. A commer. cial traveller, howover, can ohtain a deluction for expenses of travelling incurred for his business, provided no allowance is made to him by his employers for expenses of this kind.

When a person sustains a loss in any trade, profession, or vocation he can, upon giving notice in writing to the local inspector of taxes, within twelve months after the year of assessment in which the loss is incurred, apply for and ohtain an adjustment of his liability to income tax by setting the loss ngainst his assessed income of the year and hearing the tax on the balance. When such loss exceeds the arsessed income the balance of the luss can be carried forward and set off against the income of succeeding years.

Two Examples. To illustrate the working of the income tax laws two instances miny be taken, one very simple and the other somewhat more complicated. A married man with two children under 16 has a sa!ary of 1750 a year, his wife has a private income from investinents of $£ 40$ and hiniself onc of $£ 20$. He pays $£ 20$ a year in insurance premiums. The total income is, therefore, $£ 810$, and the deductions are:

Onc-sixth of earned incoine
tllowance for relf and wite
Allowance for two children

| $i$ |
| :---: |
| $1 \geq 5$ |
| 205 |
| 110 |
| $4+00$ |

i40)
He can alsu claim 28. 3il. in the $£$ or $£ 25$.
on his life. He should therefore deduct $£ 460$ from : 810 , leaving a balance of $£ 350$ ) on which he is to bear tax. Of this $£ 250$ is charged at the lower rate of 2 s . in the $\&$ and the balance at 4 s . Gd. His total lax will therefore be $\mathbf{\$ 4 7} 100$, less the $£ 2$; 0 mentioned, or £4.5 50 . Of this $£ 22100$ represents the full rate of 4 s . id . in the $£$ on the last $£ 100$ of his income. He has, however, already paid fil3 100 , as this amount has been deducted from the dividends or interest paid to himself and his wifc, and so the actuol amount due from him in cash is reducel to $£ 31150$, of which three-quarters is duc in Jonuary and the romaining guarter in July.

In the other case a prufessional man returna his earnings at $£ 1,440$ for the year In addition he has a privato income of £il8, and his wife has one of $e_{2}(j 0$. This gives him a total gross income of $\{1,878$, from which there are various deductions, in addition to the main ones of one-sixth of his earned income and $i 225$ for himself and his wife.

This protessional man has three children: one son is over 16 years of age, lut as he is still at school the father can claim an allowanco for him. He contrilutes $£ 100$ a year to the suppiort of his widowed mothor, so can claim relief on $£ 25$ in respect of this payment.

His abatements and nllowances may ber summarized thus

## One-sixth of earned income <br> Self and wife <br> Dependent mother <br> 210 205 210 2.5 <br> 1650

This amount is deducted from the total income of $£ 1,878$, making his taxable income £1,22s. He pays 2 s in the $\{$ on the first $£ \geq 50$ o! this and 4 a. (id. on the lonlance of $£ 978$. Thus lic is linble for a payment of $£ 245 \mathrm{ls}$., but as he has already paid, hy deduction at the source, $£ 98$ /1s on the incomes of himself and his wife, he need only find in cash 5146 l Hs .

Taxing at the Source. In these two cases and in many others the taxpayer does not actually himself pay over the whole of the tax due from him. This is due to the fact that he may ohtain part of his income from interest and dividends of various kinds. These uneqraed incomcs, and also certain classes of earned incomes, are taxed at the source, or before they reach their owner. In other words, the company pays the tax direct to the national exchequer and deducts it from the nmount of the dividend.

The same is dune by the Bank of England and other hanks when paying the interest on consols. war lonns, corporation stocks and other securities of that kind, and also by those who pay interest on mortgages. The only important exception is certain classes of war loan. On some of these the interest is paid without deduction of tax, leaving the recipient to pay the tax if ho be liable, while others are in the real sense tax frec or tax compounded. The holder of stocks and shares is obviously not required to pay a second time. but he is required to show such income in his declaration of his total income to the tax authorities.

The principie is exactly the same when a company pays its dividends free of tax, ns it is called. This simply means that it is paying a higher rate of dividend. To take a simple example : a company that pays 5 per cent free of income tax is really paying something over 6 per cent gross, when the rate of tax is 4s. fid. in the .f. The gross dividend inclusive of $\operatorname{tax}$ must he entered on the return by the iaxpaycr. He must not enter ilo, or whatever sum he actually reccives, but that sum plua the amount deducted.

In the case we have assumed, that sum is $£ 1218 \mathrm{~s}$, because the tax on $£ 1218 \mathrm{~s}$. nt 4 s . Gd.
in the $£$ is $£ 218 \mathrm{~s}$, which leaves a halance of
£10 for the taxpayer to receive. He is really taxed, therefure, on £12 Iss and this is the amount of income which he is assumed to have had This matter is important from the puint of view of the inland revenue authoritice, as the larger amount will, in certain cases, make incomes, utherwise free, liahle to surtax. It is also impurtant from the puint of view of a taxpayer who claims repayment because he is entitled to reclaim tax on $£ 12$ 18s. instead of on only $£ 10$.
Claims for Repayment. These deductions from income aro obviously made irrespective of the amounts of the incomes of the various persons concerned, which amounts those making the deductions cannot possibly know. Hence it comes about that many persons with small incomes, e.g. all thuse below $£ 135$ a year and those who, although they have incomes a bove that a mount. are entitled to allowances of various kinds that are equal to or greater than the income itself, find, when they receive their dividends, that they have paid a tas from which legally they are free. Others who are liable to pay momething find that they have paid more than they should have done. For instance, a man may be liable for a tax of $£ 10$. but $£ 20$ may have been deducted from his dividends Cases of this kind are very frequent.
To remedy this effect of deduction of tax at the source provision is made for returning the excess of tnx so deducted Persons, therefore, who have paid more than they are liable for should take the following steps to recover the amount whether they arc totally exempt from tax or only partially so Inmediately after the end of the year, which for this purpose is April 5, a claim for repayment should be forwarded to the local inspectur of taxes. For this purpose a special form is provided, which can be obtained from the inspector, whose address will, if required, be given by the local collector. This form should be filled up carcfully, all the particulars required being clearly entered. It should then be sent to the inspector for examination and verification. Questions may be asked about one or more of the items, but if the claim is in order the overpaid $\operatorname{tax}$ will be returned in the course of a few weeks. No claim will be admitted unless it is made within six years from the end of the year to which it relates. This is an important pmenso.
Sending in the Claim. With this claim should be forwarded the vouchers which are sent with dividend and interest warrants, certifying that the tax in question has been paid. For other kinds of incone the authorities will require receipts and letters from the payera certifying that the amount stated has actually been paid by them to the revenue authurities. When an income consists entircly or mainly of dividends on which income tax has been deducted at the source, repayment will be allowed every half-year. In other cases it will be allowed only once a year.
Relief from Double Income Tax. A certain measure of relief is allowed to persons who are linble to two income taves on the same income, provided that the two income taxes are charged within the British Empire. For instance, a man may reside in England and reccive most uf his income from property in Ontario In such a case the authorities will allow relief from the tax charged in Great Britain and will compute the relief on the amount of the Dominion income charged to tax in Great Britain. The relief thereon will be at the Dominion rate in the $£$, or at one half of that person's appropriate rate of tax in Great Britain, whichever be the less
This arrangement covers the case of the Irish Free State, which, since it came into existence in 1922, has levied its own income tnx. On its part the liree State has lairl it down that frum April 6, 1923. income tax will be declucted trom dividends and interest on the stucks, shares, bonds, etc., of any
government and company, oulside the Firer State, including British Government securities where payment of such dividends and interest is made by or obtained through a bunk., paving agent or other person in the Frec State

Exemption from Irish Free State income tax in respect of such dividends or interest is however, allowable when the owner of the stnck, shares, etc., is not resident in the Free State or in the case of those Britial Government securities which were issued exempting them from taxation of this kind, where the heneficial owner is not ordinarily resident in the Frec State: and payment of the dividends or interest without deduction of Irish income tax can be obtained by persons entitled to suoh exemption upun the com pletion of declarations on the correct forms
The Free State has decided, ton. that no deduction of tas will be made from intereat on holdings of 5 per cent war Ioan, 5 per cent national war bonds, 4 per cent war lonn, tax compounded and 4 per cent national war bonds, tax compounded, registered or inscribed in the books of the Bank of Ircland
in Dublin: but such interest will he charged with the tax by direct assessment on owners who are liable to the income tax levied by the Free State.

Protection for the Taxpayer. A society exists for the protection of income tax payers, and ita nefficials are willing to give expert advice to persms who are unable to reoover overpaid income tax and to those who have difficulties with their assessment. Advice on these and kindred matters is also given for a fee by accountants, some of whon speoialize in this subject, and by agencies that make a busincss of recovering overpaid income tax In the great majority of cases. however, the taxpayer can dcal with these matters himself, and any information and assistance he requires is usunlly civen quite willingly by the inspecturs and ot her officinla who are responsible for collecting the tax In case of serious dissatistaction with his assess. ment he can appeal to the commissioners or to the courts of law.

## Incontinence. See Enuresis.

## Incubators and Their Mechanism

## Care and Attention Needed to Secure the Best Results

As the keeping of poultry is a uomestic industry, our work contains many artic'es o interest to the poultry keeper. Such include Brooder; Poultry House. Sce also Chicken; Duck; Eggs; Fowl; Poutry, etc.

The mechanical stages in the use of a hot that when the cap is down, the whole of the water incubator are as follows, assuming that hot air will pass to the hot-air chamber and the instrument is in perfect working order: water container, and then be carried into the First the water container is filled with hot atmosphere. wnter, until it runs out of the overflow pipe or appears at the top of the filler pipe. The lamp reservoir is then very nenrly filled with kerosene oil of good quality, the wicks adjusted so that the name burns brightly without smoking, quite steadily and quietly, and generally about $\frac{3}{8} \mathrm{in}$. in height.

The lamp is inserted in place under the flue opening. To do this the spring base has to be depressed to allow the lamp glass to pass the top of the opening in the chamber. The resultant spring upon it forces the lamp upward, and the top of the glass makes contact with the bottom of the flue and thereby prevents any air getting into it except through the air passages in the burner and the independent air supply separately provided.
The egg drawer is then closed and the thernometer inserted into place. The accuracy of the thermometer should be tested against another of known eractitude, and, if yatis. factory, may be put into service. The lamp is then left burning day and night, until the temperature has risen to alout $104^{\circ} \mathrm{F}$., at which temperaturc the capsule should expand and lift the control lever. This control lever hns, on its outer end, a cap or disk, which hangs over one of the hot-air flues, with the reault

Incubator lor hatching hen's ergs. A, water lank, heated by lamp, H. C, egr tray with, beneath, water tray to keep air molst. D, thermostatic capsule, which expands at a prearranged temperature and, by means of a rod and lever, raises damper, E, rrom chimney. F. permitting bot air to escape without passing throngh incubator. When temperature drops,
capsule contracts and lowers damper
Courtcyy of Spratts latent, Lfd

When the cap is lifted by the lever and ex pansion of the capaule, some of the hot air can escape direct to the atmosphere : and consequently the temperature of the incubatur falls a few degrees, the capsule contracts, the lever falls, and the cap is autnmatically replaced at the top of the flue opening. The critical adjustment of the capsule regulating screw governs the temperature at which the lever will rise. By screwing or unscrewing it the lever is raised and lowered. A sliding weight is also used on the lever bar, because with the increase of tempernture not only does the capsule expand, but the pressure in it increases with further increase of temperature, hence the moving weight is useful : as by sliding it along the lever a line adjustment is possible. This will have to be made on the spot for each individual incuhator, and the incubator should be run for a suflicient period until the temperature remains constant for 48 hours before the adjustments can be considered safe, as with a hot-water incubator of this type several hours must necessarily elapse before changes of tempera ture become apparent.

Preliminary Experiments. The water tray will have to be refilled with water from time to time, and various other operations performed when the incubator is at work, according to the period of incubation. When adjusting the incubator for the first time, it is as well to open the drawer occasionally, as if about to turn the eggs, and for about the same length of time requisite to do this, so that an appreciation of the temperature change and the time it takes to recover the normal hatching temperature is ascertained, as a knowledge of this item is very important during the actual hatching.
The care and attention that should be given to any incubator includes the placing of the incubator in a dry position where the tempera. ture can be maintained at an equable degree. This is a very important matter, as much of the success of incubation depends on the incubator itself heing placed in some situation where it will be free from draughts or any violent change of temperature. The incubator should stand upon a firm support, either upon four stout legs with a framework, or upon brackets or any other arrangement that is

Incubator. This apparatus bas an egg capacity up to l20 ben eggs. The wate: tank is heated by an oil !amp which is controlled by a thermostat Courtesy of Spratl's l'alent. Lid.
firm and entirely free from vibration. This is a mintter requiring careful attention

As regards the apparatus itself, the only attention during the hatching period is to refill the lamp and see that the wicks are clean and in good order at regular intervals, say, about every 24 hours After the lanp has bcen in use for some time, remember to see that there is sufficient wick to reach well to the bottom of the container, otherwise the lamp may go out unexpectedly. The asbestos or other washers used to make the airtight joints around the inspection glass and the base of the flue should be examinel, and if worn or broken be replaced by new, as any ingress of cold air at these points tonds to reduce the heating value of the lamp.
The internal air passiges, or flues, should be cleaned out from time to time with a stiff. bristled brush with a flexible handle. The regulation of the capsule has alrcady been described, and when it is functioning properly it should not be disturbed, as it depends upon chemical action for its functioning, and the action will always take place at the same time in every case. Therefore, when the regulator is properly adjusted it is hest to leave it alone, except to sce that the pivot bars have not worn and to keep them slightly oiled, so that they may work perfectly smoothly.

If it is deaired to vary the temperature, as, for example, at the beginning or near the end of the hatching, the lead adjusting weight may be moved in preference to altering the adjusting screw for the capsule. The drawer, egg tray, water tray, and drying compartment should be kept scrupulously clean and be washed out between every hatch, preferably with hot water, with a small addition of disinfectant, followed by a washing in clean water.

The outside of the cabinet will keep in better condition by the application of a little furniture polish or an oily rag, as this preserves the wood in good condition and makes it Icss susceptible to atmospheric changes. The little nir vent holes should he kept clear, and the water tank examined and the water-level tested between each hatch, making good the deficiency with bot water. After a year's hard work, the water tank should be emptied to free it from sediment which might accumulate.

INDIAN CLUB. The practice of various exercises with Indian clubs helps to develop the chest and the muscles, and enables the performer to acquire an ercct and graceful carriage. The exercise or drill is well adapted for musical accompaniment if desired. In shape the Indian club resembles a slender, jong-necked bottle with a knob at the end.
l'lese clubs are usually made of willow or elm
The wrist plays an important part in the exercises, which consist of a serics of $t$ wists and swings. The clubs are made to turn in circles by the wrist action while they are swung from the shoulders with wide, swecping movements to right or left. There is an outer and an inner swing. ln the former the clubs are raised and swung downward away from the body and back to the starling point: in the latter he swing is upward
INDIAN CORN The variegated. leaved varicty of Indian corn or maize (Zea mays) l:as long been a popular plant for use among others in summer flower-beds, but improved varieties of the common kind are being increasingly grown for the sake of the cobs, which are cooked in the way described in the article on Maize. This plant needs rich, deep soil and copious watering in hot weather. Seeds may be sown under glass in March and the seedlings set out of doors in May, or seeds can be sown out of doors in the latter month. The rows should be about 2 ft . apart, and the seedlings thinned to 10 or 12 in . from each other. See Maize.

INDIAN CRESS. This is a popular name for the common or garden nastur. tium It is a familiar and easily grown annual which bears showy flowers in many shades of red, yellow, orange, scarlet, and terra-cotta. The climbing varieties. See Nasturtium.

Indian Fig. Popular name of the Opuntia cactus (q.v.).

INDIAN GRASS. This is a liardy perennial grass of pretty tufted growth, attractive in mixed horders, and is sometimes known as lavender grass. It will grow in good ordinary soil, in any position, and may be plantel rom March to June, or during autunin. It hears smooth, rigid lea ves of delicate green, variegated with white, 8 to $1: 2 \mathrm{in}$. in height. Propagation is by simple division of the roots in spring or autumn. See [3order.

INDIAN PINK. This is a popular name of Dianthus chinensis, known also as Chinese pink, a favourite summer flowering plant with large fringed blooms in many colours. It is commonly treated as a biennial. Seeds are sown out of doors in June, the scedlings being transplanted once to give them room for development : in October they are put out where they are to bloom the following year. Well-drained soil and a sunny situation suit them best. From seeds sown in a heated greenhouse in January or early February the plants will Hower in tho summer of the same year if planted out of doors in May or early June.
Indian Shot. Alternative name for the canna, a large and handsome summer bed. ding plant. See Canna.

INDIA-RUBBER PLANT. This is the popular name of Ficus elastica, $\Omega$ favourite room and window plant witl large, handsome deep green leaves. The variegated leaved varicty is even more attractive. Both thrive if potted in a compost of sandy loam Careful watering is necessary, as with all room plants. When the soil is just moderately dry the pot should be filled to the rim with water. An occasional sprinkling of guano or watering with soot water has a beneficial offect on the growth of the plant.

INDIGESTION. Pain of discomfort is caused to many persons in consequence of $a$ disturbance of digestion in the stomach or boirels. This may assume an acute form, with headache, nnusea, vomiting, and scvere piain in the stomach. If the voniting is not free, the stomach may be relieved of its contents by tickling the back of the throat and giving large draughts of tepid water. The bowels should also be cleared, and for this purpose $\frac{1}{2}$ oz of Roclielle salts or 2 oz . of enmpound inixture of senna (black draught) may be taken. The pain over the stomach may be relieved by a hot-water hottle or by a large mustard plaster

No food sliould be given for at least 12 hours, but warm water with from time to time a pinch of bicarbonate of soda in it may be given. Milk, diluted with hot water, soda water, or lime "ater, may be commenced if the stomach has properly settled; then beef tea, chicken soup, stcamed white fish, and so on to ordinary diet.
In the chronic form of this complaint, as in the acute, it is neccessary always to bear in mind the possibility of the stomach symptoms being due to some disorder of the digestive apparatus calling for special treatment, or to some general disease. When dys pepsia begins in a middleaged person whose digestion has hitherto been quite good medical advice sbould be obtainerd.
Causes and Prevention. In most cases if inquiry is made as to the state of the mouth,
ndian Corn Leaves of the variekated maize, a plant much grown or its decorative va!ue and the habits are brought under review Iairly obvious reasons can be found for the protests which the stomach is making. The mouth is often very septic, and this is lesponsible for a variety of mischicf. Not uncommonly in people who suffer from

shronic catarth of the nose, pus is continually being discharged from the back of the nose and is then being swallowed.
The teeth may be too few for the mastication of ordinary food, leading to the free use of liquid at meals to make the swallowing of the large, partially chewed masses possible. The same result will follow when, either from hurry or reading at meals, sufficient care is not taken to reduce the food to a soft, semiliquid pulp. The strain on the stomach is increased in the case of the man who feeds with his eyes always on the clock. For half an hour after a meal other functions should be made to go easy. If oircumstances dictate a hurried meal it should be small and easy to digest. Taking a meal dry and leaving any beverages to the end greatly helps to promote better mastication.
Meals should be regular, and casual food between meal times is to be deprecated. Many people err by taking too many meals, or, even if they take a reasonable number, they load themselves with too much food. The manner in which food is oooked is im. portant. It may be said that thingg that are fried, that is, conked in super-heated fat, may strain the digeative powers too much, and the same applies to meats stewed in the ordinary way in a saucepan or baked in pies. All such and pastries of any kind, should be oschewed by the dyspeptic Grilling and roasting, or stewing by the French method on a water bath, are the methods whioh favour digestibility. Pork, salt or corned meat. cheese (uuless of the mildest description), shell fish, nuts, pickles, vegetablos if fully grown and tough and stringy, now potatoes, and new bread will do harm.
Inlemperance in tea, coffee tobacoo or alcohol may be responsible for dyspepsia The diet should be as varicd as it is possible to make it, and should include some fresh food, tender salad, and a little fresh, ripe fruit if possiblc, avoiding plums and the stringy parts of oranges. But if theso disagree a frequent ration of squeered orange-juice should be taken for the sake of its vitamins.

## Importance of Avoiding a Chill

It is important to keep the abdomen warm, and much benctit may be derived from wearing a flannel binder. especially in cold and in damp weather. The fect should also be kept warm, and this fact applies very especially to infants and young children. The general fitness should also be advanced by a sufficiency of open-air exercise. The bowcls should be kept regular, and for this purpose nne of the preparations of cavoara or aloes may be employed. Where there is much distross after a meal a small teaspoonful of the following powder may br taken in a little milk 20 min . before or half an hour after meals :

If Hatulence tends to be a troublesome symptom, a wineglass of peppermint water with a pinch of bicarbonate of soda or 1 or 2 soda mint tablets will relieve it.

It is not infrequent for pain to come on in the night. This is known ns the hunger pain, and it may be relieved by taking a leaspounful of bicarbonate of suda or of this combined with bismuth. But as this symptom is char. acteristio of an excoss of hydrochloric acid in the gastric iuice, with which a duodenal uloer is apt to oocur, anyone who suffers in this way should put himself immediately in the hands of his duotor.
Wher bottle-fed babies are not digesting their nilk well, as shown by the appearance of curdled milk in the stools, 1 grain of sorlium citrate may be added to each no.. of milk used. In older children the starch and sugar con. sumed may have to be reduced. and a meal or
two of Benger's food each day may be a useful way of mceting any difficulty in digesting starch Flatulence may be relicved by sips of hot water, a teaspoonful of dill water, or a crushed soda mint tablet. Sec Constipation ; Diet ; Digestion : Eating ; Hydrochloric Acid : Stomach, cte

INDIGO. 'The blue dye known as indigo produces a dark blue colour on woollen cloth that is fast to light, and on this account the dye is used for all the dark-blue oloth employed in the navy and for dress materials and suitings, etc.. of the better qualition in the shade known as navy blue.
The dye bath is a mixture of indigo, lime and fermentable substances such as bran. In this form a colourless liquid is formed. After cloth has been soaked in the dye bath, it is exposed to the air and the blue colour develops. Much of the indigo now used is prepared artificially. See Dyeing.

INDIGOFERA. The indigo of commerce is supplied by Indigofera tinctoria, an Fast Indian plant. Few species of indigofera are grown in gardens: the most important is gerardiana, a shrub which bears rose•red, pealike flowers in late summer. It is often planted against a sunny wall where it will reach a height of 10 ft . in the course of time. If planted in the open garden the branches should be cut down each spring to force the development of frash ones which will reach a height of about 3 ft . Often the branches are cut down by frost. This shrub thrives in ordinary soil in a sunny place and is increased by cuttings inserted in pots of soil in a frame in Septemter.
INDUCTANCE. This is that property of an electrical circuit which tends to oppose any change in the current flowing round the circuit. A conductor is stated to possess inductance when the flow of electric current causes a magnetic field to be set up and to become linked with the conductor. The inductance value may be incroased if the conductor is made to take the form of a coil, and is greatly increased by.winding the coil upon an iron core.

If one inductance is arranged so that its magnetic field (magnetic lines of force) becomes linked with a second inductance, the two inducfances are then "coupled" and " mutual induotance" is said to exial between them.

Any flow of alternating curment in the firat inductance will induce a sionilar current in the second inductanze, the value of this inducel current depending upon the efficiency of the "coupling " between the two circuits. The unit of inductance is the henry.

Inductance Coll. This is a length of wire or other conductor arranged in a particular manner so as to produce a definite amount of inductance

In a wirelesq reoeiver it is the name usually given to the tuning inductance, e.g. serial coil, grid coil, etc.

The most efficient tuning coils are those of the single layor type, but in certain cases it is

Inductance Coil. Simple coil with three tappinga
necessary to adopt special methods of winding, e.g honeycomb, lattioe, duolateral, etc, in order to keep the dimensions within reasonable limits A well designed coil should have low distributed capacity and its high frequenoy resistance should be small.
Binocular and astatic ooils employ a method of winding which reriuces the external mag. netic field, thus minimising the danger of instability due to interaotion in high frequency amplifiers. See High Frequency: Low Frequency; Selectivity: Tuning.
INDUCIION. When a body charged with electricity produces an eleotrio oondition in a neighbouring body not directly conneoted with it the result is termed induction. A similar effeot is observed if the body be charged with magnetism, in which case the magnetic condition is induced in the neighbouring body. Should an electric current be flowing tinrough a conductor, it will induce electricity in anot her wire brought near.

In internal combustion engines the word induction is used to describe a phase of the suction stroke, and particularly refers to the state of affairs which exists in the pipe or passage connecting the cylinder to the carburetter, generally known as the induction pipe. The difference between the pressures in the cylinder and the oarburetter induces a How of gas from the carburetter to the cylinder. See Internal Combustion Engine.

INFANT. In English law an infant is one under 21 years of age. An infant is not held responsible for ail his actions: for instance, contracts made by him to repay money or pay for goods are void unless they are for ncoesaities. The definition of a neceesity depends on the social position of the infant. An infant is not liable to pay a bill of exchange, oven if it has been drawn for necessities.

An infant under seven is not capable of colnmitting a crime in the eyes of the law. It is an offence to send printed matter to infants inviting them to borrow money or to bet Infants cannot aot as trustees or execu. tors, nor be made bankrupt. In an allied sense the word is used for a baby. See Baby: Child: Guardian ; Juvenilo Ogender.

INFANTILE PARALYSIS. The infeotious disease named aoute polionyyelitis is morc generally known as infantile paralysis It is a serinus and not uncommon complaint in childhood, especially during the first three yaars The onset may be sudden, with hcadache. vomiting, fever, and perhaps convulsions. After a few hours, in some cases, the child shows evidence of paralysis, involving the limbs, and perhaps the trunk. The paralysis passes away from the greater number of musoles, but remains permanently in one limb or part of a limb, sometimes in two or more. The paralysed limb becomes shorter: deformities such as club foot may be produced, and the limb is blue and oold.
The disease most commonly ocours in the hot summer months. It is due to the entrance of a germ into the body. the source of which is not quite clear It may oocur in epidemics, and when this is the case milk should be boiled. All cases of this disease should be isolated. Treatment will be in the hands of the doctor. Paralysed limbs must from the beginning be placed in positions which will avoid any stretching of the muscles, and the doctor's direotions on this head must be carefully followed.
INFECTIOUS DISEASE. Any disease which is transmissible from one person to nnother is said to be infectious. Some in. fectinus diseases, such as tuberculosis and ringworm, may be derived from the lower animals A disease is infectious because it is due to a living organism which can multiply
in or about one person, and be discharged and thecome parasitic in or on another person

Some parasites, like those of a common cold or influenza, are discharged in the breath, eapecially when coughing or sncezing. and in such diseases as tuberculosis and pneumonia the sputum terms with organisms which may be dispersed by coughing, or as a fine dust when the sputum dries. The dried crusts of smallpox and chicken-pox are in. fective, and their dust contaminates the air.

The parasites of other diseases, such as typhoid fever, dysentery and cholera, are chiefly spread by contaminated water, and these ane therefore often described as waterborne diseases Not only may infection come from drinking such water, but from utensils or fresh vegctables or fruit which have been washed with polluted water. Milk may be charged with parasites by being kept in such vessels. or by dilution with the water. Icecream may also convey infection.

Other insects convey infcction when they bite; or infected faeces of an insect may be inoculated into the skin by scratching. By the last method typhus, relapsing fever and trench fever are disseminated by the louse. Mosquitoes, by biting, spread malaria, yellow fever, dengue and filariasis; the flea transmits bubonic plague; the bed bug. plague and possibly leprosy and other diseases; the tsetse fly, sleeping sickness; the sand-Hy, threc-day fever; and the tick, relapsing fever.

Articles of clothing, books and other objects which have been in contact with an infected person may carry the infection, and are referred to as fomites.

Not only may a person actually suffering from a disease be a source of danger to others, but also some who have recovered but still retain a focus of infection in the body. Such a person is called a carrier.

A person suffering from an infectious disease should be isolated until all danger of communicating the infection has passed.
It may be possible to isolnte a patient at home, hut if there is any difficulty in doing so, and especially when the disease is one of the more serious infections, the patient should be sent to an isolation hospital.

## Room Chosen for the Patient

The room chosen should be at the top of the house, and should have a fireplace. A sheet wrung out of lyeol solution, a teaspoonful to the pint of water, or somc other antiseptic, and hung over the door, has the advantage of emphasising the fact of the isolation if it does nothing mure. Carpets, heavy hangings, and all unnecessary furniture should be re. moved before the patient goes into the room. Feeding and other utensils used by the patient must be kept for his separate use.

Some person must be told off to attend to him, and should wear an overall when outside the room. Books should not be allowed to leave the sick-room When the perind of infectivity is over, the patient must be properly washed all over and dressed in fresh clothing, and the room and all its contents must be dealt with as described under the hcading Disinfection.
Not only must the patient be isolated, but also anyone who has been in contact with him, the duration of this quarantine being regulated by the incubation period of the disease, and estimated from the last date of exposure to infection.

Some infectious disenses must be notified to the Medical Officer of Health for the district, and this should be done immediately the diagnosis is made. A list of such diseases is given under the heading Notification. Reaponsibility for notifying falls both on the doctor in attendance and on the head of the house or any other person in a similar position, but in practice the notification of $\Omega$ doctor
usually suffices. The fine for failure to notify is 40 s . The Act applies to boats, tents, vans or sheds used for human habitation, as well as to houses and other buildings. See Disinfection; Fever; Fly; Quarantine: Rash.
INFIRM PERSONS: Care of. Elderly people left by themselves, either through gradual mental decay or neylect. often get into n dirty and soinetimes verminous condition Particularly is this so where they have only one or two moms in a house ; they then become a nuisance or danger to themselves and the other inmates of the house by their insanitary ways. The position is $\Omega$ very diffioult one, and calls for tact on the part of the landlord or chief tenant of the house. In such circumstances the first step is to communicate with the reantives, if any can be traced, and get them to act and make provision for someone to look after the person and to keep them and the room and contents reasonably clean.

If such friends or relatives cannot be found the next step is to communicate with the relieving officer of the local Public Assistance Committee. He will interview the persons and thy and persuade them to go into the local infirmary or hospital and be taken care of properly It frequently happens that they will not consent, but prefer to continue in the old ways and kecp their independence and muddle along, to the detriment of themselves and the other inmates of the house
In such a case the only remedy is to notify the local sanitary inspector, who will make inquiries and refer the same to the modical officer of health. Lindon and some of the larger cities and towns have acquired powers to deal with this problem. After examination of the person, the medical officer of health gives a certificate in writing that he or she is aged. infirm, or physically incapacitated. and resides in promises which are insanitary owing to any neglect on the part of the nccupier, or is living under insanitary conditions, or is suffering from any grave chronic disease and is unable to get proper care and attention. Then the medical officer of health makes an application at the police court and gives evidence to the mingistrate as to the danger to health and fire to the person and other inmates of the house.
Most of the Acts make the period of detention and maintenance in the hospital or infirmary under the magistrate's order at three months. Application must be made to the court for an extension of this period : ample provision is made to protect the liberty of the person, and every means is taken to get into touch with relatives and friends of the aged person, for it has to be remembered that the person becomes a charge upon the rates.

Before application is made to the court for the removal of the person, three clear days' notice must be given by the medical officer of health of his intention to apply to the court for this removal, and should any relatives be found who will come forward and take care of the infirm person, then, even after the order has been made, the court has power to make a rescission order and allow the person to be taken under the care of relatives and friends. Sec Old Age; Old Age Pensions.
INFLAMMATION. When any part of the body is irritated by an injury or the presence of bacteria, there is an increased flow of blood to it, producing the four characteristic symptoms of heat, redness, swelling and pain.
Diseases whose names have the termination "itis " are inflammatory diseases, e.g. appendicitis, bronchitis.

In the treatment of inflammation the first thing to do is to remove the cause, if possible ; for example, removing a foreign body from the eye. The part should then be put at rest.

Pain may be relieved by lessening the amount of blond in the part; by keeping the part raised up, eg. a whitlow in a finger; by applying cold applications which contract the blood vessels or by using heat to dilate blood vessels at some distance from the site of inHammation, and so draw blond awny from this point, as when a poultice is applied to the chest wall to relieve congestion in the lung.
INFLATION. In the econonic life of motor tires, and also pedal cycle tires, in. flation, which is distending or filling with nir. is an important factor. Tires must lic kept inflated to the correct pressure as stated by the makers if freedom from trouble, e.g. chafing at the beads, is to be avoided See Tire.
INFLUENZA. Due to a germ, there is good evidence for believing that the influenza bacillus of Pfeiffer is the one primarily responsible for this disease, although other germs have been found in association with the disease, and may be responsible for at lenst some of the complications.
The onset of influenza is sudden, and occurs from one to four days after exposure to infection. Running at the eyes and nose may suggest a bad cold, but usually the fever is higher, there is considerable headache and pain in the back and limbs, and more prostration. Often the throat is sore, and there is a dry, irritating cough. The tongue is furred, and therc may be nausea and perhaps vomiting. The brunt of the diseasc may indeed fall on the digestive organs, and the symptoms be so sudden and severe as to suggest food poisoning. In some instances, it may be added, the onset of the disease is unusual as, without feeling noticeably unwell, a person has dropped unconscious in the street.

Ordinarily, after having persiated from three to five days, the temperature drops, suddenly as a rule. Some complication, however, may supervene. Bronchitis may become severe, developing into bronchopneumonia Sometimes the lobar type of pneumonia develops pleurisy, heart disease or Bright's disease. Apart from legacies left by some of its complications, even an apparently simple attack of influenza may have troublesome sequelae, such as considerable mental depression or neuralgia.

The chance of recovering from an nttack of intluenza is, gencrally speaking, good except where young children or aged or debilitated persons are concerned. The general treatment is that of the state of fever, but special emphasis must be laid on the necessity for rest in bed, abundance of fresh air, and of sufficient time for convalescence. Aspirin in 10 -grain doses is useful for relieving muscular pains and headache. This or salicin, sodium salicylate or quinine may be given at intervals in order to combat the toxaemia of the disease. The patient ceases to be infectious in three or four days after the temperature has become normal.
The infection of influenza is mainly spread by the breath of an infected person, and the danger is increased by his sneezing and coughing.

During an epidemic an infected person should be given as wide a berth as possible. It is a prudent thing ta walk to business, for example. or go on the top of a bus rather than in a closed vehicle, and rooms and offices should be especially well ventilated.
It may help to lessen the risk to gargle the throat and spray the nose with a weak solution of permanganate of potash twice daily. Should suspicious symptoms make their appearance, 15 drops of essence of cinnamon or of spirit of camphor taken on a lump of sugar may cut them short. Mixed vaccines, containing the influenza bacillus and other germs associated with the disease, are of definite value. See Cold: Cough : Fever.

# Ingle NOOKS and Their Construction 

An Old-World Feature Adapted to the Modern House

This article, aided by further information under such headings as Corner Seat; Cortage: Joint; Stain; Wood, tells how on amatcur can make an ingle nook for his house. See further the entries Chimney Piece; Fireplace; Settle

The ingle nook may be described as a large splaying the jambs and building in a barless opening fitted with i scat or with two scats, fire at the back.
one on either side of a fire and within the A false oak beam could be fitted across the chimney breast of the fircplace. Such are only possible in the large fireplaces of Tudur and Stuart times, or in those built in imitation thereof.

In some ingle noolis the sents are built into the walls, but if they are not, the nook can be completed by pircing a wooden seat on one or hoth sides of the lire, care being taken that the rlistance hetween it and the fire is sufficient to leave the sitter in comfort Obviously the seat must not be trimmed in any way.
The construction of an ingle nook will have (u) lic determined as regards ils size and detail, accorl ing to the geography of the roum in which it is to be construct al, and the purpose for which that roon is required As the ingle nook is a chiaracteristic of the old style honse, the construction should be on anlid lines, and trated in such a manner that it will retain these characteristics Generally this is accomplished by the use of rough-hewn oak posts and simple, direct methods of construction. As a typicalexample, the illustrations, Figs. 1 to 4 , show how an ingle was formed in the dining room of a modern house, and suggest a miethod of construction which may be adopted elsewhere.

The Work Described. In the case illustrated the fireplace was a brick recess, spanned by a heavy oak beam and nccommodating a wrought :-on basket fire mounted on a basc of brickwork: but where that arrangement cannot he followed it is, for example, often possible to remove a cast iron register stove and to face ably higher at the front than the back, and up the opening with narrow facing bricks, if the rest, or back, be similarly sloped and

Ingle Nook. Fig. 1. This is built in the dining room of a modern house. The fireplace, a wide brick recess contaling a basket grate, is flanked by comfortable settles, with sloping backs and seats
rightly adjusted, a really comfortable sent is the result. On no account should the scat and the hack be at right angles, for the seats will not then be comfortable.

The next step) is to prepare 1 in tongued and grooved floorbaards and nail them on the top of the framework, thus forming the sent. Oral brads should be used for this work, and their heads punched well below the surface. The front of the seat or that part of it which faces the length of the room. is prepared from similar boards sawn to the desired shape, lengths of floorband heing cut as nearly as possihle to match the curicil shape, which may afterwards be worked up by saving it with a pad saw and linished when in place both with a spokeshave and sandpaper.

These pieces should not be glued together, but should he simply secured by 2 in oval

Ingle Nook. Fig. 3. This shows the iraming in place, with plywood facing in position on wall
brads to the face of the framework, or preferably by screws passing thmugh the framiowork into the side piecea A dummy upright post, comprising a rough hewn onk plank attached to the wall, may either be grooved to reccive the side members or thesc may be secured in position by heads on each side; the latter is the simplest way for the amateur.

The next step is to cut a sufficient number of pieces of $\frac{3}{3} \mathrm{in}$. matchboard to the length requisite to form the back, and to bevel the upper and lower edges so that they are a good lit on to the top of the seat and on the mugh ground attached to the wall, respectively. A single crossbar is fixed between the front part and the wall, and also two rough picces inclined at an angle and attached respectively to the "all and the side piece of the seats, to form a foundation to which the back can be nailed. A capping is then fitted to the top of the front picce and a simple moulding run around the wall on this line, across the back of the seat along the sides and terminating at the great benm over the fireplace.
To cover the nail heads and make a neat finish around the seat, sides, and back, a simple $\$$ round moulding is glued or pinned in the corners. The whole of the woodwork is stained dark oak colour.
Dummy Timbering. If it is desired to fit dummy timbering, a heavy plank about $\mathbf{6} \mathrm{in}$. wide and about 2 in. or so thick should be rough hewn to represent a beam spanning the two uprights of the back and sides. This is firther supported by two roughly shaped and curved members, rising from the capping on the top of the sides and terminating about a quarter the length of the heam from the walls. The false timbering on the ceiling is easily arranged with rough hewn strips of oak, or even plain deal stained to a dark brown colour,
and secured to the rafters by oval hrads. driving these right through the plaster into the rafters or floor joists
When two small windows are in existence or can be provided one on cach side of the fireplace, they add a great charn to the ingle and have a real value in providing light for tho seats. They make reading or sewing a practical proposition, as uaually the corner by the fire has a tendency to be dark. The ingle can he further decorated by a few judiciously applied strips of rough hewn oak attached to the wall to represent old timbering.
INHALATION. The method of inlalation is used for many drugs, mostly in the treatment of respiratory disorders. Creosote, eucaly ptus oil, compound tincture of henzoin (Friar's balsain), menthol, camphor, ete., may be administered in respirators, inhalers, volatilized in steaming water or on respirators, while sonie drugs to relieve asthma are smoked,

The simplest method of giving medicated steam inhalations is to fill a large jug with a pint of boiling water. 2 parts, cold water, 1 part, add a proper quantity of the drug, cover the head with a towel, and place the face over the jug. One teaspoonful of Friar's halsam used in this way will sometinues cut short a cold, if no time is lost after the first symptoms appear.

INITIAL: How to Work. The usual custom of initial embroidery is to choose the first letter of the surname, but this is often varied as occasion demands. by working instead the first letter of the Christian name, or for a more elaborate device, taking both the first letter of Christian and surname, and grouping them together attractively.

The Stitches Used. When working initials it is important to prepare the ground by padding the outline, in order to give a raised effect that is particularly attractive The simplest method of doing this is to cover the inside part of the outline with rows of rumning stitches, all of an even length, and fairly close together as shown. It is possible to buy at most fancywork shops some attractive initials made in papier niaché that will form a pad. ding, and only require to be placed on the material and closely covered with satin-stitch

Ingle Nook. Fig. 4. The seat complete and ready for staining. See opposite page
to secure them in place: but these are not to be recommended for garments that are to go to the winsh.

Another method which is very good for fine work on such things as linen handkerchiefs or underivear is to emplay a thick thread or fine cord, and lightly sew this to the outline of the initial before covering it with a close oversewing stitch. Satin-stitch should always be worked ncross the shorter way of the shape to be embroidered It consists of perfectlystraight and even stitches, that sliould be made to lie quite closely together.
A more elaborate result miny be olitained by "orling the
 and sal-ammoniac in $\geqq$ pint of water. The zinc should be thoroughly cleaned before the ink is applied.

Marking Ink. Marking ink is mainly metallic in conposition and is usually prepared with aniline salts, which produce a deposit on the surface of the article markod It is generally used for marking names or initials on linen, cotton and clothing. The deposit may be obtained by passing a hot iron over the writing, but in sonte varicties it is possible to dispense with this process.

Other Special Inks. Sipecial inks are made for other purposes, copying and drawing among them Any ordinary iron gall ink will yield a copy for some time after writing, but in order to get better re sults a larger proportion of
tian ladder work, and in this case the padding is un. neccsanry, as the centre of the shape is cut awny. The whole outline is first closely covered with a finc running stitch, and the ladders that connect it from side to side are worked in buttonhole. stitch. With very fine scissors cut through the centre of the shape and turn back the edges to the line of the running stitches. Now closely work round the outline in fine over-sewing or in but-tonhole-stitch as desired. Carefully cut away the raw edges of the material when the embroidery is finished.

Another device for embroidering large initials is to cut out the outline in a contrasting material, and appliqué it to the article. Blanket-stitch is a good medium to use for securing it in place, and it is advisable to choosc a materias for the lettering which is not easily inclined to fray. Another plan is to embroider the initials in satin-stitch on a fine piece of net, and then to insert the net, shaped into some fancy device such as a circle, square, or oblong

Jasy to make and very suitable for towels is the initial worked in cross-stitch as shown in diagram. The stitch is made by taking up equal strands with the needle in a slanting direction, and at right angles to each other, each pair of cotton strands forming a single cross-stitch. It is advisable to work this embroidery on very coarse threaded material, as this helps considerably when the threads havo to be counted in orcer to keep the stitches regular. The simplest way to obtain an outline for the initial is to sketch one on finely squared paper, and then count the squares that are thereby oovered, making each square represent a stitch. It will be quite easy to follow this guide on the actual linen. See Cross Stitch; Embroidery.

INK: Its Varieties. Ordinary black writing ink is made by mixing ferrous sulphate with 'Turkey or Aleppo galls, which contain gallo-tannic acid, and adding a little gum arabic. There are many recipes, the proportions varying in each, but the best results are said to have been obtained with one part of the sulphate to about 3 parts of the galls. A good black ink may be made by boiling 8 oz . of galls in a gallon of water and adding 6 oz . each of ferrous sulpliate and gum, or 6 oz . of galls and 4 oz . each of the sulphate and gum in 6 pints of water.

A special ink is required for the zine labels used by gardeners. This is made by mixing
$\frac{1}{2}$ oz of lamp-black with 1 oz. each of verdigris
ferrous sulphate, galls and dye should be used. With this should be mixed a small amount of n substance such as glycerin, to prevent the ink from drying too rapidly.
Drawing inks include sepia, Indian ink, and the so-called waterproof ink. Indian ink is composed niainly of fine lamp-black and glue Waterproof ink consists of a pigment or colouring inatter suspiended in a liquid nedium, e.g. a solution of shellac. Typewriting inks frequently consist of a solution of methyl violet with a thickening agent, such as glycerin or oil. For writing on bottles a suitable inls can be made by dissolving (6) parts of borax by weight in 250 parts of water Warm the borax and add the water to it, stirring all the time. For colouring, one part of methyl violet can be added.

INKSTAND. The inkstands sought by collectors are chielly articles of silver or Sheflield plate dating from the eighteenth century. They appear to have been lirst made in England about 1700, and the styles are many. ranging from the boat-shaped one with its pair of silver-mounted bottles to massivo silver pieces that are heavily moulded. A popular style is the box-shaped one, which has corners of heavily stamiped metal, and in some silver pieces four cast feet. One beautiful silver example, dating from 1770, stands on four claw and ball feet. The tray has a gadroon border, and there are three pierced cages for the threc bottles, which are of crystal with silver mounts. Many of these old inkstands are provided with a sandhox, a waferbox, penwiper, and a taperholder in addition to the bottles.

Inkstands are included sometimes in modern writing desk sets of lacquered or painted wnod. Opayue glass in a brilliant colour is effective for inkpots, pen tray, ash tray and candle aticks. Other charming inkstands are of flowered china mounted in ormolu with holes at each side of the inkwell to accommodate quill pens in harmonizing colours

## Inlaying: The Art Explained

A Pleasing Decoration for Pieces of Furniture
Those interested in this subject should consult the articles on other forms of wood decoration, e.g. Fretwork: Graining; Marquetry; those on the various picces that are inlaid, e.g. Calbinet; Furniture; Hepplewhite; Jacobean Style: Sheraton
The art of inlaying consists in cutting away measuring anything from $\frac{1}{\text { o }}$ in. to $f$ in thick or recessing a given ground work to receive a is required and is cut at a different angle. substance cut to a corresponding shape, the Figs 1 and 2 show the two methods emploved inlaid portion being of either different material or different colour, so that it will thus show in relief against the ground work Its use. for the main part. is a decorative one, though it san be employed to advantage in a theoretially constructive sense.
The more advanced work naturally requires a good deal of skill in its execution, and can hardly be recominended to the amateur as a branch of work within his range but among the more simple trpes of inlaying there is a

great deal of scope, and there is no reason whatever why he should not make his work more interesting by decorating it with a simple form of inlay. The nethods employed in inlaying may be roughly divided under two headings, that of inlaying a given ground and that of applying a surface piece, already inlaid, to a ground work This latter is in many respects similar to the method employed in marquetry work, but differs in that marquetry is made from veneers and requires a special cutting arrangement, known as a donkey, and is cut at a right angle to the work; whereas in the method to be explained here a surface
to give the same effect. Fig. I heing inlaid directly in the ground, and the other formed on an applied surface The former is the inlay proper, and is often the only method which can be practicably employed
Simple Inlaying. Fig 3 represents an inlaid pattern of holly and ebony for an oak ground. The design should be first carefully drawn full size on a piece of paper and an indication made of which portions are to be in holly and which in ebony The shape of each inlaid portion is then marked out on the corresponding pieces of wood for inlaying (these being about $\frac{1}{1}$ in thiok) by means of carbon paper, and carcfully cut out with a fine fretsaw: all the pieces are assembled on the drawing and fitted together, care being taken to get close joints. Any straight joints may he trued up with a plane, while for the shaped parts a spokeshave or rasp will be uscful They are then all glued to the drawing and together, and another piece of paper glued to the other side. the whole then being laid between two flat boards and cramped and allowed to set When dry the drawing is stripped off the back and any surplus glue cleaned from off the edges, and the inlay placed in position on the ground work and scribed round the edges with a pointed tool

The ground is now cut away to a depth slightly less than the thickness of the inlay, to allow for oleaning off This is done with chiscls and gouges and must be as clean as possible. the bottom of the recess being porfectly flat and equidistant from the surface all over. In the larger portions this is better acoomplished with a muter.
The inlay nust now be made perfectly flat quite cheaply. They sre made in great on the undersides the best way to do this is variety, some being shown in Fig. 15 For the with n toothing plane, which not only levela

Inlaying. Egamples of modern pieces. Above cabinet in figured oak with inlaid lines and applied marquetry panels. Below, osk sideboard inlaid with lancy banding in ebony and satinwood

Rowlel Gallery, Kinsington

## 

the work. but makes a scries of fine acratches which enable the glue to hold better It may then be glued in and cramped and left to set for as long as possible, and then claaned off If insufficient time is allowed in the setting, it will be found that the inlay will sink

The same method is followed when it is desired to inlay it piece of marquetry in a solid ground, such, for example. תs Fig. 4, which shows a mahogany tray the centre of which it is desired to inlay with a Sheraton ornament, as Fig. 5. These can be bought cut in the form of marquetry

To begin, the two axes are marked on the oval and the corresponding centre lines on the tray These will give the exact position for the oval (Fig 6). It is then proceeded with as before It will be found that the marquetry has a piece of paper glued on one side: this must face upward so that the glue will grip the plain wooden side Glue the inlay in position and heat a Hat block of wood large enough to cover the inlay, and cramp this down on to the inlay with a piece of paper between to prevent the block from stioking to the work. The heat of the block will thus re-liquefy the glue and allow the inlay to be presed right down.

Bandings and Lines. Bandings may be male by the worker, but they can be bought

Inlaging. Fig. 1. Direct inlay. Fir. 2. Surface inlay. Fig. 3. Inlaid pattern in bolly and ebning. Fir. 4. Mahorany tray ready for central inlay. Fig. 6. Sheraton ornament for tray. Fig. 6. Method of marking position for inlay. Fig. 7. Edge removed for a wide
banding. Fig. ©se of cutting gauge for inlaging lines at edge inlaying of these a special tool is required known as a scratoh. This is easily made by the worker and is of the form given in Fig 16. It consists of a block of wond shaped as shown, cut in two and then screwed together again, so that the two pieces may be loosened at will. A piece of steel for the cutter is then filed to the width of the inlay to be used (a piece of an old saw blade will do) and inserted between the two parts of the scratch at the required distance from the shoulder, and the screws tightened. To use it the shoulder is kept tightly up againat the edge of the work and worked up and down (Fig. 17) When working across the grain it will be found adviss ble to cut in the two sides of the groove with a outting gauge or chisel to prevent the wood from splitting up.

For wide bandings to be put round the edge it will be found better to out round with a cutting gauge and then remove the surplus, as in Fig. 7 , with $n$ bull-nose or shoulder plane; while for a line to be put at the edge, a gauge may be used on both edges (Fig 8). The bandings are glued in and pressed well down with the back of a hammer (Fig. 18). In a rectangular shape the corners are mitred. When two lines cross, put the
narmw one in first, and scratch the other across it when dry To put a line round a circular or oval ground such as a mirror frame, the edge is gauged round to form the rebate for the line, as is shown in Fig. 8.

When glueing. put a screw in the inside of the frame and tie a piece of fine string to it and the atring to it and linto hen put in the line ceed undinding the string round as you prohe line is the starting point is reached, when the line cut off, as in Fgs . The joint in an shape so that the line will not be so apt to spring out. The string, having been damped, will pull the line in tighter. It is then cleaned off in the usual way.

When inlaying a line a little distance from a circular edge, a good plan is to use a gauge having two projeotions fastened to the fence, as in Fig. 10, to keep the gaugo held rigidly in the correot position.
When a line or banding has to be inlaid in such a position that it is not possible to use a gauge or soratch from a parallel edge, as in Fig. 11, a straight-edge should be held down in a line with the required inlay, and the groove soratched out with a narrow chisel or bradawl the same width as the inlay, while for shaped inlays a template of the shape is out, and this used as a fence against which the tool may be worked, or in the event of the shape being a oircular curve it is sometimes better to file one of the leg points of a pair of dividers for a outter to the width of the groove and use these, the other log acting as centre. This is only praoticable when the shape is a quiok one. It is sometimes necessary when glueing the line to steam it to render it sufficiently pliable to bend round a quick shape. In all cases of lines or bandings use the glue as hot as possible, work in a hot room and proceed with it quickly.
An example of inlay not used for a purely decorative purpose is in the case of a veneerod surface, when an inlaid linc is put across the

tafaying. Pis. 15. Lines and bandings emplojed will cover. holding the saw tilted at a slight angle so as always to underout the inlay, as in Fig 14. The tilt of the saw must be always in the direction of the inlay, so that when this is put in position a close joint will show. Having out the pattern, the two thioknessea are separated. the paper removed from the underup in the usual way. making the draw. ing on papor, the ground is prepared, planed perfeotly truc, and toothed. Now take the limits of the inlay, i.e. the extent of ground it

Next prepare the wood for the inlay the same thickness as the background, and with thin glue and with paper in betweon apply it to the background in a position to cover all the inlay. When dry, mark out the design from the drawing with carbon paper (Fig 13 shows the two pieces marked out), and with a fine saw cut round the design, side of the inlay and the two portions tried together. They aro then glued down on to the ground, oramped between two flat boards and allowed to set, and, when dry, cleaned

Fig. 15 shows some lines and bandings used in inlaying. A and $\mathbf{B}$ are lines usually made of either box

Fig. 10
Fig. 13 or satinwood; C and D, of ebony or of a cheaper wood stained black to represent ebony. $E$ is a combination of the two. $F, G, H$, and $J$ are bandings made in various fancy woods, such as kingwood, rosewood, tulip wood. etc. The lines at the edges are not only decorative but strengthen the inlay, binding the whole together.

INOCULATION. The act of introducing a disease germ into the body through a breach of the skin or the mucous membrane is called inoculation. The microbe of tetanus may be inooulated; for example, through treading on a dirty nail or through a out. Vaocination against smallpox is an in.

Pis. 17

stance of preventive inoculation, the virus of cow-pox being introduced through the scarification of the skin so that by passing through the milder discase a person may be protected against the more serious. Inoculation is performed by soarifying the akin and rubbing with virus, or, alternatively, by the use of a syringe. See Diphtheria: Vaccination

INQUEST. In England an inquest or inquiry by a coroner, with or without a jury, may be held into the death of any person whose dead body is in the district, but no inqueat is hold as a rulo if a medical man given a certificate stating the cause of death It is therefore employed in the case of death from violence and also in the case of sudden death when no doctor has been in attendance, and is intended to find out whether or not there

has been anything liko foul play Instead of holding an inquest the coroner may now order a post mortem examination to be made, and if he is satisficd with the report no inquest is necersary. In Scotland the above duties are discharged by the official known as the procurator-fisoal.

Before 1927 it was necessary for a coroner to have a jury to assist him in his inquiry. This is no longer obligatory, unless there is reason to suppose that the death is caused by murder, manslaughter or infanticide, or by a street accident, or that it took place in prison. The jury must number at least 7, but not more than 11. See Death; Funeral.

INSANITY. The term insanity covers a great variety of mental disorders which differ in their causation, treatment and outlook for improvement or recovery. The following are the principal forms: manic-depressive insanity, which includes mania and melancholia; acute confusional insanity, a disorder that may follow exhaustion resulting from influenza and other diseases, surgical operations, child-birth, severe anaemia and excessive mental or physical fatigue ; paranoia, in which the pationt suffers from systematized delusions; dementia, a general loss of mentaloapacity; general paralysis of the insane, the primary cause of which is syphilis ; and opileptic insanity

Heredity plays an important part in the oausation of all forms of insanity, and other factors aro infection with syphilis and addiction to aloohol A large amount of mental disease is preventable. That due to heredity, however, could only be prevented by suitable marriage Any person with a neuropathic inheritance should be a total abstainer. Public health measures, by diminishing
diseage generally, and educational and eonnomic measures which raise the standard of comfort of the poorer classes and lessen the stress of their struggle for existence, will be beneficial
Some insane persons can safely be kept at home, but when restraint and skilled nursing are nceded the expense and worry involver usually makes institutional treatment neocs. sary. This has the further advantage, how ever, that the routine of an institution generally has $a$ tranquillising effect on a disordered mind. The legal procedure in volved in putting an insane person under restraint in an asylum is dealt with under the heading Lunatic. See Delusion; Fceble minded: Hysteria: Neurasthenia.

INSECT: In the Garden. The policy of the average gardener is to make an end of all insects he sees, prompted by his belief that they are his enemics Such an attitude is to be explained only on the ground of ignorance. But no real gardener is justified in remaining ignorant of the forces that help or hinder him in his chosen work.

All the butterflies and moths pass through a eaterpillar stage, and with few exceptions all caterpillars are plant-enters. But all the butterflies and moths do not leavo behind a batch of eggs from which the all-devouring caterpillars will issue. Out of more than 60 butterflies on the British list, only the largo white and the small white are pests.

With the moths it is different; though some may have come from neighbouring woods and hedges, many of them may have developed in the garden at the expense of the plants.

All caterpillars found upon p!ants are there for purposes of plunder. The forwardtapering, somewhat flattened larva of the hover-fly may be mistaken for a kind of caterpillar, but the observation that should precede drastic action would show that it feeds exclusively on plant-lice (aphis) and is to be encouraged. The grubs of the numerous species of sawfly aro very like caterpillars ; but any mistake in this direction dlees not matter, for these are all enemies. The larvae of the lady-bird beetles are often mistaken for plant-fceders of some sort, but the error is a disastrous one. They are sluggish creatures of slaty hue spotted with red. blue and black. Their sole food consists of plant-lice.

Any other beetles that may be seen upon foliago should be regarded with suspicion They gnaw shot-holes in the leaf, not eating them from the edge as most caterpillars do The large cockchafer and the smaller summer chafer are great delinquents in this matter continuing the injuries they have inflicted during their long life as grubs underground The beetles that live in the ground during all their stages may be regarded as valuable allies, for they prey upon foes the gardener may never see.

Dragon-flies, including the large falsely called horse-stingers, are to be welcomed, for their food consists of other insects. The legion of two-winged flies (diptera) are a very mixed lot and require nice discrimination. On the one hand they include the pernicious onion-Hy. celery-fly, lettuoe-fly, and crane-fly. or daddy longlegs ; on the other hand, the helpful hover-tlies, already mentioned, and a number of species whose grubs are internal feeders in caterpillars.

Beneficial Insects. The inseots with four transparent wings (hymenoptera), including bees, wasps and ichneumon-waspa, are, with the exception of the sawflies, beneficial. Bery of all sorts, when they visit flowers for nectar and pollen, are also assisting in the production of fertile seeds by the transfer of some of the pollen; and wasps, though they attack over ripe and daniaged fruit in autumn, are engaged
all the summer in destroying noxious insects for the nourishment of their helpless grubs Over 1,200 British species of ichneumon-wasps carry out similar useful funotions, though in a different way, laying their egge in or on caterpillars and nther insects that their grubs may flourish by consuming the internal sub. stance of the gardener's foes.

Of opposite nature are the bugs (hemiptera) of all kinds, including plant-lice, froghoppers and scale-insects; being all sap-suokers, they are, as a tribe, noxious. Farwigs, though they damage cortain flowers by gnawing the potals, also feed partially on insects

The gardener who wishes to be sure as to the identity and the friendly or unfriondly nature of insects should keep in a pocket of his garden jacket two or three of the glassbottomed boxes used by entomologista. In those he can imprison insects that are unknown to him, observe them elosely and in detail, and arrive at a decision as to his attitudo to that species. See Beetle; Moth, otc.

INSECTICIDE. Insecticides are fluids for dostrnying certain inseot and other pasts, and so protecting trees and plants. They may be divided into two classes, one used against suoking and the other against hiting insecta.

Washes of the poison type act by poisoning the food of the insects, and are used for all the leaf-eating pests. Arsenate of lead in paste form is recommended, and the formula for making it is $\frac{1}{\mathrm{lb}}$. of lead arsenate pasto to 5 gallons of water. The wash should be applied in a fine spray, the aim being to wet all the leaves without drenching them, so that when they have dried they will be oovered uniformly with poison. Contact insecticides, which are aprayed on to their objective, kill insects, not by poisoning their food, but hy contact with their bodies. To attain this, the washes should be applied with as much force as possible with a coarse spray. A wash containing nicotine is advised.

The formula for nicotine soap wash is 홓 oz. of nicotine to $\ddagger \mathrm{lb}$. of soap and $\overline{5}$ gal. of water. Both the water and the soap should be soft If, however, the water is hard 1 lb . of soajp should be used. Dissolve the soap in hot water, dilute it. to the required strength, and the nicotine, and then stir it well. Hard soap can be used if soft cannot be obtained.
It should be noted that niootine and lead arsenate are very deadly poisons. Lead arsenate should not be used where vegetables are grown underneath fruit trees, or on gooseberry bushes if the fruit is to be picked green. If nicotine is applied, a fortnight should bo allowed to elapse before the vegetables or green fruit are gathered. Empty nicotine bottles must always be destroyed. See Apple : Currant Sawfly ; Fruit; Gouseberry: Green Fly: Spraying: Syringe, etc.
INSERTION: In Needlework. An in. sertion is a narrow strip of lace with straight edges on both sides, which distinguishes it from a lace horler.

The original ure for an insertion was to join two pieces of material together, as its French name of entre deux, that is, betwcen the two, inıplies. In this way it was used to
 Repeet from now. Repeat from lst row
for length required for the work.

Crochet Insertion. 'i'he example illustrated was worked with No. 26 ordinary crochet cotton and a No. 5 steel hook. and measures nearly 2 in. wide. Begin by making 45 chain stitches for the foundation. lst row : 1 treble into the ninth chain from the hook, 2 clain, miss 2 chain, 1 treble in
the next stitch, making n space; repeat from * four more times, then 1 treble in each of the next three stitches, 0 spaces, 5 chain. Turn
2nd row: 3 spaces (putting the first treble on the second treble from the hooki, 6 treble, 3 spaces, 6 treble, 3 spaces, 5 chnin. Turn. Turn each row with 5 chain throughout the pattern, and this will form the first space of following row.

3rd row : 3 spaces, 9 treble, 1 space, 9 treble, 3 spaces. 4th row: 4 spaces, 6 treble, 1 space, 6 treble, 4 spaces. 5th row: 6 spaccs, 3 treble, 6 spaces. Gth row: 4 spaces, $G$ treble, 1 space, 6 treble, 4 spaces.
7th row : 3 spaces, 9 treble, 1 space, 9 treble, 3 spinces. 8th row : 3 spaces, 6 treble, 3 spaces, 6 treble, 3 spaces. 3th row : 6 spaces, 3 treble, 6 spaces. Repeat from the 2nd row for the length of insertion required.

Machine-made embroidery insertions can be inset by machine when the insertion is tacked to thie material on the right side and machined down close to the edge of the hem. Then a narrow hem is turned on the wrong side and if hand sewn the stitches will be practically invisible. When sewing lace insertion on a fine inaterial the latter can be rolled and whipped to the edge. See Crochet; Knitting; Lace.

INSOMNIA. Sleeplessnces may arise from any of the following minor causes : cold feet, bad ventilation of bedroom ; uncomfortable bed, too heavy, too warm, or insufficient bedclothing, a hot room ; hunger, a full stomach, too high or too low a pillow, noise, too much light in the room, tea or coffee taken late in the cuening ; mental or physical overwork and exhaustion, want of exercise, worry, financial anxiety, domestic troubles; retiring at irregular hours, and from many other small errors which can be corrected.
Habitual insomnia may result from a prenccupation of the mind with the worries and chagrins of the daily lifo; but it may result also from repressed experiences, whether or not thesc assert themselves in dreams, arousing the patient to unensy wakefulness. In these cases psycho-therapy may be of service.

In relief of the condition the following precautions should be observed
See that the ronm is well ventilated. It should have a fireplace or an efficient ventilator.

The window should he wide apen, or the top sash lowered 8 to 12 in . The best temperature for a bedroom is a bout $60^{\circ}$.

Let the bedclothes be light, but sufficiently warm. For most picople a pillow 3 in . high is safisfactory. It is often a good plan to raise the head of the bed about 2 in . by placing blocks of wood under the legs at that end This tends to prevent any undue filling of the brain vessels with blood. Never go to bed with cold feet.

As a rula it is well not to eat a substantial meal Inter than three or four hours hefore bedtime. On the other liand, the want of food may banish sleep. In this case a glass of warm milk with a few biscuits should be taken at bedtime. Sometimes when one wakes up and cannot get off to sleep again, munching a biscuit proves effective. Strong ten or coffee taken late may prevent sleep.

It is best to cease both mental or physical work at least an hour before bedtine. A tepid bath just before getting into bed is another good remedy, or a hot foot-bath may be effective. A brisk walk is an excellent producer of sleep, even when one is already tired. Massage is one of the best remedies. Sometimes the change from a hard to a soft bed, or vice versa, will effect a curc. Go to bed at regular hours, and just before getting into bed sponge the face with tepid water, and then brush the hair for a few momenta. Repeating poctry, counting numbers, picturing peaceful scenes, and many other such devices sometimes succeed in mild cases; and autosuggestion may be useful.

Drugs should only be used when other measures fail, especially in habitual insomnia, and then should never be used except when under the care of a doctor, or a drug habit is formed and difficult to break. See Sleep.

INSULATOR. This is a substanco which offers an oxtremely high resistance to the passage of an electric current. Insulators are used to prevent the flow of electric currents between conductors, or bet ween a conductor and earth. Such substances as glass, cbonite, bakelite, mica, glazed porcelain, vulcanite, etc., are good insulators.

Insulin. See Diabctes.

## INSURANCE: LIFE, FIRE AND ACCIDENT

## Protection for Property and Provision for Death

This arilcle deals with the whole subject of Insurance as far as it affects the houschalder. Insurance agalnst lll-health, the national scheme, is explained In the succecding article. See Burglar Alaım; Fire; Fire Alarm: Motoring
Insurance is a 日ystem whereby for a con-insurer can prove that something material sidcration, usually the premium, an insured person has made good for him, up to the limit of his insurance, loss or damage befalling him through an event insured against. Insurances are usually carried by companies, but sometimes by individual underwriters, and occasionally by mutual associations. The operations of those carrying on insuranco are contmilerl by various Acts of Parliament, so that the interests of the public are fully protected in every way.
Kinds of Policy. Practically all the offices now transact all classes of business, varying according as the policy is a fire policy, a life policy, a marinc policy, or an accident policy ; and, as the accident section of the business includes all the miscellaneous classes of business, the accident policy conditions vary accorling to the class of risk insured. Policy conditions are in the main an epitome of conmon law bared on common sense.
Those who are insured should appreciate two of the principles lying behind these considerations, viz., good faith and indemnity. Good faith requires that notling material to the contract into which an insured may enter sliall be withheld from his insurer, and if the
to him to know has not been disclosed, the policy issued by him is void.

A policy of insurance is a contract of indemnity, i.e. an insured is only indemnified against any loss or damage sustained by him through the happening of the ovent he has insured against, but no more. If he were to securo more, he would convert his loss into profit, and this by many legal decisions has been beld to be contrary to public policy. Personal accident policies and life policies, however, are not strict contracts of indemnity, the sums payable under them being determined by the amoment of the insurance, and not, as in contracts of indemnity, by the loss, but always within the limit of the insurance. Insurable interest is also necessary. Possession does not of itself constitute insurable interest, though the householder's comprehensive policy, including, as it does, the property of himself and his household (including his servants), might suggest this.

Practically every contingency to which human life and property are subject may be covered by insurance. The following. apart from the more usual types of insurance, make
somenppuen to the householder ; key insurance,
live stocl: insurance (for other than fire ot lightning damage), plate glass insurance, public liability insurance, baggage insurance (a form of marine insurance), and some of these are included in the householder's comprehensive polioy described below.

A Comprehensive Policy. Originally com. bined policics for the houschold were confined to the risks of fire and burglary. Later, when accidents to servants were included under the Workmen's Compensation Acta, a householder's liability in this respect was added to this combined cover, other miscellaneous riske being also included. Now a householder ean obtain what is callerl a comprehensive or "all-in" policy, covering the majority of the risks and liabilities to which he is exposed.
A perusal of the prospectus of any reputable insurance company will give full details of the cover granted by such n form of policy. The polioy may cover building or contents or both, and the rates charged are, as regards buildinge if all the risks specified are covercd, 2 s . 3 d pet cent, if certain risks (cartliquake, alorm and tempest and others) are cxcluded, la. 9d. per cent, or if the cover is limited to fire, explosion, lightning or thunderbolt, is Gd. per cent Contents policies may be obtained in respect of private divelling houses, fints, residential chambers and private dwellings forming part of business premises, but for the last an increased premium may be required. From the contents insurance are excluded motor vehicles and accessories, livestock other than horses, and such things as deeds, stamps, manuscripts, etc., unless specially stated in the policy.
A condition of the policy is that the full value of the property shall be insured, and the insured is required to sign a declaration which he agrecs shall be the basis of the contract ; if the sum insured is less than the value, his declaration is false, and in this case the policy can be made void

Proving a Claim. An insurance of this description has for the householder, besides its inclusive cover, the added attraction of one policy, one promium, one renewal. In the ovent of a loss arising, an insured person should promptly advise his insurance office, and they will tell him what to do to prove his claim. In this, as in the cffecting of the insurance, the essential thing is that he should observe good faith with his insurance office. In effecting an orlinary fire policy, however, covering fire only, an insured is not required to make a declaration as to value, so that it is possilile for him to recover any loss up to the amount insured
Life Assurance. Policies of life assurance differ from other insurance policies in that the latter are in respect to events which may happen, wherens life assurance policies have relation to an inevitable event death-the common lot. There being no escape from this, the prudent man will provide against it, and this for the man of limited means can best be done by means of life assurance

In the casc of ondinary asinga, all that is sccured at any time is the actual capital represented by these savings, and any interest accrued, but in the casc of life assurance one premium secures a capital sum of from 20 to 40 times the amount of the premium, nccording to the age at which the assurance is effected. this capital being available at the death of the assured for the benefit of his dependents. Security is thus obtained through the working of two principles: the average duration of a number of lives, ascertained by mortality tables, and the combination of insured lives, so that by regular payments of adequate premiuns there is formed the fund from which to provide the capital sums assured as these will necessarily fall due

Two Kinds of Policy. The two most usual forms of life assurance are whole life assurance and endowment assurance : the former nrovides
tor the payment of the sum assured at death, and the latter provides for the payment of this aum nt a given age, or at death. if this takes place carlicr. In the early years of life assurance the latter form of policy was rare or unknown, but to-day, for every whole life policy issued, two endowment policies are sasued. The premium on the whole life policy may be paid annually, half-yearly, quarterly, or in sume cases monthly. If it is imperative that the premiums in parly years ahall be as low as possible, half premiums may be paid for the first five yarrs; or if the policy is with profits the ordinary premium may be reduced by discounting the bonuses.

The premiums on an endowment assurance may also be paid by yearly or other inatalmients as agreed. and it may be so arranged that for the first five years the promiums are on the scale of a whole life policy. with the option of having the assurance converted into an endowment assurance after five years on pryment of the required premiums.

Premiums masy also be arranged to be paid for a limited term of sears in respect of whole lite policies, these policies, if with profita, still sharing in profits, after all the premiums are paid. Such policies carry special privileges ao regards surnender values and paid-up values. each premium securing a proportion of the original assurance.

Thus, if the premiums are limited to 20 payments and the assured for any reason docs not wish to continue the assurance, assuming he hiss paid say, five premiums. he can obtain a paid-up polioy for onefourth the original assurance, and to this is added any bonusey which have accrued The surrender values of such policies are similarly higher, and the asme is true of endowment assurance policies also, both as regards paid-up values and surrender values

Term assurances may be taken out to meet special circumstances which may terminate after a certain number of years. and such po!icies, if for a sufficiently long term, carry with them the right of having an ordinary assurance, with appropriate premiums for the age without further medical cxamination.

## Relief from Medical Examination

The provision relieving from medical exnmination is of importance. considering that health itself is uncertain. Other assurances are double endowments. securing to an susured a sum double the sum proposed if the life attains the age proposed; if denth takcs place earlier than the age proposed only the sum originally proposed being paid. Leasehold insurance is of importance to the houscholder having only a leaschold property. enabling him for $n$ comparatively small premium to provide the capital sum required for the renewal of his lease; pure endowments are endownents only, i.e. payable only if the age for payment is reached. Usually there is a provision for the return of the premiums if death takes place earlier. Children's endowments are usually of this type

Since the Grent War the volume of life assurance business transacted has notably increased, but even now it is probably not on $\Omega$ scale sdequate to the needs of the indivilual hnuscholder So often at tho death of the breadwinner the only provision is a life policy, but this. unfortunately, quite in: adequate It his been suggested that the lifo nssurance policy taken out should amount to, say, five times the annual income.
Some of the newer types of policy endeavour to overcome this by an income plan polioy, which can be arranged whether the assurance is whole life or endowment It provides, in the crent of death within 20 years of the date of the policy, for the pryment of a capital sum, plus an income of one-fifth of the capital sum for the balance of the 20 years.

Schemes in connexion with the operations of building societies and staff asaurance and pensions schemes have helped to swell the total busincss transacted. There lias also been n notable advance in recent years in the honuses declared by life offices. pmbably mainly becanse of the incrensed rate obtained by offices on their investments. Many intend ing insurers are still attracted to the without profits policy because of the immediate maximum cover secured for the premilm They may be paying : for many it is still worth while to take out with profits policy

The rebate for income tax increases the value of a life nssurance polioy and this is obtainable in respect of premiums on policies on a man's own life or on the life of his wife. The tax payable is reduced by as sum repre senting tax at half the standard rate up to onesisth of the total income, but if premiums exceed 7 per cent of the sum assured there is no relicf in respect of the excess

Benefls for Children. Other assurances of special benefit for children are clucational assurance and deferred assurance The former may be on the father's own life and provile for payment of a certain sum in the later school years of the children, and it can be arranged that if the father dies earlier the premiums cease. The most rocent form of polioy combines, with educational benefits for children and family protection, income on retirement and remission of premiums during illness Children's deforred asaurances provide, for comparatively low premiums policies which may be whole life policies or endowment policies available for the child upon attaining his or her majority.
l'roof of aye should be submitted at the time a policy is taken out: then all that is necessary to secure payment of the sum assured is the proofs. The pmofs of death usually requined are registrar's certificatc of death, certifionte of death signed by the doctor whn attended in the last illnese, and a certificate of identity from some intimate friend.

A number of policies are taken out for the express purpose of paying death duties, the sum assured being paid over to the inland revenue authoritics before the issue of probate. This arrangement makes it unnocessary to realize for the purpmse of paying death duties any of the property left by the deceased.

Accident and Sickness Assurance. There are throe classes of policics, one confined to personal accident only, one combining personal accident with certain specilied
discases. originally confined to such as are notifiable to the medical officer of health but now extended to about fi0 in all and one combining personal accident with all sickness or disease Disease must he something pronounced and manifest. and sickness means any illness requiring the attendance of a doctor. There are two systems of policy in respect of sickness insurance, one into which the age does not enter, except that policies are not issued to persons over 60 (in some cascs over 55) ; and the other strictly actuarial, age and other factors being taken into account. Certain risks, suoh as motorcycling, etc., are only covered by special agreement : the policies. excent as atated. are annual contracts and terminable by the office on formial notice, and a pin rata return of premium for any part of the year of insurance that is not expired
Risks from suicide, intoxication, war, invasion, riot and civil commotion, military or naval service, racing, or aviation, are ex cluded; also in the case of a disease and sicknesq oontract. venereal diseases. drug taling. nad insanity. Medical expenses are payable under the disease and sickness contract, and there is a system of cumulative bonuses inoreasing the original sum insured by 5 per cent at cach renewal up to 50 per cent should a policy remain continuously in force
Claims should be notified within 14 or 21 ditys. Women are eligible for this olass of insurance if engaged in some wage-earning profession or occupation, at higher rates than are charged for men, and ordinarily such policies exclude risks arising in connexion with child-bearing

Industrial Assurance. For the working man. industrial life assurnnce may be ob. tained through the collector at a cost of a few pence per week the policy securing at lenst a sum available for funeral expenses, the limit of the assurance, which is without medical examination, being $£ 100$. Policies can also be taken out on the lives of children, but the amount of such is limited to $£ 15$.
Newspaper Insurance. Mention should be made of the insurance against accident which is effected by means of a subsoription to some of the daily papers, notably The Daily Sketch. The Daily Dispatch, The Daily Mail, and The Daily Exprese. By giving an order for the paper to be delivercd and filling up $\Omega$ form the subscriber is entitled to certain benefits in case of accident or accidental death Full details as to the exact nature of these will be found in the paper concerned.

## Insurance: The National Health Scheme <br> Payments and Benefts that Affect Millions of British Workers

## Thls subcer is of interest both is the cm:ljyer and employed. Other articles that deal in one <br> way or another with their relatlons are Emp'oycrs' Liability; Servant. See also Accidents and

the entry on nsura cee against unemployment that follows
In Great Britain and Northern Ireland since atatutory company that provides benefits for 1911 the great majority of the workers have its employees that are not less than those given been insured by the state against sickness, and since 1926 this scheme has beon linked with the one giving pensions to insured peraons and their wives on reaching the age of 65, instead of waiting until they are 70. The scheme also provides pensions for the widows of insured persons and allowances for fatherless and orplaned children. All these benefits are covered by a single weekly payment.

The Exceptions. In general all workers hetween the ages of 16 and 65 must he insured Certain classes are excepted, the chief being all non-manual workers who are in receipt of a salary of over $£ 250$ a year. Manual workers, whatever their remuneration, must be insured, unless they belong to certain excepted employments. Excepted employment, in this sense, is service under the crown a public authority, or a railway or other
under the national scheme. A certificate of exemption can be obtained by a non-manual worker who has a private income or is otherwise independent. In these cascs, however, the employer must pay his share of the weekly contribution. Otherwise he would be under a temptation to give prelerence to persons who can obtain exemption from the insurance payments. Peraons who need not be compulsorily insured can insure as voluntary contributors. Such pay a smaller weekly premium, as they are not entitled to medical benefit.

Contributions. The ordinary rate of health and pensions contribution is ls. Gd. a week for men, and ls. ld. a week for women. In Northern Ireland the rates, until 1930, were lower (1s. 4d. and 11d.), but they are now the same as in Great Britain. The contribution
is paid by affixing a health and pensions insurance stamp to a contribution card. Contributions at the above ratcs cease to be payable when the insured person reaches the age of 05 . Where, however, a person is insurably employed after the age of 65, a weekly contribution of 9 d (man) or 7 d . (woman) is payable by the employer.

In the case of an employed contributor, a contribution is payable for every contribution week, i.e. from Monday to the following Sunday during the whole or any part of which the contributor is employed or for which he receives wages, but no contribution is required to be paid for any week during which the member is prevented by sickness from working, whether he receives wages or not.

The whole of the contribution is payable in the first instance by the employer, and must be paid by stamping a card at or before the time of payment of wages for the week for which the contribution is due. The employer is then entitled to recover by deduction from the wages the employee's share of the contributions so paid. The employee's share is ordinarily 9 d . in the case of men, and 6d. in the case of women, but in certain cases of low wage earners the employee's share is less, as explained on the contribution card. No part of the contributions payable for employed persons over 65 is recoverable from the employee. An employed contributor is entitled to be excused arrears for weeks of genuine unemployment if he furnishes his society with satisfactory evidence of his inability to obtain entployment.
The Benefits. The ordinary benefits to which insured persons are entitled in return for contributions in respect of health insurance aremedical, sickness, disablement and maternity.

Medical benefit consists of the provision of medical attendance and treatment, including treatment and attendance for tuberculosis and the provision of proper and sufficient medicines and such medical and surgical applianoes (and chemical reagents) as are named in the regulations made in the Minister of Health. It does not include medical attendance or treatment in respect of a confinement, which is the subject of a separate benefit.

Sickness benefit moans periodical payments during incapacity for work caused by some specific disease or bodily or mental disablement of which notice has been given, commencing ordinarily on the fourth day of such incapacity and continuing for a period or periods not exceeding 26 weeks in all. Disablement benefit is a continuation of the periodical payments at a lower rate in respect of incapacity after the period of sickness benefit has been exhausted. The right to sickness and dissblement benefits ceases when an insured person reaches the age of 65, but, subject to the nccessary conditions having been satisfied, a contributory old age pension then becomes payable.
The ordinary rates of sickness benefit are 15s. a week for men and 12 s . for women, but until a person has been insured for 104 weeks and 104 weekly contributions have been paid in respect of him, sickness benefit is payable at the reduced rates of 98 . for men and $7 \mathrm{~s}, 6 \mathrm{~d}$. for women. The normal rate of disablement benefit is 7 s . 6d. a week for both men and women. All these rates are subject to reduc. tion when the member is in arrears with his weekly payments.
Maternity benefit consists of the payment of a sum of 40 s . On the confinement of the wife (or, in the case of a posthumous child, of the widow) of an insured man, or of a woman (whether married or unmarried) who is herself insured. The benefit is paid by the approved society concerned. If a woman is herself insured, she is entitled to maternity benefit from her society in respect of her own insurance. and in the case of a married woman this
is additional to any maternity benefit payable by her husband's society in respect of his insurance.

Sickness, disablenent, or maternity benefit is not payable to any person in respect of a period when such person is an inmate of a hospital or similar institution supported by a charity or by voluntary subscriptions or out of public funds; but it can be devoted to the relief of his dependents or to defraying the expenses of the hospital or accumulated until he is discharged.

Married Women. An insured woman who marries is required to give notice of her marriage to her society within eight weeks thereafter, and any woman who fails to comply with this requirement is liable to a penalty. If owing to the failure of a woman member to notify her society of her marriage more sickness benefit is paid to her than she is properly entitled to receive, the society is entitled to deduct the excess from any benefits which may subsequently be payable to her.

An insured woman who marries and who, immediately before her marriage, had already completed eight consecutive weeks of unemployment, or who completes that number of weeks of unemployment within the year im. mediately following her marriage, comes under special provisions as to health insurance benefits on her marriage or on completion of the eight weeks of unemployment (whichever first occurs). In reckoning this period of eight weeks no account is taken of weeks of siokness of which the society is notified at the proper timo, or of weeks during which the woman shows to the satisfaction of the society that she was available for, but unable to obtain, employment.

The Insurance Card. Every insured person is required to obtain a contribution card from his society or from the post office, and his employer can demand its production at any time. It must be delivered to the employer on the commencement of an employment and whenever he may reasonably require it for the purpose of paying contributions, or for production to an inspector or to any other authorized person.

There are two methods of arranging for the custody of the card during its currency. The first is for the employer and worker to agree that the employer shall keep the card, in which case he is responsible for its safety; he must stamp it regularly at the proper times and must return it to the worker upon the termination of the employment, or, if the worker leaves without notice, within 14 days, upon the expiration of the period of currency of the card or within six days thereafter; and where the worker at any time so requests, within 48 hours after the receipt of the request.
The other way is for the worker to keep the card, and this must be done unless the employer and worker agree that the employer shall keep it. When the worker keeps his card the employer must, on each occasion of stamping, return it to him as soon as he has stamped it. On the death of a worker whose card is then in the hands of his employer, the card should be forwarded to the insurance department of the Ministry of Health as soon as possible.
Joining a Soclety. To obtain the full advantages of insurance it is necessary to join an approved society. An insured person can join a society at any time. A list of approved societies, giving the addresses of their secretaries, may be seen at the office of the local insurance committee, or at any employment exchange, or district office of the Ministry of Health, Insurance Department.
To join an approved society the first step is to ask the secretary, or agent, of the society selected for a form of application for membership. After this is filled up and sent in, the applicant should receive within a reasonable
time a notification from the society that he has been accepted or rejected, as the case may be, and he should make further inquiry if he does not receive notification within one month after application. An insured person who doek not join an approved society within a certain time becomes a deposit contributor.

At the end of every half year an insured person must send up his contribution card to his society, or, if he has not joined a society, to the Ministry of Health, Insurance Department, or to the Welsh board of health, according to the instructions printed on the card. No credit can be given for the contributione until the card is received by the society or the Insurance Department.

INSURANCE: Against Unemploy-
aent. The national scheme for insuring ment. The national scheme for insuring duced in Great Britain in 1911. At first it was confined to certain specified classes of workers, but in 1916 many munition workers were brought in. In 1920 there was a large extension, and the scheme now applies to all employees between the ages of 16 and 65 , except non-manual workers who receive over $£ 250$ a year, and certain other classes.

Exempted Classes. Apart from these nonmanual workers the chief classes of persons who need not be insured under this scheme are agricultural labourers and domestio servants. Employees of local authorities, of railways and other publio utility undertakings, and also persons with rights under statutory superannuation schemes, are exempt if the Minister of Labour grants a certificate. Other industi ies can set up insurance schemes of their own, and if the minister thinks these are satisfactory the employees therein can obtain exemption from the national scheme. To be satisfactory these schemes must give benefits at least equal to those of the national scheme.

Weokly Contributions. The contributions to this scheme are paid in the same way as contributions to the national health insurance scheme. Every week the employer must stamp a card for each employee insured. Part of the cost of this stamp falls on himself, but part he can deduct from the wages of the employee. The weekly contributions are as follow:
Men
$\begin{array}{ll}\text { (is to } 21 \text { ) } & \because \\ & \because\end{array}$ Women
Boys
Girls $\underset{\substack{\text { Boys } \\ \text { Girls }}}{\text { Con }}$

| Employer | Employee | Total |
| :---: | :---: | :---: |
| 8 f . | 7 d . | 18. 3d. |
| 7d. | 6 d. | 1s. 1d. |
| 7 d . | 6d. | 18. 1d |
| Od. | 51. | $11{ }^{\text {d }}$ |
| 4d. | 31d. | 7 dd . |
| 3td. | 3 d . | $61{ }^{\text {d }}$ |

Contributions cease to be payable when the employee reaches the age of 65 , as he or she is then qualified for an old age pension. If, however, the employee continues to work, the employer must pay his share of the joint contribution.

Rates of Benelit. The benefits are at the following rates :

In addition there are allowances for depen dants, these being 98 . for an adult and 28 . for a child. Thus an unemployed man with a wife and three dependent children will draw 32s. a week. No contributions are required during periods of unemployment.
To obtain the benefit the unemployed person must prove: (1) That not less than 30 contributions have been paid in respect of him or her as an insured contributor in respect of the two years immediately preceding the date on which application is made. (2) That he or she has made application in the prescribed manner, and proves that since the date of the
application he lias been continuously unemployed. (3) That he or she is capable of and available for work. (4) That, if so required, he or she has duly attended an approved course of instruction. The Act of 1930 repealed a condition in the 1924 Act, "that the applicant is genuinely seeking work, but unable to obtain suitable employment."

Disquallications. A claimant is disqualified for receiving benefit if it is proved by an officer of the Ministry of Labour: (1) that he or she has, without good cause, refused or failed to apply for or refused to accept a suitable situation notified to him or her as vacant or about to become vacant; or, (2) that the claimant has, without good cause, refused or failed to carry out any written directions given him or her, with a view to assisting him to find suitable employment.

A worker is disqualified if he or she is unemployed owing to a stoppage of work which is due to a trade dispute, or if he or she has left his work through misconduct or without just cause. He or she is disqualified, too, if the inmate of a prison or workhouse, or if in receipt of an allowance under the health insurance scheme.

The benefits are paid out at the employment exchanges, or, if the insured prefers, through a trade union. The officials of the exchanges are responsible for verifying the claims made. Disputes are settled by courts of referees. Both employers and employees have reprementatives on these courts and the chairmen are appointed by the Ministry of Labour.

INTARSIA. This is a way of inlaying wood which is now practically identical with marquetry. In its origin intarsia was the inlaying of one or more colours upon a lighter or darker ground, while marquetry proper is composed of pieces of thin wood or other material of equal thickness laid down upon a matrix and fastened with glue. See Inlaying; Marquetry ; Mosaic.

INTENSIFIER : In Photography. When a negative, whether on glass or on a film, is too thin to give a satisfactory print, it may be subjected to a process of intensification whereby, in suitable cases, a negative which gave a hat print with poor detail may be made to give a quite satisfactory silver print. The amateur, however, should be extremely cautious in using any of the intensification processes detailed below, particularly if the negative is one which is valucd.

The mere re-wetting of a negative is frequently attended with risk of stain or other damage. Under the best conditions some intensifiers, particularly those containing mercury, are liable to attack the gelatine, causing holes or reticulation, i.e. a series of wavy cracks in the gelatine of the negative. They also shorten the life of the negative.

Every effort, therefore, should be made to obtain satisfactory prints before resorting to intensification. If it is decided that a negative must be intensified, first make the best print that can be obtained on vigorous gaslight paper to keep in reserve.
It is useless to attempt to improve the printing strength of a negative which gives Hat prints because it is fogged; the intensifier will simply increase the fog and make the result worse. If the negative is freo from fog the edges which have been held in the dark slide will be seen to be perfectly clear. Make certain that the plate or film has been thoroughly fixed and properly washed; a trace of hypo left in the negative is almost bound to cause irregular stains after intensifying. See that the surface of the negative is free from smears, stains, or a chalky appearance, the latter indicat ing insufficient washing.

One of the safest processes is the following : The negative is first placed in a solution of 20 gr . of alum to 1 oz . of water to harden
and clear it, leaving it in the solution for a bout $\frac{1}{2}$ hour. It is then washed and placed in a solution made by dissolving 30 gr . of potarsium bichromate in 3 oz . of water and adding 1 dram of hydrochloric acid.

The hydrochloric acid should be the pure acid obtained from the chemist, and not spirits of salt ; 60 drops can be counted out if a dram cannot be measured. The negative will quickly become white, and the action should be allowed to continue until the bleaching is complete; it is then washed until the whole of the yellow stain is removed, which will take anything up to an hour.

When it has been thoroughly washed the negative is re-developed in a non-staining developer, such as amidol or metol-hydroquinone. When it will darken no more, wash well and dry. This intensifier is best suited to cases where the negative has been properly exposed but is under-developed, i.e. it is clear and bright, but thin. If the amount of intensification is insufficient, the process can be repeated, omitting the alum bath.

For a negative that is thin through underexposure and has not been seriously overdeveloped, uranium intensifier will give good results, provided the negative is absolutely free from hypo. The solutions are :

Mix 1 or. each of $A$ and $B$, and add 1 dram of acetic acid. After intensitication wash in several changes of water (not running water) until all stain is removed.

For a plate that is over-exposed but not over-developed, i.e. it is thin but has a veiled and flat appearance, the mercury and ammonia intensifier may improve matters. It is liable to cause pinholes and discoloration after a time; as explained above, it should be used with caution. The bleaching solution is macle up of :
Mercury perchloride (corrosive subli-
mydrochloric acld
Water to
50 gr.
5 oz .
The hydrochloric acid is dropped on the powdered mercuric chloride, and the water then added.

Note that the solution is extremely poisonous.
The negative, being soaked as before in clean water, is placed in the above solution and the dish rocked until the back of the plate appears quite whitc. Wash thoroughly in running water for about $\frac{1}{2}$ hour, and then blacken in the following solution :
A mmonia (strength .880 ). . 20 min It may also be blackened in hydroquinone, pyro-ammonia, or ferrous oxalate developer. See leveloping; Fix ing; Hypo; Wash. ing.

INTEREERENCE. In a wire. less receiver this is the intecruption caused by unwanted signals, c.g. undesired broad. cast transmissions, atmospherics, induction from electrical machin. ery, etc., on the
wave-length to which the set is tuned. See Selectivity.

INTEREST. Interest is money paid for the use of money. It is calculated at so much per cent, i.e. per hundred, and varies according to the standing of the borrower, the state of the money market, and other matters.

As it is occasionally necessary to calculate interest in household matters-for instance, when a house has been bought or built by the aid of a mortaage-the following method mav be found useful: Divide the amount of thi loan by 100 and multiply the answer by the rate of interest. Thus, if a man borrows on his house $£ 450$ at $3 \frac{1}{4}$ per cent., he should divide $£ 450$ by 100 , i.e. $4 \frac{1}{2}$, and multiply the $4 \frac{1}{2}$ by $3 \frac{1}{2}$, i.e. the annual interest will be 15 , i.e. $£ 15158$. It is well to remember that 5 per cent is exactly $q_{\text {a }}$ shilling in the $£$, and $2 \frac{1}{2}$ per cent is sixpence.

Interest is usually paid half-ycarly or quarterly, and the borrower is usually entitled to deduct income tax from the amount he pays. Income tax, however, is not deducted from the interest on bank overdrafta, but the amount paid can be deducted from the income when the return is sent in. Interest on these overdrafts is charged quarterly. See Banking: Building Society ; Mortgage.
INTERNAI COMBUSTION BNGINE. There is an essential difference in the working of the internal as compared with the external combustion engine. With the latter, the fuel may be consumed away from the engine, which is the actual power producer. In the steam engine, for instance, fuel is consumed under the boiler, thus raising the water to a sufficient heat to give off the steam, which is conveyed to the cylinders.

With the internal combustion engine the conditions are entirely different. The fuel is gaseous, or is rendered so by vaporisation, and is burned in the engine. We may tako the petrol enginc as the type. Through the medium of the carburetter the fuel is drawn into the cylinder in a semi-liquid form composed of a mixture of air and sprayed petrol. This is turned into a highly explosive petrol gas as it enters the engine, and is exploded through the medium of the high tension spark that is caused to jump the points of the sparking plug at precisely the right moment.

Fig. 1 illustrates the Otto, or four-stroke cycle of operations. The diagram shows the four strokes of the piston that go to produce one power impulse, namely, induction, compres sion, explosion or power st roke, and exhaust. As the piston has to descend and ascend during one complete revolution of the crankshaft, two complete revolu. tions of the crank go to make one cycle of operations No matter whether the engine has one or a dozen cylinders, the cycle of operations will be the same for cach; the only difference is the firing periods.

In the cycle of operations the chief factor is the valves, two of whichare cmployed, an inlet and exhaust valve, for each cylinder of the engine. The inlet opens at the commencement of the induction stroke and closes at the
end : the exhaust valve remnins on its seating. Both valves remain closed during enmpression and the firing or power stroke. Finally the exhnust valve opens on the exhaust stroke, the inlet valve remaining on its scating; at the end of the exhaust stroke the inlet valve again opens, and so the operation gees on. The valves are operated by the camshaft. Igni-

INTESTACY. An intestate is a person who dies without having made a valid will disposing of all his property. The property of an intestate is used first in payment of the funcral and other expeases and debts, and the residue is diatributed in accordance with certain rules. In English law no distinction is now made between real and personal property
share on attaining the age of 21 or marrying before that age If a child of the intestate has predeceased him or her, any children of that child living at the death of the intestate will takic the share to which their parent would have been entitled had he or she survived.

If the intestate leaves no descendants the following classes take in order, subject to a

Fig. 2. A. induction and compression : B. transfer to cy!inder ; C. explosion ; D. exhaust
tion is carried out usually by a high tension magneto, driven at crankshaft speed, or by a coil and accumulator

Two-Stroke Cycle. The difference betwcen the two-stroke engine and the four-stroke is that the former has one power stroke at every downward atroke of the piston, and the latter at every alternate down stroke. There are lirec main working parts, the piston, connecting rod, and crankshaft, no valves, timing gears, camahaft, and tappets being required. The half-compression valve or decompressor shown in the dingram is provided to facilitate starting the engine.

The cycle of operntions is shown in Fig. 2. The initial induction and compresaion of the fresh charge takes place below the piston and in the crankcase. There are four ports positioned in the cylinder walls and controlled by the movement of the piston, the sequence of operations being as follows :
The piston rises and creates a partial vacuum in the crankcase. On rising further, the inlet port is uncovered, thus allowing the fresh clarge to enter, assisted by the vacuam crented. On the completion of the up stroke the piston descends and compresses the charge in the crankcase, and just bcfore the stroke is completed, uncovers the transfer ports, allowing the compressed charge to pass via these to the top of the piston.

After the piston has risen a little way the transfer ports are closed, and the further tise of the piston compresses the charge that is now on top of the piston in readiness for the explosion to take place immediately the piston commences the down stroke. During the down stroke the same cycle of operations is going on below the piston in readiness for the opening of the transfer ports. This cycle is cominon to all two-stroke engines.

As the fresh gases enter the cylinder when the burnt gases are passing out through the exhaust ports, a certain proportion of the fresh gas is hound to mix with and pass out with the exhnust residue. This fault is guarded against as far as possible by the provision of a bafle cast on the piston head that tends to deflect the fresh gas to the top of the cylinder, thus keeping it for as long as practicable from coming into contact with the exhaust. Figs. 3 and 4 show a two-stroke stationary engine. See Big-End; Camshaft; Carburetter; Crankshaft; Lubrication; Motor Car ; Motor Cycle, etc.

If the intestate leaves a husband or wife he or she takes all the personal chattels of the intestate-i.e such things as furniture, silver; jewelry, motor cars and the ardinary contents of the home, and in addition a sum of $£ 1,000$ absolutely. After this payment has been niade any residuc left over will, if the intestate has left no descendants. be he!d in trust for the husband or wife for life-i.e. he or she will receive the intereat on the money, but not the capital sum.

If there are descendants the husband or wife will get a life interest in half only of this residue and the descendants will take the whole residue subjeot to that life interest upon what are called the statutory trusts. 'Jhat means that the children will divide the property cqually, each becoming entitled to his or her

Courlesj of l'elfern. Lid. Yeovll
the wall of the caecum. It communicatea with the bowel, but is closed at the other end. The important role of the intestine in the processes of digestion is dealt with under that heading

The intestines are subject to a large number of diseases. Inflammation may attack the intestine as a whole (enteritis), and also involve the stomach (gastro-enteritis), or affect only a part of the intestine, as the capcum (typhlitis), the colon (colitis), the appendix (appendicitis), the rectum (proctitis). It may be acute or chronic, a mild catarrh, or a severe ulcerative form.

Improper diet is one of the chief cauces. Tainted meat, unripe fruit, bad beer, the frequent use of irritating purgatives, chilling of the abdomen, may all set up inflammation. The common symptoms are griping, colicky pains, diarrhoea, thirst, nausea, and loss of appetite, leadache, languor, and prostration.
In cases duc to errors in diet two to four grains of calomel may lie given at once, or else from two teaspoonfuls to a tablespoonful of castor oil, with ten minims of laudanum added. Let the patient rest in bed. The food must be warm and liquid-skimmed milk, boiled arrowroot, well-beaten eggs, strained gruel. To relieve the pain, a iarge mustard plaster, fomentations or linseed poultices may be placed on the abdomen until the pain is easiet. If diarrhoea is severe or is prolonged, a doctor should be called in.

## Sagging and Obstruction

Sagging of the intestines is known as enteroptosis, and is generally associated with descent of stomach, kidneys, and sometimes liver and spleen. The common causes are poor development, a rapid loss of fat, tightlacing, many pregnancies, etc. Flatulence and constipation, neurasthenia, and a large variety of other symptoms may be present. Keep the bowels regular by means of laxatives such as two to four grains of cascara at night or liquid paraffin. A well-fitting abdominal belt often gives relief. Strengthen the abdominal walls by massage.
Obstruction of the intestines may arise from a large number of causes outside, in the wall of, or within the intestine. In an acute attack severe pain is suddenly felt, perhaps after a violent muscular effort. At first the pain comes in spasms, and commonly in the region of the navel; then it becomes continuous and agonizing. Vomiting soon appears; at first the stomach contents, then of bile, and finally of faccal matter. The doctor must be summoned instantly. Purgatives are most dangerous, and should never be given.
Tuberculosis of the intestine may occur through infection by ingested milk or other food, or may accompany tuberculosis of the lungs. It occurs frequently in cascs of the latter. The prominent symptoms are colicky pains and diarrhoen, with perhaps some blood and pus in the stools.
Duodenal ulcers occur, as a rule, in males between twenty and forty years old, and are upually preceded by months of more or less constant dyspepsia. Pain, three or four hours after meals, may lie felt in the stomach region. It frequently assumes the character of hunger pain, which comes on just as the patient is beginning to be hungry, and is relieved by taking food. There is generally blood in the istools, though it is not always obvious. Vomiting is common, and the vomit may contain blood. In somo cases medical treatment may be advised instead of operation. See Appendicitis; Colitis; Constipation; Diarrhoea; Digestion; Piles, etc.
INULA. These vigorous hardy herbaceous plants, rather coarse in appearance, bear large yellow daisy-like flowers in late summer. They flourish in ordinary sbil and are increased by division in autumn or by
seeds sown out of doors in May Glandulosa, Honkeri and royleana, all about 2 feet high, are the best; cnsifolia, 9 in . high, is suitable for the rock garden.
TNVALID COOKERY. The actual diet will be prescribed by the doctor, but the cook must be able to present it attractively and with sufficient variety to tempt the patient's appetite. Hot food must be served really hot, and cold food quite cold.

Much depends on the serving. A patient may refuse a dish which, if more attractively served, he would cat with enjoyment. Jellies, puddings and moulds are more appetizing scrved complete than as a helping, and soups, etc., more attractive in a dainty bowl than in a cup or soup plate. Highly Havoured things are to be avoided.

It is a mistake to send up large quantities of food to a sick-room, as the patient's appetite will probably disappear at sight of it.

Low diet consists of slops, and it is almost entirely fluid. A little bread or toast will represent all the solid part of it. For such diet the cook should send up some kind of liquid food at two-hourly intervals, varying her menu between milk, beef tea, gruel, Benger's food and such things. A liberal supply of barley water and lemonade is generally appreciated.

Light diet is usually understood to include fish, eggs, chicken, and milk puddings, thus giving the cook a wider scope for her ingenuity. Lightly-boiled or coddled egg and poached egg are suitable for invalids, while scrambled eggs are appetizing as well as wholcsome. Both fish and chicken are best steamed, but as the patient progresses he may have the chicken roast and the fish baked..
Full diet will include everything eaten by the normal person, with the rescrvations mentioned at the beginning of this article.

Among vegetables suited to invalid diet are potatoes (most digestible when mashed or baked), caulifower, vegetable marrow, wellboiled onions, spinach, asparagus, stewed tomatocs, and stewed celery. Of meats and fish the most digestible are chicken, turkey, pheasant (the breast especially), most kinds of birds, mutton, lean, tender beef, whiting, brill, soles, plaice, halibut, trout, turbot.

With specialized diets for definite diseases such as diabetes, chronic rheumatism or certain forms of heart disease the doctor will issue detailed instructions, for the cook to follow implicitly. See Beef Tea; Diet; Gruel; Imperial Drink, etc.
INVENTORY. An inventory is a detailed list in writing of furniture and other goods, usually drawn up for a particular purpose. When a furnished house is let it is usual to make an inventory of the furniture and utensils left therein, and when a house changes hands an inventory is made of the fittings, etc., which the incoming tenant is taking over. Such inventories are best made by an estate agent.

Sometimes an inventory of property and other possessions is made in connexion with the proving of a will, while an inventory of the personal possessions of the borrower must be attached to a bill of sale. See Executor; Furnished House; Will.
INVISIBLE MENDING. This term is used for a kind of mending which not only repairs the rent or hole, but removes all traces of its presence. It is generally left to tailors and others who make a speciality of it, but can be done, with varying degrees of success, at home. See Mending.

INVITATION. All formal invitations are written and answered in the third person. The usual form runs as follows: "Mrs. S. requests the pleasure of the company of Mr. and Mrs. K. oll Saturday, Nov. 10, at such and such a time." If an anziver is required it is
usual to put R.S.V.P. in the right-hand corner; but in any case it would be extremely bad manners not to answer.

The reply would run thus: "Mr. and Mrs. K. have" (not "will hare") " much pleasure in accepting Mrs. S.'s kind invitation for Saturday, November 10," or "regret they are unable to accept." It is to be noted that an invitation should be answered to the person from whom it is sent as designated by hinn or herself. For example, if it comes from Mrs. Arthur Walker, the reply should be addressed to Mrs. Arthur Walker. The reply should be prompt. Much inconvenience is cansed by people who forget or neglect to answer invitations until the last moment.
Wedding invitations are sent out by the bride's family. They are sometimes printed in silver, and are usually on a folded sheet of good notepaper. The wording is as foliuws: "Mr. and Mrs. Arthur Walker request the pleasure of Mr, and Mrs. Robinson's company at the marriage of their daughter, Mary Elizabeth, with Mr. Richard Kent, at St. Peter's Church, Eaton Square, on Saturday, Norember 10, at 2 o'clock." If the wedding is to take place out of London some people add a note in the corner giving times of trains, the nearest stations, etc. See At Home; Bridge Party ; Dance; Dinner Party; Etiquette; Erening Party; Wedding.

IODINE. A non-metallic element occurring in dark lustrous crystals, and procured largely from the ashes of burnt seaweed, is called iodine.

As a counter-irritant the tincture, the strong tincture, and the ointment are frequently used in chronic inflammations of the joints, swollen glands, pleurisy, etc. Painted on a bunion or chilblain, tincture of iodine sometimes markedly reduces the pain and swelling. The colourless tincture of iodine or iodine ointment is suitable for exposed parts.
Iodine is a powerful germicide. Accidental wounds may be painted or daubed with tincture of iodine, the surrounding skin also being dealt with. There is some smarting, but this quickly passes off.

For iodine poisoning gire an emetic (q.v.), and immediately send for the doctor.
It is uscful to remember that a weak solution of photographic hypo will remore iodine stains from clothing.
I.O.U. An I.O.U. is a piece of paper in this form

March 1, 1931.
To Mr. John Smith
I.O.U.

Twenty pounds.
(Signed) W. Jones.
This is an acknowledgnent of indebtedness only, and is very strong evidence that Jones owes Smith $£ 20$, but not that the transaction was necessarily $a$ loan. But it is not a contract or agreement. Nor is it like a bill of exchange or promissory note, which is negotiable; nor does it need to be stamped, as those documents do. If the I.O.U. goes on to say, " I promise to pay you the money on the lst of June," it is a contract or promise to pay, and must be stamped as a promissory note or with a sixpenny agreement stamp, or as a promissory note. See Promissory Note.

IPECACUANHA. The dried root of a Rrazilian plant yields the drug ipecacuanha. The dose of the powdered root is one half to 2 grains when used as an expectorant, 15 to 30 grains when used as an emetic.

Ipecacuanha is a reliable emetic, but it acts slowly. As such, one of its chief uses is to clear out the clogged-up air passages in chest diseases in children who have not yet learned to cough. The vomiting induced by the ipecacuanha, together with the expectorant effect of the drug, causes the accumulated mucus, etc., to be thrown out of the bronchial
tubes. The compound powder of ipecacuanlía iris (atylosa) (Dover's powder) is frequently prescribed as a diaphoretic in slight fever

IPOMOEA. These are quick-growing climbing plants. Some of them may be grown out of doors, while others are suitable only for a heated greenhouse. Ipomoea rubro-caerulea, which bears beautiful blue flowers in summer, is raised from seeds under glass in spring and may be grown in the greenhouse or planted out of doors in a warm sunny place in late May. Coccinea, bright red, and versicolor, red and yellow, are others that may bo grown in a similar way. The correct name of the common Morning glory (Convolvulus major) is Ipomoea purpurea. Horsfalliae, rose colonred, and Tearii, blue, must be grown in a hothouse Bona-nox, white, is suitable for the greenhouse

IRESINE. This plant, which is grown for the salie of its coloured leaves, is a favourite for summer bedding and is also useful in the greenhouse. It is easily increased by cuttings of the young shoots in spring in warmth under glass; if subsequently potted in 3 -inch pots they will be well rooted by early June when, after having bcen hardened off, they may be planted out of doors. A compost of loam, leaf. mould and sand is suitable. The favourite linds are Herbstii and Lindenii, with dark red leaves, and aureo-reticulata which has red and vellow leaves.

IRIS. This is one of the most important groups of garden plants; a selection of the best kinds will pro. vide flowers from early spring until late summer. The chief types are the May and June flowering bearded irises; the beardless irises and the Japanese irises which bloom in summer; and the early and late bulb irises which are at their best in spring and summer respectively.

The bearded flag irises are beautiful plants dist inguished by sword-shaped leaves and large flowers of brilliant and varied colouring, in May and June. The common purple flag iris (germanica), the best known of these, will thrive in partial shade, but the finer varieties need a sunny place. They may be planted from June to September in well dug soil to which lime has been added if necessary ; they do not Hourish in soil which lacks lime. An application of superphosphate of lime, 2 oz . per squaro yard, to the soil is beneficial. Care must be taken not to bury the rhizome or root stock deeply: it should be only partially covered with soil.

A few of the best of the numerous varieties now a vailable are (May-flowering) Florentina, white, Kharput, purple, Zwanenburg, bronze and yellow, Queen Flavia, pale yellow, and Charmant, blue purple. Of the June Howering varieties these are exceptionally fine: Rhein Nixe, crimson purple and white, Alcazar, mauve and purple, Archevêque, purple, Albert Victor, lavender blue, Caprice, rose-red, Iord of June, lavender-blue, Standard Bearer, rosecrimson, Ma Mie, white with blue margin, Ambassadeur, crimson bronze, and Darius, yellow. The dwarf bearded irises which bloom in March, April and May are valuable plants for the rock garden and for sunny borders.

Among the beardless irises (which have no crest or beard on the falls or lower petals) are the lavender blue Siberian iris (sibirica), aurea, yellow, Monnieri, yellow, orientalis, blue, the common yellow Hag (pseudacorus) and the monspur varieties of several colours; all these like deep moist soil and are auitable for borders and the watersicle. The beautiful Algerian
which bears lav ender blue blooms in winter is in this group; it should he planted in spring at the foot of a sunny wall in well drained soil containing mortar rubble.

The Japanese irises (Kiemp. feri) bear large, Hattish, brilliantly coloured Howers in summer; they should be planted in moist soil by the waterside and must have a sunny place.

Bulb Irises. Among the bulb irises the Spanish and English are hear blue, white yellow flowers in June, shades of mauve, purple and rose. The proper time to plant the bulbs is in Octoher, those of the Spanish irises being set 2 inches deep and 4 inches apart, those of the English irises 3 inches deep and 8 inches apart. The minia ture bulb irises which are in full beauty in spring are very charming in the rock garden or for cultivation in pots in the cold greenhouse : reticu lata, violet, Danfordiae, yellow, and histrio, blue, are some of the best. The bulbs should be set in rather light well drained soil in September.
In addition to those named many specics or wild types are cultivated and the oncocyclus or cushion irises which need apecial treatment-a sunny position, a raised bed of well drained gritty soil and suitable protection in ny admirers.
Iris Diaphragm. See F. Number; Stop.
IRISE HEATH. This is a beautiful flowering shrub about 15 inches in height, with drooping, crimson-purple flowers. There is a beautiful white variety, alba. Its culture is the same as for the heaths. Its butanical name is Dabnecia polifolis. See Heath.

IRISH JIG. Each of the 9 steps in the Irish jig takes 8 bars, and with repeats 16 bars It may or may not be danced with a partner. The jig step starts by striking one foot againet the back of the other leg while turning in a circle, this being repested seven times, finish. ing by stamping twice with each font. A shuffle is done in the next step, first with the right foot and then with the left, and repeated. The dancer next steps to one side and hops, while striking one foot against the other leg, finishing

Iris. Left, early-flowering Spanish ; right. Jacquiniana or common \#lar
favourites. The former with $\Omega$ douhle shuffle Other movements include turning in a circle while carrying one leg raised in front, and tapping one foot against the heel of the other finishing with the single shuffle and stamping of the feet. The last atep is similar to the second. but brisker at the finish. A shillelagh is often carried

IRISH MOSS. Irish or Carrageen moss is best known as $\Omega$ remedy for ohest complaints, but it also possesses certain nutritive properties. It should be washed thoroughls and should be soaked for several hours before being cooked It is usunlly taken is a drink. which is prepared by siminering $\frac{1}{2}$ oz of moss in a quart of cold water for about 4 hours Then strain the liquor, sweeten it to taste. and, if liked, add a little lemnn juice.

Irish moss is used as $\Omega$ substitute for isinglass in blancmange and jellies and is also employed in making sizing and lager bcer

IRISH STEW. This popular dish is very cheaply and easily made. Cut 1 lb . neck ol mutton into chops, and put it, with 1 lb . sliced onions and $\frac{1}{2}$ pint water or stock, into a stewpan or casserole, and simmer it for about 1 hour.
Then add $1 \frac{1}{2} \mathrm{lb}$. potatoes, whole, if small. or cut into thick slices, and salt to taste. Continue to simmer the stew for about an hour, when it will be ready to serve. If conked in a casserole three hours should bo allowed in all, and the stew should be served in the casserole.

IRISE TERRIER. This rough-coated dog is most devoted to his own people, and can be trusted fully with the care of little children, whose exigent demands upon his attention are not resented. He should be wholly of some tint of red, save for a black nose, and,

Irish Terrier. Prize-winning specimen of a favourite breed of house dog perhaps, a spot of white on the deep chest ; the head should be long and squarelooking, carried on a fairly long neck, which broadens to the shoulders and the straight back.
The small, in. telligent eyes are of a dark hazel colour; and the small V-shaped ears fall forward to the cheeks. He wears a thin beard. The hard, wiry coat is straight and Hat, and, in spite of its length, neither shaggy nor curled.

He is smallet than the Airedale, and his weight should not exceed 24 lb See Dog; Terrier.

IRISE WOLFHOUND. The Irish hound attains a greater stature than any other dog, some having been exhibited that measured 37 in at the shoulder Assuming that Oliver Goldsmith measured to the top of the skiull

arisu Woflnounu, the largest breed of sporting
dog. much valued as a guard
instead of to the shoulder, as we do, he may have been right in putting the height at 4 ft .

The Irish wolfhound is powerful and active, with a wiry coat, similar in colour to that of the deerhound The few breeders find a steady and remunerative market in the United states and the Dominions, the dog being prized as a guard or for hunting wild animals, his size and strength making him incomparable. See Dog

IRON : General Uses. Iron in its simplest form is known as wrought iron, and is obtain. able in large shects, strips, round, squared, and tlat str:ps, or bars, angle irons, or " $L$ " shaped section bars, and similarly in "T" shaped and other various sections. Thin strip iron is used for packing-cases, being known as hoop iron, and also used in a similar way for securing the staves of a barrel.

Vrought iron can be welded or brazed without difficulty, and in addition can be
drilled, or cut with a hack saw. It is inlerior to stecl, both as regards strengtl। and the ease with which it can be tumed in a lathe.

Iron, whell melted and poured into a mould, is moulded to most intricate shapes, and is then known as cast iron, being used in this form in the making of innumerable articles, but, as it necessitates a high temperature to melt it, the process of making iron castings is scarcely practicable to the amateur See lient Iron Work: Casting: Forging: Soldering Stecl, etc.
IRON: Medicinal Uses. In the maintenance of health iron is of the greatest importance. It occurs in hacmoglobin, the ied colouring matter of the blood, which is necessary to the carriage of oxygen throughout the body. In order to maintain the stock of hoomoglobin iron must be taken in food, the argest quantities being found in yolk of egg, red meat, ontmeal, and spinach.
It is, therefore, in annemia that the adminisIration of iron preparations is obviously necessary. In dehility such as follows acute discases, or resulting from overwork or strain, or in chronic diseases such as tuberculosis, iron may be given with happy results.
The astringent preparations ol iron, the perchloride and the sulphate, are used to arrest bleeding. When taken internally they may upset the digestion, produce constipation, headache, and irritability of the bladder. To avoid this they may be combined with purga. tives, e.g magnesium sulphate, or, if necessary, a change may be made to a blander form, such as the citrate of iron and quinine or of aninionium. Iron also tends to blacken the teeth, and the astringent forms may injure them. For this reason it is a good thing to suck liquid iron mixture through a glass tube.
Among the most popular and widely used preparations of iron for its tonic effeot are Blaud's pills, the scale preparations, and Easton's syrup. A course of any of these preparations following on convalescence after any illncss or when in a generally run-down state frequently gives most gratifying results.
Iron may also be taken in natural iron waters, such as are found at the chalybeate springs at Tunbrìde Wclls, Harrogate, and other places.

## Irons and Ironing in the Home <br> Describing Electric, Gas-heated, and other Types

For re:ated information on this subiect the reader is referred to the article on Laundry. The
entries on Box Iron: Clothes Line; Coppra; Gas: Gofering; Labour Saving: Mangle:
Pressing, should also be consulted Pressing, should also be consulted
The irons in general use include the flat iron, and sprinkled with powdered bathbrick the iron heated by gas, and the one heated by electricity ; but there are also other varietics, such as the fuel-charged box, the spirit iron, and special goffering and polishing iron.

Fint irons weigh, as a rule, from 2 to $S \mathrm{lb}$., the heavicst being used for pressing such materials as tweeds. For ordinary purposes, gizes 5, 6, and 7 are the most useful, though it should be remembered that the larger and heavier the iron the longer it will retain the heat.
Flat irons may be heated over a gas ring, on top of a stove, or before an open fire. In the last case the iron is placed in an upright position against the bars of the grate. Irons should never be put on the fire itself, for this tends to blacken them and also to destioy their smooth surface. Special stoves for heat ing irons can also be obtained, but thesc are not necessary unless a great deal of laundering is done. But, whatever the' method of heating used, an iron slipper or shield should be fastened on immediately before ironing to prevent the clothes from becoming soiled. When this is not done, the iron will require careful cleaning by rubbing it on a thick sheet of trown praper nailed to a board or lable
and sprinkled with powdered bathbrick A
little beeswax may then be applied with a soft cloth, and the iron finally polished and dusted.
The heat of an iron may be tested by dipping the finger into water and then dabbing it lightly on the surface of the iron. If the water dries immediately and leaves no mark, the iron is hot. Old pieces of cloth may also be used for testing. During ironing a stand or trivet should be placed on the table so that the iron may rest upon it when not in use. This will prevent unnecessary scorching of the ironing cloth. In iron holder, thick enough to prevent the heat of the liandle penctrating through, must also he provided Irons should be put away in a dry place, for danip rusts them. The gas iron (see p). 520) has a tube attach. ment which connects it with the burner and a tap for regula. and the heat. Tue

Iron. Left, adjustable voltage iron for use during holidags or travelling. Kugbt electric iron which concentrates additional heat in the point Courtesy of Hotpoint Electric Appliance Co., Ltd.; and al Edison
and to prevent scorching a damp cloth may, for the first ironing, be placed between the material and the iron. Keep all frilis that have been set in pleats carefully ironed to their original state. Use goffering tongs for the narrow lace edgings and frills of clothes and bed linen. Lace collars should be ironed lightly on the wrong side with a cool iron, and there should be a piece of muslin between the iron and the lace. Then iron again without the muslin, having previously pulled the edges into shape. Finally pull out with the fingers any raised flower petals, and so forth, that there may be in the design.
When ironing a pleated garment tack the pleats in place or iron them carefully two at a time, placing a damp cloth between the material and the iron. Pressure and a very hot iron will probably be necessary.
Men's linen collars of the turned-over type and the straight are ironed flat, first on the back and then in front. Some men like their turn-over collars glazed both back and front, in order that the tie may slip easily between the folds. They have preferences, too, in the case of the shirt collar-band, some calling for a stiffened band and others a soft one, for which reason the laundries have a plan of using coloured threads that denote exactly the fancies of their customers.
To keep irons polished and clean is an absolute necessity, and the ironing board cover should be washed, especially if iron-moulded, for this mark is catching and can be communicated by the iron to a fresh fabric.
Ironing Board. A board can be prepared for irouing purposes by taking a smooth piece of wood 3 or 4 ft . long and about 9 in . wide and covering it with blanket or felt. This material must be stretched tightly enough to produce a smooth surface, and over it a length of white linen or cotton material should be pinned when ironing takes place.

A specially shape.i board of this kind is used for ironing skirts, petticoats, and frocks. It should be narrower at onc end than at the other, 80 that the garment can be fitted over it. Other boards shaped so as to facilitate the ironing of sleeves and shirt fronts are covered in the sante way
Ironing Cloth. The blanket and sheet used to cover a table while ironing is in progress are together known as an ironing cloth. They may be of one, two, or more thicknesses, but the main point is to see that they are perfectly smooth and free from creases. If preferred, a piece of felt may be used instead of the blanket. The sheet must be white, otherwise thore will be a danger of damp clothes ironed on it taking the dye.
Ironmould. This is a stain produced by ink or rusty iron. It can be removed from most mnterials by means of powdered oxalic acid or some salts of lemon and hot water, but if either of these acids is used, the article so treated nust be washed immediately afterwards to prevent the acid from causing holes. Salts of lemon may be applied two or even three times on strong white materials, but oxalic acid needs to be used more sparingly.

If salts of lemon is used on coloured materials it should be made into a fairly weak solution with hot water, and the affected part only dipped into it and taken out again before the colour begins to fade. Then put the material into a basin of cold water to stop the blenching action of the salts and the stain should have disappeared. This process may be repeated, if necessary, but it must be done rapidly and the cold water used afterwards on each occasion.
IRONSTONE. This is an impure iron ore with a heavy proportion of clay. In districts where it can easily be obtained, it may be used for decorative purposes in the garden. It is also used in the pottery industry for the manufacture of some classes of cooking utensils and earthenware.

ISINGLASS. The purest kind of gelatine is known as isinglass. Colourless and without smell, it melts quickly in hot water and is used mainly for jelly maling, etc. It is often adulterated with ordinary gelatine, and may he tested by dropping some of it into cold water or vinegar. In cold water, isinglass becomes white and cloudy, while gelatine remains clear; in vinegar it swells and becomes jelly-like, while gelatine hardens.
An invalid dish made from isinglass is prepared by dissolving an ounce of isinglass in $\frac{1}{2}$ pint hot water, and adding $\frac{1}{2}$ gill white wine and the juice of a lemion. Sweeten all to taste ; then add the beaten yollis of 3 eggs, and thicken the whole over the fire. Pour it into a basin, and when cool, but not set, turn into a mould. See Gelatine; Invalid Cookery.
ISLE DF WIGHT DISEASE. This discase of bees, a very destructive one, is caused by a tiny parasite. Various symptoms have been noticed, among them being the following The bees lose their powier of tlight, either gradually or suddenly, and also the use of one or more pairs of legs. Sometinies they are very vicious and use their stings freely, but at other times they are quite the opposite. The combs may be soiled with excrement.
Bee-keepers who notice any of these symptoms, or indeed any general indication that their bees are disinclined to work, should at once examine their stocks and if they have any doubts should consult an expert or communicate with the Ministry of Agriculture.
No certain remedy has been discovered for this disease, but in Leaflet 253, the Ministry of Agriculture and Fisheries gives a few suggestions for preventing its spread and mitigating its severity when it appears. Cleanliness is of great importance in this connexion.
After an outbreak of disease, the inside of the brood chamber and the foor board of all movable comb hives should be charred with a painter's lamp. All skeps, quilts, combs and honey that have come in contact with the affected colony should be burnt, together with all dead bees, and the soil round the hive should be sprinkled with petrol and ignited. After the fire has subsided the ground should be dug over and covered with quicklime.

Bee-keepers should endeavour to see that no stagnant water is left in the neighbourhood of their apiaries, especially when there is any disease in the neighbourhood, and should endeavour to supply their bees with a pure supply at a short distance from the hive. The drinking fountain should have a sheltering board about one foot above it to prevent the flying bees from soiling the water with excreta which they void when on wing. In the spring very thin syrup could be given in the ordinary feeders, as this lessens the demand for water. Some authorities advise supplying them with salt water, especially in the spring.
Bee-keepers who live in districts which are free from disease should on no account purchase swarms or driven bces from an infected district. There is no surer way of spreading disease than to transfer bees from one district to a nother, for swarms, even from apparently healthy stocks, sometimes develop disease when placed in new hiver. See Bee.

I SPY. This outdoor game is a variant of hide and seek. The player chosen to be the spy stands with closed eyes at the place fixed upon for the goal, while the others scatter and hide. He counts up to 100 or some other agreed figure and then starts upon the chase, going warily lest n player should dart out and reach the goal before him. As soon as he catches sight of a player, he must shout his name, run back and touch the goal.
The player who has heen scen, however, has also this right, and if he touches the goal first he is not caught. The other players can also run for the goal, but if they are seen
and named the spy may bo able to get there before them. If the spy calls out a wrong name, the player wrongly named and also the one whose name was actually called are both free to return to the gonl.

A game ends when all the players are caught, or all have succeeded in reaching the goal. In some parts of England this game is known as lurky and there are other localized names for it in various parts of the country.
ITALIAN CREAM. To make this sweet, prepare a custard with a pint of milk, the yolks of 3 eggs, and sugar to taste, Havouring it with the thinly peeled rind of a lemon and a little cinnamon. Stir in $\$ \mathrm{oz}$ gelatine previously dissolved in a little water and a dessertspoonful of strained lemon juice. Let the whole stand until it cools and begins to set; then add the stiffly beaten whites and put the mixture into a mould rinsed with cold water. When firm, it may. be turned out and served with stewed fruit made into a purée.

ITALIAN GARDEN. Although there are cxamples of this style of gardening to be found in England, its principle of subservience to architecture is too pronounced for English tastes. The free and natural growth of plants, which nowadays is such a feature of British gardens, is absent ; the stately Italian garden, is distinguished by stereotyped beds of glowing flowers and ornamental plants, balustrades and statuary.

The design is tormal, with carefully ordered beds laid out in geometrical shapes. Paths intersecting the beds are paved with stone, or loosely gravelled. Effort must be made to maintain a succession of the most brilliant flowers from spring to autumn, but difference of climate makes it almost impossible to grow many of the striking trees and plants prominent in the gardens of Italy.

Agares, yuccas, aralias, and dracaenas can be brought into the scheme during summer months, together with specimens of topiarian art. Sculpture, in the form of an ancient wellhead or Venetian cistern, a fountain or stone scat, if possible, should find a place.

Modern gardening regards the plants as of most intercst, but old Italian gnrdens were designed as an ornainental extension of the architecture of the house. See Loggia.

ITAIIAN GREYHOUND. This miniature edition of the Enylish greyhound has the appearance of great delicacy and fragility, and in consequence has been treated by its owners too often as one of the expensive pets of the drawing room. Gentle and affectionate, of exquisite form and beautiful colour, some shade of fawn, he should be given proper opportunity for exercise.

The head sliould be long, flat, and narrow, tapering to the fine muzzle and dark nose, set upon a long and gracefully arched neck and
 of the breed of strong but frapile-looking doz
long, sloping shoulders; back curved to the hidden on the surface by n close texture ol hind quarters and the long tail; fore-legs line Botany wool, which lends warmth to straiglit with small bones; feet long and the garment. In poorer qualities less wool is hare-like. The small, soft cars should come used, and in the larger part of Italian cloths close together behind the head; the cyes there is no wool at all. large, bright, and expressive. For show purposes there a re two classes: those under 8 lb . in weight and those of heavier build. See Dog.
ITALIAN LINING. Available in many qualities and in colours to tone with all the materials ordinarily used in tailored clothing. Italian lining is smooth faced, and is the chief lining used for men's coats and waistcoats. The best qualities liave a strong cotton warp, its natural strength

## Italian Renaissance Work

## Modern Simplified Form of an Interesting Old Handicraft

The articles on Gesso Work and Lacquer Work should be consulted in connexion with this, as there are points of resemhlance in methods and materials employed. See also Lampshade; Leather W'ork; Papier Mâche; Stencilling
The original method of applying this orna- transparent oil colours. The panel on the mental craft was a long one and entailed blotter in Fig. 4 is a photograph of a well great skill and patience. It was largely known picture, those on the tea caddy in employed in the interior decoration of churches the same illustration were cut out from a and other buildings and many famous examples are to be seen in Italy. As with gesso work, a paste is employed, and this was used thickly, layer upon layer, and when hard the design was carved out and gilded or coloured. In this article the work is only dealt with from the point of view of the amateur, for the decoration of small articles, but in its antique form it enriched large surfaces.

It is not practicable on metal or glass, but can be used on wood, papier maché, and even cardhoard. As the paste fills in cracks and dents it is an excellent method for re-decorating a wooden box or blotter, or for book ends which have become shabby. It is also largcly used for decorating white wood articles, which-are obtainable in great variety in most good art departments, together with the materials required for this work.

If the article to be decorated is old it should first be thomughly cleansed with soap and water and dried. A woolen surface, if smooth, may be sandpapered quickly and just sufficiently to roughen it. A coarse sand paper should be used, or the surface inay he acratched up with a pointel instrument.

Method and Materials. A sniall box is a simple article to hegin experiments with in this craft. which is an ideal one for quickly making decorative objects for a bazaar stail at little cost A special form of paste, called renasco paste, is employed for the raised decoration. It is easier to apply than harbola paste, which requires expert modelling to obtain good resulta, or than gesso, used for lacquer work, which requires to be exquisitely smooth. Decoration may consist only of the raised paste work done in conventional scrolls all over the article with a spoon-shinped modelling tool supplied with an outfit. Practice is required, but the work in its simple modern form is especially suited to those who cannot draw or paint.

More effective work is done by utilizing a panel as shown in the examples of finished work in Figs. 3, 4. Such panels may le original designs drawn and painted by the worker, in which case the craft may be raised to the atandard of an art, or a picture may bo cut out and glued to the article and coloured with barbola colours. Photographs and picture postcards can be used and tinted with

colour The actual painting of the panel is left until the remainder of the decoration of the box is finished. While the panel is drying the rest of the box is covered with the paste, using a hog hair brush. Apply the paste unevenly, covering any strips of cardboard or of wood which may have been glued or nailed into, position round the panel. The paste should not be allowed to spread on to the latter.

This first coating of paste is left to set for $t$ welve hours, unless the weather is very damp, when it may take longer. For the sccond cont the paste is used of a consistency which, when the brush is raised, flows from it in sufticient thickness to make coils. Only the paste is allowed to touch the surface of the first coating, not the brush. which is kept moving in circles, figure eights, or leatlike formations to cover the box with raised decoration. The scroll work design on the right-hand box of Fig. 3 is done with a spoon-shaped modelling tool instead of the brush.
Gilding and Colouring. When the second conting of the paste is dry, the whole article, except the portion reserved for the panel, is gilded and coloured. A squirrel hair brush is hicst used for this purpose. Gold bronze mixed with the special medium is painted over the paste (l'ig. 1); when this gilding is dry it is in turn painted over with vandyke brown oil colour thinned with turpentine. This is allowel to dry for a short time and then with a piece of clean rag the colour is reduced in places to give an antique look (Fig. 2). A greenish shade may be obtained by mising emerald green oil colour with the vandyke brown.

By the time all this has been done, the raised portion of the panel design will be quite dry. Barhola colours look well on this work as they are somewhat suggestive of the old tempera colours used for this form of decoration in the time of the renaissance. Sable brushes are best for painting and water for thimning. As little shading as possible should be used, the colour heing applied, except for details, in Hat washes. When raising, the paste should he used more thinly than for the rest of tho decoration. Gesso powder is quite suitable for this purpose as applied to the handkerchief hox described in p. 529. The object in the first case is to provide a smooth surface in very slight relief; in the second, a mugh surface in bolder relief. For raising the panel design use a salile brush and twist it to avoil brush marks and to make the paste lie correctly. Instead of cardboard strips the framework round the panel can be formed by drawing the paste nlong and turning the lirush while working it is important to remove or raise the lids of boxes before applying paste.
panels and strips of cardhoard which may lee utilized to form a raised framework round the panel and should be affixed hefore the renasco paste is applied. Such a framework has heen used to surround the photograph panel onthe blotter:
To decorate one of the hoxes illuatrated in Fig. 3, the space which the panel will fill must first be decided on and then the design must be drawn, traced, or the photograph, card or picture must be glued into place. Where it has been decided to decorate this panel design with barbola colours, portions of the design, trees, birds or figures can he slightly raised with the paste reducel with water to the consistency of a thin cream, and allowing it to dry hefore applying any

Italian Renaissance Work. Fig. 1. Gitding the paste : a squirrel brush
is used and the gold powder is mixed with renasco medium. Fig. 2. is used and the gold powder is mixed with renasco medium. Fig. 2. Removing excess of oil colour with a clean rag Contrext of ivfusor Aeicton, hed.

The edges can he trimmed with a sharp penknife when the paste is dry.

Candlesticks and wooden table lamps can be successfully decorated in this method. On the white wood blotter and tea coddy illustrated in Fig. 4 the panel pictures are mercly coloured and no raising paste has been applied to them. After glueing on the panels a rubler roller should be employed in order to remove ang bubbles which spoil the appearance of the work.

For the blotter thin strips of cardbonrd are glued round the panel to form the frame and the back of the blotter is gilded all over. Paste is not used for this as the back is required to lic flat on the table. A pretty effect is gained by mixing silver with the gold bronze powder for painting the paste nind introducing a little vermilion and vandyke brown oil colours, wiping the latter off, as shown in Fig. 2, so that the metallic lustre is not lost. When the paste work on the front is painted, the photograph is coloured with
 transparent oil colours, using megilp as the medium for this decorntion.

The white wood ten cadily is decorated with fire pictures cut to fit sides and top. When these are limmly glued to the wood the box is covered with the paste. Opening the lid, do the sides lirat and the top last. Bron\%c powders are used to colour the paste, a good effect heing gained with copper instend of gold, the brown oil colour being left only in the unraised portions. If picture postrards are used to decorate the loox, they must be tinted with oil colours; if drawings or cutout line illustrations, these can be worked up with barbola colours.

Many of the materials in the various handicrafts to which the render is referred can he utilized to make varicty of designs and colourings when the worker gains experience. and in this way original pieces are produced. Barbola work, for instance, in a floral design could be used instead of a panel, or for an edging on a box deccrnted with renaiseance work. Stencila can be employed when painting small panels at the hasc of candlesticks covered elscwhere with relief work.

ITCHING. Itching of the stin, or pruritus, may be transient and easily controlled, but it is sometimes so severe and continuous as scriously to affect the general health. It accompanies many akin disenses. It may also be the result of irritation by tleas, lice, scabies, or hy coarse wonllen underclothes. In netilerash or hives, often found in indigestion. the chief symptom is intense itching.

Wherc the sensation is localized, bathing the part with a one in forty solution of carbolic
acid sometimes gives relicf. Another useful
lotion for sopping on the skin to relieve localized itching is the following: Carbolic acid.

- 1 dram Bismuth carhona lectitled spirits of wine $\varrho$ " oz. Wuter, enoush to make 8
Make into a lotion, sop on to the itching skin, and allow to dry. These lotions are pmisonous if taken internally.
General prorituswithout apparent causc may be benefited by Turkis! baths (if the doctor approves) or hot baths, and to the latter might be added bran or oatmeal. 2 lb ., or carbonate of soda, 2. oz., to the 30 gallons. See Scabies.

IVORY. There are four linds of ivory: Indian, African, walrus, and
 1 o ndion other designs.
Articles miade of walrus or vegetable ivory are inferior in quality and nppearance. Vegetable ivory is chietly used for buttons, and although it is generally described as ivory. the material aclually is cut from a nut, the nut ivory button industry being quite large in certain lialinn manufacturing districts Theso articles of nut ivory are easily distinguished by their whiteness and almost bone-like colour, and the absence of graining such as is seen in tusk ivory. The walrus ivory is mnstly

Ivory. Walrus ivory tau-head fixed to the top of a walking-stick. Northern Europe. 12th century B" permission of the Director. Fieloria a Albert Nuseum. S. Kensingion
obtained from the tusks of the Baltic sea lions, and as these are small the chief usc for this ivory is in making bead necklets and othor small articles. It is nore fragile than clephant ivory; also it has not the lustre, and it cracks verv easily. It is usuad for it to he bleached, and the chemical action frequently causes cracks to a appear.

It is advisable when purchasing ivory goods of any description to inquire whether the ivory is elcphant. wnírus, or innm. moth. The last two are comparatively cheap. From the description given ahove it should be possible to dis. tinguish the finc qualities from the less expensive.
lf ivory is to be silvered, put it into a weak solution of nitrate of silvor and leave it there until it has nequired $n$ deep, vellow colour.

Then wash it with water and exprose it to th sun for about three hours. or until it turns black. Vigornus rubbing will then produce the desired silvery effect Preparations. together with directions for slaining ivory red, blue green purple. yellow. and othri colours can be obtrined from mosl chemists
Antique and Decorative Pieces. Fol the purpose of home decoration the classes of ivory earvinge most readily available are

Ivory, warnese statuette, 17th century

IVY. The common ivy (Hedera helix) is an invaluable evergreen shrub of climbing or trailing growth it is one of comparatively few self-clinging climbing plants and is thus often used for the purpose of covering walls If planted in auch a position it should be cut hard back annually in April to get rid of the old leaves and straggling shoots iv thrives in ordinary soil and is propagated hy cuttings set in a frame in August or out of dours in October
The varlegated ivies are more attractive than the common green leaved form: a few ol the best are Crippsii, Lee's Silver and varic gata elcgantissima. The golden leaved ivie too are favourites, and there are some distinct varieties among the small-leaved ivien, such as Caenwoodiana, crenata and gracilis. Some ol the best large-leaved ivies are canariensis (Irish ivy), dentata and amurensis The leaves of purpurca are green in summer but ake on a purplish tint in autumn
A curious irait of ivy is that as soon as it reaches the top of its support it loses it climbing or trailing form of growth and becumes what is called a tree ivy It develops a bushy habit of growth and bears flowers and fruits lvy malies a gond ground covering beneath trees and in very shady places where little else will grow
IVY LEAVED GERANIUM. The type ol pelargonium known as the ivy-leaved geranium is useful in the garden in summer flower bed: and in vases. It is valuable for covering green house walls. for hanging baskets under gless Western market They are often tawdry alld house wals. for hanging baskets under glass
for window boxe
lacking in attrac-
tiveness. because balconies. tiveness. because they do not interpret native focling.
I vory carvings which retain the mellowness of age should not be washed. but polished with soft leather A bath of turpentine. followed by ex. posure to sunlight for a few days, is sometinies advan tageous and quite harmless Some forms of artificial diacoloration can be detectel by apply. ing a danip cloth. Old specimens zhould be bept under glass, away from the sun

Propagation is by outtings taken in August iand kept under glass until spring, when they нre transforred singly to 4 in pots, points of main shoots being nipped a few days later to make stocky plants and to cusure prolifio flowering. Madame Crousse, pink, and Solivenir de Charles Turner, carmine ruse. are two favourite varieties See Pelargonium

IXIA. This is a bulb plant which bears flowers of many brilliant
sunmer. It is not very hardy and should be grown in pots in the greenhouse or he planted in well-drained soil in a sunny sheltered horder preferably at the foot of a wall The bulbs are potted or planted in September if out of doors they should be covered with 2-3 inohes of soil and protected by old ashes in winter. If grown in pints they inust be dried off gradually after the Howers are over and re-potted in autumn. The green and black ixia (viridiflors) is very handsome . numerous wthers named in catalogues have blooms of warlet, rose, crimson. and yellow. They are propagated by offyets.
IXIOLIRION. This is a rather uncommon hulb plant from Peraia which, when grown in British gardens, needs a sunny sheltered placo II a well-drained compost of loam. leaf-mould and sand The bulbs should be set in autumn 1-2 inches deep, a covering of old ashes should be put on the soil early in winter Pallasii (tataricum) is the only kind usually grown : it bears blue fowers in early summer

IXORA. These are beautiful hothouse shrubs, known also as the West Indian jasmine. They form bushes of glossy foliage, surmounted by lovely panicles of Howers, either white, yellow or red Ixoras like a compost of two parts of rough loam, one part leaf-mould, and one part fibrous peat, with a good sprinkling of sliarp sand.
Propagation is effected by means of cuttings. For this purnose fairly mature shonts which

Ixora Flower uead and glossy foiliage of the
show no signs of bloom should be inserted singly in small pots, in sandy peat, and plunged in a propagator. After the cuttings have been rooted, remove the tops, as this will conduce to a bushy habit. The plants should be potted on until 6 in . pots are reached. After flowering give the plants a rest in a temperature of from $55^{\circ}$ to $65^{\circ}$ during the autumn and winter months. The tinc for repotting is when growth is just starting.

ABORANDI. Dried jaborandi leaves are important in miedicine because they contain ceitain akaloids, especially pilocarpine. Both jaborandi and pilocarpine are largely used as outward applications to the hair to stimulate and promote its growth. Taken internally, they cause an increased flow of perspiration.

JABOROSA. A hardy perennial plant allied to the mandrake, this is one of those curious freaks of hortioulture which are said to shriek when their roots are torn from the ground. Jaborosa grows in any warm soil in

JACINTH. This semi-precious stone is I ransparent and bright in colour, varying from a dark red to orange. The best stones have a lustre and are pretty, but not valuable.

JACK: For Lifting. A jack, or a lifting jack, is a mechanical device for raising weights or for exerting great pressure. It usually takes the form of a strong metal casting, broad at the base and tapering towards the top. Through its centre prases a rod with a square sectioned screw-thread cut upon it. A steel nut with actuating handle turns upon this rod and rests upon the top of the body of the jack. Consequently, when the nut is rotated the steel rod is forced upward, and the head, or pad piece, which is affixed to it bears against some convenient part of the ohject to be lifted, thereby forcing it upward.

When using a screw jack for lifting operations, it is important to see that the foot of the jack rests upon a solid base; if it is tilted to one side it is liable to slip when the load is brought to bear upon it. Similarly, the head of the jack should bear upon some firm, solid part of the object to be raised, the essential thing being that the pressure is exerted in a straight line.

A jaok is very convenient if it is desired to force an object along for a few inches, as the jack can generally be laid in a horizontal position, with the foot bearing upon a solid piece of wood which butts against the wall of the house, or any other sufficiently strong resistant structure.

A convenient type of jack has a worm and wheel to rotate the screw-nut, and this permits of still easier operation of the jack, and, to avoid the necessity of approaching near to the jack, a long extension handle may be employed to rotate the worm, as in Fig. 1.

A lifting jack is an indispensable part of the equipment of the motor car, and there are
$\square \mathrm{w}$ workers in wood, as by its aid the rough and uneven wood is planed to a true surface.
Jack planes are made in several sizes, vary ing in width from 2 in . to $2 \frac{1}{2}$ in., and from ahout 14 in . to 15 in . or so in length. Most are made of beech rood. This type of plane is generally sold with an open or single handle, others have a try plane type of closed handle, another variety has a single handle or horn at the front, but the most usual has the handle at the back, and this type is to be preferred for amateur use. They are to be had with a single or a double iron, the latter being preferable, as it is easier to use.

The iron is secured by a wooden wedge. which has to be removed to withdraw the iron for sharpening purposes. This is accomplished by grasping the plane in the left hand with the fingers on the face, and the thumb in the throat pressing on the iron ; a blow is then struck on the top front of the plane; this is repeated if necessary, and releases the iron, which is then withdrawn, the two parts separated by unscrowing them, and the cutting iron sharpened on a grindstone in the usual way. The iron is replaced and secured by driving the wedge back into its place with a hammer. See Amateur Carpentry; Plane; also illus. above.

JACKDAW. No bird is more easily tamed than the jackdaw, and once it gains the affections of its owner, it will attach itself firmly to him. It has a strong partiality for bees and bectles, and will devour mice.

The food usually provided for the bird in captivity consists of bread and milk, oats,

Jack Plane. Sectional drawing showing construction insects of all kinds, and scraps of meat. The jackdaw may either be kept in a cage, which should be large, or allowed the run of the house. As it has thievish propensities, bright objects, such as rings, brooches, etc., should be kept out of its reach.

JACK PLANE. This name is given to a JACK PLANE. This name is given to a
ype of long plane used to prepare the surfacea f timber It is an indispensable tool for all .

Jacobean Style. Fig. 1. Beautifully carved oas table, dating rrom the 17ta century. The top is $\forall x e d$ ana ine bulbous legs are supported upon stretcher rails
Ay dermission of the Director. Victoria \& Albert Museum. S. Kensington
of these set on stands and were the earliest attempts at sideboards. A court cupboard and a livery cupboard would be found in the dining hall of the day, a courting seat, or double armchair, might be seen there towarda the end of the Jacobean period. A bible box and a mirror, pillows, tapestries, curtains, and carpets were accessories and amenities which softened the otherwise austerely utilitarian appearance of the wealthiest home.

Panelling was extensively used for interior decoration, and plaster work of great heauty is seen on friezes and ceilings of the period. Examples of rooma can be atudied at the Victoria and Albert Museum, South Kensington. The small oak panel of the Jacobean period had sometimes an inlay of coloured wood and the moulding of its frame was often elaborate Small pancls were also a feature of the heavy onk doors

Inlay and Carving. Iacobean furniture is not cabinet maker's work as now understood. It is the work of a joiner, and is very sinuply put together. Its main appenl is on account of the decorative treatment, which is distinc tive and easily recognized. Where inlay was used it was in geometrical or Horal patterns. Sycamore, holly, and box were favourite woods for inlay; and sometimes ivory, hone, and mother of penrl were used on chests and more elaborate pieces. On these and on wall panelling relief carvings are alao seen; otherwise carving in the main is incised. Guilloche strapwoik and arabesque ornamenthwere frequently carved on cheata, settles, and buffets. Architectural shapes were given to panels by applied mouldings. Relief carving enriched this style and, where genuine, the piece decornted with it is of great value

Jacohean styles continued to be made in oak and cheaper woods for the furniture of middle.class homes and farmhouses well into the 18th century, and often where the carving is somewhat crudely incised on a genuine antique this may be found to be a later piece of farmhouse furniture, the decoration having been done by the joiner and not by a carver.
For these comınonet pieces perfectly straightforward patterns were incised into the wood by the V-tool and gouge. It was a common custom to sink the ground and leave the pattern flat, with a little relief introduced by gouge and V-tool veinings. Many chesta of the period have a diamond form incised in the width of the panels, and a few gouge cuts put in the corners or centre or on the edges of the rails give a little relief. Frequently a date occurs on a chest or court cupboard, but many plain chests of the Cromwellian period and later have had earlier dates put on, so that it is unwise to take dated fumiture at face value.

Rails enclosing panelling were not as a rule mitred, and the upper moulding was often scratched on.
. lacobean carving of this type has usually an amateur look. It is conmon to see furniture of the period carved all over the front-in the case of chests, huffets, and dressers-and only a little plain space left here and there. Welsh, settles and chests are seen quite crudely treated in this way, the ornaments being often merely a that, conventionalized dragon or the acanthus leaf form.
The arnachair of the period was a very clumsy article. It consisted of hcavily turned lega and arni supports, a square panelled back finished sometimes with a crest rail,
 letected by fabrics the the back and face of the cloth are a perfect replica, but in reversed colourings
The name has nothing to do with the kind orgrade of material, for silk, wool, cotton, and linen may all hic woven by this means. Using fine enough thread and a suniciently elaborate jacquard machine, portraits and coloured pictures can be reproluced quite success fully and faithfully in woven cloth. See Loom; Wea:ing.
and rails connecting the lower part of the legs and occurring immediately bencath the plain, tlat, wooden seat. The hack sloped back a little, and it was common for ornamentation to he inroduced in the form of incised leaf orna. mentalion and possibly strapwork.

JACOBINIA. This South American tropical plant requires ordinary hothouse treat. ment. It is propragatei: by cuttings taken in spring-time, and necda a compost. lonm, peat

Fios 2 and 3, buverniesion of the Director Fictoria \& Albert Museum:

JADE. Jade is a very hard mineral, and appears in various shades of green, greenish white, and yellowish grey. Jadeite is brighter in colour.

Large quantities of jade and of its imitations are now used in Europe. It is worn in the form of carved ornaments and beads and is chiefly valued on account of its brautiful colouring. Gcnuine carved Chinesc pieces of gond workmanship and colour are, however, intrinsically valuable.

JAM. Jam can be made from many kinda of fruit, although some kinds are more suitable than others. Some fruit, e.g. the apple, goes well when mixed with certnin other fruits, but does not itself make good jam.

Dried fruit is sometimes used, but fresh fruit unakes a much better article. When jam is made from dried fruit, the fruit must be soaked overnight in water which covers it well, and fruit and liquid boiled together the following day.

The chief fruits used for jam making in Great Britain are raspherries, strawberries, gooseberries, currants (red and black), plums, damsons, and apricots. Rhubarb is used chiefly to mix with other fruit, and apples go well with blackberries. Quinces, pineapples, and cranberries are among the other fruits used. Marrow jam is made, and ginger is also used to Havour other fruits.

For jam the fruit must be sound, and most of it should be rather under-ripe. The jam will not keep or set well if over-ripe fruit is used A mixture of one-third ripe and twothirds unripe fruit will produce a janm of good flavour and good setting qualities Green gooseberries are used. The colour may be intensified with a little green vegetable colour. ing, or the jain may he reldened with cochineal.

The Process Described. The preparation of the jam depends to some extent upon the kind of fruit used. Gonseberries must be topped and tailed, currants must have their stalks removed, raspberries must be hulled, and so oll. All bruises and blemishes must be removed. Some fruits are stoned for jam, but this is not essential, even in plums. All fruit, except soft fruits suoh as raspberries and strawberries, should be washed in cold water. These should be tossed lightly in a olean towel, to remove any dust. Iron or tin utensils should not be allowed to onme in contact with raw fruit. It should be prepared with a silver or stainless steel knife; stirred with a wooden spoon and boiled in an aluminium or enamel-lined preserving-pan All fruit should be weighed hefore boiling.

This done, the fruit should be put into a thoroughly and recently cleaned preserving pan. If it is liard fruit, sufficient water must be added to start the cooking, but if it is soft fruit no water is required. In the former case about a pint of water to 10 lb of fruit is an average quantity, but very under-ripe fruit may require more. As for sugar, white granulater should be used, and from $3_{3} \mathrm{lb}$. to 1 lb allowed to each pound of fruit. The sugar should be warmed before adding to the fruit. Ripe fruit requires slightly less sugar than unripe. Gonseberry jain, for instance, will require 1 lb . of sugar to each pound of fruit in order to bring out the flavour of the berrics. This jam is also an instance of one which requires more water, $\frac{1}{2}$ pint being necessary to each pound of fruit.

The fruit should then be boiled. First atir it over a moderate heat until its texture is broken down. Then add the sugar and atir the fruit until all of it is dissolved. The jam should then be boiled rapidly until it sets when tested. The preserving-pan must be large enough to allow of rapid boiling without fear of the jam boiling over. The jam must be stirred in order to prevent burning. Scum should he rewoved after the sugar is added.

The jam should be tested frequently by fitted is known as the reveal, for the reason placing a little of it on a cold plate If, on that the jamb is visible or revealed. The cooling, the consistency is firm, it has boiled sufficiently. If it is boiled ton long it will not set, and it will he syrupy. When it is boiled, pour the jam into heated jars, and place on its surface, while still hot, wax japers, and tie on a cover of parchment paper. Store the jars, when cold, in a cool, Iry place.
Some fruits, such as strawberries and some of the sweeter varietics of raspberies, require the addition of a small amount of citric or tartaric acid, or of acid fruit juice, for instance, that of red currant, to produce a jam that will set An average amount of acirl is $\frac{1}{2} 07$. to every 8 lb . of fruit It should be dissolved carefully in as small n quantity of water as is possible, and should be mixed thoroughly into the jain before the sugar is ndded. If acid fruit juice is used, about a pint should be added to every 4 lb . of fruit.

If less than lb . of white granulated sugar is used to each lb. of fruit, or if it is insufliciently boiled, it will not keep, nor if stored in a damp cupboard or in too warm a place.

Although usually made from fresh fruit. jam can also be made from fruit pulp which has itself heen made from the fresh fruit. The advantage of this pulp is that it can be kept until it is required for the jam Apples, plums, dainsons, goose berries, and mapberries are especially suitable for pulping Fruit pulp can be bought from any large store, so that it is possible to make jam all the year round.

Jam Containers. Containers for preserves good, well-drained soil, and reaches a hoight are obtainable in various sizes to hold 1 lb ., of ahout 3 ft .
$2 \mathrm{lb} ., 3 \mathrm{lb} .$, or 7 lb . ; larger sizes are also made, particularly for the marmalade. These jars or pots are minde of glazed earthenware or ginss, the latter being preferred by many, partly for ita appearance, and also because it enables any trace of mould on the preserve to he detected without removing the cover.

To prevent the jars from cracking while the hot jam is heing poured in, make aure they are absolutely dry, and warm them a little beside the stove Of the various kinds of patent covers used to keep jam jars airtight, the most easily adjusted are those with clips or fanged rims or screw tops If bladders are used, the jam should first be covered with a round of white paper, the bladder washed in warm water, partly dried and then stretched across the top of the jar and tied down tightly with string. Parchment paper or greaseproof paper can also be used. Packets of tissues and gunimed covers can be bought in various sizes to fit the jars. See Blackberry. Gooseberry, etc.

Jamaica Pepper. See Allspice.
JAMB. This term is often used in architecture and building construction to describe the side posts of a doorway, the side of a window opening or of a fireplace. The word is better understood if it is rememhered that, in substance, the door, window frame, or grate is jammed or compressed into the opening of the surrounding hrickwork, alt hough the framing may be built into position

The part of the wall that remains visible after the door frame, for example, has been

Jamesia. Hardy shrub called after an American botanist. It is allied to the hydrangea, and is very effective grown in a large sunny parden Courtess of Amatcur Gardening

Plant from autumn to spring, and when necessary prune directly after its white Howers have died down. Propagation inay be by seed, but the best method is to insert cuttings of ripe wood in sandy soil under a cold frame during autumn.

JAM PUDDING. Some suet pastry and jam of any kind aie needed to make the following jam pudding. Use a little of the pastry to line a basin, put in a spoonful of jam and then cover it with a round of pastry. Continue these lagers until the hasin is full, making the last layer one of pastry. Cover the pudding with a greased paper and steam it for $2 \frac{1}{2}-3$ hours.

A baked jam pudding is made by mixing together ? lb of llour, $\mathrm{f}_{\mathrm{i}} \mathrm{oz}$. of siogar. a teasponnful of baking powder, 6 oz. of finely chopped suet, and the grated rind of one large or two small lemons. Work in gradually 2 well-beaten eggs and $\frac{1}{2}$ pint or more of milk. Have ready a greased piedish, and into it put 4 tablesponnfuls of jam Pour the mixture over it, and then hake the whole in a moderately hot oven until it has risen and is quite firm. This is arfficient for ahout seven jersons.

JAM RISSOLE. To make these 2 oz of margarine. $\frac{1}{2}$ teacupful of water, 4 teacupfuls of tlour, and a little jam are required. Melt the margarine in a saucepan ; then add the water and bring them to the boil. Move the pan to the side of the fire and let its contents oool till they are just warm ; then work in the flour

Jam Rissole. Dish of a isvourite swieet somewhat simllar to donghnuts
with castor sugar, and the other side is spread with warm jam. The oake is then rolled up quiokly and left on a wire stand to cool. This is sometimes nlso known as a Swiss roll.

## JAM ROLY POLY

 This favourite kind of jam pudding is made by rolling out some suet pastry to an ohlong shape and apreading it and mix all to a frirly soft paste. adding more water if necessaryKnead the paste on a Houred board until it is smooth, ro!l it out to the thickness of $\ddagger$ in., and eut it into rounds with a tumbler. Put in the centre of one round about one teaspoonful of jam, damp the edge of the pastry all round, and lay another piece on top of it, pinching the edges well together Have ready a deep pian half full of smoking hot fat, put in the rissoles and fry them to a golden brown oolour. Drain them well on paper, roll them in castor sugar, and serve at once They oan be made with far less trouble from a good short pastry

JAM ROLL. This roll is made necording to the directions given for jam sandwioh, except that the mixture is poured to a depth of $\frac{1}{d}$ in. into a flat oblong-shaped tin lined wit ${ }^{1}$ paper When baked, it is aprinkled on une side

be started Into krowth In a temperature of $45^{\circ}-50^{\circ}$ Striawberiles in pois to provido parly frults should tie placed jinder glans

 round Wet the edges and moll up the pastry Wrap and tie the pudding securely in a scalded and floured pudding cloth, and boil it for about $1 \frac{1}{2}$ hours dam roly poly is also baked, but in this case a short pastry is used
JAM SANDWICH. The cake known as a jam sandwioh is made by whisking together for 15 minutos 6 oz of oastor sugar and 2 eggs Into a separate basin sicve $\frac{1}{2} \mathrm{lb}$. of Hour and I teaspoonful of baking-powder and in a naucepian over the fire mett 2 oz . of butter Fold the flour lightly into the eggs and sugar, and add the melted butter and the grated rind of half a lemon
Grease two sandwich tins, pour half the mixture in each, and bake them in a very hot oven for 10 min . Place them on a sieve until they are cold : then split each sandwich and spread it with jaın. Sprinkle castor sugar over the top and cut each cake into eight pieces and serve.

JAM SAUCE This sauce is especially well suited to baked and boiled suct pud dings. To make it hlend a tensponfula cornllour with a little water, and boil whit remains from $\frac{1}{2}$ pint ol the latter with 2 table spoonfuls of any jam Pour these on to the corntlour, and boil all for 5 min . Add the juice of a lemon, and then it is ready 10 serve Syruportraacle sauce oan be made in the same way, two tablespoonfuls of syrup or treacle being used instead of jam.

JAM TART. Small jam tarts can be made by lining some patty pans with short or puff pastry, filling the cases with rice in order that they may not rise, and then baking then in a hot oven until they are lightly browned Theymaythen be filled with warm or cold jum of any kind. and served either hot or cold A large open jain tart oan be made in the same way, the pastry lining being pricked with a fork. If liked, some narrow twisted strips of pastry may be laid acrose the tart, but in a case of this kind the jain should be put in before the tart is bnked.

JAM TURNOVER. Make 8 oz Haky prastry and roll out ahout $\ddagger$ in thick Shape it into small rounds with a fancy cutter, and on half of each place a teasponful of any kind of jam. Damp the edge of the ronnd and then fold over other half, pressing edges well together. Brush the turnovers with milk, and bake them on a grensed haking shect in a hol

Jam Turnover. Dish of the appetising pastry sweet sometimes known as jam ontt
oven for about 15 min The pastry should be made according to the dircotions given in the article on that subject. See Pastry

JAPANESE ANEMONE. This valuable, hardy. herbaceous perconial beary white or coloured tluwers on stems 3-4 ft. high in September. It should be planted in autumn or apring in deeply dug and manured soil in sunshine or partinl shade ; it becomos esta blished slowly and should remain undisturbed for lears. It is a good plant for the shady border The botanical name is Anemone japonica Some of the finest varibliea aif

Japanese anemone. Lellicate, long stemmed blooms of the autumn-flowering white variety
alba, white; Queen Charlotte, rose-pink Mont Rose, rose: Lord Ardilaun, double white; and Lorclei, double rose pink

JAPANESE CUCUMBER. This type of cucumber is very similar to the ridge varicty It is perhaps more productive, and may orsily be raised from sced. It should be grown in rich soil in a sunny place out of doors, from sced sown in May.

Fruits grow up to a foot in length but, as the habit of the plant is really a olimbing one help must be given with branches or stakes so that tendrils may linve good support. A fourfoot trellis is excellent for the purpose. It must be understood that this variety does not compare with the frame oucumber either for quality or size. See Cucumber: Frame.

## Japanese Gardens and Gardening <br> With Instructions on Making a Dish Garden

The articles in this work that deal with the garden in one form cr another include Garden Italian Garden: Rock Garden. See also the entries on the various plants; also Path

Ample space and a congenial position are tamiliar full-moon bridge, erected in a sem essential to secure an artistic Japanese garden The ideal position is near a running stream. Artificial hillocks and knolls or pools and shallow waterways may be constructed when missing from a position otherwise desirable

Harmony must be maintained by using furniture and material of Japanese character for such adjuncts as a summer or tea house or n bridge over a lake. Typical Japanese trees and shrubs in pots and tubs will be altractive, with gmups of the dwarfest kinds planted here and there in hillocks and linolls Quaint bridges should span narrow waterways, the shallow parts of which may be crossed by causeways of grey stepping-stones, while footpaths wander deviously through varying heights of ground. Where the soil itself is of a moist character. irregular slabs of stone should be placed to form a path. Aquatic plants are one of the greatest charms in Japanese gardens, and a home for these waterloving specimens, together with a pool for water lilies, must be included in the general scheme of the garden.
Screens and Hedges. The wistaria and Japanese roses should be utilized, as these are indispensable for covering structures, or bedging out an undeairable aspect. A boundary or acreen of Japancse llowering trecs, hardy bamboos, and evergreens is necessary where a natural one does not already exist. Near the centre of the garden there should be a dominant hill, with lesser hillocks, banks, and knolls, suitably placed in the picture. The path, perhaps, may complete a circuit. winding in and ouf, up and down, until eventually it rejoins at the point where it began, with a connecting path run. ning to the centre True circles and straight lines must rigidly be excluded from any ground plan

There should be a lalie consisting of two pieces of water joined by a narrow, curving bottle-neck channel and as much of the charm of a Japanese garden is derived from its quaintness of detail, this bottle.neok. spanned near its middle by a bridge approached by an informal setting of grey. llat stones, may very well be one of the most fascinating spots. When excavation is necessary to make a lake, the soil removed niay be used with ad vantage to form rising ground

Bridges play an important part, and there are many curious and effective examples in wood and stone. Some are elaborate like the ronfed bridges with their clustering wis. taria, others just simple strictures of faggot and bamboo covered with soil or turf An. other type is the

Japanese Garden. Corner of this artistic and fascinating type of garden,
with stepping stones leading between aquatic plants to the miniature pagoda
circle, the reflection in the water bencain completing a circle, and thus creatin. the iden of a full moon. Where the water course is very narrow a simple slab of stune may be used

At one end of the lake rockwork with alpines should be placed, while along its banks aquan tics and water-loving plants may find their home. If possible, a garden well should be included, also a guardian tree of either bamboo pine, or plum. An attractive adjunct is the square or octagonal lantern

The lake, in most cases, will be the chief difficulty, but beyond a good deal of hard work, its formation is not insuperable ; and being in close proximity to the proposed hill, or hillock, in the top left-hand corner the soil excavated may very well be used in order to form the rising ground

Miniature Japanese Gardens. A fascinating pursuit which children can enjoy is laying out a little Japanese garden in a llat dish. Such a garden may measure anything from 6 in . to 2 it. or even more across. A shallow brown earthenware baking dislı measuring, say, 12 in by 7 in., is a useful size with which to make a start. The dish may be oval, oblong, square, or round, but an oblong is easiest to plan out successfully The first thing is to decide on a rough plan of the garden: for instance, on the position of the little hill on which the pagoda is to stand, and the lake or pool, without which no Japanese dish garden is entirely complete.

Fill the dish with finely sieved and welldampikd garden mould to just above the rim.
pressing it down firmly, and arrange a good hillock on one sids Next start out armed with a basket and a short, blunt table-knife in seareh of some tine vivid green cushion-mos, with which to turf it An old wall, or bridge will often yield just the specially line kind reguired. Add some tufts of rather coarser moss to serve as bushes and a few minute Howering plants. Low growing Alpine rock plants sold at 6d. cach are suitable. Moss can also be bought if it is not possible to obtain this on a country walk; quite a large piece is obtainable for $2 d$ Tiny imitation pine trees can he bmught cheaply
Children who live in the country can seareh in the shrubbery for minute seeding linllies or firs The paddock or hillside will often produce tiny, dwarfed oak trees and beech trees, with miniature leaves, where the acorns and nuts have sprouted on very poor soil-just the thing for the dish garden. Failing these, a small asparagus fern. costing sixpence, stripped of its wower fronds to leave a single tall stem, makes an excellent Japanese acacia trce while a small plant of fine white heather will suggest a bush of white flowering broom

A slab of rock such as is used for a rock garden, which can be flaked with a blunt knife. will provide flights of stone steps and miniature mocks beside the water's edge Stones may be utilizod taken from the roadside or garden

## How to Arrange the Garden

First thoroughly damp the moss, and, having damped and drained the mould in the dish (which, of course, has no bottom drainage), plant any trees with good balls of their own earth round their roots, and proceed entirely to turf the landscape, running the moss right up to the stems of shrubs and trees, and to overhang the lake or pool in the garden. Press it well down and make any necessary undula. tions in the surface. The trees should be perched up on the hill, to give it height, with the pagoda just beneath their shade.

Arrange a winding flight of steps down the hillside to the water's edge, and one or more finely gravelled patha to meander between moss bushes and flowering shrubs round the outside of the garden. Shell gravel (procur able at any bird-seed shop for a few pence a tiny sack) scattered from a penny pepper pot with rather large sprinkler, or sand spread from a picce of paper made into a cone-shaped poke and used as if icing a cake, allowing the sand to trickle out of the hole at the end, can be used to make a level surface for the paths

If space allows, place a rocky island in the centre of the lake, cementing it to the botton of the small oblong glass or china dish used for this purpose, which must be lined with dull green plasticine ( $a$ penny stick will do) and covered with shell gravel before the water is poured in, planting a tuft of rushes beside the tiny landing stage formed of a serap of rock half embedded in the turf.

Connect the island with the mainland by an arched bridge made of a short atrip of straw berry punnet, stained dull green with water colour paint, or formed of several minute brown twigs, wired with dull brown florist's wire to lie side by side. More claborate bridges can be bought.
For a larger garden a real Japanese dwarf tree is often employed, and the tea house is placed under its shade. More elaborate gardens can be made in a corner of a conservatory and built up on a large tin tray

If real water for the lake is objected to, substitute a piece of clear glass (a well-polished stripped negative glass does) over the top of the prepared hole, in which a minute toy goldfish has been arranged, with a tiny moss water plant, to add a touch of realism, or make no excavation, merely pressing a strip of lookingglass on to the soil at just below dish-level,
bringing the turl right over on to the suriace to make irregular green banks. A bridge thrown over the water and a tiny, flat

JAPANESE MAPLE. A number of lowgrowing $t$ rees or shrubs, varieties of Acer iaponicum and Acer palmatum, are known as Japancse maples. They are suitable for planting out of doors except in cold districts, for the rock garilen, and for cultivation in pots in the greenhouse. The spring and autumn leaf colouring of some sorts is very benutiful The following are some of the best valicties. Of Acer aponicum-aureum and laciniatum. Of Acer palm. at um -rosea-marginatum, sanguincum, Osakazuki, septemlobum and dissectum are noteworthy Miniature trees of the Japanese maples are sold by dealers See Divari Trecs.
JAPANESE QUINCE. This is the popular name of Pyrus japonica (sometimes called japonica), a hardy shrub whiclı bears red flowers in spring. See Pyrus Japonica.
hottomed punt afloat upon the lake or pool complete the illusion.
Swinging lanterns are ensily made from a vivid-coloured oval bead, with a smaller bead of contrasting colour on either side of it, arranged to swing from an iron stake formed of part of a bent hairpin.

Tiny ligures, birds, tea houscs, pagodas, boats, steps, aummer houses, red bridges, and a variety of suitable tiny plants can be bought at a sixpenny store

A fountain which will play in the centre of the real water lake is an additional attraction to the garden. For this a small oblong tin makes a good tank, with a hole bored in the bottom, to which a length of fine indiarubber tubing long enough to go from the bottom of the tank (fastened to the wall, or to the top of a stout garden stake, thrust into a flower pot, at least eighteen inches a hove the level of the water), and passed over the edge of the dish and under the turf along the bottom of the lake, to emerge from the centre of a tiny rockery (made from scraps of rock cemented together), with the nozzle of the glass tube (bent at right angles) fitted to the end of it, the join being carefully plastered with plasticinc to prevent leakage. When in play the fountain will throw a water jet scveral inches high into the air.

To cut the glass tubing to the necessary length saw it half-way through with a threesided file-it will then break easily at the point required. Point the end to be used as mouth. piece for the fountain by holding it obliquely in the flame of a powerful lamp, or in a gas jet, twisting it round and round in the fiame, so that it may thicken evenly all round as the glass melts, and continue this until only a tiny hole in the centre of the tube remains To bend it at right angles, hold it straight across the Hame at the point at which the bend is needed; as it gets hot it gradually melts, and, bending with its own weight, falls downward at right angles

For a waterfall make a second hole in the tank, with a second length of tubing concealed beneath the turf to appear at the top of a rocky gorge, beside the pagoda, down which the waterfall can play. The mouthpiece of glass tubing must be melted to a fine point, as for the fountain, but need not be bent. The garden must be watered with a dolls' watering pot, and then tilted to drain about every other day, 10 keep the mossy turf green

Japanese Golden Bell Flower. This is the popular name of forsythia ( $y v$ ), one of the most beautiful spring-flowering shrubs.

## JAPANESE SPANIEL. This little snub

 nosed, straight-haired, silky dog is a comparatively recent introduction to the list of ladies toys in Britain, but in Japan they have enjoyed popularity for centuries. It bears a certain resemblance to another type of Eastern dog, the Pokinese, which has also found favour in England. It has a relatively large, broad head, short, wide muzzle, large, dark, lustrous eyes far apart, and simall, V. shaped and feathered ears. The body is short and square-looking, the dog's length being equal to its height, which is about 10 in . at the shoulders.The spaniel has a profuse, rather ailky coat, the long straight hairs with a tendency to st and out The small legs, thighs, and tail

Japanese Spaniel, a popular toy breed with a long, straight-haired, silky coat
arc well feathered, and there is a thick ruff around the neck. The colour is clear white, with patches of black or some bright tint of red over the body, cheeks, and ears. It should weigh between 4 lb . and 9 lb ., the lighter weights being more highly esteemed than the heavier. Its constitution is by no means mobust, and great care is needed in the feeding of it. See Dog ; Spaniel.

JAPAN LACQUER. This is a liquid made of shellac, or some similar resin, metallic oxide, turpentine, and linsecd oil. It is used to a considerable extent as a medium when grinding and mixing colours, and as a drier to hasten the setting and hardening qualities. It is reputed to have originated in Japan. Virtually a hard black varniah, it is applied as auch, and dies with a glossy and smooth surface. See Lacquer; Varnish

JAPAN WARE. Articles treated with an application of Japan lacquer are known as Japan ware. The latter is used in the home in the form of tea-trays, bread-pans, candlesticks, etc, its main virtue being the ease with which it can be kept clean. Lulie warm water ahould be used for washing, and a soft cloth for drving and polishing. A smeared surface caused by grease should he sprinkled with a little Hour and then rubbed with a soft cloth; hot water should not be used, as this invariably produces cracks

JAPONICA. This old and favourite shrub usually inay be found in nurserymen's lists either under Cydonin japonica or Pyrus japunica See Pyrus Japonica
JAP SIIK. A great deal of silk is made in Japan and consequently that country is noted for the supply of cheap, plain and usually undyed silk, which is used very largely in Great Britain for blouses. dresses and linings, and for cutting and sewing into handkerchiefs and many other articles.
This silk is made in standard widths of 191 $, 22 \frac{1}{2}, 27$ and 36 in. and in pieces mostly 50 vards long. The weight is designated by nommes, a Japanese unit of weight; the thinnest are 2 mommes and suitable for lining hats: 5 mommes silli is medium, and the heavier kinds run $8 \frac{1}{2}$ mommes and upwards.
The fabrics are mostly handwoven and made from comparatively unworked silk. When thicker silk is wanted the threads are not twisted together, as is usual in European cloths, but are gummed together and woven.
After weaving the cloths are boiled and the gum and paste are thus taken out of them, so improving the colour; they are made a still better white by being dricd in the sun They are sprayed next with gelatinc to stiffen then, and are ironed or calendered bet ween heated ateel rollers They are often irregular, containing minor defects, but are so cheap that small imperfections are overlooked. The sillis arc graded according to their quality.

When Japanese silk is washed for the first time some loss of weight and substance may be expected, consequent upon the removal of the gelatinc stiffening. This cannot readily be replaced in a made-up garment, and the attempt is likely to lead to cloudy patclies Soda in more than very small quantities is bad for silk and weakens it. The best snap should be used for washing, and if a good heary quality of silk is bought the lost weight will not be missed. A little vinegar should be used in the last water. The whiteness will be increased by drying outdoors.

Jap silks are dyed extensively in Great Britain by professional silk dyers and in colours to suit the demands of the season. Before dyeing, the pieces are well washed to remove the gelatine, which would cause une venness of shade. They are treated, after dyeing, generally with some kind of starch to make them feel fuller, and so that they shall not be too stiff the starching is broken up by rubbing and brushing the cloth by machine. If a garment is to be redyed at home it slould be beaten lightly to remove dust, be washed perfectly clean, and silk dye should he used on it. Jap silks are often printed in colours in Britain or in France, to befit them for dress materials, linings, and hat and neck trimmings. See Dyeing ; Silk.
Jargoon. This translucent, colourless or smoky variety of zircon, found in Ceylon, is sometimes used to make imitation diamonds.

JASMINE. Two of the most popular hardy climbing plants are Jasminum nudicaule, which bears yellow fragrant flowers in winter, and Jasminum oflicinale, with white, sweetsmelling flowess in summer. The former is suitable for a sunny wall; it should be pruned
as soon as the flowers are over by shortening the side shoots of the past summer's growth to within an inch or 80 of the base. The white jasmine should be planted to cover a trellis, arch or porch. It is difficult to prune this shrub systematically, because its long, slender shoots intertwine freely, but these ought to be thinncd out in spring.
Both these jasmines flourish in ordinary soil, and ss they are grown in pots they may be planted at any time, preferably in spring or autumn. They are propagated by cuttings in a frame or out of doors in autumn Other climbing jasmines are Beesianum, red ; primulinum and revolutum, yellow. They are
 suitable for planting against a sunny wall Gracillimum, white, must be grown in a heated greenhouse. This opaque stone, a variety of quartz, is widely used for orna. mental purposes. Several kinda are known, some being red, hrownor yellow, while others $h$ avc various markings, such as stripes and spots.
JASPER WARE. The hard, dense and vitrified biscuit ware which Josiah Wedgwood perfected in 1776 and called jasper is one of the triumplis of English pottery. For twenty years, until his death, the output was very large, especially of tiny cameos, generally portraits and olassical scenes in white relief usually on a blue ground, although in various tones. A number of other colours were also employed as backgrounds.
Cameos were often set in gold and steel mountings for finger rings, brooches, buckles and other personal ornaments. Larger medallions, tablets, and plaques sometimes as much as 27 in . wide, were separately framed, or inserted in the fronts of cabinets and mantelpieces. During his last ten years Wedgwood produced some superb vases, whose exquisite finish was due to lapidary work after the firing. Of this the collector can hardly hope to secure the larger examples except at a substantial outlay.
Wedgwoorl jasper is still produced in the original designs, and may be recognized by some differences in the mark, such as the addition to the word Wedgwood, after 1891, of the word England. In 1907 the date was fixed by a mark consisting of the ligure 3 , to denote that it was in the third of the alphabetical cycles started in 1846, with a capital letter for the workman and another for the year, that for 1907 being J. The old mark Wedgwood \& Bentley used on plaques, medallions and portraits during the period 1768-80 is not found on pieces with an olive, sage, pink, lilac, yellow or black ground, and not on blue-ground vases.
Jasper ware should be kept clean with soft leathers and a sparing use of plain water, because otherwise the unglazed surface tends to become streaky and discoloured.
Some of Wedgwood's pupils and rivals turned out jasper more or less according to
his designs and recipes Of these collectors purchased in a prepared form fiom chemists, prize the work of John Turner, whose blue or made up at home in the following way : ground is rather violet, and also of William Shake together in a bottle 30 oz of water and Adams, whose descendants still produce a 2 oz . of chlorinated lime or bleaching powder jasper-looking semi-porcelain Foreign imita- and, when they are well mixed, add a solution tions and counterfeits of old jaspet are usually poorly done and readily recognized. See Wedgwood.
JAUNDICE. This is a condition in which the colouring matter of the bile circulating in the blood gives a yellow hue to the skin, the mucous membranes, and also to the urine and other secretions. Jaundice is not itsell
a disease, but a symptom for which a cause must always be sought. The yellow colour is at first noticeable in the eyes.

It may be caused by gall stones or parasites obstructing the bile ducts, or by a tumour of the stomach, pancreas, or liver, etc., pressing on the bile duct. A very cominon
 jasper ware, beight 12 in.

British Museumi consisting of 4 oz . of carbonate of potash (pure pearlash) and 10 oz of water.

When the mixture has been allowed to stand for a fow days separate the clear liquid from the sediment by means of filtration. White olothes only should be treated with javelle water, since the latter contains certain properties which destroy colour. For bleaching purposes about a cupful should be added to a copperful of water, and the clothes should soak in the solution overnight.

If used for removing stains, either from clothes or paper, the liquid whould afterwards be washed off with clean "ater, otherwise the material may rot. Grass and ink stains and scorch marks on tion is catarrh of the bile ducts, and this linen or cotton goods may be treated with may be produced by indigestible or ill- javelle water; but in the case of a scorch masticated food, a chill, excessive consumption alternatc applications of oxalje acid solution of alcohol, etc. This catarrhal form of are required.
jaundice may pass away in a fortnight, and it rarely lasts more than six weeks.

Jaundice may occur in fevera and in poisoning by phosphorus and other substances. It may follow a severe fright, or a fit of anger, or other violent emotion, in which case it comes on suddenly and goes as quickly.

The treatment of jaundice will obviously depend on the cause, and the diagnosis should be made by a doctor. See Gall Stone; Liver.

JAVELLE WATER. An excellent bleach ing agent prepared from chlorinated lime and pearlash, javelle "ater is much used for whitening discoloured clothes, and also for removing various kinds of stains. It can be

JAZZ. The word is of American negro origin, and refers more to the music which is played in syncopated time than to the ateps of a dance. There was nevertheless a rolling step known as the jazz, which formed part of the fox-trot. There wns also $n$ straight jazz tep which was really a three-step
A jazz band is composed chietly of piano, banjo, saxophonc, drum, and at intervala the voice, while various other instrumenta are often added. The musio is played in syncopated time.
JEAN: The Material. Overalls can be made in jean which is an especially strong cotton twill used in lining leather boots and

## Jellies and Their Making <br> <br> Strawberry, Lemon and Other Attractive Varieties

 <br> <br> Strawberry, Lemon and Other Attractive Varieties}Recipes for other swects for the table are given throughout this work under such heading; as lecs ; Tritte. See a'so Cherry Jelly: Children's Party; Mould: Sweets

Jelly is the name given both to the fruit jelly uscd as conserve and to the moulded table jelly To make jelly the general prinoiples are as follows:
The fruit should be on the under-ripe side. as pectin, the jellifying substance, is only fully present in under-ripe fruit. As pectin will only work in conjunction with acid, very oweet fruits should either have oitric acid or the juice of more acid fruits such ns apples, lemons, rhubarb, added.
The fruit, carefully picked over, should be put in a preserving pan with just enough water to keep it from burning. Very slow hent should be used to extract all the juice. Boil it gently until the fruit is pulped, then pour it into a jelly-bag, and leave it overnight in order that the juice may drip through into a busin. Do not press the bag or the jelly will be oloudv.

Measure the juice back into the preserving pan, and add the sugar. the proportion of "hich varies with the kind of fruit, but is usunlly about 1 lb . to 1 pint of juice. It is important that the quantity of sugar should be exactly right. With too much sugar the jelly will not set ; with too little it will be tough, so test for the quantity with a small amount of juice. If the jelly will not set, add a little citric acid or lemon juice until the desired consistoncy is reached, and then add the acid in the same proportion to the juice in the pan.

Boil the syrup ngain until a little jellies when dropped on a cold plate. If it is boiled too long, the jelly loses Havour and becomes dark and sticky ; if not boiled enough it will not set. Poui it into warmed jars and tie down at once. Tho pulp left after the juice is abstracted
can be mixed with apples or some other juicy fruit for making jam.

Jelly Bag. This devico for straining the juice from the fruit in the making of jelly is a cone of folf. or of strong flannel, with loops of

Jolly Bag for straining amall quantuties of jelly
clean coarse cloth is often tration A of flannel
A stand can be obtained to which the jelly bag is fastened, but can easily be improvised at home, the loops on the bag being liung on to the backs of two chairs. A quickly im. provised jelly bag can be made as follows: Turn a kitchen chair upside down on the edge of the table, then tie the corners of a square of strong, new flannel to the four legs. A large bowl is then stood upon the inverted seat to catch the juice. The jelly bag must always be moistened with hot water before the fruit is poured in.

The jelly bag illustrated is very useful for making small quantities of jelly. An ordinary basin is placed on a table where it will not be disturbed, and the jelly bag fixed over it.
A jelly bag should not be washed with soap. As soon as it has been used put it into a basin of boiling water, and stir it about with a stick. Change the water once or twice as it becomes dirty, then add some cold, and wring it out. Rinse it well, then dry it in the open air, but be sure that it is quite dry before putting it away.

Table Jollies. These are made either with gelatine and fruit Havourings, or by pouring boiling water on to a preparation obtained in crystal or powder form. or as a lump of very solid jelly, which is cut up into squares.

In making a fruit jelly of the first kind, the quantities and methods of preparation vary with the different fruit. The following simple recipes give some instances:
Strawberry Jelly. Strawberry jelly is made without boiling the fruit. One pint water and $\frac{1}{2} \mathrm{lb}$. loaf sugar are boiled with $\ddagger$ pint red currant juice, and this syrup is then poured over $\frac{1}{\frac{1}{2}} \mathrm{lb}$. carefully picked straw berries. When cool, I oz. gelatine. dissolved in a little water, is added, and the whole is poured into a mould.
Lemon Jelly. Lemon jelly is made thus: Dissolve $\frac{1}{\frac{1}{2}} \mathrm{oz}$. gelatine in 1 pint water, then add the grated rind of 4 lemons and the juice of 2 , nnd $\frac{1}{2} \mathrm{lb}$. loaf sugar. Then, to clarify the jelly, add the white of an egg, and the shell, crushed in the hand. Put the whole on the fire and whisk it continuously until on the point of boiling. Then strain it and pour it into a wet mould to set. This jelly is usually clarified. Orange jelly is made in the same way, but needs only 5 oz . sugar.

Wine Jellies. To make wine jellies, such as claret, sherry or port wine, use 1 oz . gelatine to one bottle of chcap wine and $\frac{1 \mathrm{lb}}{1} \mathrm{l}$. loaf sugar. Simmer until gelatine and sugar are melted, and then boil for 5 min . Add a little carmine or cochineal in order to give a better colour if necessary. Strain into a mould and leave to set.

To decorate a table jelly with fruit it is paper. Several of the cakes can be cooked necessary to line the mould with jelly to keep it in place, before the bulk of the jelly is put in This is done by taking two moulds of the same shape and pattern. but one slightly smaller than the other. Let a little cool jelly mixed with fruit set in the bottom of the larger mould. Then put the smaller one inside it, and fill up the spaces with fruit and jelly. When this is quite set pour a little hot water into the inner mould. which can then be removed without difficulty.

In making a packet jelly with the addition of fresh fruit it should be remembered that less water is needed; fruit and water together should measure only a pint

Jelly Mould. There is a large variety of moulds for table jellies, both as to shape and size. They are made of tin, aluminium, china, or glass, and are usually ornamented with some raised design which is reproduced on the jelly. Frequently the design is of fruit, and in that case it is desirable to use a jelly of the same flavour. A pineapple jelly, for example, may be set in a mould decorated with a pineapple, and a jelly flavoured with port or claret in a mould with a bunch of grapes upon it.

The nould should not be very deep in comparison to the width, or the jelly may break ujon being turned out. Some moulds are made with a deep indentation in the bottom, the corresponding hollow in the jelly being then filled with whipped or clotted cream or with chopped fresh fruit or a purée of fruit.
Before using a jelly mould, make sure it is quite clean, then fill it with cold water and let it stand for a few minutes. When the jelly is ready to pour into it, empty out the water. but do not dry the mould.

Jelly Fingers. These quickly prepared sweets are made from half a dozen sponge fingers, a pint of raspberry jelly, and an ounce of almonds. Pour a thin coating of the jelly in a shallow glass dish, and when it has set arrange the sponge fingers on top, leaving about 1 in . of space between cach.

Soak them with a small quantity of jelly, and cover the top with the almonds, blanched, skinned, and each split into three or four pieces. Pour over the remainder of the jelly. taking care to keep the biscuits in position, and leave it to set. Then cut out the fingers with a sharp knife and arrange them tastefully on a glass dish.

Jelly Trifie. A trifle made from sponge cake and jelly, and decorated with almonds and whipped cream, is prepared thus: Cut 4 large sponge cakes into halves, and arrange them in a dish with the cut sides downwards. On the top of them stick 1 oz . of blanched, skinned, and halved almonds, and pour over a pint of strawberry jelly. Leave the whole until it sets, then decorate it with a gill of whipped cream, sweetened to taste. A layer of pineapple or sliced peachcs may be placed under the sponge cakes and the creant ornamented with crystallized violets and angelica strips.

JERSEY WONDER. These fried cakes are made as follows: Rub 3 oz . butter into 1 lb . Hour, and then add 3 oz . castor sugar, and a little ground nut meg, ground ginger and grated lemon peel, and mix to a stiff dough with 4 well-beaten eggs, and, if liked, a few drops of brandy. Turn the dough on to a floured board, and roll it out to a thickness of about $\frac{1}{2}$ in., and then cut it into oval shapes, about 4 in . by 3 in .

Two slits should now be cut down the centre, not cutting through the ends. Pass one side of the cake through the slit in the other side, and drop it at once into a pan of boiling fat. Turn it in about 2 min . time, and in another 2-3 min. it wil! be done, and nicely risen. Take it out with a fish slice, and drain on kitchen

Jerusalem Artichoke. An easily cultivated plant belonging to the sunflower family, with edible roots. See Artichoke.
JERUSALEM SAGE. This is the popular name of Phlomis fruticosa, a half-shrubby plant about 3 ft . in height, with sage-like leaves, and yellow flowers in summer. It thrives best on light soils, and is propagated by seod sown in spring, or by cuttings during the summer.

JET : For Wear. The best hard jet is very tough, and can be carved and then polished with jeweller's rouge. Formerly almost the only jet ornaments available were massive and funercal-lonking brooches and necklets. For modern neck ornaments jet is often used in bead form with crystals.

Imitation jet is really a variety of coal, cannel coal, highly polished, and so skilfully cut that it is difficult on inspection only to detect the difference between it. and the more costly genuine jet.

Besides being made into jewelry, imitation jet, which is a composition of black glass, hard black wax and other substances, is used for trimming dresses.
To clean jet, wash it in warm, soapy water, and drv in sawdust, but if it is regularly brushed with a soft brush each time after use it will not be necessary to wash it very often. This is an advantage, because although the jet itself is not affected by washing, the material on which it is threaded deteriorates when wet, so the process should be avoided as much as possible.
JEWELRY. Fashion plays a great part in the wearing of jewelry. One year it is correct to wear precious stones in the daytime ; anot her year, except at the smartest afternoon functions, they will be seen only in the evening. In any casc good taste is governed by a certain simplicity. Pearls and coloured stones are seen to best advantage without any mixture except diamonds. For instance, a sapphire and diamond pendant should not be worn with ruby or emerald bracelets or brooches, or it will lose its distinction.

Where a particular gem is liked, it is a good plan to collect the various pieces of jewelry to form a set, choosing a simple artistic design unlikely to go out of fashion, and the stones themselves for colour rather than size. If a large piece of oriental or modern art jewelry introducing a number of coloured gems set in filigree gold or worked silver be worn, it looks best, as brooch, clasp or pendant, without other ornaments.
The same isolation may be observed with carved Chinese pendants of chalcedony, amber or jade, into which further colour is often introduced by the threading of amethyst, coral or carnelian beads on to the loop of the pendant ; also with the long chains of semi. precious beads which in themselves provide a trimıning for a dress.

Pearls are always fashionable, either real or countcrfeit, many of the finest imitations and artificially cultured specimens defying detection except by the expert. Single pearls, or pearl hoops and tassels, are favourite forms of earrings, and old seed pearl ornaments look well worn with a black evening dress, though they need careful handling.

For modern jewelry French set tings are, as a rule, most admired. - Yellowish or greyish tinges in diamonds detract from their value ; sapphires should be of a rich royal blue or they lose their beauty at night, appearing to be black. The finest Burmese rubies are of the coveted pigeon blood colour: emeralds are rarely without a slight flaw. These four stones are well imitated in paste, some of the old French examples being set with exquisite
finish, and in the case of coloured paste often mounted with real hrilliants. Modern paste has a fine lustre when new, but it deteriorates, and it can always be distinguished by the expert on account of its comparative softness Another form of innitation gem sometimes sold in cheaper jewelry is the doublet, a thin piece of real stone cut to form the front, while the hack is paste

Ruhies, sapphines and emeralds are cut in the same ways as diamonds or en cabochon that is, with a rounded surface, which has a beautiful effect in rings when the coloured stone is surrounded by brilliants. For opaque or semi-opaque stones such as turquoise, cat's eye or opal, the cahochon form of cutting is always used. The beauty of turquoise lies in its lovely blue colour, hut it is liable to turn green and the stones should be kept from contact with grase or perfume. The opal suffers from the persistent superstition that it is un lucky, but a fine specimen possessing brilliant flashes of fire always holds its place in public favour. The opal is a soft gem and easily dulled by scratching after much wear. This defect can be removed by $\Omega$ jeweller and the surface brilliancy entirely reatored.

Victorian Styles. Many of the less precious coloured genis are exceedingly beautiful, such as peridots of soft, transparent green; topaz, pink and yellow ; aquamarines, sea-coloured as their name implies; tourmalines, red, pink green and brown. Victorian pieces of garnet jewelry have returned to favour with the cameo and onyx. The last named, which is chalcedony stained to a hlack, has been used with diamond workmanship for exclusive designs in jewelry of all kinds.

Earrings are probably the most valued of Victorian pieces of jewelry, as many of these show fine quality of workmanship. Filigree or chased metalwork settings for black or hlue enamel or turquoise are sought after. Much Victorian jewelry was made of, or set in, pinchbeck, a metal which was composed of a mixture of zinc and copper and practically untarnishable. Pinchbeck was an invention of a 17 th-cent ury jeweller of that name. Only those pieces of pinchbeck jewelry made before the 19th century have value for the collector.

Amethysts, never out of fashion, are best when of a deep purple. The alexandrite possesses the quality of appearing by daylight a rich green and by artificial light changing to red. Moonstones with their silvery semiopaque shimmer are very pretty set in conjunction with coloured stones, eapecially red. In the 20th century the fashion has been for geometrical designs in the setting of jewels rather than the copies of hirds, insects, Howers, etc., favoured during the latter half of the 19th cent ury

All kinds of semi-precious stones and also ivory, amber and coral are formed into beads for necklets and long chains. Lapis lazuli is popular on account of its deep blue colour, and it is imitated in stained agate. Jade, either green or white, is not imitated so successfully. Jet, though chiefly used for mourning jewelry, is effective when combined with crystal for necklets. Jewelry for men, now that the wristlet takes the place of the watch chain, resolves itself into pearl studs for evening wear, cuff links, and a signet ring. See Bracelet; Brooch; Diamond; Emerald; Earring; Pearl; Ring: Ruby.

JEW'S MALLOW. This is the common name of Kerria japonica, a hardy Chinese shrub, about 3 ft . high, which has yellow flowers in spring. The double variety, which bears much larger flowers, is more vigorous and an excellent wall shrub; it is one of the few shrubs that do fairly well on a wall facing north. It thrives in ordinary soil and is increased by cuttings placed in sandy soil in a frame in August. Pruning should be done as soon as the flowers have faded by cutting out
the oldest hranches or parts of them. If grown in pots, the Jew's mallow is very useful for the cold or alightly heated greenhouse in spring.
JIGSAW PUZZLE. To make one of these puzzles it is bert to start on a small puzzle for practice. For this a suitable coloured picture on thin paper can, as a rule, be found in an old magazine or weekly paper. A picture with a shiny surface should be chosen, as dull-surfaced paper becomes so quickly soiled with handling when fitting the puzzle together
The more definite the picture the easier it will be to put together. A puzzle with a wide expanse of clouds and sky, or of aoftly shaded fields, for instance, is much harder than one with a scene depicting huntsmen and hounds in full cry, or a dog st udy.

Experienced jigsaw puzzle solvers delight in a really difficult puzzle. One of the most succesaful ways of gratifying their desire is to choose a large figure subject which fills most of the picture, and to cut away the hackground, leaving the puzzle solver no clues in the shape of straight-sided horder pieces and the eagerly sought-for corners
Making a Puzzle. The tools neerled in jig. saw puzzle making are few. A small fretsaw and firame, a set of extra hlades, and a wooden cutting-tahle-a metal cutting-table is apt to hlunt the blades-and clamp, to enable it to be fastened to the edge of any convenient steady table It is essential to use proper fretsaw wood on which to mount the pictures, as other kinds will he found to split. Good quality 3 -ply wood is the right thing to use. Satinwalnut wood is also excellent, and there are other kinds of good thin wood which fretwork material outfitters will recommend. From ${ }_{16} \frac{3}{}$ to $f$ in. thick are the best widths.

To start, make anme good strong paste from a tablespoonful of Hour, mixed to an absolutely amooth cream with a little cold water, and made up to half a pint by the addition of boiling water, poured in slowly, stirring the mixture all the time. The paste should gradually thicken and clear, becoming semi-transparent if necessary, turn it into a small saucepan, and stir over a low flame to attain this result. Set it aside to cool; when cold it is ready for use. Trim the picture carefully, removing any white margin, and, placing it fnce downward upon a sheet of clean, white kitchen paper, brush it over with paste, and then leave it for five minutes to expand.

Brush it over with paste a second time and, lifting it up carefully by the two top corners place it face upward upon the fretwood, and press it down until a hsolutely smooth with a pad of white cotton rag. Make sure that it lies
absolutely flat, and that any air buhbles have been smoothed out, before placing a sheet of white paper over it and putting it under a pile of heavy bonks to press until it is quite dry Meanwhile, fix the cutting-tahle to the edge of any steady tahle of convenient height for fretsawing, and when the picture is a haolutely dry proceed to cut it out to the exact edge of the margin.

Now take a pencil and, placing the picture face downward, mark out the pattern of the jigsaw picces into which you intend the puzzle to be cut. In doing this, remember to avoid sharp points or too thin waists to the individual pieces, as these are liahle to break off when the puzzle is in use. Count the number of pieces marked, and note down the number
For the first attempt it is as well to keep the pieces of fair size, and of not too intricate a pattern. Place the picture face downward on the cutting-hoard, and proceed to twist it a hout with the left hand to bring the line to be cut into contact with the cutting edge of the saw, which works up and down perpendicularly in the hole in the cutting-table provided
When once the knack has been obtained, the work usually goes very swiftly, and soon the puzzle is cut out. Gather the pieces up carefully, counting them to make sure that none arc missing, and mark each piece on the back with the same small device-a star, a heart, an arrow head-in water colour, 80 that if accidentally mixed with the pieces from another puzzle they may easily be re-sorted. Pack them into a small cardhoard hox, upon the lid of which a label should be neatly pasted, giving the title of the picture and the number of pieces it contains.
When mounting a picture that is printed on rather thick paper it is a good plan to well damp the back with a sponge squeezed out in cold water, leaving it for five minutes and repeating the process a second time, and again leaving it fully to atretch before brushing it with paste and mounting it in the usual way. If a picture is brushed with paste and mounted without waiting for it to stretch, it is apt to dry into countless minute wrinkles which it is impossible to smooth away, and the picture is ruined See Fretwork.

JOB'S TEARS. The name of Job's teare is given to a half-hardy flowering grass, Coix lachryma, 2-3 feet high, which is attractive when mixed with cut flowers by reason of its drooping clusters of pearly seeds. It requires rich light soil and a sunny position. Seeds may be sown in a temperature of $60^{\circ}$ in spring, transplanting seedlings during May.

John Dory. See Dory.

## Joinery : ITS General Principles

## The Choice of Materials and the Tools to Use

A knowledge of joinery is jndisoensable to those who wish to make the many woodworking articles about which dircetions are piven in this wrerk, such including Burcau: Cabinet; Cupboard; Dresser and many others. Seealso Amnteur Carpeatry : Bench; Joint; Wood, etc.

Joinery is that branch of woodwork concerned with the preparation of the more ornamental parts of a huilding, and partioularly the art of joining woorl to form a strong structure, durable and pleasing in appearance. Joinery is allied to carpentry; but although many of the tools used are common to hoth, carpentry is, generally speaking, a rougher class of woodwork.

In addition to a knowledge of the various timhers in common use it is necessary for the joiner to know the limitations of his material. Joinery becomes ineffective in general for three particular reasons: first, by warping or aplitting of the material ; secondly, owing to failure of the joint due to the expansion and contraction of the wood; and thirdly, as a reault of the natural process of decay. In gnod joinery all parts should he framed together in such a wiay as to allow for shrinkage or
expansion, at the same time proportioning the thickness and breadth to prevent warping. Another point is that the work should he put tngether so that no end grain, or the minimum of end grain, is exposed to the weather The end grain is the most liable to attack, because it virtually consiste of a series of amall pipes conducting moist ure to the interior. To reduce shrinliage, all exposed paits should be as narrow as possible, this applying mostly to those members which happen to be framed up.

Choice of Material. It is a counsel of perfection to specify that all material should be thoroughly seasoned : that the wood should be chosen from the heart of the tree, and that sapwood, the portion of the tree whicl surrounds the hearlwood, should be rejected

Wood employed in joinery comprises battens or scantlings, measuring from 2 in . to 7 in ., hoards ranging from 7 in . to 9 in wide and up
to 2 in thick, and planks, that is, stuff wider than 9 in. Deal is the name given to rawn timber 9 in wide and from $2 \frac{1}{2}$ in. to 4 in thick. The name does not necessarily apply to yellow deal only, and the term is frequently used to distinguish different kinds of timber, though it properly only means any timber cut to the sizes specified above Thus the name white deal is commonly used to mean spruce, because this tree is cut into deal for export Quartering is another name by which certain sizes of eawn timber are known: it is applied to stuff approaching the square in section, as 3 in . by 3 in. or 3 in. by 2 in. All timber should be subjected to a second seasoning after it has been sawn into boards or planks, and from the joiner's point of view this second scasoning is the more important one.

A useful wood is American whitewood, which is obtainable in various widths and thicknesses and is free from linots. It is susceptible of effective treatment with stain and lakes a good poliah. Mahngany, walnut, and similar ornamental hardwonds are also employed, but for most work ondinary softwoods are used. Of these pine, particularly yellow pine, is the most serviceable for many purposes in the home

For the provision of panels and all places where large pieces of thin boarding are required, a useful material for the amateur joiner is plywood. Its use saves much trouble in planing, and it has the added advantage of not being liable to warp or shrink when in position

Tools for Jolnery. The tonls required by the joiner include planes and saws, together with a good selection of firmer, paring, and mortise chisels, and firmer and scribing gouges of different sizcs, brace and bits, hammers, pincers, and oilatone a well-equipped workman will need a quantity of special planes, such as a plough, a fillister, rebate planes and beads, moulding and compass planes, hollows and rounds Much joinery work is done by machinery. Accurate planing is done by thicknessing machines, moulding and beads are cut by formers, curves are cut by bandsaws, and mortises and tenons and dovetails are cut by special machines. The setting out of intricate pieces of work calls for skill and experience and the accurate use of the rulc, square, and bevel, even if the work is partly done by machine.

A solid work bench is essential, and should be about 6 ft in length and 2 ft . in width. $A$ heavy kitchen table provided with a bench top may be used; but the best work requires a properly constructed bench provided with a strong vice.

The amateur woodworker who talies up joinery should commence by making a careful study of joints and the methods of making the various kinds. Many of these are specifically dealt with under their respective headings, and a general article on the subject follows the present one. Aniongst them may be mentioned for special notice the housing joint, the mortise and tenon, the mitre dovetail, and the various classes of halved joints

It is an excellent plan to begin by practising on a piece of softwood, and in this way to acquire some degree of skill in planing and sawing to a line, for it is little use trying to make even the simplest joint unless the wond is accurately planed, marked out, and sawn. The tools inust be kept in the best condition The plane should be sharpened and set to take a fine shaving. The saw should be sharp, and the thickness of the eut made by it noted: neglent of this precaution will sjoil a joint Chisels should have keen, sharp edges, obtained by grinding and sharpening on an oilstone
Care must be taken to guard against bruising the wood, for which purpose the use of a mallet is preferable to a hammer. When knocking the paits of a joint together, it is helpful to interpose a rough piece of wood between the mallet and the joint. It is also desirable when erecting
the work to sec that it does not come into contact with the tools, as if the wood is badly bruised it will be difficult or impossible to eliminate any defects that are made

Generally the operations involved in joinery include sawing. planing, edge and end grain shooting, rebating, grooving, moulding. and mitreing, in addition to the construction of joints and frames. The proportioning of panelling is an important part of joiner's work, as are the relation of the panel to the width of stiles, rails, and muntins and the size and shape of the mouldings and beads, while the effect of light and shade on the surface calls for skill and experience. All joinery requires a good surface finish and neat.
accurate joints. The latter are obtained by careful workmanship, and the former by diligent scraping and glasspapring and leaving the work in a suitable state from the plane

Scraping is done with a specially prepared piece of steel, which is held at an angle to the work and operates by removing fine shavings from the surface. The use of the scraper is essential when dealing with hardwoods, because it is almost impossible to plane the surface without leaving some marks. With the exception of knots on tho surface of softwoods, it will generally be possible to obtain a smooth surface with glasspaper, but if the wood contains many

## JOINTS: IN WOODWORK

## An Important Detail of the Woodworker's Craft

Supplementary to this gencral article are shorter entries on the various ioints, e.g. Butt ; Dovetail ; Halved Joint; Housing Joint: Mortise: Rulc loint. Reference should also be made to the entries on Bookease ; Burcau; Cabinet Making: Drawer; Gluc ; Table, etc.

For the sake of convenience, many of the best-known and specific joints are dealt with in this work under their respective headings.
Joints are used in wondwork generally for one of two reasons. Either the size of the material available is insufficient for the purpose, in which case a joint is necessary ; or joints are inade so that the various components can be arranged to the best advantage from the point of view of the direction of the grain of the wood and the relative proportions of the various pieces. In the former case the joint is often effected by simply glueing both pieces of the material and clamping them together while the glue sets hard. The second case comprises all those structural joints, such as the mortise and tenon, in which one part is shaped to fit into a hole made in the other part Essentials of any joint of this character are (a) that the fitting surfaces of the wood shall be accurately shaped, so that when assembled the joint is virtually solid wond; and (b) that the one part is Hat or true with the other, since a very small error in the shaping of the joint faces causes the one part to take a different direction relative to the surface of the other, with tho result that the

nown as winding.
One of the simplest joints in woodwork consists merely of placing one piece of wood upon the other and glueing and screwing them together: or in the case of light work, sticking them together with an adhesive cement or glue. When these joints are effected by nails or screws, they are generally known as butt joints.

In constructional work, or when it is desired to effect a strong joint between two pieces that will be called upon to resist considerable strain, the joints are often effected by shaping the ends of the faces so that to some extent they interlock They arc further secured by means of nuts and bolts.

Still another series of joints is effected by cutting recesses or grooves to receive the other parts, and this series of joints is generally known as housing joints. Dovetail joints aro adapted to resist strain in certain directions, that is to say, the grooves or holes in the one part are ao shaped that the leg or end of the other part can be pulled out only in one particular direction. There are many varieties.

A form of joint extensively used is that in which the one part, such as a panel, fits in a recess or groove in a frame. In the former case a portion of the edge of the framework is cut away, either with a cutting gauge or with a rebating plane, the space so cut away being known as a rebate. The joint is in this case effected by placing the panel in position and securing it with a bead or fillet. When the panel fits into a groove, the latter is produced with a plough plane.

Sliding joints are sometimes necessary in woodwork to provide for the shrinkage or expansion of the material according to the humidity of the atmosphere. Thesc are all more or less in the form of a ploughed groove or a long slot of some kind, to hold the material from warping or twisting, but to allow it freedom of expansion and contraction in the
direction of its greatest breadth. The jointing surfaces of wood may be secured by an adhesive, by nails, screws, bolts and nuts, pegs, and also by means of a variety of special fasteners, such as corrugated fasteners and drawbolt fasteners. To tighten up the joint surfaces, a commonly used plan is that known as draw-boring (q.v.). in which a peg is arranged so that it draws the faces of the joint together very tightly.

Another class of joint includes the varictics known as hinged and shutting joints. In goodclass work the joint is rebated and provided with a dust or draught bead, Fig I, and is then a combination of several joints. When a door is hung on a centre pin, the joint surfaces have to be curved, as in Fig. 2.

Many pieces of furniture are made with interual hinging joints, such as the section shown in Fig. 3, which shows how each piece of nuterial has to be shaped to allow for the rise and fall of a flap, as in a bureau.

Among miscellancous joints is the device known as pocket screwing, Fig. 4, which consists in horing a hole obliquely through the rail or similar part, and gouging out a recess or pocket in the side of the rail. This allows the screw to be inserted, and provides a llat surface for the head to bear upon. This device is used for fixing table-tops.

Another type of joint is known as cleating or clamping. It is simply a batten screwed to the separate parts to be joined together. Fig. 5 shows a buttoning joint, which comprises a rectangular block of wood rebated to fit into corresponding grooves formed in the rail or fixed part of the construction. The button or wood block is then screwed to the table-top or elsewhere, bringing it firmly into position. It is an excellent joint for fixing a table-top on to the side rails of the table. Slot screwed is another form of joint which is easily carried out and effective in use. It consists of cutting a slot through one of the parts to be jointed and securing it to the other with a screw.

Dowelled joints comprise all those forins where the two jointing faces are flat, and kept in position by one or nore pegs fixed firmly into one part, with a portion of the dowel projecting, which fits into the hole formed in the other part of the joint. The dowelled joint may be permanent or detachable, as desired.

JOINT : Of the Body. Joints are fixed, as those of the skull; pirtially movable, as those between the vertebrac; or frecly movable, as the hip, shoulder, etc. In the movable joints the ends of the bones are covered with smooth cartilage, and the joint is surrounded by a sheath of fibrous tissue lined with the synovial membrane which exudes a lubricating fluid into the joint. Infammation in a joint may be synovitis, when it is mainly this membrane which is affected, or arthritis (q.v.), when all the structures of the joint are involved. Other diseases and injuries to which joints are subject will be found under appropriate headings. See Ankle; Dislocation; Elbow; Hil, Disease; Knee; Rheumatoid Arthritis; Shoulder; Sprain ; Wrist, eto.

JOINT : Of Meat. The parts into which animals that are killed for human consumption are cut up are known as joints. The names of the various joints are given under the hendings referring to the different animals. The names given are those in general use, but the names and the inethods of cutting differ somewhat with the locality. See Aitchbone; Bacon; Beef; Carving; Lamb; York; Veal, etc.

JOINTER. This term is used to describe two entirely different tools. In the one case it refers to a large plane, resembling a jackplane, used when planing the edges of hoards preparatory to jointing them together.

The bricklayer's jointer is composed of a cast steel blade, tapered at one end and having
a handle attached at n bout an angle of $45^{\circ}$ to facilitate its use in pointing in brickwork. It is used to smooth or finish the pointing or joints between briclework, particularly the type known as flush pointing. See Plane: Pointing.

JOINTING RULE This implement, used by plasterers and bricklayers, consists of a batten of wood about 5 ft . long, 3 in . wide and 1 in. thick, bevelled on one edge. It is used for floating or levelling the surface of plaster in the angle of a room, or for working the surface of a screed on a wall, or any ot her place where a Hat surface of plaster is to be built up. It is also used by bricklayers in the jointing of horizontal and vertical joints in brickwork, particularly in the pointing operations.
The amateur can easily make such a tool from a piece of ordinary clean deal, but it is imperative that it be planed up perfectly true and straight and sandpapered, as any roughness on its edges would be transferred to the ourface of the plaster. Its form and method of use are illustrated in the article on

## plastering.

JOIST. The word joist is applied to horizontal supports for floors or ceilings, and in domestic work joists are generally composed of timber, although the use of rolled stcel is common, especially in connexion with ferro concrete constructions. Joists are further described by the addition of the name of the part of the structure to which they act as a support.
For example, the floor joists support the floor, ceiling joists carry the ceiling, and sleeper joists are placed upon the honeycomb sleeper walls under the floor, and act as an intermediate support for the other floor joists. Dovetailed sleeper joists are oftell embedded in the concrete of a floor as a convenient merns of attaching the floor covering in the form of boards, which are nailed into the slecper joists.

The joists should be of adequate strength for the load they will be called upon to sust ain, and for the ordinary type of small house the ground Hoor joists, which are supported by sleepers at about 3 ft . centies, may be 4 in . deep and 2 in. in thickness. For an upper floor the joists must be much larger, dependent upon the span of the building. but in the case of an ordinary sized house where the joists have a span width of 12 ft ., a convenient size is 7 in. deep and 3 in. in thickness, or 9 in. deep and $\mathscr{O}$ in. in thickness. In the former case there is no necessity for intermediate strutting between the joists, but in the latter it is desirable to fix diagonal struts of light section, about 2 in . deep) and $1 \frac{1}{2} \mathrm{in}$. in thickness, to prevent the joists twisting sideways. The average spacing of the joists is about 15 in . for the ordinary 1 in. Hoorhoards.

Ceiling joists usually average 4 in . in deptl, and 2 in . in thickncss, spaced about 14 in . apart, and are streng thened and supported by longitudinal members, so that the span does not exceed 5 to 6 ft. See Floor ; Roof.

JOLLY MILLER. This game can be played either indoors or outdoors. Each mian of the party, with one exception, chooses a lady for
his partner. The excepted one stands in the middle of the room, while the others in couples walk round hinı singing :
There was a jolly niller who lived by himself: As the whecl went round he made his wealth: One hand in the colfer and the other in the bag, As the wheel went round he made his krab.
At the word grab everyone must change partners, and while they are doing this the miller tries to seize one of the ladies. If he succeeds in this, the man who is left without a partner takes the place of the miller and so the game continues.

JONQUIL. Bulbs of the common swectscented jonquil, a variety of narcissus, should be planted 3 in. deep and about 6 in . npart in autumn. They are equally valuable for forcing or for planting as a woodland flower. Double campernelle is a particularly noteworthy variety of this flower. There are several line modern varicties with large, bright vellow Howers, e.g. Buttercup and Golden Sceptre. See Daffodil; Narcissus. JUDAS TREE, This is a hardy summerdeafing, ornamental tree, Cercis siliquastrum, about 15 ft. in height, with pur-plish-pink, peashaped Howers in late spring. The flowers are out before the leaves have fully developed.
The tree is common in Judea, and Judas is said to have hanged himself on one. It is grown from seed sown in spring. Propagation by layers in autumn may also be practised if there are branches situated in convenient positions.

JUDICIAL SEPARATION. This used to be called divorce a miensa ot thoro (from table and hed), to distinguish it from divorce c vinculis matrimonii (from the bonds of matrimony). A judicial separation may he obtnined either by husband or wife for (1) adultery, or (2) desertion for two years or more, (3) cruelty, or (4) refusal to obey an order for restitution of conjugal rights. It is an a haolute bar to a suit for judicial separation that the petitioner has committed adultery since the date of the marriage.

Judicial separation orders may also be made by magistrates for cruelty, desertion, or such drumkenness or conduct as compels the wife to leare the husband. Coupled with such inagistrates orders are provisions that the husband shall pay anything up to $£ 2$ a week for his wife's maintenance. An order for judicial separation comes at once to an end if the husband and wife cohabit again. See Divorcc ; Maintenance ; Separation Order.

JUG. Among the jugs sought by collectors are the chocolate jug of Queen Anne's time and the winc jug of a century or more later, hoth types being fitted with lids. These jugs are usually of silver, hut they were also made in Sheflield plate.

Two heautiful examples are illustrated, the first heing a silver vase-shaped jug in an Adam design, and the second a Sheffield plate chncolate jug. These shapes are frequently reproduced to-day for hot milk jugs. In the chocolate jug shown in the illustration, the knoi in the centre of the lid is removable, thus enabling the contents of the jug to be
stirred without being cooled by exposure to the nir.
Some of the antique silver jugs copied to-day stand on three feet, while others have one circular base. Some of them are finely chased with scrollwork and other decorative features, including beading and gadroon A form of jug much sought after by collectors is the Toby jug Old lustre jugs are also valued. Antique brass, copper, or pottery ewers and pitchers form decora tive vases for flowers. See Cream Jug; Crockery Glass: Pewter : Sheffield Plate: Silver; Toby Jug.

JUICE. This is the name given to the liquid part of fruits, and also of vegetables and ineats Juice is extracted from fruit in the making of jellies, drinks, syrups. sweets, etc., and also, as is the case with lemous and oranges, ralie in a moderate oven, sprinkling the for flavouring purposes Lemon, etc.

JUMBLE CAKE. These small cakes can be flavoured in a number of ways. To make some, cream together 2 oz . butter and 3 oz . sugar, then beat in an egg and add the strained juice and rind of half a lemon. This is then thoroughly mixed with 8 oz sifted flour. Turn the dough on to a houred board, and roll it out lightly to a thickness of not more than half an inch. Cut it into fancy shapes, and

Notes for the Month
collect sucli things as they feel disposed to send These need not be confined to clothes; almost any diacarded article, especially in the way of usable household goods and linen are saleable. If possible, it should also be arranged that all contributions will be called for a couple of days or so before the actual sale Boy Scouts or Girl Guides are usually only too willing to do this, and a message or postcard from the person having articles for sale will be promptly attended to

When all have been collected, the next task is to sort, tidy, and price the various things. The pricing should be as low as possible. It must be remembered that the sale involves no initial expenditure, but that every penny taken is clear profit ; also, that besides bringing in money for whatever charity fund is concerned, it may be a very real charity to provide poor people with good clothes for a few shillings, and will be far more apprecinted than if those same clothes were given away in the ordinary haphazard fashion.
Prices should be clearly marked on tickets and either sewn or gummed on the articles for sale. As far as possible, the garments should be arranged in stalls according to thicir nature ; if there is a large assortment of other things they may be divided into classes or put together on a rariety stall

The sale should be fixed for a day when it is thought that nost of the poorer women will be able to attend-probably the local early closing day will suggest itself-and should be open from the early afternoon until 8 or 9 p.m. Many people prefer to hire a hall for the occasion, but a jumble sale can be held very successfully in a large loft or outhouse if there are no suitable rooms in the house.

## Notes for the Month

```
July 1-Dominion Day, Camada
JuLY 4.-Independence Day, U.S.A
JoLy 15.-St. Swithun's Day,
```

JUNE BERRY. This is the common name of a beautiful small flowering tree, Amelanchier canadensis. It rcaches a height of 15 feet or more, has white blossom in April and May, and nutumn. tinted leaves. It thrives in ordinary soil and can be inoreased by seeds. A variety named oblongifolia grows only 5 or 6 feet high and bears white flowers freely in spring

JUNIPER. The juniper is a most important family of hardy evergreen shrubs and trees of many habits and ranging from 1 ft . to 40 ft in height They are particu larly useful as lawn tices and in shrubberies, while lovers of the rock garden should take special note of the dwarf varieties.
The junipers thrive particularly well in chalky soil, and are propagated by cuttings taken in jury. The name plants may also be raised from seed. One from this duty are peers, memhers of Parlia of the best for general planting is the Chinese juniper (Juniperus chinensis); surea, with golden leaves, and Fortunei, with grey-green leaves, are attractive varieties
'The common juniper or savin (communis) is a low bush, about 3 feet high, but the viriety hibernica, of slender column-like form, is a particularly graceful tree. The dwarf variety, hibernica compressa, is one of the most popular miniature conifers for the rock garden The red cedar or Anierican juniper (virginiana), which provides wood used in the manufacture of lead pencils, is an attractive tall tree; the silvery-leaved variety glauca is beautiful

JUNKET. This dish is made in the following way: Heat a pint of new milk to about $98^{\circ} \mathrm{F}$., which is its natural heat. Then pour it into a dish and add a dessertspoonful of white sugar and 2 teaspoonfuls of essence of rennet. After this let it set, the time necded for this being from $1 \frac{1}{2}$ to 2 hours. When it is set, sprinkle it with powdered nutmeg, and then cover it with a layer of clotted or whipped cream

The rennet for making the junket can be obtained in tablet or powdered form. In the latter case it is sold under the name of junket powder, and directions as to the quantities required are printed on the packet The powder is sometinies preferred to the liquid rennet because the latter varies in strength, more being needed to turn the milk at one time than another, as climatic and other conditions vary.

If the milk does not solidify with the first addition of rennet or junket powder it can be rehcated and more powider or rennet added. A pinch of salt should always be added. The milk used for junket sliould be perfectly fresh and sweet: if there is the least suspicion of sourness it will not clot, but form into flaky curds. The milk should not be diluted with water, nor fruit juice used for Alavouring. Spirits or highly concentrated essences should he used for this purpuse, but only sparingly, so that they will not have a curdling effect on the milk.

For flavouring junket brandy is often used, but either whisky or rum makes a good substitute, while on the top cinnamon may take the place of nutmeg. If spirits are not liked, soine such llavouring as vanilla or almond essence can be employed. It may be left to set in a room of ordinary or even warm temperature, a cool place such as is required for jelly being unnecessary and unsuitable.

June Berp. Walte spring Howers of this beautiful small tree

A bowl of junket must be handled carefully, as it sepa rates at once if shaken. It makes a light and nourishing dish at all times, but is especially suitable for inva ids who cannot eat solid foods. See Clotted Cream ; Invald Cookery: Rennut.
JURY:Liability to Serve. With certain exceptions, men and women who are qualificd as houscholders or property owners are bound to serve upon a jury if called upon to do so. Men liable are those between the ages of 21 and ( 60 who possess land of the clear value o. $£ 10$ per annum, or who are assessed in the valuation list for a house valued at not lesa than $£ 30$ in Middlesex and $£ 20$ plsewherc Women who possess the same qualifications are liable, but husband and wife must not serve on the same from this duty are peers, memhers of Parlia
ment, judges, clergymen, lawyers, ductors, officers of the army, navy and air forces and Territorial Army, and chenists

When a jury is required the sheriff or clerk of the peace chaoses the r.ames from the list of persons liable and sends by post notices to them. This inust be done at least wix days previous to the meeting of the court. Jurymen

Juniper. Specimen of the winter-flowering variety chinensis, eflective either in the sbrubbery or in a large rock garden
are required for assizes and quarter sessions, and rilso in Landon for the sittings of the central criminal court and for certain civil actions heard at the law courts. It is usual to summon more persons than are required. and if the reasons given are deemed adequate a man called can be excused from service. Jury men who fail to attend the court on the appointed day can be fined. They are not paid, except that small fees are given to common jurors and to members of coroner's
juries. In some cases rerreshments are provided at the expense of the sheriff
Juries are either grand, petty, coroner's special, or common. A special jury is one called to hear certain civil actions. Special jurors are taken from those who occupy houses above a certain rental value, usually a bout $£ 60$ a year Juries in Scotland and Ineland are similar to those in England, although in Scotland the methods of procedure are some what different: for instance, there are no coroners, and hence there can be no corcner's jury.

Women on Juries. By the Sex Disqualifica tion (Removal) Act, 1919 women u.e enabled and bound when summoned o sit on juries Thi presiding judge may however, cither at his own instance or on an application mude by one of the partics, order that the jury shall be composed of men only, or of wonien only A woman may also apply to be excuaed from serving on a jury in a particular case, and if the nature of the evidence to be given or the issues to be tred make it reasonab e that she shall he excmpted, the judge may exempt her If he thinks fit to do so

If a woman who receives a jury summons $i$. pregnant, or suffering from some feminine condition or ailment, she should apply to the summoning officer or the under-sheriff, enclas ing a medical certificate, and asking to be rxcused from attendance. This should be don: within three days after the jury summons has bcen received.

JUVENILE OFFENDER. In English law a juven le offender is une who is or appears to be under the age of 16 years. When such a person is arrested, the police superintendent or inspector must let him out on bail. unless the offence is homicide or some other grave crime or unless it is in the interests of the uffender to remove him from some reputed criminal with whom he is associating it he is not relcased on bail he must not be put in a prison but in some other placs of detention until his case can be dealt with. The object of these provisions is to prevent jupeni es from being expossed to the risk of contaninatoon from older criminals.

Juvenile Courts. Special courts ure held for the trial of juveniles. They may or may not be held in the ordinary police courts but if they are they must be held at difierent times from ordinary sittings; and from thesc courts ali are excluded except persons connected with the case and bona fide pressmen. Juveniles are not to be mixed up with ondinary prisoners. In London the Home Secretary appoints for each juvenile court, to assist the regular police magistrate, two other justices one of whom must be a woman.

In dealing with juvenile offenders, the powers of punishment are restricted. No juvenile con be sentenced to death or penal servitude. He may be whipped or ent to a reformatory or industrial schuol, or he or his parents may be fined, or he may be handed over to the care of a welfare missionary, or his parents may be bound over to see that he l,eliaves himself for the future He cannot. however, be sent to prison in default of paying a tine or the costs of the trial, ay an adult can 'The power that the courts have of fining parents for the offence of a chilid $i$ the only instance of vicarious punishment known to the English criminal law

A child under 14 cannot be sentenced to imprisonment, but for certain grave ofiences may be ordered to be detained for a period such as would formerly have been the period of imprisonment. If convicted of murder, a juvenile may be ordered to be detained during his Majesty's pleasure. If a juvenile is ordered to be detained, the court may make an order that his parent or putative father shall contribute to his maintenance See Child

KAFFIR LILY. The hulhous-rooted perennial plant known as Kaffir lily, or winter gladiolus (Schizostylis coccinea), has long, iris-like leaves, and scarlet flowers on a tall spike in carly autumn. It is not very hardy, and is generally grown outside in a sunny

Kaffir Lily. Scarlet blooms and irlslike leaves of the winter aladiolus
spring. There is a heautiful sheltered position, in a compost of loain, leafmould and sand. The bulbs, or rhizomes, may also he placed in pots in early spring. After being estahlished in the cool house or frame ther may be stood out of doors during the 8 nmmer months and taken in for an autumn display inside. Propagation is by division in pink variety named Mrs. Hegarty.
KALANCHOE. This is a greenhouse perennial flowering plant with thick fleshy leaves. The hest is Kalanchoc flammea from Somaliland, which bears scarlet flowers in summer. It should he potted in sandy loam and kept safe from frost in winter. The easiest method of propragation is by cuttings.

KALE. Of this hardy and useful green winter vegetahle there are many varieties, e.g. cottager's, asparagus, ourled and Drumhead. Sceds are sown out of doors in April, and the scedlings are planted out in summer at about 2 ft. apart. See Curly Kalc.

Kale. Fine head ol a varjety of this green vegetable known as asparagus kale

KALMIA. These beautiful hardy evergreen tlowering shruhs thrive in peaty or limefrce loany soil. The best is kalmia latifolia, the calico bush, which grows 3 to 5 ft . high and bears pale rose coloured flowers in iearly suminier. Glauca 18-24 in., and angust.folia, 2-3 ft., hoth have rose coloured blocoms An important detail of cultivation is to remove the faded flowers to prevent the developmient of seeds. These shrubs are propagated by seeds, though the seedlings grow slowly.

KALOSANTHES. This greenhouse plant, which is classed as a succulent because of its thick fleshy leaves and stems, is not very coinmonly grown, but one species, Kalosanthes
(crassula) coccinea is very showy. It grows about 20 in . high and hears clusters of scarlet tube-shaped Howers in summer. It should be potted in a compost of loam and sand and during winter needs a temperature of 45 to 50 degrees. Propagation is by cuttings in summer. Kalosanthes lactea hears white flowers in winter.

KAPOK. The vegetable down obtained from the thistle and other plants, and used for stuffing cushions, pillows, etc., is known as kapok. See Down.

KAULFUSSIA (Cape Aster). This is a pretty hardy annual from South Africa, which grows 6 in . high and hears small daisy-like blue, white or crimson llowers, according to the variety chosen. It is suitable for sowing as an edging. From sceds sown out of doors in April the plants hloom in sumner.

KEDGEREE. This is an Indian dish prepared mainly from rice ard fisl. To make it, melt loz. of butter in a stew pan and add to it $\frac{1}{2} \mathrm{lb}$. of hoiled rice, $\frac{1}{2} \mathrm{lh}$. of any cold cooked fish broken into tlakes, and the coarsely chopped whites of 2 hard-boiled eggs. Season the whole with salt and pepper to taste, make it thoroughly hot, and then pile it up on a hot dish. Garnish the kedgeree with the yolks of eggs ruhbed through a sieve, and some chopped parsley.

KEESHOND. Breed of dog, popularly known as the Dutch Barge dog. In some respects the Barge dog is similar to the pomeranian, chiefly differing in size and colour. The colour should be like that of the wolf, namely fawn, either light or dark, the long hairs being tipped with hlack, but the colour on the muzzle, around the lipe and on the legs

Keeshand. Specimen of this excellent breed of dog. closely resembling a Pomeranian
and tail are of a lighter shade. The coat should he very profuse excepting on the head, ears, and front parts of the fore and hind lega where it is smooth. The ears are erect, eyes dark, with a foxy expression, and the head of fox-like conformation. The body should be short and compact, the chest deep, and the tail carried over the back like a plume. The keeshond is about 18 in . in height, and makes an excellent companion as well as a good watch dog. It is a distinctly hardy breed.

KENNEDYA. This greenhouse climbing plant bears pea-shaped Howers in spring or summer. The favourite kind is Kennedya comptoniana, with purplish blooms in spring. Another is Marryattae, which hears scarlet flowers in summer. Theso plants, which are not often grown nowadays, thrive in layge pots filled with sandy loam and need a minimum temperature of a bout 50 degrecs. Pruning should be done after flowering.

## Kennels and Their Construction

## How to Provide Accommodation for the Watchdog

This article suggests a reference to the entry on Dops, ond also to thos: on the various breeds of dog, c. g . Bloodhound; Spanicl: Terrier. Sec also the cnirics on the materials uscd in the making of a kenncl, c.g. Board: Hinge; also Amateur Carpentry: Concrete; Shed

Kennels are of several kinds, but certain general principles are cominon to all. All alike should possess roominess and warmith and accessibility, the last mentioned quality being necessary in order that the kennel may he cleaned, as it should be, at least once a week. Attention should be paid to the situa. tion of the door, in order that the dog may escape dranghts, while, if possible, a south or south-western aspect should be selected. More necessary perhaps is it that the ground should be dry, for damp is very favourable to disease. Sunshine, fresh air, adequate drainage, and good ventilation are as desirable in the case of kennels as they are in that of houses.

If it is necessary to confine the inmate in the daytime, on no account put him on a chäain. A small run can he attached to his kennel, either of railings which are sold for the purpose, or very stout wire netting fixed to posts. Bedding may consist of straw, pine shavings, or sawdust. The latter is a good thing for long-coated animala in winter-time, because of the manner in which it will absorb the wet. The ideal arrangement would be to have an inner sleeping compartinent berlded with straw, and an oister compartment littered deeply with sawdust.

Making a Kennel. The kennel shown in Fig. 1 is suitable for a terrier or similar dog. Elevations with suitable dimensions are shown at Figs. 2 and 3, and details of the framework nt Fig. 4. Deal is a suitable wood to use throughout.

The corner posts (A) are 2 in. square, and the side and end rails ( $B$ and C) $1 \frac{1}{2}$ in. square. The rails may be tenoned into the posts, as in Fig. 5, or lapped, as in Fig. 6 . The joints in either casc should be painted hefore fixing, the tenons being secured with
wood pins, or the lapped joints with screws. The rafters (D) are $1 \frac{1}{d}$ in. square, half lapped together (Fig. 7) and nailed or screwed to the framing. It will be a good plan to paint the framework before fitting the bottom or covering the side and roof.

The bottom is of $\mathfrak{f}$ in. grooved and tongned matchboard, fitted around the corner posts, and nailed to the top edges of the hottom rails. The sides and ends are covered with similar boards. An entrance is arranged at one side, being about 1 ft . 2 in . high by 10 in . wide. It will be conrenient for cleaning purposes to have a door at one end. The door should be hattened together. as shown at Fig. 8, and hung with a pair of long flap hinges. The boarding ahove the door opening should finish in the middle of the top rail, so that the top edge of the door may shut against this rail as well as against the bottom rail. Weather boards are very suitable for covering the roof. They should overhang 3 in . all

Kennel. Fir. 1. Waoden isennel suitable for a
lerfiet or other dog of medium size
round, and the roof is finished with a rillge mall at the top. The kennel should be painted with threc coats, or treated with a preservative.

For a retriever or similar dog the kennel should be 3 ft. 3 in. long, and of the section shown at Fig. 9, while for a still larger dog, such as a St. Bernard, the length should be 4 ft ., with a section similar to Fig. 10. Their construction will be similar to that already described, only the framing and boarding may be stouter to correspond with the increase in size, and it may be advisable to add a couple of rafters across the middle of the roof.

EONTIA. This graceful palm is suitable for a heated greenhouse. It may also be grown in a room window during the summer months. Belmoreana and fosteriana are the favourite kinds, the former being less vigorous than the latter and better suited to cultivation in small pots. A compost of loam, peat, and sand suits these palnis, which need a minimum temperature of $50-55$ degrees in winter.

KEPHIR. This is a form of fermented milk, like koumiss. To make fermented milk, put boiled cow's milk into strong pint bottles, leaving a small purt enipty; adil $\frac{5}{4} \mathrm{oz}$. of white sugar and a amall piece of yeast about the size of two peas to each bottle. Corl:, wire, and place the bottles on their sides. Shake them every morning and every evening. The milk will be rearly for use in a reek. See Milk.

Kerosene. This name is used for the oil obtained from bituminous coal and petrolcum. It is used for lamps. See Lamp; Oil.

Kerria. Alternative name for the shrib better known as Jew's Mallow (q.v.).

KERRY BLUE TERRIER. In size this terrier stands midway between the red Irish terrier and the Airedale. They are rugged fellows with a shaggy, soft cont and dark, intelligent eyes.

They linve a reputation for high courage in tackling vermin and are devoted guards. With children they are said to be very gentle, and they are capable of retrieving or scenting

Karry Blue Tarrier. Nofa Jacobin, champion of this breed of shagry-baired dog
a wounded hare or bird. At present the term blue applied to this terrier admits of a liberal interpretation, the colour appearing in various gradations. See Dog.

KERSEY. One of the earliest woollen fabrics made in England, kersey is coarsespun, like blanket and twill-woven, and usually white or checked. Kerseys are used for horsecloths. Cheap kersey cloths are used for floor scouring.

KETCEUP. Ketchup is a sauce made from mushrooms, walnuts or cucumbers.

Mushroom Ketchup. To make mushroom ketchup, gather the mushrooms before the sun has discoloured them, and break them very small into a basin. Sprinkle them with

Kennel. Fig. 2. Side elepation. Fig. 3. End elepation. in corner dost. Fig. 6. Simpler method of securing Doop strangthened with battens. Figs, 9 and 10.
salt and let them stand 3 days; then boil and strain them. They must be simmered till all the juice is out. After straining boil up the Jiquor again with the whites of 1 or 2 eggs to fine it, and then strain. Return the liquor to the fire, adding to every quart of juice 6 shallots, $\frac{f}{}$ oz. whole black pepper, $f$ oz. ginger, 1 tablespoonful grated horse-radish, $\mathbf{6}$ or 8 allspice, and 1 laurel leaf. Simmer about \& hour; then skim and strain into bottles and cork them well.

Cucumber Ketchup. To make cucumber ketchup, pare the cucumbers and slice them as thinly as possible into an earthenware bowl and cover them thickly with salt. Cover closely and let them stand until the following day; then st rain the liquor into a stewpan. To every pint of liquor add $\frac{1}{2}$ pint of white wine vinegar and a teaspoonful of peppercorns, and simmer gently for from 20 minutes to $\frac{1}{2}$ hour. Then allow it to go cold, strain it into hottles, cork it tightly and atore in a cool, dry place.
Wainut Ketchup.
For walnut ketchup the walnuts must be very young, green and tender. To cvery 100 walnuts allow one quart vinegar, 3 oz salt, 4 oz . anchovies, $1 \cdot 2$ chopped shallots, $\frac{1}{2}$ stick grated horseradish, $\frac{1}{2}$ teaspoonful each of mace, nutmeg, ground ginger, ground cloves and pepper and a pint of red wine. Bruise the walnuts slightly, put them into a jar with salt and vinegar and let them stand for 8 days, stirring them daily. Drain the liquor into a stewpan, add to it the rest of ingredients and simmer very gently for 40 minutes. When cold, strain into bottles, cork and store in a cool, dry placc.
KETTLE: Choice and Care. Kettles are made in tin, aluminium and copper and enamelled ware, while more ornamental ones are in silver, electro plate and brass. The latter, however, are only for use with a small spirit stove, not for the ordinary task of boiling water on a fire. Kettles of aluminium, tin or
block tin are the cheapest and for kitchen purposes most suitable. They can be bought to hold $2,3,4,5,6$ or 8 pints, or cuen more. Copper kettles are more expensive, but their durability is much greater Some kettles arc fitted with wooden handles, which do not get as hot as the metal ones. Others in aluminium are fitted with patent insulated iron handles always cool to the touch.

An aluminium kettle is provided with a cup which fits over the kettle top and can be used to poach an egg in thic steam. Another kettle is obtainable with a grooved base so that it forms a lid to a sauccpan and serves a dual purpose. Square ket tles in aluminium economise space and gas on a gas cooker if used in conjunction with square saucepans. Both kettle and saucepan can be packed neatly together over one burner and no heat escapea between them to be wasted. Absolutely llat bottomed kettles aro made for use on electric cookers.

Another kettle is made to hang on a stand, with a heating apparatus in the form of a small spirit stove, while another rests upon a small oil stove. A kettle with folding handle is made for the use of travellers and picnic parties, some of these having a corrugated bottom as an aid to boiling. Bronchitis and fish kettles are amongst those which are made for particular purposes.

Kettles of enamelled ware should be of good quality, for the cheaper makes are apt to chip and to become a source of danger when used for heating drinking water. They may be washed in hot soapy water, and, in case of stains, cleaned in the same way as other enamelled goods. Electric kettles fitted with a heating apparatus and a cord for connecting with the electric wires can be used in any room containing a plug or lamp holder. They liave many advantages, among these being the fact that they are easily kept clean, and their contents may be heated on the tea-table itself and kept hot throughout the meal.

Kettleholders. These may be made of almost any non conducting material, from the ashestos ones, which can be bought at most ironmongers, to pieces of serge or woollen cloth from the scrap-bag. Among the most popular are those worked in cross-stitch with bright coloured wools.
Unless at least three thicknesses of material are allowed, the kettleholder will not serve its purpose efficiently. A small loop at one corner is useful, as the kettleholder can then be hung up on a hook by the stove: 6 in sq. is a satis. factory size for such an article. See Brass; Bronchitis Kettle; Electricity; Kitchen Silver: Soldering: Tin.
KEY: In Engineering. This is the name given to the specially shaped piece of cast steel that is fitted into keyways cut to receive it on the shaft and the part that is to be mounted on the shaft and secured from turning. The key shown in Fig. 1 is the type commonly used in general engineering. To fit this pattern the outer part is first driven home on the shaft with the keyways dead in line, and the key cut very slightly taper from the head on
 the faces marked $a$ and b. This taper will be cut to correspond to the amount of taper already given to the keyways. The key when driven home with the hammer should protrude from the shaft, as shown, by not less than $\frac{1}{} \mathrm{in}$. This point is essential, if trouble is to be avoided when removing the key
If a key is allowed to become slack, movement will take place between the outer part and the shaft, which, through friction, will very quickly destroy the smooth faces of each, making repair a costly matter. Fig. 2 shows a key properly fitted to a keyway in a shaft, ecuring a flywheel
KEY: In Woodwork. In joinery and woodwork, keys of various kinds are used in different varieties of joints, some of which are referred to under separate headings, but in general a key in joinery is a piece of wood which fits into a dovetailed groove to allow the framing to shrink but prevent it warping.

Key: in Woodwork. Showing a keyed joint in carpentry suitable for thin trusses in small roofs

Key : In Ensineering. Fir. 2. Close-up view ol a key flted to a keyway in a shaft, showing how it fits clogely into the boss of the fy-wheel
mitre They may take the form of thin strips converging so ns to form a kind of dovetail, or a thick piece known as a false tenon.

A keyed joint in carpentry suitable for thin trusses in small roofs is illustrated below; it shows a rafter keyed to a heam. The key is simply a piece of hardwood accurately fitted into slots cut in the meeting faces of the beams, which are usually further held together by a bolt or strap. See Joint.

## Key-cutting. See Lock.

KEYHOLE : How to Cut. This operation can easily and quickly be done with the aid of a small brace and bit and a keyhole saw. The correct position for the keyhole should be found, this being done by placing the lock case in position against the door, and passing a scriber or other convenient article through the keyhole in thi lock-case, and marking its outline on the woodwork of the door.

Having obtained the correct position of the keyhole, the next thing is to bore a hole of a aufficient diameter to admit the keyhole raw. All that is now required is to cut around the marked outline with the saw. Generally the keyhole is covered by an escutcheon, that is, a metal flap, hinged to the wood or metal work, over the head of the keyhole, so arranged that it can cither be lifted up or, as is more generally the case, pushed on one side. This should prevent draughts passing through the keyhole. See Door; Lock.

Keyhole Saw. This tool is specially adapted for the cutting of keyholes in wood. It comprises a narrow tapered saw with fairly fine teeth with considerable set, to ensure freedom in cutting to the various patterns. A wood or metal handle is used, the former being slotted to allow the saw blade to pass down through it. The blade is secured by set screws in the ferrule. The saw illustrated has a metal handle madc of malleable iron and provided with two clamps for holding the saw perfectly square. Spare hlades or blades of different lengths and fineness of teeth are procurable.

In using the key. hole sam it is necessary to push the saw perfectly in line with the blade, otherwise it is very liable to buckle or break. Too much pressure must not be put on the saw for the same reason, but if these two points are horne in mind the keyhole saw will be found extremely useful for cutting out all manner of shapes in wood up to about 1 in . in thickness. In ordinary work a hole is bored, through which the saw may be passed, and the variousshaped portions sawn away.

When working, it is particularly necessary to see that the saw-blade bc kept at right angles to the face of the work, otherwise the edges will be tapered and badly shaped. This saw can be sharpened and set in the ordinary wav. See Saw.

KID : Its Uses. A light kind of leather used for gloves, shoes, and fancy articles, kid is prepared either from goat or sheep skin.
Thornugh wetting in water shrinks kid Certain kinds of heavy kid gloves are sold as washable, but it is safer merely to sponge the surface while the gloves are on the hands. Special glove soap can be used on the sponge. After being semi-dried by rubbing with a soft cloth, sponged gloves should be taken off and left to dry slowly in the air. Rust and ink
stains on kid can be removed with oxalic acid applied with a fannel. See Glove.
KIDNEY: In Cookery. Both sheep's and calf's kidneys can be cooked separately and according to the same directions Sheep's kidneys, either grilled or stewed, are a favourite breakfast dish, and are also made into curries, pies, etc., while ox kidneys are used mainly for soup-making and stewing. Pig's kidneys may be broiled in the same way as sheep's kidneys, but will require nore time.

To prepare grilled kidneys and bacon, remose the rind and lightly fry 6 rashers of bacon. Then put them on a dish in the oven to keep hot while the kidneys are being cooked. Skin and cut 3 sheep's kidneys into halves, and remove the cores, place them in the pan with the cut side down, and cook them gently. turning them once. Dish the bacon, putting half a kidney on each piece; season and place a small lump of butter on each

Stewed kidney and bacon are prepared from the following ingredients: 1 lb . ox kidney, 3 oz fat bacon, 2 small onions, $\frac{1}{2} \mathrm{oz}$. flour, a seasoning of pepper and salt, and $\frac{1}{2}$ pint water. Cut up the kidney and wash it well. Place it in a saucepan with the bacon cut into slices, the water, and the sliced onions. Simmer all gently for two hours. Mix the flour, salt and pepper to a thin paste with 2 tablespoonfuls of cold water and add them carefully to the stew, stirring all the while. Boil up the whole. cook it for 5 min , and then serve.
Macaroni and Kidneys. Kidneys and macaroni make another savoury dish. Skin and halve 4 sheep's kidneys, sprinkle them with salt, pepper, and powdered herbs, and then fry them in a pan containing 2 o7. of butter. When they are cooked on both sides, pour off a little of the butter and add $\frac{1}{2}$ pint of tomato sauce to what remains in the pan. Heat the whole thoroughly; then turn it on to a hot dish and garnish it with a border of boiled macaroni cut into pieces an inch long. On each kidney place a quarter of a hard-boiled egg, and just before serving dust over the whole some grated cheese.
Mushrooms and Kidneys. Melt $\frac{1}{2}$ oz. of butter in a saucepan, stirring in 3 level teaspoonfuls of Hour, and then adding $\frac{1}{2}$ pint of stock. Stir the whole until it boils; then add 2 teaspoonfuls of chopped ham, 2 teaspoonfuls of chopped mushrooms, and a teaspoonful each of mushroom ketchup and chopped parsley. Mix these well, add seasoning to taste, and then 2 sliced tomatnes. Cook the whole gently for 5 min , and in the meantime skin, halve, and grill 4 sheep's kidneys. Add them, and then reheat the contents of the pan, but do not let them hoil. Turn the whole on to a hot dish with sippets of fried bread.

Kidney Cassolette. Cassolettes of kidney may be prepared by cooking 2 sliced sheep's kidneys in a little melted butter, adding a

Keyhole Saw, a tool specially adapted for cutting a keybole in a wooden door
finely chopped shallot and a few button mushrooms out into small pieces. When they have been allowed to fry for a few minuter, add a small teacupful of any good brown sauce and a little sherry. Conk the mixture slowly for 20-30 min., season it, and heap it into some small batter cases for serving.

Kidney Croquette. Croquettes of kidney and bacon are made by lightly frying 3 sheep's kidneys and 3 oz of streaky bacon, and then chopping them finely. Melt an ounce of butter in a pan, stir in smoothly $\frac{1}{2}$ oz. of flour, add $\frac{1}{2}$ pint of stock, and stir all until they hoil. Put in the bacon and kidney, season the mixture, and then turn it on to a plate to cool. When cold, shape it to form small corks, dip these in egg-and-breadcrumbs, and fry them a golden brown. The croquettes should then be drained on paper, and seryed with fried paraley and tomato rauce.

Kidney Soup. An ox kidney is used to make this soup. Wash and dry it, and cut it into small pieces, removing the fat from the centre. Dredge the pieces with flour and then put them into a pan containing 2 oz . of melted butter or margarine. Fry the kidney until it is brown. then add a large onion cut into dice, and brown that alan. Pour in 3 pints of cold water or atock, bring it to the boil, skim it, and then add a carrot and a turnip, cut into dice, and some green celery topa chopped up coarsely. Simmer the whole alowly for 2 hours, then atrain and return the liquor to the pan. Blend a tablesponnful of flour smonthly with a little cold water, add it to the liquor in the pan, and stir the soup until it boils. Simmer it for 5 min., season to taste, and then serve. If preferred, this may be served as a stew, with thick gravy and a border of rice or macaroni.

Kidney Toast. Either a calf's or sheep's kidney, previously conked, may be used to make kidney toast. Mince it finely, season to taste, and then heat it up in any good brown sauce. Serve the mixture heaped on slices of hot buttered toast. If liked a little chopped paraley and shallot may be added to the mince. A few small mushromms are alan an improvement to this dish, and a little sherry to flavour. See Batter; Steak.

KIDNEY BEAN. Varieties of French beans, the seeds of which are shaped like kidneys, are known as kidney beans. They are cooked according to the general directions given for French beans. See Bean; French Bean.

RIDNEYS: Functions and Diseases. Situated one on either side of the spine, the kidneys are partly covered behind by the last ribs. Their function is removal of the nitragenous waste products in the form of urea, uric acid, etc., and of other substances from the blood. The essential elements of the kidney are arteries to bring blood containing waste matcrial; urinary tubules to separate this latter, together with a large quantity of water, from the blood; and veins
 a karry hnd vein Charles Spaniel. Specimen of the silky-coated healthy kidneys separate blond. While the acid and certain salts from the blood, they do not allow sugar or albumin to pass. In disease they lose this selective power, and great quantities of sugar may pars into the urine in diabetes, and large quantities of albumin in Bright's disease and other maladies. of uraemia disagreeable effecta, as a rule fomentations or a large linseed poultice. nephritis, is described under the heading Bright's Disease. Septic infection may involve the organe; this is called pyelo-nephritis. Fmm such an infection an abscess may form. Tuberculous disense may affect one or both kidneys. The symptoms rather resemble those of as lady's finger (q.v.). Electricity ; Watt. intruders may be quite the reverse.

On the other hand, they may fail to remove Some of these points are hidden by the long the urea, etc., and thus give rise to symptoms

Abnormalities are sometimes found. There may be only one kidney, or the kidneys inay be united at their lower ends, forming what is called a horseshoe kilney. In some people, and expecially women, the kidneys may be more or less freely movable. This has no

A renal calculus, or stone in the kidney, may exist for a long time without giving rise to symptoms. A dull pain in the loin is common, however, and there may be frequency in passing urine and this may contain pus and blood. Should a stone of any size pass into the ureter it gives rise to renal colic, spasms of excruciating pain which shont down to the front of the thigh. Associated with this there is shock and vomiting. The doctor should be summoned and meanwhile the patient is placed in a hot bath for ten to twenty minutes. Friling a bath, apply loot

Inflammation of the kidney substancc, or stone in the kidney, but a proper examination of the urine will reveal the presence of tuhercle bacilli. See Bright's Disease; Diuretic, etc.

Kidney Vetch. This is another name for the hardy herbaceous perennial better known

KILOGRAMME. This is a measure of weight in the metric or decimal system. It consista of 1,000 grammer, and is equal to $2 \frac{1}{3}$ pounds avoirdupois. See Metric System.

KILOWATT. In electricity this is the name given to a unit of power. It is the commercial unit by which electricity is sold, and is the equivalent of 1,000 watt hours. See

KING CHARLES SPANIEL. Although bred in the present day especially as lapdogs, the King Charles were formerly used for sporting purposes, and they still make excellent house dogs. They are very gentle and affectionate, though their demeanour to

Under the name of King Charles are also included the varieties that breeders and fanciers distinguish as tricolour, Blenheim, and ruby spaniels; but the difference between them is only one of colour, and it is quite possible that one litter might comprisc examples of each. The following points apply to all of these varieties.
The head has a semi-globular dome, the turned-up nose is ahort and hroad with a black tip. The large dark eyes have horizontal lids, and are always more or less weeping. The heavily feathered eara are set low on the head, hang flat to the cheek, and reach nearly to the ground when the dog is walking. The body is compact, the back short and broad, the chest wide, the legs stout and strong.
silky cont, which should be wavy, not curling The feet, the backs of the legs, and the tail are all feathered. For show requirementa the tail is docked to 4 in

The King Charles proper is glossy black with some rich tan on the legs and below the root of the tail, also on the cheeks and over the eyes. The tricolour is white with patches of black, the inside of the ears tan, and the usual spots of that colour on the cheeks and brows. The Blenheim also is white with patches of cliestnut or ruby red, and cheeks and ears red, and from nose to above the forchend a long patch of white with a clear spot of red in the upper part See Dog

KING POST. This is the centre or principal upright post in a king post roof truss, of which examples are found in many forms of domestic architecture. The roof truss comprises the horizontal member called a tie heam, which reaches from one side of the huilding to the other and rests upon the walls The principal rafters are framed into thistie beam, and

them in wood smoke. Most commonly the word kipper is applied to hervings.

The kippers niay be cooked in the oven, or broiled in front of the firc. It improves them if they are plunged for a minute in boiling water before cooking them. If no double gridiron is at hand they may bo tonsted or bung in a Dutch oven. Before broiling, trim the fish, and after they are cooked rub them with butter. Another way is to put them in a casserole with a little butter or good dripping, cover them tightly and cook in a hot oven 10 to 15 min . In this way no smell of cooking escapes into the house. The same method may be used for kippered mackerel, but they will take longer. See Fish ; Herring.

KIRMAN RUG. Persian rugs of the Kirnian type can be obtained in carpet sizes. Their soft and harmonious tones, in hlue, green, fawn, rose and old gold, and their naturalistic designs of bouquets and vases,

## Kitchens and Their Arrangement

## Suggestions for Suitable Furniture, Fittings and Equipment

An article on the Kitchen, which is the domestic workshop, suggests reference to its fittings, e.g. Cooker; Cuphoard; Dresser; Range : Refrigerator-Sink; to the practice of conking, on which there are hundreds of articles in the work; and to the entries on Eletricity; Gas, See also Chair; Cottage; Door: Flat; House; Labour Saving Larcer; Sculicry; Tile

Compactness is a great advantage in any kitchen and the disposition of cupboards, sink, range, electric or gas cooker should be thought out with a view to minimizing the number of steps taken in the various duties to be performed. A small kitchen saves much walking about, but it is more difficult to work in, as constant tidying up is necessary, if muddle is to be avoided. Even in the largest kitchen compactness can be achieved by careful consideration of the disposition of furniture and fittings, placing the working equipment close toget her and reserving extra space for comfortable chairs and a table for meals. Adequate ventilation is most neces sary. A grating high in the wall or over the outer door is desirable, as this permits the escape of the hot, stale air that rises when cooking is in progress.

A north light is best, and the larder should be on the north side, so that this is the proper location for the kitchen. The relative positions of the sink, kitchen cabinet or dresser, and stove should be such as to minimize the number of journeys between them. The range or cooker should he well placed with, if possible, a cross light. A convenient cupboard may be on the left and a kitchen cabinet, or fitted dresser, on the right. The sink should be under a window, or at least well lighted, and easily accessible from the work table. If possible there slould be an electric light or gas fitting above the sink. In a house where the kitchen adjoins the dining room a service hatch saves labour and a lift is a great convenience for service from a basement kitchen to a dining room on the lloor above.

It is most important that a kitchen should be bright, light, and as airy as possible; that it should have as many simple labour saving devices as are compatible with its size and the required amount of cookery to be done: and that the home worker who spends a good deal of time in the kitchen should have a comfortable corner in it, if no other sitting room is available. An attractive kitchen is no more expensive to decorate at the outset than a drab one.

Where there is a scullery it is often better to concentrate all the rough work there and let everything that is to do with food and the preparation of food, except vegetables, be done in the kitchen. For this renson many people find it better to have a small white porcelain sink in the kitchen as well as the larger one in the scullery. If all cookery equipment is in the kitchen the labour and steps involved in going in and out
show up excentionally well with 18 th century period furnishings. They should be examined for their cotton warps, their line, closely woven and slightly lustrous woollen naps, and the rich reds and blues of their threc or more bordel'stripes.

The design usually includes a large central medallion, sonnetimes scalloped. Among the devices used are the tree of life, the eightpetalled lotus, birds, gazelles, and other animals. The old patterns are reproduced at Tabriz and elscwhere. The carpets known as Turkey Kirmans are coarser, being fabrics of less merit. See Persian Carpet ; Rug.

KIRSCH SAUCE. This is made by mixing together and then bniling t pint of water and 2 teaspoonfuls of arrowroot. When they have boiled for two or three minutes, sweeten thein to tnste, and add ahout a gill of kirsch. If liked, cornflour may be substituted for the arrowroot.
of the scullery for water and also for many of the utensils required can be avoided. The perfect sink to wash up in is about a foot deep, fixed at a convenient height, which does not necessitate stonping, with draining bnards on cither side. Large sinks are sometimes divided for washing and rinsing with swivel taps or a double set of hot and cold. A plate rack over the draining board and, if possible, a tiled splash hack to the sink arc obvious advantages.

Where several servants are kept a pantry between kitchen and dining roon containing glass and china cupboards, service hatch and a sink is a great convenience. A separate washhouse is a useful feature where much laundry is done at home. Kitchen quarters must be adequate for the size of the family to be cooked and cateied for, also the number of servants kept must be a consideration. A scullery and pantry mean simply extra labour and cleaning for one maid, but it is almost impossible to do without them and be com. fortable if both a kitchenmaid and scullery
maid are kept, or if a large household has to he cooked for and the work entails a great deal of washing up and preparation of food. A gond sized kitchen is often a practical necessity in the case of the houscwife with young children. She wishes to have them under her eye, but not under her feet while she is working. Some of the newer houses are provided with an alcove for meals in the kitchen which is a great asset and can be utilized as a playroom for the children during the morning's work. Where a maid is kept such on alcove forms a pleasant sitting room recess.

Walls and Ceiling. The decoration of the kitchen has advanced of late years in practical and yet attractive fashion. Washable papers, good enamel paint, tiles and their substitutes are well employed in a room where hygienio cleanliness is the firet cousideration. There is no need for too much white in a kitchen. If on the northern or sunless side of house, or flat, in spite of the glow from cooker or range, an all white kitchen will look cheerless. On the other hand, there is something suitable a hout a cool scheme, such as blue or green with black and white. Glossy effects are excellent in a kitchen. A dado of white tiles with white enamelled walls and ceiling is refreshingly clean if the rest of the woodwork is painted blue, a black and white linoleum being chosen for the lloor, and black and white check gingham curtains for the window. The printwork can be picked out with black and the architrave of the door can also be black to give character to the room if a large onc The saucepan stand and various containers could be enamelled blue, a gaily coloured pattern chosen for the dinner service on the dresser, while rush mats would add further brightness to a cheerful scheme.

There is an excellent and inexpensive substitute for wall tiles. This is an cnamelled zinc product of British manufacture and may be used for wall tiling or for lining a cooking recess and for a sink surrourd. These tilings need not be necessarily in white, but are obtainable in attractive tints. Another form of imitation tiling which enables the housewifc to produce a charming effect at a small cost is obtainable in sheets which are applied to the walls in the same way as an ordinary paper. This tiling substitute can also he washed and wears excellently. It is infinitely more pleasing

Kitchen. Fig. 5. A well arranged small kitchen with tiled walls. recessed gas cooker, convenient shelves for saucepans above it, and ample cupboard accommodation

Iluninhrey ،f Vera Joel

Kitcuen. Fig. 6. Showing a kitchen cabinet in oak fited with Lour bin, ertending porcelain table, cupboards and drawera, conveniently placed near the larder
than the old-fashioned varnished papery which are still obtainable in tiled patterns.
Ancther suitable wall decoration is a washable paper which has a mat surface and is waterproof. Stains can be removed from such u paper by means of a damp cluth. It is made in a variety of colours and patterns. l'here is a preparation for rendering any wallpaper washable, which can he used by a decorator without alfecting the appearance of the wall covering. Ceilings are best treated with enamel, but, failing this, one of the flat wall paints will be found more durable than ordinary whitewash.

Furnishing and Floorings. Where a kitchen is well lighted and also used for meals, built-in furniture catn be stained oak brown. W'indsor eliaira and the table can also be of oak, but a porcelain enamelled top may be fitted to the table if it is to be used for culinary prepara. tions. Such tops are obtainable in white or in colours. Very practical kitchens are equipped with these tops, made to measure for the table surfaces of dressers, draining boards, shelves, window sills, wall slabs cupboand tables and Iarder shelves. The surface is especially prepared to withatand hot plates, dishes or cookery utensils. No scrubhing is required for cleansing, but merely a rub with a damp cloth.

Where space saving is important a meat safe and table combined is a good idea. In some thats the larder is merely a shallow cupboard with shelves and not well ventilated. The provision of a meat safe table, with steel cnamelled top and having a cuphoard below which is zinc lined, with a ventilation regu lator is therefore an excellent solution for storage of hot fond, which must never be put into a refrigerator. The latter piece of kjtchent furniture has become more usual of late years. Models are obtainable which can beroun by gas or electricity and some by paraffin oil, making it possible for people in the country to liave refrigeration in their kitchens where neither gas nor electric power is a vailable. The more costly pieces of kitchen furniture are obtainahle by paying a small suni down and then by monthly inatalments.

The all important natter of the range or cooking stove is discussed in detail under the various headings, Cooker, Range and Stove. The use of fuel or power is frequently dictated by local conditions and where electric power is cheap it has certain advantages on the score of oleanliness though in a large country kitchen the range provides a cosy centre to the home. Norlern coal ranges are excel lently equipped and there is also a cooking stove which burns small coke or anthracite This is an efficient stove and needs only to be filled once and riddled twice in twenty-four hours. It also provides about ien gallons of hot water for washing up.

Kitchen Cabinets. Kitchen cabinets have increased in number and practical advant ages The one illustrated in Fig. 6 takes the place of a store cupboard and has an extending porcelain table, which is ideal for pastry making and requires no scrubbing. The position of the cabinet in this case has been determined by the larder, which is seen on the right, and within easy reach of culinary operations Additional side units, as seen in Fig. 7, make a kitchen cabinet quite complete with ample accommordation for all cleaning requisites on one side and cookery utensils on the other. Cubinets may have vegetable racks, metallined bread drawers, egg racks, tlour bins, and baize-lined cutlery containers. One model has an automatically sealing bread and cake bin and also a detached steel enamelled tup table with extra chopping board. This table can be folded away inside the oupboard when not required. Such cabinets may be in oak or finished in enamel to natch the woodwork of the kitchen. In any cesc, the inside is linished with glossy white enamel.
Where there is good cupbosid and larder accominiodation the kitchen cabinet is often
dispensed with. The dresser may be made more practioal by having the upjer shelves fitted with glass doors so that the dinner service need not be exposed to the dust of the kitchen. Cupboards underneath the dresser ary also is space-saving iden and provide shelf room for kitchen orockery and tools. For storage purposes, if will space permits, a long shallow oupboard is better than a narrow deep one. In the former it is possible to see at a glance what is on the shelves, whereas in the Intter type of cupboard articles get puslied to the back out of sight. A washing up machine is very useful, but almost indispensable within reach of the sink is the plate rack, with compartmients of various sizes, made to hold cupe and saucers as well as p!ates and dishes. Another essential article is a clock. Waslable porcelain kitchen scalcs are more hygienic than the old-fashioned ty pe.

A good method of disposing of rubbish is a vital point of kitchen equipment, especia'ly in a flat. A sanitary receiver which is always covered is almost a necessity even where the private dustbin is lucnted just outside, as constant going to this causes delay and is tiresome in bad weather One with a detachable interior pail and an outer case of white enamel to which the lid is attached is a con venient refuse receiver. The lid opens by means of a foot pedal. A vegetiable rack and a tripod saucepin rack are inexpensive items which should be provided. Pans should never be stored in a cupboard, but kept where a current of air reaches them.

In many modern houses jointleas composition llooring is laid in a plastic state which has a surface that is easily cleaned. Tiled, brick or stone Hoors are all attractive and oleanly, but they are cold to the feet, and rush or other suitable mats should be provided. Rubber floorings and inlaid tiled linoleums of a good quality are suitable for boarded rooms. Plain lark colours are not a goad choice for these last ns they show marks and footsteps. Curtains can be of any washable material, but glazed chintz, gingham or coloured linen always look well. There is also a liking for rubberized material and for American oloth for casement curtains. Unless the kitchen is of the old-fashioned picturesque country type, or is used as part living-roon, when the real domestic workshop is the scullery, a certain severity is best in furnishing accessories

Kitchen. Fig. 7. Another type of cabinet in oak, with side units. The left-hand portion has shelves for cookery utensils, that on the right is made for vacuum cleaner, brooms and brusbes Courlesy of Triumpli Cabinel Horlis. Le.l.

Only practical curtains should hang at the windows unless the kitchen is overlooked, When starched mualin glass curtains may he provided, preferably with rods top and bottom to keep them trutly in place Checked American cloth is n good material for table covers and terry cloth for chair cushions

Illustrated Suggestions. Our first photograph is of a kitchen in a small country house fitted with modern.labour saving convenience and yet retaining a cosy look with its oak coloured woodwork, tiled flooring and chintz curtains. The porcelain sink possesses a doulile draining board Electric power being available, there is an electric cooker and kettle. In the tiled recess beside the cooker is a boiler for the hot water services and small radiator system. A little sitting room for the maid opens out of the kitchen. The dresser is fitted with cuphoards below, has sliding glazed doors above and a shelf specially fitted to take the row of gilded containers for dry ingredients. There is ample other cupboard accommodation on the wall not shown in the illustration.
Completely equipped with electric laboursaving devices the kitchen depicted in Fig. 2 is admirably designed to make the most of a small space. It possesses a British made refrigerator, an electric cooker, boiling plate, water heater, washer and iron. The conveniently deep sink is well lighted; the plate rack is on the wall at right angles (not seen in the photograph), and the vitreous porcelain kitchen table is just discernible on the left. Green enamel surmounts the dado of glistening whitc tiles on the walls. A kitchen cabinet opposite the window with cuphoards to contain china, glass, silver and drawers for cutlery and a fitted cupboard for brooms complete a compact and thoroughly efficient furnishing scheme.

## An Elricient Town House Kitchen

A larger kitchen of a town house is shown in Fig. 3. The range has been removed to make room in the now tiled recess for two hoilers. One of these is for the domestic supply of hot water and the other for central heating. The enamelled gas cooker is provided with a ventilating canopy. There is a seven-tiered saucepan stand and the porcelain sink is under the window. Beyond, not visible in the picture, is a teak wood draining board and a plate rack. The kitchen table top is half of marhle, which provides an ideal surface for pastry making. The enclosed dresser is opposite the window and there is a white enamelled clock and an enclosed electric light ceiling fitting.

A most efficient domestic workshop is shown in Fig. 4. Here the equipment is suitable for a Hat or house where gas is laid on. The double sink with swivel taps adınits of washing and rinsing at the same time. The high dado is composed of tiles on the wall by the elevated gas cooker (note the hoorl under which is the special ventilation grating and fue taken through the wall to the chimney) and the sink, while blue-green enamel is used for the dado on the other walls surmounted by pale primrose yellow for upper walls and ceiling. There are nuslin glass curtains and gingham practical ones. The meat safe table between the windows is zinc lined and has a vitreous jorcelain top impervious to heat. There is a gas radiator to warm the kitchen when the cooker is not in usc, and the central table is of the modern dual purpose type with fitted drawers for cooking implements and cutlery and also possessing an extra deal leaf, which renders it suitable for pastry making on the porcelain surface or for chopping on the wooden one.

An attractively designed small kitchen is shown in Fig. 5, which is suitably furnished for a flat. The cooker is recessed, the pot shelves are conveniently arranged, the taps are porcelain finished and there is excellent cupboard nccommodation. The tiled walls could be less expensively treated by one of the
imitation tilings mentioned earlier in this article. The flooring is a jaspé linoleum In light grey this tones well with pale blue tiling, dark grey enamelled woodwork and aluminium saucepans.

Culinary Requisites. Besides decoration, and the more insportant furniture, there are a number of service aids and cooking utensils to be thought of when equipping even a small kitchen. Aluminium has taken the place of other metals to a great extent, but an iron frying pan is a convenience, as iron will stand a grenter amount of heat than other metals, and boiling fat reaches a very high tempera. ture. Fireproof china and glass are also used extensively in cooking, and these wares have the advantage that they can be brought to the table, thus obvinting the necessity for extra dish washing

The articles required for equipping the kitchen must vary with indivi-
dual needs. It is a wise rule, however, to dual needs. It is a wise rule, however, to
have a few things and renew these as occasion demands, and to have the simplest equipment possible.

For a small family the following equipment is suggested as a minimum : A set of pans, one of each size ; $\Omega$ small and a large frying-pan; a preserving-pan, if preserves are to be made at home; a medium-sized fish-kettle, which can also be used for boiling hams and large puciclings; a couple of kettles, an earthenware casserole, some oven glass ware and one or two small fireproof dishes. A set of basins and jugs for milk, two or three pudding dishes, a jelly mould, wooden spoons for mixing, a soup strainer, colander, mincing machine, grater, pastry board and rolling pin, with varioussized cake tins and a Yorkshire pudding tin

Cutlery and Containers. Knives, spoons and forks for kitchen use and special culinary purposes should be included in the equipment.
A stainless steel saw edged tomato slicing and

## Kitchen Gardens and Allotments

## Details and Plans of Two Serviceable Plots

Associated with this subiect are the articles on the vegetables nnd fruits grown in a garden of this kind, e.g. Apple; Beans; Cabbage; Potato. Sec also Digging. Fruit; Insecticide; Manure

The successful management of vegetables depends chiefly on thorough cultivation of the land, a correct rotation of crops, and the choice of kinds and varieties whieh will maintain an unbroken supply of produce. Those who cultivate vegetables to perfection for exhibition purposes trench the land from 2 to 3 ft dcep, but that is costly and laborious work and unnecessary to ensure vegetahles for an average household.

Copping a vegetable garden is $n$ most important operation. The principle of rotation is simplicity itself, leing inerely a system which prevents the growing of crops belonging to the same natural order repeatedly year after year in the same ground. The potato, however, is an exception to the rule, becauso good crops of potatues may be raised from the same plot ycar in, year out. always provided there is a change of seed tubers every second season. An easy way to ensure proper rutation is to divide the gmund into four portions. Planting will be as follows:
plot 1.
Wirst year.-Peas, beans, celery, leeks
Second year.-Carrot, paranip. beetroot
Third year.-Cabbage, caulillower, kale, Lrnccoli. Brussels sprouts, onlon, lettuce, turnips
Fourth vear.- Potatoes
Fourth year.-Potatoes

Kitchen. Fig. 8. Kitchen containers in alazed earthenware obtninlifting knife, a fruit and regetable slicing knife, an apple parer, a meat chopper, tin opener, grape fruit cutter and corer, kitchen scissors. a juice extractor and a variety of pastry and vegetable cuttery are a useful collection. There are many other devices which can be acquired as neerl and occasion arise, such as fruit slicing, bread cutting and potato mashing and peeling machines, but these are only essential in the larger household.

Glass containers for dry ingredients are excellent for use in a store cupbonrd, as their contents are quickly seen, though they should also be clearly labelled. Enamelled or gilded containors look well, when bought to match, in a row on a shelf or on the chimney piece. The newest and most attractive, however, for the small or less severe type of kitchen are tho ones illustrated in Fig. 8. In creamy white highly glazed earthenware, decorated with quaint designs and delightfully shaped, these are obtainable for dry ingredients and for condiments.

Firat year.- Parmiip: Parrot 2.
Firgt year--Parnilip carrot luetront
Second vear.-Cablange, cantllower, kalo. Brussels prouts
Third year.-Potatoes
Fourth year.-Bcans, peas eclery, leeks Pliot 3
First year.-Cabbaige canlitlower, kale druasels sprouts
second year.-Potrtome
Thiril ycar.--Pcas, brans, celery, lecka Fourth yeir.-Carrot, beetroot parsnip Piot
Firgt year.-Potatcke
Second year.-Pcesk, heans, celerg. lec
Third vear.-Carrot. heetroot, paranip prouts, kale, turnip. onions, lettuce

It will be noticed that in the diagrams accompanying this article departure has been made from the above by suggesting a thrcecourse cmpping system. This scheme will be found equally satisfactory, and gives opportunity for devoting one of the four centre heds to the cultivation of small fruits. If the four-course system is preferred, however, ample space will be found in the marginal or outside borders for growing the small fruits shown in the plan.

Planting of vegetsbles is another matter which should receive much care. Endeavour
to plant in showery weather, always use the crops always min off the end of the an root o. garden line to guide sowing or planting in scedings, as this wist, $\notin$ or.-Sow in Feb. to April, 1 in. deep in straight lines, and do not cramp distances Irills 1 ft . apart

Plant not less than 2 ft . apart all round. Four crops of cabbage may be produced, sowing times being August, March, April, and May. When transplanting green

 Kitchen Garden. How to lay out a garden which measures 132 by 83 ft . Three plots are devoted to vegetables, kitchen garden measuring 148 by 98 ft., showing a similar rotation ol crops and fruit
crops as rhubarb and herbs, it affords plenty of room for seedlings of various kinds.

By the middle of August the following crops hare prohably been cleared off the ground : early potatoes, peas, broad beans, spring cabbages, early turnips, early salads, spinach (not spinach beet), and shallots. Early varieties of pen are best for small plots The places of the early crops have been taken by winter greens, autumn caulillowors, lecks, late turnips and vegetable marrows. There may be a piece of neatly raked ground sown with spring cahbages. autumn onions, and lettuces.

Now let us look at our table for the second half of the season.

| Crops at mid-August |  |  |
| :--- | :--- | :---: |

On a $20-r o d$ plot everything is easy as far as allotting space is concerned. There can be 10 rods of potatoes, with a change of ground every year. Practically everything suggested for the 10 -rod plot can be carricd out, but on a larger acale.

KITCHENMAID: Her Duties. A kitchenmaid is, for all practical purposes, an assistant to the cook, and her duties are mainly confined to the kitohen and the preparation of meals. In large establishments two or more kitchenmaids are kept.
Her duties vary with the size of the household, but she is generally expected to cook the regetables and such foods as do not need a high degree of akill, and to prepare the materials which the cook needs. Much of the washing. up usually falls to the lot of the kitchen: maid. In some establishments the cooking for the other servants is done by her. Many girls who aspire to become cooks gain their early experience in this way, and a kitchenmaid who has served under the cook of a famous establishment will find the training there valuable if she seeks a post of that kind for herself

Kitchenmaids can be obtained, like other servants, by advertising in the newspapers, or by visiting a registry office. They should be insured against accidents that may happen to them in the course of their work, and also under the National Health Insurance scheme. See Cook; Insurance; Servant.

KITCREN RANGE. This contains an enclosed fireplace, with one or more ovens at the side, and a flat top, wherein are a number of holes, with removable covers; this structure enables the fire to be ferl and cooking utensils to be placed thereon. There is a great variety of ranges, and they are made to suit all types of houses, from the largest to the smallest. Some firms make a speciality of ranges suited for the tiny kitchens found in flats and amall dwellings generally. See Cooker; Range; Stove.

KITCHEN TABLE. Fig. $l$ is probably the simplest method of construction for a kitchen table, since it involves no mortise and tenon joints. Dimensions are given in Fige. 2 and 3. The legs are cut from 2 in . deal squares to the height of the table, less the thickness of
the top At the top end of each leg on two strengthened with corner blocks rubbed in at adjacent sides mark with a square the width the top. These blocks should be planed to of the rails, and with a gauge set to half width so as to line up with the inner surface the thickness of the rails, i.e. $\frac{1}{2}$ in., mark the of the leg and act as guides. The drawer may ends of the legs, thus indicating the width be dovetailed or rebated. The top is fixed and depth of the shoulders to be cut to take the rails.

The two surplus portions of the legs may be cut away with a tenon saw, as is shown in Fig. 4, and the !egs then tapered from below the shoulder $\ddagger$ in. on each side. The rails should then be prepared from 1 in . stuff, cutting them off square at each end. Note that the side rails reach only as far as the recessed portion of the leg (Fig. 4), while the end rails are sufficiently long to line up and cover the end grain of the side rails. The undersides of all rails are bevelled off as shown, and holes to take the screws bored, those in the end rails being farther away from the end so that all the screws will go into the leg. The whole is screwed together, fixing the side rails on first (Fig. 4), and corner blocks glued in for additional strength. The top, of course, will have to be jointed up to obtain the width. One-inch stuff should be used, and this should be fastened down to the framework by pocket screwing, as shown in Fig. 5.
Another Type of Table. The table in Fig. 6 has a better appearance and is fitted with a drawer, though this may be omitted. The necessary dimensions are indicated in Figs. 7 and 8. The lege are cut off, and the top ends marked out for the mortises. If a drawer is not required, all four legs will be marked alike, otherwise the drawer end will be fitted with two rails, as in Fig. 3, the lower one being tenoned in and the top dovetailed. These two rails should be about $\frac{1}{2}$ in. wider than the legs, and are cut round the latter as shown.
When all the joints have been carefully cut, the whole is glued together, taking the two sides first, and allowing them to set before glueing the remainder. When dry, runners are fixed, Fig. 10, being nailed, glued, and further as before with screws fastened from underneath. See Drawer; Table

KITE : How to Make. The best-known simple kite is the pegtop pattern, shown in Fig. 1. It is of fairly small sizc and covered with tissue paper gummed to the frame; such a kite, a foot long, can be flown on stout thread as a line. The frame consists of a relatively stiff wooden backbone, and a thin, llexible piece of split cane bent to a semicircle by a string arranged like a bowstring. The centre of the bow is lashed to the top of the back bone, and strings are run from the horns of the bow to the bottom of the backibone; these strings, however, are not tootight, as the strain is to be taken on the bowstring.

After the frame is covered, a piece of atring double the length of the kite has its two ends tied to the backhone, one near eachend This is the hridle, and the kite line is tied to it so that the upper arm of the bridle is shorter than the lower. The rig of the kite is completed by a tail, to which convention consigns the form of a string two or three times the length of the kite, tied to the bottom of the back bone and having screws of paper tied to it at intervals; a strip of fabric, however; answers the purpose equally well, being nore durable and less trouble to fix.

Home made pegtop kites sometimes have a rigid wooden member instead of the bowatring. This is a mistake, as it tends to prevent the horns of the bow from bending backwards under the air pressure, as they must do to give the dihedral angle effect needful for stability.

The adjustments that have to be made consiat in varying the amount of tail carried and the point of the bridle at which the line is

Kitchen Table. Fig. 1. Simplest form of kitchen table. Figs. 2 and 3. Side and end elevationg, giving, measurements. Fig. 4. Detail ol joints. Fig. 5. Method of fastening table top to framework. Fig. . 6. Another type of table, fitted with a drawer. Figs. 7 and 8 . Side and end elevations. Fir. 9. Detail of drawer ftting. Fig. 10. Runners and corner blocks in drawer aperture
adjustments are made suit. able to the speed at which the wind is travelling

The pegtop pattern is in convenient in large sizes, as it cannot well be taken to pieces for travelling. A modified form of it is therefore used in which the bowstring is replaced by a straight and particularly flexible stick and the bow omitted, the frame thus consisting of two wooden members arranged in the form of a cross, with a surrounding edge of string tied in succession to the four ends of the sticks. If this frame is covered with a light cotton fabric it can easily be arranged so that the sticks may be removed and the whole rolled up for trans port. The same adjustments as in the case of the pegtop kite are needed in order to secure for it a satisfactory stability.

Ań Eddy Kite. A more ambitious form of portable kite is the Eddy type. In this the frame consists of two sticks of equal length

E F, can be made from any very light material such as cambric or madapolam. Cut two pieces each 6 ft .3 in . long and 13 in . wide. Turn a hem on each side, and sew it twice to give the greatest strength. Take care not to cookle the material; the flatter the bands the better they will be. When hemmed, the bands should measure exactly 12 in . in width. Now overlap the ends and sew them together very strongly, thus making two endless bands. Lay them flat on the table and then Hatten them out, creasing the folds. Have one fold at the joint of the ends. Next fold over again, thus dividing the piece into four and again press at the folds. These 4 crcases will show just where to fix the 4 longerons, one being tacked on with 5 brass tacks to each corner or crease; and on the inside of the band.

Notch the ends of the diagonal struts, and glue a bit of tape around them near the ends, to prevent splitting. The length of these struts arranged in the form of cross, the two should be such that when they are in place being lashed together at their meeting point, they will be slightly bowed, and thus keep the which is one-fifth of the !ength of the backbone bands taut. Tie the struts together at the from the top end; a surround string is fitted centre with thin string, and to prevent them as usual. The dihedral angle effect in the slipping from their position glue or nail some Eddy kite is obtained by bending the ends of the transverse stick backwards and holding them in this position by a bowstring, which, of course, lies clear at the back of the kite. The cotton covering is made rather wider than the frame, so that it is rather baggy, and bellies out like a sail when the kite is flying. When properly adjusted these kites do not require a tail at all; the adjustments consist in varying the point of attachment of line to bridle, and in regulating the tension in the bowstring at the back of the kite.

Box Kite. Named from its rectangular form, the box kite is an excellent fyer, and can easily be made. The sizes given have proved successful, but can be modified to suit individual requirements. Constructional and other details are made clear from Fig. 3.

The longerons or corner pieces, A B, are made from $\frac{8}{8} \mathrm{in}$. square stripwood, obtainable at most model shops, or may be cut from a piece of pine in. thick, and planed up true. These pieces should measure 42 in . long. The diagonal struts, C, are approximately 26 in . long and made from similar material, but these

tile blocks of wood to the longerons. By leaving the struts loose the kite is easily dismantled for transport purposes.

A bridle of stout string is securely tied to one of the longerons, 6 in . from either end. The kite line is attached to the bridle with a reef knot and bowline knot to permit of its being adjusted on the bridle, the best positions being found by experiment. In general, the lighter the wind the shorter the front line of the bridle. In a very strong wind it might be advisable to attach the kite line directly to the longeron, just behind the front band.

KLONDIIRE. This is a card game for one or more persons. It is played with the ordinary full pack of $5 \underline{2}$ cards. The cards are shuffled and cut in the ordinary way, and the first card is turned face upwards on the table. To the right of this card, but face downward, are placed in a row six cards. Immediately below the left-hand card of this row of unexposed cards is placed another card, face upward, and five more cards to the right of it, below the top row and face downward. So the next row has one faced card and four face downward, and so on until there are seven faced cards and twenty-eight cards in all on the table in the form of a right-angle,

Any aces which have been exposed are taken from the lay-out and placed elsewhere on the table to form the foundations on which to build. Upon themare placed cards in sequence, two. three, fourking. When any card of the lay-out is uncovered by playing away the bottom of the row, the next card in that vertical row is turned face upward. Cards in the lay-out are built in descending sequence, king, queen, jack, etc., to
the two, and alternate red and black suits. The remainder of the pack not put down in the lay out is dealt out one at a time, and any card exposed may be used either on the lay-out or on one of the foundations. Spaces in the lay. out can only be filied with kings. If there be more than one card at the bottom of a row showing, all must be moved together or none.

A player pays fifty-two counters for his pack and receives five counters for every card he succeeds in getting on the foundations, running through the pack once only.
ENAPSACE. This is a form of bag used by soldiers, soouts, and travellers on a walking tour, to hold the necessary articles of food and clothing. It is carried on the back, supported by shoulder straps, the usual type being equipped with a long, loop-like strap, attached to the top of sides, to pass under the armpits and over the shoulders round the back of the neck.

Enapweed. The common name of the perennial Centaurea. See Comflower; Sweet Sultan.

ERNEE. This joint is formed by the junction of the lower end of the thigh-bone, the femur, with the upper end of the large legbone, the tibia. The patella, or kneecap. glides over the front of the joint. The bones are held together by a number of ligaments

The knee is much exposed to injury, and this may be followed by synovitis with an accumulation of fluid in the joint, on which the kneecap is felt to ride or float. This requires rest and perhaps painting with iodine to promote absorption. The knee should also be tirmly bandaged with a flannel or a woven elastic bandage. Very often it happens that when one gets up and about the swelling recurs, but with the daily application of the bandage this gradually diminishes and disappears.

Not uncommonly one of the cartilages is displaced, in football or similar accidents. The knee is locked in a bent position and is very painful. When put right it may easily recur, and a protective cap should be worn. See Dislocation ; Housemaid's Knee; Knock Knee.

ENEJLING PAD. Pads or mats used to kneel upon while floors are being scrubbed serve to protect the knees from cold, damp, and soreness. They are especially necessary on tiled floors, and should be thick enough to prevent the cold from penetrating through. Several thicknesses of folt or some similar material make a good pad, but the rubber kneeling mats obtainable in kitchen equipment departments of stores are the best for indoor and outduor use, being dampproof.

ENIFE : For the Table. It is claimed for some of the newer types of stainleas steel table knives that they never require re-sharpening. These have serrated edges and include dessert and bread knives.

Stainless steel knives which are not thus guaranteed need a special form of sharpener. The best is one which has two grooved revolv. ing rollers. The edge of the knife is placed between these two rollers and drawn backward sharply. Stainleas steel will become soratched somewhat easily. To clean blades of the stainless variety they should only be dipped in water and wiped. The placing of handles of knives in hot or cold water should be avoided, as this usually causes early discoloration.

Hardened steel knives which are not stain. less are to be had in various qualities. The cheap varieties are fitted with what is known as singleshear stoel blades, but the higher priced and more durable qualities are fitted with doubleshear steel blades, which are cross-rolled.

Handles for Kinives. The best handles for knives in everyday use are those which very closel y imitate ivory. There are many materials which give quite an excellent reproduction of ivory, but as long as cutlery is purchased from some well-known firm that specializes in Sheffield-made cutlery there need be very little

Knite Box. Fig. 1. Example with marquetry of satinwood, mahogany and sycamore. Fig. 2 Urn-shaped bor in painted satin wood. Both of 18th cent. English

Victoria \& Albert Aluseum
xpansion or owing to the varying temperatures
A simple test can be applied to assure one self of the quality of a metal-handled knife. The end of the liandle of the knife should be held lightly bet ween the finger and the thumb, and the point of the knife should be sharply tapped on some hard surface, such as china or glass. If the blade is hard soldered to the handle the metial will ring almost like a silver or gold coin when it is tested. If a knife is fitted with an inferior tang, and the metal blade is filled with a composition, there is a dull sound when the above test is applied.

Metal handles for knives are made in Georgian styles : also many continental styles of knives hise come into vogue. The difference between those and the usual English patterns is that the continental styles of knives are usually fitted with shaped hlades.

Cleaning the Knives. Knives which are not of stainless steel can be cleaned with a damp rag dipped in powdered batlibrick or by means of a knife hoard or cleaner.
The latter is prefershle; but a specially prepared powder should be used with the board. It is well not to wash knives in hot water, as if the blicdes are heated the metal tanga expand and the handles may split. Many persons try to avoid this by immersing the hludes only.

Ivory and bone liandles should never be washed with soap or in lasewarm water, as this causes discoloration. It is better to wipe them with a soft eloth that has been moistened with peroxide of hydrogen, and afterwards place them in the sun, which will whiten the ivory or bone.

Repairs to Knives. The handle of a carving or table knife may possibly become slack, and when it does it should be immediately eeen to. If the blade can be removed from the handle, it will be evidence either that the tang
fear regarding the discoloration of handles, as all the best firms use a reproduotion of ivory which will neither discolour nor split ; wherens with real ivory handles, unless of the finest grain and quality, there is always a risk that theivory will crack owing to the
is broken, which can be seen by inspection, or that the holding pins have sheared or hrolien. If the latter is the casc. carefully punch out from the handle the remaining portions of the pins, and do likewise from the tang, and test to see that it is atraight and true. Next prepare some cement comprosed of melted resin, pour this into the hole in the handle, and having pre viously warmed the tang, insert it in place and hold it in position until the resin has set. Then drill out the resin from the pin holes and inake them all secure with new pins of brass or Germitn-silver wire. They only need very slight riveting in order to make them secure Xylonite-landled carving knives and forks frequently have serrated tangs, which are difficult, if not impossible, to remove. Other types have through tangs, which ure often riveted on to a washer or cap at the end of the handle. This has to be removed before the knife can be repiired. A slight slackness can he taken up by further riveting the end cap. If the knife or fork is of rustless steel it will need especially careful handling, as this matcrial is much harder and more prone to break while being repaired Drilling is inore laborious, and requires plenty of lubricant on the drill to keep it cool and cutting freely. Otherwise similar nethods can be applied. This second style of case is illustrated in lig. 2. It is constructed of satinwood and heautifully painted

## Knitted and Stuffed Toys

Instructions for Making Nursery Favourites
Other articles in our work which deal with the construction of playthings for small children are
Dolls and their Homes; Noah's Ark: Toys. For related information consult also Crochet and the subsequent entry under the heading Knitting

To knit delightful, inexpensive and cuddle some toys which really appeal to babies and very young children and are also most sale. able articles on the nursery stall at a bazaar requires no special skill in arts and crifts and only a simple knowledge of knitting, which can be quickly acquired by studying the article on that subject which follows this one. The success of a stuffed toy depends largely on the way it is stuffed. Kiapok is used for these, and 1 lb . bags cost from 1 s . fid to 2 s . It is astonishing how much stufting is required in order to make a toy really hard wearing and nicely shaped.

The five toys illustrated and described oan be made up in other colours and the sizes varied. We have to thank the Best Way Serics for kind permission to reprint some of their excellent ideas here. The abbreviations used are K., knit ; tog., together; st., stitches; inc., increase : p., purl; lps., loops: rplt., repeat.

Wilfrid the Rabbit. The first toy is that well established favourite 11 ilfrid. He costs about 3 s . bid to make and requires $2 \frac{1}{2} \mathrm{oz}$. of pale blue and | oz of white teazle wool ; one pair of knitting needles (steel) size 11, 2 black shoe buttons Kapok for stuffing.

The work begins at the base wf the hody. 1st row. With the bluc wool cast on 14 st k. 30 rows. 31 Rl oo:0. Inc in flrst st. (15). 32 nl roov: lnc. in last st. To make up the monkey, sew up the borly to the throat. Sew over top of, heal, and along the back, leaving about 2 inches open for stuffing. Sew in the fawn face, placing where stitches were cast on to the neck. Sew along the sides. Sew up the arms and sew into nrmholes. Sew up the legs and sew in the fawn soles. Sew legs into the openings. Turn the work. Stuff well with kapok, pushing the kapok well into the head and limbs with a knitting needle. Sew up the opening that was left for stuffing. Sew on the ears. Sew in the shoe buttons for eyes, mark the nose and eyebrows with fine black wool. Mark the mouth with red wool. Sew up the tail. Stuff lightly with kapok, and sew on to animal. Mark the hands with black wool. Sew up the red cap, drawing all the stitches together Make a tassel of a few strands of black wonl Stitch the cap on to the monkey's head.

## KNitting: Stitches and Patterns

How to Obtain Both Simple and Fancy Effects
This general outine of the principles of knitting suggests, reference to the entricson Glove;
Knitting consists of loops or stitches of the right hand, and allow it to pass over the formed by means of two needles when working a flat picce, or four or more needles when working in a mound. Through connecting the stitches in one continuous piece an elastic fabric can be produced. In its earliest stage knitting $u$ as practically limited to making stockings in a fint piece on two needles, which were afterwards scwn up; from this, knitting stockings in a round was evolved, avoiding the back seam, and fastening off at the toe

The first process is casting on the stitches Hold the short end of the wool in the left hand, take the main lencth in the right hand and pass the latter over the short end, so that it forms a loop. Bend the main length of wool under this loop, keeping the latter in position with the thumb and forefinger of the left hand, and pass it up through the loop so that it forms a complete stitch, as in Fig. 1. Pass this loop on a knitting needle and draw up the wool closely until the loop just fits the needle. Huld this needle in the left liand, and take the working needle in the right hand. Twist the length of wool round the third finger first finger of that hand as the work proceeds. The tightness or looseness of the rool and the manner in which it is held over the third finger determine the tension of the knitting, and it is only by an even tension that good work can be produced. In working, the stitches should be kept near the points of the need!es
One stitch is now on the needle. To make further stitches, put the right-hand needle from left to right through the loop on the left hand needle, pass the wool round the point of the right needle, bring it through the single loop, lig. 2, and draw it out until it is long enough to pass it over the point of the left-hand needle, when another atitch will be produced. Continue this uperation until enough stitches are on the ncedle.

Plain and Purl Stitches. To work the first row, now put the needle in the stitch from left to right, and pass the wool round the right-hand needle as described for casting on Draw the loop through, and with the right hand needle pass the first stitch off the left necdle, as the new stitch now rembins on the

Knitting. Fig. 1. How to make the first stitch out of a loop in casting on. Fig. 2. Making the second stitch with the needles. This also shows how the right-band Angers rerulate the tension of the wool during work

Knltting. Fir. 3. Plain knitting, producing garter stitch, in prorress. Fig. 4. Purl stitch, Arst stage, with working thread in front of needle. Fig. 6. Porl stitch, second stare. wool round needle. Fig. 6. Casting off
right needle. Repeat this action to the end of the row, and if these rows are continued little ridges will be seen on the work, two rows making one ridge. Fig. 3 shows this stitch, known as garter stitch, in progress. To make a neat edge on a piece of knitting, work the first row through the back of the loops.
The next form of knitting is known as purling. This is used to produce the reverse side of the stitch, so that if stocking web is wanted and the work is being done on two needles, the hack row must be purled. Put the righthand needle through the stitch from right to left (Fig. 4). and keep the working thread to the front of the needle Pass the thread over and round the right-hand needle and back to the front ayain; then let the right hand needle pass through the loop of the stitch, while the latter stips olf the left-hand needle. Fig. 5 shows the sccond action, with the wool round the needle

Casting Off. The chief method of casting off the stitches is shown in Fig. 6. Knit two stitches as usual, then put the point of the left-hand needle, from left to right, through the first stitch knitted, and lift it over the second stitch and the point of the right-hand needlo. Knit the next stitch on the left needle and pass the first one over the second. Repeat this until there is only one stitch left ; then cut the wool and pass it through the remaining stitch, draw it up sccurely, and fasten in the end with a darning needle.
If a loose casting off is wanted, knit two stitches together by inserting the needle from right to left through the two stitches together instead of one only ; then knit them in the ordinary way, when one stitch will result on the right-hand needle. Now pass this stitch back again to the left-hand needle and knit it together with the next stitch, and again pass the resulting stitch back to the left-hand needle, and continue to the end of the row, when a loose edge will be the result This particular edge bears a reseniblance to $n$ cast-on cdge as near as possible.

Increasing and Decreasing. The next step to learn is how to increase and decrease stitches for the purpose of forming a picce of knitting into a different shape, such as the leg of a stocking that has to be narrowed towards the ankle. Therc are two methods of decreasing At the beginning of a row the decreasc is genorally formed so that it turns
 towards the centre of the row. thus: slip one stitch by simply passing it off the leff. hand needle on to the right, without passing the thread round it. Knit the next stitch, When there will be two stitches on the right-hand needle, and lift the slipped stitch over the knitted one with the point of the left-hand needle. This is usually re-

or similar garment this does not make a neat scam when the two edges are sewn together. Fig. 7 shows a piece of plain knitting decreased at both enils of the row
To increase, a stitch can be knitted into twice to make one extra. Knit in the usual way through the front of a stitch, then knit again through the back of the same loop befors passing it off the left-hand needle, and two stitches will result Another method is to lift up the loop immediately under the first stitch on the left-hand needle and knit it ; or knit one and purl one in the same stitch.

A made stitch is not really an increase, as this term should be used in fancy patterns only, to produce a hole and usually a stiteh is decreased directly after it to restore the balance of the stitches. To work n made stitch before a knitted stitch, simply bring the wool to the front of the needle so that it passes over the latter when knitting the next stitch, and a straight loop results on the right-hand needle. When working the next row this made loop is knitted like an ordinary stitch, and a complete new stitch results. To make two stitches in this way the thread is passed mund the needle twice, then when working the next row a stitch must he knitted and purled in the made loop, otherwise one of the made stitches will be lost. liig. 8 shows an openwork design that is based on inade stitches with plain stocking web rows between.

When knitting in a round for such articles as stockings or children's gaiters without side seams, the stitches must be divided equally on three or more needles, and a fourth one taken for the working needle. At the end of the round the wool must be drawn up very closely so that a gap does not occur between the needles, and when beginning a new neerlle put the latter in the first stitch of the next needle behind the needle that has just been worked, otherwise a little gap will appear at the beginning of every fresh ncedle, and this would produce a ladder right down a stocking. A flexible circular wire with points at both ends is often usell for knitting jerseys and other tubular garments.

Ribled knitting is used for the tops o stockings, hems and necks of jerseys, for slceve edges, and for any position where contraction is required, as the ribs cause the knitting to fit closely. In the case of stocking that are ribbed all the way down, the welt. usually about 3 in . decp, is worked in a different rib from the rest of the stocking. generally a single rib of knit one and purl one alter nately Double rib is two knitted and two purled stitches worked alternately, and a variety of rib designs can be formed, including many broad ribs such as knit 5 and purl 2 alternately. Fig. 9 shows specimens of single and double rib in knitting.

Joining Wool. In the course of a large piece of work, joining new wool or thread is sure to be done. When the first ball is getting near the end, stop when there is about 8 in . left, take the new ball and lay the two ends to gether, knit one stitch with the two ends, then knit the following stitches with the new and the old ball alternately. In knitting stockings
lerred to as the slip, knit. and draw-over method.

If a decrease is wanted at the other end of the same ncelle, two stitches should be knitted together as described above, and these are usually the sccond and third stitches from the end, so that there will be one stitch to knit at the end after the decrease If possible, a void decreasing right at the end of a row, as it makes an uneven erlge, and in the case of a jumper

Knitting. Fir. 7. Piece of plain knitting decreased at both ends. Fir. 8. Pattern resulting from made stitches with plain rows between. Fig. 9. Specimens of aingle and double ribbing, for tops of stockings
or any round piece of work this join will only be visible on the inside of the work, 80 on a flat piece of work on two needles the join should be done on the right side of the work so that the nlternate threads are passing on the wrong side.

Another method of joining is by twisting the new thread over the first as each stitch proceeds. Put the needle in the stitch of knitting, then, holding the end of the new ball down with the fingers on the left hand, pass the short end under then over the new wool, so that the latter is encirclel with the old end, then use the new wool to knit the stitch. Twist the old wool over the new ball for about 12 stitches and leave the short end of wool to be sewn down afterwards. The only place in which a knot is allowed is at the end of a row when a fancy pattern is being worked, and which would be spoiled with an ordinary joining. If the knot is tied right up to the edge of the knitting it can be hidden when joining up the side scams. A knot is never allowed in stocking knitting.

To make a chain edge on a piece of flal knitting, the lirst stitch must be slipped purlwise, and the last stitch should be knitted through the back of a loop instead of through the front in the ordinary way. This edge is used on the flap of a stocking heel, each chain being picked up afterwards when turning the heel to represent one stitch. It is also employed on the armholes of jumpers, and the sleeve stitches are picked up in the same way.

Double knitting is done on two needles, and is worked so that when the flat piece is completerl it has two distinct halves that can be pulled apart like a bag, but they are caught all round the edges. It is a useful pattern for scarves where extra warmth is required, as stitches can be cast on for any width and the picce continued for any length. Two stitches are usually knitted single at the berinning and end of each row, so an even number of stitches should be cast on to begin with.
Knit one plain row, then proceed thus : Knit two stitches, bring the wool to the front of the necdle, slip a stitch as if for purling, pass the wool back again, and knit the next stitch. Repeat these two stitches alternately to the end of the row, except the last two stitches, which are knitted plain to match the beginning. Continue this ruw for any length required, and it will be noticed that in the second row the slipped stitch is knitted, and vicc versa, which thus causes the two distinct sides of the bag.

Fancy Deslgns. Brioche knitting is a fancy rib, and for this the number of stitches cast on must be divisible by three. To work it, bring the wool to the front of the needle and slip one stitch purlwise: knit together the next two stitches, and repeat this alternate movement to the end of the row. Every row is worked in the same inanner, and in suc. coeding rows the two stitches that cross each other are always knitted together.
Two-colour knitting is chiefly plain knitting using two colours of thread in the same row to form a design. Sometimes six colours or more are used in one design, but two are usually confined to one row, as the different colours have to be carried along the row during the work. The first movement is shown in Fig. 10. The second wool which is not in use is held over the first finger of the left hand as for crochet, and in the first step it is passed over right-hand needle, before the working wool is passed over that needle to knit the
stitch. T'his catches the spare wool in with the stitch. The second stitch is knitted in the ordinary way, but holding the spare wool on the left finger away from the stitch. The wool not in use passes through every alternate stitch, and is only slightly visible at the back.

When working coloured stripes in ribbing, say, at the hem of a jersey. one plain row should be worked with the new wool on the right side of the work each time the colour of the wool is changed. This plain row will sink in the ribbing and give the work a neater appearance where change of colour is effected.
Graftling. Two pieces of knitting can be joined together so that the join is quite invisible and quite flat. It is usually employed for finishing off the toes of socks and stockings.

In the case of
a stocking toe the stitches would be equally divided on two needles, one being placedbehind the other. The

Knitting in two colours. Fig. 10. Firgt position, with second wool pacsed over right-hand needle belore working wool. Pig. 11. Second position, showing
thread should be cut off, leaving about 18 in . hanging for a stocking toe, or longer, according to the number of stitches to be grafted together. Pass the thread into a darning needle and, beginning on the front row-that is the row nearest to the worker-put the needle in the first stitch as if for knitting, pass the stitoh off the needle and draw up the thread, but not too tightly. Put the needle in the second stitch as if about to purl, draw the thread through while this stitch is on the needle, and do not slip it off.

Go to the back needle and reverse the action Put the needle in the first stitch as if about to purl, draw the thread through and alip this stitch off the necdle; put the needle in the second stitch as if about to knit, and draw the thread through, but do not slip the stitch off the needle. Repeat until all are taken off. The thread must not be drawn tightly.

The method of grafting above described can be memorized thus: knit and slip off, purl and keep on ; purl and slip off, knit and keep on. This includes the two needles.

Knitting Needles. Knitting needles are sometimes referred to as pins or wires. They are divided into two classes, steel needles, which are made in the finer sizes, and bone needles for the coarser sizes. The latter in. cluded aluminium, celluloid, ebonite, and amongst patent materials are silver and brass tubing coated with nickel silver.

Needles are numbered 1 to 10 on the bell gauge (q.v.), which is the standard knitting needle measure.

Steel knitting ncedles are sold in paper packets in sets of four, and bone in pairs of two and sets of four, some with knobs on for flat pieces of work, and the sets with points at both ends for knitting round or tubular garments. Thicker needles can be bought in
a variety of colours, so it is well to use dark needles for light thread and vice versa.

When buying bone needles they should bo carcfully inspected to see that there are not any flaws, as the tiniest chip will split silk and wool. When a flaw does occur it can be smoothed away with fine glasspaper. This also applies to the point of the neerle, which should not be too sharp.

Wooden needles can be treated with glasspaper and given a perfectly smooth finish. Celluloid needles are always smooth, but should not be used for very heavy work as they bend easily. Aluminium needles soil light wool, and should be used only for dart materials ; those made from brass tubing cuated with nickel silver are light in use, and do not soil the work.

Knitting shields can be bought cheaply for protecting the points of the needles when not in use. They are made in pairs attached by elastic. In shape the shield resembles a thimble, into which the needles fit.

Knitting Wool. All wools have a certain ply, whether it be 2, 3, or 4 ply, and so on, the word ply meaning the number of threads which compose the thickness of the wool in each case; but a 4 -ply fingering produces a garment about half the size of a 4 -ply thick wool; using exactly the same number of stitches and following also the same directions. There are numerous fancy wools on the market but the following are the main standard kinds.

Fingering, which is the kind in most general use, is divided into Scotch, super-fingering, and the cheap varieties. All these are employed for stockings, children's dresses and coats, jumpers and underwear. The term Scotch fingering has nothing to do with the plase in which it is made. The name should only be used when applied to such wools as are put up in skeins of certain definite yardage, so that the same length of wool is given quite apart from its weight.
Coming under the name of fingering, how. ever, there are many 4-ply threads to which the name of Scotch fingering should not be applied, as they are shorter in the skeins, or contain fewer threads than 60 to 1 oz ., the weight in which a skein of 4 -ply fingering is made up Cheap fingerings are harsh and do not give the same warmth or comfort in wear.

Vest wool is about the thickness of Scotch fingering of the same ply, 2, 3, or 4 ply. but it has a softer finish, being specially made for underwear. Unshrinkable vest wool is a common terin, but a real unshrinkable wool is not possible to produce without injuring the fabric, as some of the most valuable properties of the wonl would be extracted.

Soft knitting is sold in packets and is so labelled. Wheeling or Allos yarn is a dis tinctive yarn of 3 -ply thicknoss, usually sold in 2 oz . skeins, 8 of which form a head of 1 lb . When of good quality it is suitable for heavy socks and stockings, as it is rnuch thicker than 4 -ply fingering, although one ply less. Children's dresses and coats are made with this wool.

Double knitting is a 4-ply wool about twice as thick as 4 -ply fingering, and similar in weight and thickness to a good wheeling, although of much better quality and appearance, as well as softer to the touch.

Zephyr wool is equivalent to the old Berlin wools, and is sold in the same thicknesses, namely, single Berlin 4-ply, and double Berlin 8-ply ; it is particularly soft and full in the thread, and is more suitable for indour articles, as its smoothness and softness do not allow for the friction of hard wear.
Shetland wool is the name of a very fine 2 -ply wool, finer than 2-ply fingering, and receives its naine from the Shetland Isles, where very fine shawls, underwear, and jumpers are made. Andalusian is the standard name for a soft 4 -ply wool twisted in a similar manner to soft knitting, but finer
in size owing to the twist. Sold in 1 oz packets, it is chiefly used for children's garments and for socks.

Enocker. See Door.
ENOCE KNEE. In the common deformity known as knock-knee the legs diverge from one another below the knees so that the latter tend to knock against each other in walking. The affection may begin in early childhood, being then almost always due to rickets; or it may come on between the ages of 12 and 18 years. Weak boys or girls who carry heavy weights are very liable to suffer. Pushing a heavy wheelbarrow, for example, may cause the detormity. A child showing signs of knock-knee should not be permitted to crawl or walk. It should lie down as much as possible in the open air and sunshine, and be properly fed.
In many cases these measures alone will remove the deformity, but it is generally desirable to apply pressure. This can be done by putting a soft pad between the knees, so as to separate the lower ends of the thighbones, and bandaging the ankles together.

The legs must be massaged daily, and manipulated in a way the dootor will direct. The boot heel should be made higher on the inner than on the outer side, and, when walking, the feet should be turned in a little.
In the oases which develop later in life, a metal splint from the heel of the boot to the outer prominence of the hip may be used But the deformity, if pronounced, can be removed by a surgical operation. See Knee.
KNOP. This term is used for the knobs found at the handle end of old spoons and sometimes for those on the covers of drinking and other vessels. A familiar example is the apostle spoon, while the acorn is often found figured as a knop. Knops are also the rounded protuberances found in the stems of wine glasses. See Glass Ware; Spoon.

ENOT: In Timber. A knot is a hard part of the wood occasioned by the growth of a small branch, which, by growing out at an angle to the normal grain of the tree, causes one set of fibres to cross the other, thus forming a hard spot, very difficult for the amateur to deal with.

When the worker purchases ordinary prepared timber which has already been
machine planed, it will be found preferable to use it in that condition if the material is at all knotty, rather than attempt to plane it up. It is not always possible to do this, as the machined surfaces are not all smooth enough for the purpose for which the timber is required. In such a case, one course to adopt is, when planing, to set the plane iron very fine, so that it makes a very fine shaving, and to press it firmly upon the surface of the work, especially when planing over the knots.

It inay be as well, when a good surface is required, to cut the knot away bodily. In some cases, such as when the wood is thin, it will be found that the knot can be driven down through the wood with the aid of a small punch and hammer. If this is the case, the hole can then be enlarged with a twist drill, and plugged with a circular piece of wood which should be glued and driven in tightly. When the knots are running more or less with the surface of the timber, a recess should be chiselled out with the edges slightly underout, and a now piece of wood cut and fitted into it with the grain running in the same direction as the rest of the timber. These pieces should be properly glued in and allowed to set hard. The timber can then be easily prepared.

Whenever possible, knots should be avoided by selecting timber that is not prone to this trouble, such as American whitewood, Californian redwood, beech, and similar timber, which can be obtained in sufficiently large pieces to avoid the presence of a knot altogether.

Knots In Paintwork. In paintwork, the presence of knots is very objeotionable, as they contain a kind of resinous material which may ruin the paint if not specially treated. For this purpose various compositions are prepared, known as knotting. This should be brushed over the surfaces of the knots, prior to the application of the paint, and when the knots are very numerous, two coats or more of knotting will be better than one. The surface may then be prepared in the usual way. See Wood.
ENOT : How to Tie. Knots may be divided into the simple ones that are tied every day by ordinary persons, and the more elaborate ones that are used for various purposes by sailors and others who need something
much stronger in the course of their work.

The illustrations on this page show how the knots in common use, and also some of the more elaborate ones, are tied. Some of these, e.g. the timber hitch, are only used for certain special purposes, but others are useful in everyday life, and the more difficult among them can usually be tied after a little praoticgo.

Fig. 1 shows a common loop by which most knots are oommenoed, with its parts lettered for reference. The upper part $A$ to $B$ is called the standing part of the rope, $B$ to $C$ the loop or bight, and $C$ to $D$ the end. When the end is drawn through the loop, the simplest of all knots, a half hitch, is formed.

A figure-of-eight knot, Fig. 2, is made by forming a loop, placing the end behind the atanding part and finally over and through the loop and pulling taut. This knot is useful for making a stop on a rope to prevent the end fraying or slipping through a block. A reefknot, Fig. 3, is the simplest and best of all knots for tying together two ropes of equal size. A single sheet bend, Fig. 4, is a good method of joining two ropes of unequal sizes, and if the ropes are wet, or likely to be so, the knot can be made atill more seeure by again passing the end of the thin rope round the loop on the other, as shown by the dotted lines.
A hawser bend, Fig. 5, should be used when two thick ropes or cables require to be joined. A half hitch is formed on one rope and the end tightly lashed with strong cord to the standing part. The end of the second rope is passed through the loop on the first and secured in the same way. Two half hitchea, Fig. 6, are made on a rope to fasten it to some object. to finish a lashing or form a noose. This is a good knot for general use.

A round turn and two half hitches, Fig. 7, are employed for tying a rope on which there will be a great atrain so that the hitches shall not jam. For fastening ropes to posts, raising heavy beams, weights, etc., it will be found of great service. Two turns of the rope are taken round the post or beam, and then two half hitches are formed on the standing part and drawn taut. If there is an excessive or jerking strain increase the hitches or lash the end down.

The fisherman's bend, Fig. 8, which should be distinguished from the fisherman's knot, will be found useful in making fast where there is a give-and-take motion, or a varying atrain on the rope, as in drawing water from a well with a bucket, tethering cattle, attaching anchors, stays, etc. A bowline, Fig. 9, is made on a mpe to form a loop or noose which will not slip. It is used when a permanent loop is required at the end of a rope, or to attach tn other ropes. A running bowline or slipknot can be formed by drawing the standing part of the rope into the loop.
The Timber Hitch. A timber hitch, Fig. 10, is chiefly used for holding timber, etc., where the weight will keep the hitoh tight. The knot consists simply of a half hitch made with a rather long end, which is twisted baok again round the loop. In cases where there is to be a continuous strain or the timber requires to be kept pointing steadily in one direction, a half hitch should be added as at $H$. A clove hitch, Fig. 11, makes a good knot for commencing and finishing the lashing together of poles, beams, etc. As it will not slip, it can be attached to another rope or pole and still leave the end free for further use.

A lever hitch, Fig., 12, is a simple way of fastening a rope to a lever worked by a windlass
or to pilcs. stakes, tree-stumps, etc. which are to be drawn out of the ground by horses or power. It is very handy for fixing the rounds of a rope-ladder The draw hitch shown in Fig. 13 is of great service in securing a rope to a post, ring or other rope, in such a way that it can he instantly released The diagrams 1, 2, and 3 show its formation This knot will resist a give-and-take motion and can be released by jerking the end.

A sheepshank, Fig. 14, is used to shorten a rope. To make it, take up the length desired and fold it as in A Then with parts I and 2 form a half hitch round each loop as in B Wooden toggles can be inserted for further security, is at ' $\Gamma$, or the loops can be lashed to the standing parts of the rope as at L . A simple clinch, Fig 15 . is a small loop or ring formed on the rope and held together by tightly lashing with strong cord. For attaching a block, lantern, cte., it will be found very handy.

A catspaw, Fig. 16, makes a temporary loop for hooking on a block or supporting another rope. It is formed by first making two loops as at $A$ and then twisting them up as in $B$; bring the two eyes together and insert the hook of the blook or pass the rope to be suspended through them To make a double houk hitch Fig. 17, take the loop of the rope or sling and place it over the upper part of the hook crossing it behind, then place the under rope over the hook and cross the upper part over it, and draw both taut. This hitch will hold a weight more securely than any other form of hook knot. See Clove Hitch.

KNOTWEED. This is the popular name of polygonum, a large group of hardy plants some of which are very decurative. See Polygonum

KNUCKLEBONES. This game, also called chuckstones, five stones, dibs, jackstones, and hucklebones, is played with five or six small objects, the aim being to throw them in various ways. The objects, originally the knuoklebones of a shecp, are usually of metal ; but amall stones or pieces of wood will serve slmost equally well.

Of the several games, one consists in throwing up one of the pieces, and, while it is in the air, picking up one or more of the others from the table, continuing until all have been picked up. For this six stones are usually employed. the one thrown being called the jack. Another game is to throw up one piece and catch it on the back of the hand, following with two pieces, then with three, and so on until, if possible, the five are thrown and caught together. Special names are given to some of these throws, such as peas in the pot and horses in the stable.
Knuckle Joint. See Rule Joint.
KOCHIA. This half hardy annual, from 18 to 24 in high, of graceful bushlike growth,

Kochia, or Summer Cypress, valued for its graceful pale green foliage
is valued for its light green leaves, which turn reddish purple in autumn. It is known as the summer oypress and is often used in 8 ummer bedding, where it contrasts finely with flower ing planta The seedlings are raised in a heated glasshouse in February or March, are potted singly
in small pots, and are planted out of doors in May or early June Pron. Kö ci-a.

KODAK. This name is applied to cameras and other photographic products made and sold by the Eastman Kodak Company. It is generally understond to refer to roll-film cameras. See Camera Developer: Film. Photography: Plate

KODOL: A Developer. This photo graphic developer, which is made by the Eastinan Kodak Co., is a single solution of the paramidophenol type clean working, nonstaining and without liability to fog It is equally suitable for plates, films, bromide papers and gaslight papers. In ordinary dish development by the visual method, I dram of Kodol is used for every 3 oz . of water.

Development should be full, since there is a tendency for a certain amount of density to he lost in the fixing bath. Where the negative is known to he over-exposed, increase the strength of the developer taking 1 dram of Kodol for 2 oz water, with the addition of 2 or 3 drops of potassium bromide

If it is certain that the plate is under exposed usc a weaker solution I dram of developer to 5 oz. water.

Tables for development by the time and temperature methods have been prepared by the Kodak Co. from whom the preparations may be ohtained

For developing bromide papers the follow ing proportions are required:

Development will be complete at nornal temperatures in 2 min ., if exposure is correct. If exposure is insufficient it is useless to attempt to obtain detail by prolonging development. For gaslight papers Kodol is used in the following strengths

With vigorous gaslight papers development should be complete in 30 sec .; with the soft variety it will take perhaps 40 sec. See Developer; Developing ; Film ; Photography.

KOHI RABI. This somewhat coarse vegetable proves uscful as a substitute for turnips during hot dry weather when it is difficult to provide the latter. It is raised from seed sown out of doors in April or May in rows 18 in . npart, the seedlings heing thinned out to about 12 in. from each other. The greenish white variety is to be preferred to the purple one.
KOLINSKI. This is a yellowish brown and orange-red fur obtained from the Asiatic mink. Cheap in price, it is usually dyed to represent sable, for which it makes a satisfactory sub. stitute. It is used extensively for trimmings and wraps, and among furriers is known as red sable. The hairs from kolinski tails are widely used for making into artista' sable brushes

KOUMISS. This is the name given to fermented mare's milk, a pleasant acid drink, very digestible and slightly alcoholic. A kind of koumiss can also be made with cow's milk according to the following recipe :

$$
\begin{aligned}
& \text { Fresh cow's milk } \\
& \text { Water } \\
& \text { Fresh buttermilk (thnit obtained from } \\
& \text { churning whole milk) } \\
& 2 \text { quarts } \\
& \text { L.oaf augar }
\end{aligned}
$$

The above should be mixed in a gallon jar Afterwards cover the vessel with a cloth, and put it in a warm place for 30 to 36 hours, shaking the vessel every four hours; it is then
ready for usc. Some of this artificial koumiss can he used instead of huttermilk to make a fresh quantity.

Koumiss is a nourishing drink when an irritable stomach will retain no other lood. It is useful in fever, albuminuria, disorders of the stomach and intestine, and whenerer ordinary milk cannot be well digested. It is slightly laxative and diuretic.
KROMESKIE. This term is used to describe a dialı made from a mixture of fish or meat enclosed in rashers of bacon, coated with batter and then fried.

KRONA PEPPER. Though not so strong as cayenne, this is also a red pepper. It is made from a capsicum pod known as the Hungarian paprika and is sometimes also know's as paprika pepper. See l'epper.

KUMMEL. The Russian and German liqueur which bears the German name of the herb cumin is made with swectened spirit Havoured with cumin and caraway seeds Its distinctive Havour is nainly due to the caraway seerls 'The Russian variety of Kummel was formerly made at Riga, but is now manufactured in Norway and Sweden

ABEL: Its Uses. Adhesive or gummed labels and tie-on labels or tags are the two kinds most cominonly used in the houschold. They can be obtained from any stationer, and are often sold in packets containing a dozen or more of each

Tags are made of manilla or other atrong, durable paper, cut roughly to 5 in . by $2 \frac{1}{2} \mathrm{in}$. and other sizes, with an eyelet through which string is passed. They are used for parcels of all kinds sent by rail or post, and for labelling luggage, being generally tied to the handles of

Kohl Rabl, a usetul summer substitute for turnip travelling cases, trunks, and bags. Dis. tinctive labels are an advantage when sorting out luggage at a rail way station. Large oval tags in a variety of bright colours are ohtainable which can casily be recognized. It is a good plan to choose a particular colour and always keep to it for lug. gage la bels.

Adhesive labels are employed for similar purposes, and are often more convenient, but are more liable to get torn or rubbed off in transit than the tag.

Labela should be addressed in a bold, clear handwriting, so that they can be easily and quickly read by anyone who may have to handle the luggage or parcels. Very often only the town to which the travcller is bound appears on the label, and this no doubt suffices in most cases; but it is safer to give the full address in casc of accident. Amongst other varieties is the label used for distinguishing the keys of different rooms, which are madc of bone and attached to the key by split rings of metal.

Gardening Labels. Garden labels used to indicate the names of each plant are of rolled zinc or plain wood. The former may be purchased with raised letters on a black ground Garden labels may also be obtained from some
automatic machines, which punch out any desired combination of names or letters upon strips of aluminium.

Wooden labels may be made at home from strips of wood about 1 in . wide. The surface of the wood should be well rubbed with a piece of chalk to fill the interstices, and the writing should be done with an indelible pencil. Always start writing the name of the plant at the top of the label. Wooden labels which it is desired to render as permanent as possible should be given a coat of copal varnish.

Labels for trees are usually made of tin, painted and tacked on. They should be placed at a height of about 5 ft . from the ground, on a level with the eye.

A special kind of label consists of a small, flat glass tube which is closed at one end, where there is a ring by which it is attached to the plant. The varnish or ever name of the plant is written clearly on a piece of oiled paper, and this is dipped into the tube, being held in position by a smal rubber cap which fits tightly over the open end.

Label for Plants, consiating of flat glase tube, containing a piece of oiled papar with the written name, attached by a ring to the plant or tree

Photographic Labels. The of all such aids, employing the various attachbottles containing photo- ments to search dirt out of every corner and graphic chemicals should from hitherto seldom cleaned pelmet or always be labelled to avoid valance. Long-handled scrubbers and floor mistakes. either in ordinary mops, short-handled mop dusters, a great photographic operations or variety of brushes with labour-saving curves by confusion with domestic bottles. It is useless to attempt to gum a piece of paper on the side of a bottle containing chemicals, since it will quickly become stained and illegible.

One method is to glue the label, and when dry cover the face of the label with thin glue, finished off with a coat of copal varnish. It will then be impervious to moisture and to the action of any chemicals. Another method is to rub down the front of the bottle with emery-powder until a ground-glass surface is obtained. On this any name can be written or printed in Indian ink or waterproof ink, covered afterwards with a coat of transparent shellac

The amateur photographer should make it an inviolable rule to label every bottle, tin or other receptacle that contains chemicals

## LABOUR SAVING IN THE HOME

## Ideas of Value to the Busy Housewife

This article, of necessity general in its scope, is supplemented by the entries on the various domestic fiments and appliances mentloned therin, e.g. Service Hatch; Vacuum Clesner, See also Dining Room; Housekeeping; Kitchen; Laundry; Spring Cleaning

Modern buildings are naturally better fitted for labour saving than older houses designed when economy of work would hardly even have been considered a domestic virtue. Smaller houses built on the square are planned with as few steps as possible. Jointless flooring for kitchens, parquetry, linoleum or rubber floorings for other rooms, skirtings with rounded corners so that dust does not collect where it is difficult to remove, shelfless chimney pieces, casement windows that can be cleaned from inside, ample cupboard accommodation in the kitchen and bedrooms and on the landings, gas or electric fires or radiators throughout the house, electric lighting with convenient power plugs for various electric-run devices, fittings such as taps and door handles of chromium plate, porcelain or other material which does not require cleaning, lavatory basins in bedrooms with hot and cold running water: these are all important labour-saving points, many of which architects now incorporate in the home.

Where there is no electric power or gas available, coke, anthracite and oil are all brought into the labour-saving scheme of things with new inventions. Slow combustion lires and the modern grates are aids where coal is used and so also is access to a coal store from the kitchen instead of having to go outside for fuel, especially in bad weather.

Making meal service more efficient can save many footsteps. The trolley wagon is a useful help, and the service hatch and lift are excellent where situation of rooms and circum. stances allow. Labour-saving furniture for the kitchen includes specially fitted cabinets, cupboards, sinks, and porcelain metal table surfaces. Modern bathrooms are easy to keep clean. Baths are made with enclosed sides, so that there is no space underneath for dust to collect and the waste pipes and traps of lavatory basins can be well raised from the floor in order that the space underneath may be easily accessible for mop or duster.

Cleaning Equipment. The selection of labour-saving cleaning implements and gadgets is almost bewildering. To be of real utility such devices should be simple in construction, easy to clean, and not liable to get ont of order. The cost of any apparatus should be considered along with the amount of service required, e.g. a good electric iron is worth purchasing. as

Labour Saving. Fig. 1. Electric foor polisher and adjustable heads for particular purposes save much stooping and uncomfortable body angles while working.
A floor polisher such as the one illustrated in Fig. 1 is an excellent electric aid. Owing to the carefully designed brush action no brush marks are left on the surface of the floor. The brushes for polishing and rubbing up are quickly interchangeable and special buffers obviate all possibility of damage to furniture or walls. Quick drying of polish and a highly. glazed surface are secured by passing warm air through the motor direct to the floor surface. It can be used on parquet and linoleum.

An electric dish washer is a great convenience for a large family, but is not worth the trouble of cleaning for the washing up of a few plates and dishes. Many housewives have found a clothes washing machine a good investment. Hire purchase system over twelve or eighteen months makes it possible to own one without capital expenditure. A washing machine and a good electric iron form a laundry in miniature, and where much family washing is done at home justify their expense and are a great saving of time and labour. For the small kitchen a combined cookery table and ironing board is obtainable. The latter is stowed away out of sight when not in use. A clothes airer with an adjustable frame and wooden laths which can be fitted to the kitchen ceiling and lowered to any position is also a useful time-saver. The frame projects only 7 inches from the ceiling when pulled up. The efficient disposal of rubbish can be easily effected by a gas incinerator where there is no range. There are also good designs in garbage pails with imner containers which can be lifted out to empty One make has an inner pail that is perforated so that moisture drains away from rubbish, and in this way makes the latter sufficiently dry for burning
The Preparing of Food. In addition to the implements and machines for cleaning, there are those to do with the preparation of food. A refrigerator lessens labour in the summer by enabling the housewife to turn out very easily prepared and dainty cold dishes or iced sweets for the table. These refrigerators operated by gas, electricity or paraffin are extremely simple to use, and not only render food more wholesome, but save the housewife the labour of constantly bringing in fresh supplies of foods that quickly deteriorate in the ordinary larder.

A bread slicing machine (Fig. 2) which will also cut bacon and possesses a stainless steel blade is a useful device for the larger household. It is also of great practical help in sand wich making. The fruit or tomato cutter shown in Fig. 3 is inexpensive and ingenious. It is worth possessing, together with a cucumber slicer in the salad season. A potato peeling machine is another exceedingly useful aid for the housewife who has to prepare large family meals.

Labour saving low-pressure cookers and steamers are many. The cooker shown in Fig 4 requires no water and a whole nieal can be cooked at once in separate utensils placed in the one aluminium container. Obviously a saving not only of labour but also of fuel is effected by employing this simple device. Sow-pressure cookers simplify the preparation of meals, and entire dinners can be cooked thus on one gas ring. In such cookers the flavours and vitamins of the food are preserved. A household machine that may be useful in the larger home is one which reverses
the ordinary process and turns butter and labour spent in cleaning metal is out of all milk back to cream. The operation is quite simple and enables the housewife to procure rich cream in a few minutes at about one.fifth of dairy cost.

The smaller labour saving devices include mincing machines and vegetable strainers. The latter provide excellent substitutes for colandersand save work, heat and time. The strainer illustrated in Fig. 5 fits into the saucepan and can be easily lifted out when the vegetables are cooked.

Work is simpli. fied by using the best cleansing materials avail. able. Excellent polishes, sonps and powders are on the market and many recipes of good cleaning agents are given in our work, from which wide range it should he interesting to test and select the most suitable for the particular work on hand.

Where funds permit it is a good plan to replace all housebold equipment as it weara out with the best and most modern labour saving kind on the market. These are not all simple and easy to work at sight, and it is advisable for the housewife to find out exactly how to use even the smallest appliance, or the result may be the reverse of Inhour aaving.

Easier Ways. If all the beat electrical the kinife board. Aluminium and enamel appliances were installed. the work of running kitchen ware are easier to clean than the olda house would be ininimized very consider- fashioned imn and copper, which require scourably. But it is a fact that these idenl condi- ing. Aluminium ware is quickly cleaned with tions exist for a very few only, and that many a wet cloth dipped in an abrasive powder. housewives have to make shift with houses Ornamental collections of brass in sittingthat are badly planned and often poorly roms should be lacquered. Labour is also equippel. Housekeeping, however. is essen- saved when patent clips are used for stair tially a business, and as such must be carried carpets instend of metal rods.
on in a methodical way with as many of the Table mats instead of cloths are a saving labour-saving devices mentioned as are when laundry is done at home. For the practicab'e to the particular household, and service wagon, or for dressing talbles in weekplenty of ingenuity to make up for lack of end cottage or bungalow, tray cloths and expensive equipment where instalment of this runners in bright-coloured American cloth is out of the question. In many homes the ornamented with simple designs in raffia save

Fig. 4. Aluminium cooker waich requires no water. A complete meal can be cooked at the same time in separate utensils in one container Courtesy of Slainex Kizelien Elutpmone Co
labour, as they merely require wiping over with, a clean damp duster. A rubber apron hanging inside a kitchen cuphoard. that is quickly put on saves changing an ufternoon dress to wash up the tea or dinner things.

Labour saving is also intelligently achieved by mothod in catering and in keeping the contents of the store cupboard adequate for both ordinary and sudden needs. Last, but not least, much less energy is required to do things the right way than the wrong, and if the correct postures are adopted while working. When doing any sedentary work such as mending house linen or darning it is most important to

Labour Saving. Fig. 5. Vegetable strainer lor use inside a saucepan
sit well back in the chair so that the spine is properly supported.

When pastry making, ironing or doing other standing jobs, it is important not to stoop continuously over the work, but to take an opportunity to brace the shoulders. While stooping, stand a little anay so that the stoop comes from the waist and not from the shoulders. When using a long handled broom, mop or vacuum cleaner, use the body muscles as well as the arms, swaying from the waist with each movement Not only is the work better done if you put your back into it, but it is also far less tiring and thus labour saving.

LABURNUM. A very beautiful summerHowering tree, the laburnum is suitable for cultivation in town or country gardens. Trees may be planted at any time from November fo March inclusive, given favourable weather and soil.

The laburnum tree is most effective where the Howers are shown up against a dark background. The lustrian pine, the copper-leaved beech, and the purple nut are instances of trees and shrubs which show the laburnum to advantage. Although there are few species or wild types of laburnuin (the Scotch, Laburnum alpinum, and the common, Laburnum vul. gare, are the chief ones) there are many varie. ties of hybrids, and soine of them have inuch finer flower bunches than others: the hest are Vossii, Parksia and Watcreri. One named Alschingeri, which blooms later than the others, is also 10 be recommended. Laburnuin Adami is a re, markable tree, obtained by grafting the purple broom
 (Cytiaus pur (Cytisus purthe beautiful nowering tree pureus) on the common laburnum: it bears both vellow and purple flowers. Laburnuma flourish in ordinary soil and are increased by seeds, the named varieties by grafting.

Uses of the Wood. This wood is dark brown in colour, with a greenish shade towards the heart, and has a broad yellow sapwood. Being very hard, close in the grain, and capable of a good polish, it is used in turnery work and in inlaying. Much of the furniture before and during Queen Anne's reign was beautifully inlaid with laburnum. See Inlaying: Wond

## Lace and Lace Making

## Beautiful Examples and Practical Directions

In the first fart of this article the different types of lac: are classiffed and seg eestions given for the carc and repair of valuable pieces. The second part deals with simple directions for lace making See also ine entries on Crochet; Embroidery; Filet: Hairpln Work. Insertion Linen Kichelicu Work

A lace may consist of two distinct parts traced on parchmentstitchel to $n$ linen backing the net ground on to which the design is The linesof thedesignaresewnon to the follndaworked, as in Alençon (Fig. 1), or of the tion in a slicloton puttern. which is buttonholed pattern only without a ground, but connected by threads, as in guipure (Fig. 2). It may be classitied under three headings : neddle-point ; lsobbin; and inachine made.

Wherc only a single-threaded needle is used in the making, the lace is known as needle. point; when a number of threads are wound on to bobbins, so that the twistings and plaitings of the threads form the pattern, the lace is called bobbin. The term point alone should

Lace. Fir. 1. Part ol a border ol Alencon lace. an exnmple of 17 th cent. French needle-point
not he taken to mean ncedle-made, as it is userl to express either lace of the finest qualities and also for modern hand-worked laces in which lace braids are used and formed into designs by means of connecting huttonholed hars, and other lace stitches. Bolibin lace is sometimes termed pillow, but this leads to confusion, as needlo-point laces are also sometimes worked on pillows.

Needle-point Laces. Italy may claim the int roduction of needle point laces, and certainly their finest workmanship. Venice points inspired the French lacea of Argentan and Alençon, which resemble each other, a heavy outlining cond to the pattern being a feature of bot $h$, but tho Argentan is considered the finer work. Only the Alençon is made to day. chiefly at Burano, in Italy. The Inth century Alençon, which is often on sale in old lace shops, has spots or tiny sprigs posdered over the net ground : a
foral pattern floral pattern in running festoons and a conventiona hordering pattern. In the morlem lace these powderings are occasionnlly used with real llower pat. terns. Itisan exquisitelace for flounce, fan or scarf, and wears well.

Theearlier hea vy Venice needle-points have no net ground. The ground. ine

Fig. 2. Guipure. Specimen of $17 t$ h cent. punto in aria, a type seen in many of Vandyk's pictures
tion in a slicloton puttern. which is buttonholed elaborate lace stitches. When this is complete the lace is cut awny from both foundations In rose or raised Venice point the outlines are heavily padilel by threads and then worked over As the demand for lighter laces grew, the needle-point guipures were evolved (this lace is frequently also made with boblins). and then the point on net ground which inspired the French laces of Alençon and Arventan, and also the 13 russels point de gaze (Fig. 3), an exquisitely fragile needle-lace showing the powdered ground in the 19th century dosigus. Venetian lace wns also copied in Russin and callerl point de Moscow. while in the varieties of cut work and drawn thread laces the Russians frequently intioduced oriental colourings.

Needle-points chiefly made to-day are Alençon, Burano puint, Brussela point de ga\%c, ruse point de Venisc, and Greek point. A great quantity is still heautifully worked in the old designs and stitches in Italy, some in Belginm and Ireland, but not much elscwhere. Limerick laces are of three types : a heautiful cut-work: a run lace, in which a running design is needleworked on the net, as illustrated in Fig. 4: and tambour, in which n chain-stitch is employed. The last-named was hand-made on a tambourine-shapel holder which held the net Hat while being stitched. but is so easily copied by machinery that it is

hardly ever now made by hand. The Venice points are largely reproduced in fine Irish crochet.
Carrickmacross lace is of two kinds. One. an example of which is shown in Fig. 5, has a delicatc design which is applique on net, the other is a cutwork guipure made by tracing the pattern. outlining it with stitches on tine lawn, and cutting out after working in bars to hold the pattern to). get her. Needle-point is sometimes used in conjunction with hobbin lace, as in some designs of the

Honiton sprigs, and neerlle-point filling stitches have been used with machine-made braid mounted on machine-made net.

Bobbln Laces. In bobbin laces the pattern is drawn or traced on to prechment and is then pricked with pins on to the cushion, the pins being placed to guide the threads. On the upper part of the pattern the ends of the hobbin threads are fastened, and as the threads arc unwound the boblins are thrown and twisted with regulated movements to plait the threads round the pins and form the ground and pattern of the lace with a varicty of combinations. Most of the English laces arc worked with bobbins.

Copies of Lille, Valencienner, Maltese laces, guipures and torchons are produced in Bedfordshire, Buckinghanshire and Northampton

Fig. 5. Carrickmacross. Characteristic design with pattern appliqué upon net
shire, while a good (leal of Honiton hobhin lace is atill made in Devonshire, chielly in the form of sprays or sprigs to be mounted on machinemade net grounds. The hest type is a guipure with a corded outline consisting of a number of motifa joined by hars of twisted thread. An example is shown in Fig. 6. A kind of Ifoniton lace is known as Devonia, the rpeciality of which is the raising of flower petals or insect wings so that they stand away from the net ground. The holbinin laces of other countries are well copied by convent workers in Lreland.

A great deal of bohbin luce is made in Belgium. including torchons, Cluny. wireground Valenciennes. and the beautiful Malines or Mechlin laces. The first two named are in simple patterns and a somewhat conrre thread is used Valenciennes made fiom fine linen

Lace. Fig. 3 (above). Specimen of polnt de gaze, an exquisite needle-lace with powdered ground and raised cord outline to the pattern. Fig. 4 (below), Limerick lace of the type in which a running design is needleworked on the net Courleall of llayivards (Bond Street), Lld.
thread is a Hat luce without any raised design. The machine-made varicties are quickly detected by the even mesh of the ground Fig. 7 shows the slight variations in the handmade net Mechlin lace is sometimes confused with Valenciennes, but a magnifying glars reveals the mesh of the ground net to be made by plaiting and not merely by twisted threads A bright corred thread outlines the floral motifs and accents the designs of this lace In the bolbin-made Brussela lace relief is also given to the flowers and leaf veinings by a raised plaited outline Bruges duchesse point resembles the lloniton guipure. Other duch. esse lace is on net in fine designs such as the example shown in Fig. 9.

In France, a hlack silk and linen thread lace is made at Chantilly. The net work of the ground is oval in these laces and the pattern is outlined with a thicker thread. Most of them are now machine-made In Normandy Valenciennes laces are made, and hlack silk hobbin guipures at Le P'uy. In Spain silk lace is made for mantillas in black and white. Maltese lace is innde by hand in Malta in hoth silk and thread, and the hest patterns have portions of the design in high relief.

Machine-made Lace. Almost every description of lace is now made by machinery, and some is so well turned out that it is difficult at first sight to tell it from hand-made. The weakness is often in the edge-especinlly where indented-which is liable to ravel in washing. Machine lace never possesses the finish or rich, soft heauty of the hand-made, and its threads have a squeezed look. In net laces the mesh of the ground has a harl even appearance. instead of the soft, slightly irregular charm of hand work In needlepoint imitations the buttonhole-stitch, which

Fig. 6. Honiton. In tnis beautifiul erample the
design of flowers and butterfies is connected, not by a net foundation, but by bars of twisted thread
forms a large portion of the work, is not well reproduced, while the plait of bobbin lace can only he satisfactorily imitated at a high cost. Conrse laces are produced for furnishing purposes and curtain laces on bobbinet.
The Care of Lace. Old lace should be kept in a dry, warm atmosphere, and if laid away for a time should be taken out of the drawer or box and aired at frequent intervals, as it is liable, especially black lace, to a species of mould. Sometimes lace is handed on which has been cut or torn; unless the art of lace making be understood, it is worth taking the piece to an expert to he joined or mended.

In the case of laces with torn hand-inade net gmunds, which are often worn into holes

long hefore the heavier patterns show any signs of venr. the net should he repaired by necdle or hobbin, according to the original workman. ship, as a machine-made net hacking would destroy a good deal of the value of the lace.
Hand-made lace should not be dry-cleaned. as the process is injurious to the delicate fabric. It should be firnily pinned to a linen-coverel hoard with it sufficient number of pins to keep the lace flat, and dabbed gently till quite damp with a sponge. Then, pure Castile soap should he dissolved until it forms a good lather in warm water : the lace is dabherl with this till clean, the soap aponged off with clean water, and as much moisture as possible removod from the lace with a dry sponge. It must not he imned, but left to dry on the board. If properly pinned it will not be pulled out of shape.

Very thick lace that cannot he sufficiently cleansed by dablhing may he placed in a saucepan in soapy lather which has heen allowed to cool, and then brought to boiling point The lace should he rinsed in clean water, and pinned out flat to dry Black lace should be pinned in the same masuer, but dabhed with vinegar and left to dry. Should a deeper old tint be desired for "hite lace after it has been cleansed it may le laid in cold tea.

The rewing on of lace is an important part of its care. The cotton or silk used should match the lace and not the material. For lingerie laces, where a firm and yet delicate method of attachment is desirahle, a close satin-stitch is often used, and is suitable for a straight or rounded edge. The lace should first be tucked to the material, and then run with small stitches along the base This is practically n aecond tacking. which keeps the line of the lace straight for the closely covering satin-stitch. Without the precaution of this close running, the lace usually has a crooked appearance. After the completion of the satin-stitching, the raw erge of the material behindshould he cut a way close to the stitches.
For straight edges only, a hemstitched veining may be used.
Sufficient threads having been drawn for the veining. and the lower edge worked in the ordinary hemstitch way, the lace must be tacked to the upper edge of the veining. Between each ordinary hemstitch which connects a group of threads. one or two seam stitches should be put into the edge of the lace. The work is completed hy cutting the raw edge at

Lace. Fig. 8. Duchesse lace. Strip of delicate real lace, showing a cbarac-
teristic and beautiful floral pattern
threads passing through both linen and parchment. This forms a skeleton outline of the pattern and is closely covered by button hole-stitshes in thread. Connecting meshes, links, or bars, are made to hold the pattern together with buttonhole stitches. A sharp knife is inserted between the parchment and the linen, and the original stitches, which were passed between the parchment and the linen, are cut. The loose threads are picked off and the lace is complete.

In making the laces known as point lace, lace braids are first tacked carefully on to the pattern, following the design exactly. Patterns are obtainable ready drawn upon the linen. These point lace patterns are all drawn with double parallel lines, between which the braid is tacked on with small running stitches. When the brail turns a curve it must be whipped on both edges and lightly drawn up to follow the form of the pattern exactly. Having tacked down the braid, the connecting bars must be cast. Secure the thread with a small button-hole-stitch, pass to the opposite braid, and then return with a twisted thread to the place where the original small but-tonhole-stitch was placed.

Other spaces formed by the braid may be flled with various needle-point-stitches. There are about forty of these, and it is not within the scope of this article to give details of

that the bobbins themselves hang down over the cushion towards the worker and rest above the lace that is being made

Whatever form of pillow is chosen it must be firmly and evenly stuffed. It is first covered with canvas and then with green linen or sateen. Finally, a piece of white calicu larger than the design, is pinned securely over the pillow and the pattern is pinned to this. The pins are driven right into the pillow to secure the calico cover and the design in such a way that only the heads are visible. Most workers hem covers for their pillows of navy blue linen about 2 ft . square, washing the linen three or four times to be quite sure that all the free dye has been taken out.
In the centre a small circle is marked measuring about $1 \frac{1}{2} \mathrm{in}$. in diameter, and the circle is outlined all round by a running of thread. This is then buttonholed around, and finally the small circle of linen is cut out from the centre. Through this small hole the lace is worked so that the rest of the pillow and the lacework is kept covered and clean.

Ready-made pillows are not very expensive, but the beginner can make her own quite

Pig. 11

Leoc. Figt. 11 and 18. Bhowing aroasingl of the threade to make the hall-atito'」 them, or for employ-
ing them in the making of modern reticella, easily. A piece of green linen or sateen Venetian, and renaissance laces. The simp- measuring 18 in. by 20 in. is folded over, and lest braid lace is Bruges. This is made by tacking Bruges lace braids of varying widths into the selected design to form the pattern and whipping them into position. The spaces between the braids are then carefully filled. Sometimes a picot bar braid is used, or, if preferred, the connecting bar threads can be plainly buttonholed with equally good effect Having practised the handling of the braids and making the bars for this lace, it is worth while for the interested worker to purchase a book on needle-made laces.

Making a Pillow. The pattern in bobbin lace is made by twisting and plaiting the threads of linen, cotton, or silk. The design is selected first, and is drawn on paper or parchment to form the patterns. It is then pricked with holes by a pattern pricker. This pricked pattern is fastened to a pillow, and serves as a guide in the disposal of the pins used later to guide the threads.

Some workers use a circular-shaped pad attached to a board, which can be rested on a table and moved about easily. Other lace workers use a well-padded pillow, flattened at both ends so that it can be held between the knees. Whilst the lace is being made it is securely pinned down to the pillow, which is covered with a stout but soft piece of cotton for the lace to rest upon during the process of making. The threads from which the bobbins hang are fastened at the top of the pattern, so
its longer sides are joined by machine. This is turned inside out, and a half-inch hem is made at each end and a tape is run through each hem. One end is drawn up and tied securely. A circular piece of cardboard with a 6 in . diameter is placed at the end over the drawn-up portion. The pillow is filled up with sawdust or hair, and then a second circular piece of cardboard, exactly the same size as the first piecc, is placed over it before the open end is drawn up.

Lace. Fig. 13. Mesh of Buokinghamshiro lace onlarged to show details

Marking the Design. The design is drawn in ink on some strong, smooth blue paper. If the beginner finds it easier. she can have the design pricked on the paper, and even have a dot for every position where a pin must be placed later in manipulating the threads. The pins used by lace makers are smoother and more slender than ordinary pins: but the beginner can use large ordinary pins at first, and will need 4 or 6 dozen. Lace pins must be kept clean and free from rust, and a plentiful supply facilitates the work. Some workers dip the heads of the pins into melted wax, so that a little globule forms a bead at the head of each pin, and prevents it from slipping through the lace. It is a good plan to have a small pin-cushion with a tab, and to pin it securaly to the lace pillow in a position where it can conveniently be reached by the right hand when working.

Pricker, bobbins, and bobbin-winder have next to be considered. A pricker can be bought at any art needlework shop. A homemade pricker can be made hy taking the wooden portion of an ordinary penholder, melting a drop of sealing-wax, and placing it on the end, and then embedding an ordinary strong but tine sewing needle in the wax while it is still warm and soft. The wax is gently pressed round the eye-end of the needle, and when it cools and sets it hools it firmly in place.

Bobbins of many shapes are available in wood or bone. The number needed depends upon the nature of the design A beginner would only need about 2 dozen, but elaborate designs may require well over 1,000 bobbins. Each bobbin is like a little spool with a more or less elaborate handle. If the bobbins have any roughness or unevenness on their surfaces, it is advisable to rub them over gently with fine sandpaper, as the threads used in lacemaking are so fine and so easily broken. When the bobbins get dirty, they can be worked in a warm, soapy lather, but they must not be used to hold thread again until thoroughly dry.
A bobbin winder is not necessary for a beginner, but it saves time, especially if it has a skein-holder attached. It is very easy to soil the thread, so all handling must be avoided, and it is a good plan to wear white cotton gloves when winding the bobbins. Many workers wear aleo a white apron and over-sleeves to proteot the lace.

Making Bobbin Lace. Amongst the genera rules for making bobbin lace, it is important to work in a good light, preferably with the light falling from the left. Directly the eyes feel tired, the work should cease for the time being. It is not necessary to look too closely at the bobbins, but the threads should be watched, as mistakes are then quickly noticed and put right. The bobbins must be kept closely wound and are picked up lightly by the finger-tips, care being taken not to get them accidentally knocked out of place. Both hands must be used.

British-made linen thread is the best forlacemaking purposes, but mercerized cotton, silk, tinsel, and plain crochet threads are also employed. If the thread becomes entangled, it must not be handled, but the pricker must be used to free the threads. Any thread not in use should be rulled up in blue paper to preserve its colour, and put in an airtight tin until it is wanted.

If a thread breaks it must be dealt with sarefully, and a knot must never be left visihle in the lace itself. If the warp thread breaks some distance from the actual plaiting, it may be possible to knot the broken ends and finish the particular section of the lace before the knot is reached. If the break occurs in a traveller thread, it may be hrought to the erlge and there exchanged by a twist with a stationary bobbin. In this way the knot will not appear in the lace. If the broken end is very short. wind the broken end extending from the boblin round pin and tie it. Stick the pin into the pillow near the other broken end of thread. Replace the bobbin and go on werving. Then cut of the broken end close
The pattern in bobbin lace is often outlined with stronger thread than that used for the mesh. The variations in the twisting and plaiting of the mesh con. stitute an essential difference in the various kinds
of lace.
The bobbins should all be wound the same way, i.e. away from the person winding if she is right-handed. When the hody of the bobbin is moderately full, cut the thread, wind it twice round the neck, pull the end under the thread when it runs from hody to neck, and pull taut (Fig. 10). When all the bobbins are wound and hung on to pins ready to start the pattern, it is advisable to practise lengthening and shortening the threads. To lengthen, hold the bobbin horizontally and revolve it between finger and thumb until it is the length required To shorten, hold the bobbin in the left hand, insert the right forefinger under the thread which runs from body to neck, and pull upward whila the left hand revolves the bobbin until it is short enough.
If the thread gets loose from the neck and the bobbin hegins to unwind after the work is started, it is only necessary to wind the hobbin to the length required and finish by winding the thread twice round the neck of the bobbin and pulling taut. There are three elemental stitches nsed in all hobbin lace. They are known as half stitch, donble stitch, and cloth stitch. To make any stitch 4 bobbins are re quired, and to learn the stitches it is a gond plan to knot the threade of 4 bobbins together, fix the knot to a pincushion, and practise the stitches a few times before starting a pattern. Except for outlining with a gimp thread, bobbins are used in pairs.

To make a half stitch, place the two pairs of bobbins to be used in the centre of the pillow hanging from a pin and number them from the left. Cross 2 over 3, cross 4 over 3, cross 2 over 1 . The first step should be done singly and the second and third steps simultaneously. using the right hand to lift 4 over 3 and the left hand to lift 2 over 1. Figs 11 and 12 show the working 1)ouble stitch is half stitch done twice without interruption, while cloth stitch consists of crossing 2 over 3, 4 over 3, 2 over 1, and

Lace. Fig. 16. Strip of narrow Bucks lace with shell edge, made by arrangement ot pins snown in Fig. 15 above
to the pattern. The following stitch is used for it. Make a half stitch and twist once each of the pairs with which the hall stitol/ has been made. If a pin is put in, it should not be closed in. Make a Bucks stitch with thic 4th and 5th pairs, and with the 5th and 6th pairs; put a pin in hole 13 between the 5 th and 6 th pairs. Make a Bucks stitch with the 6th and 7th pairs; put a pin in hole 14. Make a Bucks stitch with the 7 th and 8 th pairs: put a pin in hole 15. Pass the gimp through the $8 t h$ pair and twist the 8th pair twice. Proceed in the same way with line B as far as putting a pin in hole 14, then pass the gimp through the 7th pair and twist the 7 th pair twice, In line C (Fig. 15) proceed as before as far as putting a pin in hole 13, then pass the gimp through the fith pair and finally twist the 6ith pair twice.
LACEWING FLY. One of the fow insects which may be called a friend by the gardener is the lacewing lly, whose larvac devour the

Lacewing or Golden-eyed Fly. One of the few insects which are heipful to the gardener.
eggs of the fly
aplides. The adult insects have slender, pale-groen bodies, about $1 \frac{1}{2} \mathrm{in}$. long.
They deposit their eggs upon hair-like filaments on leaves and shoots. About a week after tiny larvae hatch out, and these im. mediately begin to devour the aphides, slaughtering great numbers in a very short time. The larvae measure about $\frac{3}{1}$ in., and may be identified by their dirty white bodies, spotted with brown or orange. The parent fly, by reason of its prominent golden eyes, is sometimes called the golden-eyed fly. See Insect.
LACHENALIA. This showy spring. flowering greenhouse plant is popularly called the Cape Cowslip. The narrow tubeshaped Howers are chietly of yellow, orange, or orange-red colouring. Lachenalias look well in hanging baskets, or may be grown in pots. The bulbs should be potted in AugustSeptember in a compost of loam, with some decayed manure and sand added. After having been

Lachenalia or Cape Cowslip, a handsome spring-lowering bulb tor the greenhouse liept in a cold frame for six or seven weeks they will be well rooted, and should then be placed in the greenhouse. A temperature of 50 to 55 degrees will be found to be suitable. When the leaves begin to turn yellow in spring, watering should be discontinued gradually, and finally, as the leaves fall, the soil must be kept dry until August, when the bulbs may be taken out and re-potted. The chief kinds of lachenalias
are Nelsoni, pendula and tricolor, but many named varieties of improved colouring are now obtainable. Pron. Lac-e-nā li-a.

LACKEY MOTH. Much damage is done to fruit trees by the lackey moth. Its caterpillars feed on the foliage of many kinds of trees and shrubs, including the apple, cherry, plum, and pear among fruita, and the oak, hawthorn, willow, alder, clm, and rose among trees and shrubs.
In Leaflet 69, issued by the Ministry of Agriculture and Fisheries, the following measures are suggested for ridding trees of this caterpillar pest : Spraying is effective if carried out carly enough, and also at any time if there are not many cater pillars on the tree. When, however, the whole tree is enveloped in webbing it is impossible to get enough poison on to the leaves to do any goorl. The best time to spray is within three weeks after the dropping of the petals from the Howers. Lead arsenate ( 1 lb . paste to 20 gal . water) is the best insecticide to use, and the wash should be applied through a fine nozzle, giving a light dressing to every leaf on the fruit trec. In gardens with only a few trees affected the pest can be destroyed by hand. See Fruit ; Insecticide; Spraying ; Syringe.

LACQUER : How to Apply. The purpose of lacquering is to protect the surface of the object from the action of the air, and so prevent it from tarnishing. Door knobs, handles, fenders, and other articles can be lacquered, thus obviating the need for constant polishing. They should last at least six months without requiring any further attention.

The materials required are several bottles of lacquer of different colours; good quality soft camel-hair brushes, one or two clean glass bottles with cork stoppers, for the storage of the brushes, a quantity of clean saiwdust, preferably boxwood, and some means of heating the objects to be lacquered. The operation must be carried out in a warm room absolutely free from draughts, as they cause the lacquer to bloom, that is, to dry with a milky, bluish appearance.
Suppose, for example, it is intended to lacquer a polished brass or copper object such as a door knocker. The primary stages of polishing are dealt with in the article on polishing (q.v.), or the surface may be finished with a natt effect by dipping in dilute nitric, sulphuric, or hydrochloric acid. The utmost care must be taken when using these chemicals, as all of them are poisonous. Some clean tissue paper will be found useful for handling the lacquered article. The next stage is to clean the article thoroughly. This may be done by boiling it in clean water, allowing the water to drain off, and then drying it by burying it in a tin of hot sawdust which has previously been heated by baking it in the oven. After the object has been left in the sawdust for a few minutes it can be removed and brushed over with a clean, dry brush to remove any traces of sawdust. On no account must the article be touched with the bare hands after it has been cleansed, but should always be handied by grasping it with a piece of tissue prper, or some other material free from grease.
The lacquer, which is composed of shellac, a colouring material, and methylated spirit, or some similar solvent, is best obtained ready made from the makers, or from any high-class colour shop. One type, known as hot lacquer, has to be worked hot ; others are known as cold lacquer, which is brushed on like ordinary varnish, and generally sold under proprietary names. The cold lacquers are very simple and easy to use, and very handy for lacquering bath taps and fixtures which have to stand hard wear. For all ordinary purposes the hot lacquer should be employed.

Lackey Moth, an insect pest which attacks truit trees. Left and above, caterpillar ; below, right, moth B" permission of the Ministrin of All rieuture and

All types of lacquers can be obtained in a variety of colours, but, generally speaking. the colourless or crystal lacquer is quite invisible when applied to metal A pale gold scarcely jermits the yellow shade to be noticed. Daep gold imparts a notable increase in the deptl, of the colour, while the coloured lacquers. green, blue, or red, colour the metal more or less. They are all n pplied in the same way.

Hot lacquering is performed by first warm. ing the object, e.g. over a flame from a gas burner, or similar henting medium, taking care to keep the object more to the side of the flame so that it does not get soiled from the products of combustion. The exact temperature can only be determined by experience, but a few tests on various articles will show the effects obtained by variation in temperature. Roughly speaking, if the work is too cold, the lacquer dries up lustreless with a dead appearance. If too hot, the lacquer sizzles when applied to the work, and dries off with a strcaky, gramular effect.

The happy medium is that temperature at which the lacquer can be brushed on com. fortably, and will dry quickly with a very bright, lustrous surface. Usually this result is accomplished by using a large brush, dipping it into a clean glass container with some of the lacquer in it. A sufficient quantity, but not an excess, should be held by the brush, as the lacquer evaporates very quickly. Wipe some of the lacquer fron the brush on the edge of the glass vessel, but leave the hrush so charged that the lacquer will flow frecly from it, but without any tendency to drip of the brush.

Apply one corat only, on every part of the work, and never hrush the same part twice. In the case of a long, slender object, rotate it with the left hand while brushing on the lacquer with the right. In other cases, a long, firm, sweeping application of the biush is employed. Then bring the work fairly near the heating stove, and turn and twist it about for a few minutes until it is hard and dry. If any quantity of lacquering is to be done, it will he hest to make up a lacquering oven from an old biscuit tin. Fit a door to the tin, and fit up a pair of wire hooks, or a little tray, on which to rest the lacquered objects. The oven should be placed upon the heating stove and warmed up

Should the work be spoilt for any reason, the best remedy is to clean off the lacquer with methylated spirit, repolish and relacquer.

## LaCQUER WORK FOR THE AMATEUR Antique and Modern Forms of this Artistic Handicraft

Those interested in similar occupations should turn to the articles Gesso Work; Lampshade; Leather Work: Papier-Maché; Repoussi Work; Stencilling, etc. See further Bureau : Correr Cupbnard: Grandfather Clock: Sereen; and other picces of furniture on which lacquer is sometmes used; also Chinese Style; Chippendale Siyle; Queen Anne Style

Lacquer work was introduced into England in the latter half of the 17th century, and Chinese lacquered panels were imported and made up into pieces. In Queen Anne's reign English lacquer work became fashionable and was later popularized by Chippendale. The cabinet in Fig. 1 shows an exquisite example of 17 th century workmanship.

Much of the English lacquer was done on papicr-mâché trays. The tray illustrated in Fig. 2 is a gond specimen of modern lacquer copied from an old piece of English lacquer. The following directions are given for this work. Rub the tray or wood carefully with fine sandpaper, and coat it over with filling. which is paste made of whitening mixed witli water to the consistency of thin cream. Add a little plaster of Paris, and a little glue, powdered, if possible If ordinary glue is used it must be carefully mixed in when warm, and unless the filling is used at once, the mixture must be kept warm. Avoid using thick filling, as this makes an unevon surface. When dry, rub it down again with anndpaper.

A filling can be purchased together with a set of Chinese lacquer colours and other requisites in an outfit. They are subject to the Petrolcum Act and cannot be sent through the post. Spirit Incquers require careful handling as they are inflammable. and cellulose lacquers, though yielding a fine finish, possess a pungent odour to which the worker requires to accustom himself.
When the work is fillcd and rubbed down, a design has to be chosen. Designs may be bought from some firm which specializes in this kind of work. Most oriental designs are built up from several motifs, and can be adapted from illustrations or other Chinese piecos. A willow pattern plate or dish makes a good design for adapting to a small piecc of work.

The difference between English lacquer and the Chinesc is that the design is usually more cnowded in the English. Small horders of flowers, scrolls, etc., tend to alter the character. The scroll shown on the tray is typical of English lacquer.
The next step is to colour the background For this, dull black lacquer should be em. ployed. Put on one coat with a flat squirrel hair brush and allow it to dry. Then apply a second cont. If it is at all rough, sandpaper it carefully hefore applying the second coat. Two coats of black are usually sufficient, but should the groundwork look poor, apply a third coat. Draw, or trace from a copy, the

Fir. 2. Ovai papier-maché trag. a specimen of Fodern lacquer conied from an old English piece
main objects of the design on a piece of tracing paper the size of the article, then turn it over and rub the back with whitening. Lay this onrefully on the article and goover the design with a pencil, which will apply a clear white
tracing to the black surface The raising paste is next applied Makeall surfaces where it is intended to apply raising paste rough by scratching with a penknife. A paste can be used as directed for the filling, except that it must be much stiffer, or gesso powder may be employed. Clinose a hog's hair brush with ong hair for this, and apply it by working round the inside of the outline, twisting the brish towarls the worker. As it spreads a

Fig. 3. Small lacquer table. a rood modern example in the Cbinese style
little, keep inside the outline. Very little rais ing is used in English lacquer. For the tray the only part raiscd was the roof, the rockis at the back, the bridge and the figures very slightly. Allow the raising paste to become quite dry, but do not put it near a fire or it will crack. When dry, rub it carefully with sandpaper if at all uneven or mugh

Next gild the raised portions and all main parts of the desigu, onsitting any fine detail. For this gilding lirst use the special medium obtainable. Paint it over, and when almost dry dust it over with rather beavy bright gold powder, uaing a chamois leather. Allow it to dry for at least a day. Then wash with soap and water, and dry it carefully, using n soft cloth. If the fine detail cannot be put in freehand, trace, then paint it in with chrome yellow to which a little medium has been added. Dust it over with gold. When it is dry wash it, and put in any forcground. touch it up where necessary and shade it n little with black lining ink and water colour. When diy give it two coata of brown varnish, rubbing down hetween each coat with poudre de silice. After the recond cost of varnish is thoroughly dry, give it a good ruls with chamois leather. In English lacquer the floral borders aro uften painted in oolours.

Prepare the wood very carefully when lacquering an old piece of furniture. Wash it well with strong sode water, then rub it down or have it scraped, to remove any roughners. Apply the lacquer very evenly. Quick drying spirit lacquers are not easy to use. A modern outfit mold contains a special solvent for thinning these, as the best reaulta are obtainable by using two or three thin coats rather than one thick one. Amateurs should always try black first, as it is much enaier to remorly any mistakes, and usually works more evenly. Pale coloured lacquers are the most difficult for them to use as they
need careful bandling, and cannot be touched up to any extent.

After the surface is ready, transfer the design as explained, tien study it well and decide which portions are to be raised. Unless it is a large piece of work, such as a cabinet, do not raise it too much as it looks clumsy. The small table and finger plates shown in Figs 3 and 4 respec. tively had the rocks, temple, and roofs of the houses raised; the lampstand in Fig 5 had only the foreground and a bircl.

When dry sandpaper it well and dust it carefully before commencing to work in the fore ground. For this the apecial medium is required. Paint over all the foreground, and when tacky dust it over with coloured bronzes using gold, red, green, and a little silver. These can be shaded in with the chamois leather. When dry dust off any superfluous powder, and gild all the main objects in the same way. Use fine dull gold for this and the mixing is done in a saucer convenient When dry wash and dryit. When filling in the to work from while painting the article, as detail use a very fine sable brush, and make shown in Fig 8. the strokes as fine as possible. Only do a little piece at a time and dust it over with gold. The medium dries quickly and will not hold the powder if allowed to become too dry.
When the detail is finished and dry, wash it well and dry it carefully The line work must be done next. Mix the special ink with ivory.
black water. colour, and put in the fine lines. Should the gold lines be too thick, this can bere. medied by painting a black line at the side. The work may be shaded by using a little burnt aienna and here and there a touch of red Poster colours may be used. The advantage of using these is that mistakes can be wiped off with a wet rag and the parts in question put in again. Should the work be too bright when finished, dip a damp rag in a litile poudre de silice and rub it over the surface. working with the grain of the wood. A final coat of clear varnisb may be applied over the "hole work where pale ground coloura are used. Otherwise brown varnish is used as described for finishing the tray (Fig. 2).

For a silk lampshade, such as that illustrated in Fig. 5, no raising paste must be used, as the effect must be obtained by shading. The shade is painted after it has been made up. If the work is to be transparent, use oil colours and stencilling medium. Broad work is the most effective, and the use of gold should be asoided as much as possible. A vellum lamp

Lacquer Work Fig 5. Chinese lacquer lamp stand with silk lampshade
shade to suit this style of lamp may be coloured with waterproof inks.

Modern Forms of the Work There are other kinds of lacquer work of interest to the amateur. Lacquering on leather will he described under Leather Work, and lacquer used in conjunc. tion with raised and modelled gesso and barbola paste has been dealt with in the article on Gesso Work Modern methods of decorating over lacquer grounds include Worcester painting, so called from the designs chosen, which resemble those on Worcester China, and Marbling Examples of the first are shown in Fig. 6, while the candle. stick in Fig. 7 has been decorated by means of the second. Stencilling is also employed, being carried out in liquid oil colours over the ground. work of Incquer. When it is desired to mix lacquer colours for the groundwork this cannot be done from the bottles,

Worcester painting is particularly suitable for the decoration of dressing.table sets, oigarettc-boxes, and for pieces of pottery. Artistic work is achiovel with this type of decoration when applied to a pottery vasc suitable for a lamp and using the same designs for the vellum shade. On Worcester and Chelsen china tea services, etc., designs are often set in shaped panels, and birds, small flower sprays and Chinese motifs can be copied. Maroon, canary-yellow and apple. green are all correct colours for the finished groundwork, and show up the panels most eflectively. The first atage is to coat the article over with the filler, as already decribed, sandpapered to a smooth surface

Lacquer Work. Fiz. 8. Cigarette bor and powder bowls showing Worcester Cbina effect with stlppled coloured background and white lacquer

Then a coat of white brush-lacquer colour is painted evenly over the surface, using a squirral hair brush. This must be allowed to dry and a second cont applied. The work must now he left for some hours, preferably overnight, to allow the lacquer to harden before proceeding further. The inside of a hox or other article should be lacquered without the conting of filler. The supface must first be sandpapered.
The next stage is to wipe the article over with a damp cloth and then to cover it

Fig. 7. Candlestick decorated by marbling process in water colour or lacquer
with the desired shade, yellow for instance, using chrome lemon poster colour, and to stipple this over quite firmly afterwards with a dry equirrel hair brush. The method of holding the brush is shown in Fig 8.

The coat of stippled poster colour must be allowed in dry before the third and most interesting stage of the work is begun. This is illustrated in Fig. 9, which shows the methorl of wiping out the panels for the Worecster de. signs It is better to use temblates for this rather than trust to the unaided hand.

Templates may be cut out of niled manilla paper, or purchased in packets of a duzen assorted shapes for a few pence, and their usage will enaure the clean sliape of the oircle, oval or triangle. Through the template the small panel apaces are wiped out with a slightly wetted rag (see Fig 9), removing the yellow poster colour and lea ving the originally painted white lacoser: groundworkshowing. should remain.
After the panels have been thus prepared tracing paper and a carbon For this work, however, cmbroidery transfers can be used of amall floral patterns. Poster colours are used to tint these, and their simple delicate nature is shown in the three attractive pieces in Fig. 6 The powder bowl on the left has an apple green stippled ground. The interior, handle and rim are of the white lacquer Crescent-shaped templates were used through which to wipe out the panels on the lid The design of wild roses is painted in pinks and greens and the panels are outlined witt. gold Cold may also be used for the interior of a box or bowl. It must be used over the lacquered

The rim and base of the article should be green and rellow, treated in the same way. This must be done other shades being cleanly, and not a trace of the yellow colour obtained by mixture eses, as, for exainple. the designs are drawn and painted. More in the ship designs elaborste designs can be traced by means of shown, the colours are
ground work. When completed and quite dry the whole article is varnished with clcar white varnish.
Marbling is even a simpler method of decorating a lacquer foundation. This consists in wiping off the poster colour with a damp cloth in a zigzag fashion to imitate graining or the many varied markings of marble. The candleatick which is samon in Fig. 7 has been decorated in malachite green over a cream Incqucr groundwork: White or cream lacquer lends itself as admirable for

Fir. 8 (above). Method of bolding dry brush int stippling background. Fig. 9 (below). Dse of a template when wiping out the panels in Worcester China designs Courlesy of Winsor \& Neuton. Led foundations for this work, as for Worcester painting, but other lac- paper. To prevent the lines being rubbed off quer colours can be used, and except black are they are scratehed over with a steel knitting suitable for marbling. Blue poster colour can needle. Excellent results can be obtaincd by the not be used over red lacquer asithas a tendency amateur worker skilled in repousse work, who to blacken. Designs can be introduced into is able to prepare his own designs in slight relief this marbled work by means of wiping a panel on pewter, brass or copper, and subsequently apace clean through a template to show the plain lacquer groundwork Very simple landscape or llower designs of the type used in modern marquetry work look well introduced into articles with slightly marbled surfaces.

Lacquer Work on Metal. Examples of a kind of lacquer work which appeals to many people are shown in Fig 10. For this work four lacquer colours are prepared, red, blue, needle. Excer killed in repoused work who to colour them by means of these lacquers.
Bronze powders can be utilized in this work and Japan black lacquer. Camel hair brushes are employed for broader effects and line sable for details. Yellow varnish is used to coat the whole piece when finished and thus render it untarnishable
In conclusion it may be noted that brushes used for lacquer colours should be washed out
 na to enhance n already modelled in the metal. In others, as in the brass cigarette box, which is being painted in Fig. 11, the design for the most part is traced on to the metal Having clcaned the box with methylated spirit, the eelected design is transferred by means of a carbon
in methylated spirit immediately after they are linished with each time After use with oil colvurs for stencilling, if this is employed, hrushes arecleansed with turpentine, and poster colours are washed off with water.

Bottles must be kejut corked when not in use. Best results are obtainable il the work is allowed to dry thoroughly between cach process. A coat of varnish should always be given to the linished article. Varnish should be applied evenly with a suft brush and the work sct aside to dry where no dust is likely to settle on it. Lacquer colours always require an absolutcly smooth surface. Where raising paste is used the opposite rule obtains The particular portion of surface to be raised has to be roughencd to make the paste adhere firmly to the work
LACRYMA CHRISTI. A famous Italian wine from the vineyards situated on the slopos of Vesuvius is Lacryma Christi. It is a very attractive wine when drunk on its native soil, but comparatively little is imported into Great Britain An exceedingly luscious wine of refreshing llavour, it is ordinarily of a rich red colour, although white and sparkling varieties arc produced. The white variety is noted for its piquant flavour
LACTIC ACID. By the action of the lactic acid bacillus on milk sugar lactic acid is obtained as a colourless, syrupy, sour lignid It is one of the waste products of muscular contraction and has much to do with inducing muscular fatigue

Lactic acid is found in the stomach in the earlier stages of digestion, when it is produced by the action of bacteria on the carbohylrate foods. Metchniloof thought that the presence

Lacguer Work. Fig. 10. Examples of coloured lacquer work on metal. Fig. 11. Brass cirarette box in process of decoration ; the design bas been trangterred and the coloured lacquer is being applied by means of a camel bair paint brusb
of lactic aced bacilli in large numbers in the intestine prevente the growth of other bacteria and thereby prevents auto-intoxication, or wisoning from the substances manufactured by such bacteria in the buwel. For the purposes of his treatment a large number of preparations containing lactic acid bacilli are sold for the artificial souring of milk, and milk soured in this way can be had from reliable dairies
Calciutn lactute, duse 10 to 30 grains, is ued to increase the lime content of the blood, in restruining bleeding, in urticaria, chilblains, and for other purpuses. The syrup of calciunn lactophosphate, dose $\frac{1}{2}$ to 1 dram , is a good tunic
LACTOMETER. The specific gravily of milk may he measured by an instrument known as a lactometer, which is Hoated in the milk. and the figure marked on the stens of the instrument corresponding to the upper surface of the milk is then read off and represents the specific gravity. In good milk this should be 1.028 to 1034.

The greater the amount of cream the lower the specific gravity : but the increase in the figure which results from skimming off a purtion of the cream can be lowered by the sddition of water By itself, therefore, the lactumeter is a fallaciuus guide to the quality of inilk, and other tests are therefore necessary Sec Milk
LADDER: How to Use. Extending ladders. in two or mure sectiuns, aro very convenient in the home, being light in weight and oufficiently
 rigid for most household work. These are placed against the wall and extonded by pulling upou a rope or by pushing up the extending portion. Iron fittings, varying in type with the different makes, are provided to huld the two parts lirmly incontact
and prevent

Ladder. Fig. 1. Correct rositions when raising a ladder. Fin. 2. Method of lowering a ladder so that one man acts as a constepbalance to the weight borne by the man who holds it up

Ladder. Fir. 3. Useful type ol ladder giving access drawn un, and is concealed by the trap doar be Courlesn of Loft Ludders. Led.. Bromlen
the upper part of the ladder from sliding down until released.

When a ladder longer than 10 or 12 rungs is to be raised or lowered, it calls for two or more persons' assistance. To raise the ladder it should be placed on the ground, with the bottom a few feet out from the wall, in the pusition it will occupy when the ladder is raised. One person places one foot on the bottom rung, grasps the third or lourth rung above it and commences to pull, while the other person lifts the opposite end as high as possible.

The ladder is held with the arms extended above the head, by grasping the rungs and advancing hand over hand, there by gradually raising the ladder higher and higher. The other person stands on the bottom rung and holils on to the fourth or fifth rung, leaning hackwred as far as lie can, as shown in Fig. 1. This procedure is continued until the ladder is in a perpendicular position, when both persons should stand on the ground. grasping the sides of the ladder, and very cautiously allow it to fall over in the required position on the wall of the house, or wherever it is being placed. For a very long ladder three or four persons may be needed to elevate it.

As a precaution, the amateur may attach a rope to the ladder, leading it through an upper window and stationing somcone at the end of the rope to haul on it when the uthers are lifting the ladder, and to ho!d un tight when the others pause. Having raised the ladder, it should be securely lashed to some part of the building, to prevent it from swaying or rocking. The angle a ladder makes to the house is important, and it is belter to have it more upright

Hith otherwise: the more vertical a ladder is the less strain is on it, and the less it will sway while anyone is working upon it.

Lowering a Ladder. 'l'o lower the ladiler, llie sequence ol operations is to a large c.atent teversed. The lashings are removed, and if it is proposed to use the check rope from the upper window, this should be uttaclied before the lashings are cast off. The persun at the "pper winduw with the check roje should constantly watch, or be advised of the action of those below, so that all concerned inay work ith unison. The petson on the clicek rope should take the weight chiefly when the persons lowering the ludder are moving the hands from one rung to another.

The usual procedure is tirst fur one to stand on the bottom rung on the inside of the ladder with his back to the wall of the house, while the otlier stands with arms elevated, reaching up and holding on to the highest available rung. The one behind the Indder pushes, while the one in front pulle, until the ladder is vertical; the one behind then stands on the lowest rung, and holds on to the third or fourth rung, and gradually leans hackward, while the other person allows the ladder to incline over his head, walking backward, with arms erect, and grasping the ladder rung by rung until it has been lowered to such a height that it is possible fur him to cume from beneath it and hold it with one arm, as shown in Fig 2 . After this the ladder may be gently lowered.
During the whole of this time the person at the back must keep his weight as far behind the Indder as pussible, the object being to act as a counter-halance to the weight of the ladder; by this arrangement it talies on more or less the form of an L-shaped lever. The stronger person should always be the onc beneath the ladder, while the heavier individual should generally hold on to the back.
The amateur should, in all cases of cloubt, attach a strong rope to the top of the ladder so that it can be contralled. The rope could he twisted round a crowbar or stout iron or wooden bar, which might rest aoross the window-opening, as by carrying the rope in this way it relieves the slack end of much of the pressure, although it makies it more difficult to pull up the ladder. When placing the ladder, care inust be taken that the top docs not damage the eaves or gutter, or any pait of the loouse. This is prevented by tying old sacking round the ends of the ladder, but mostly by care in raising it

Fig. 3 shows a useful type of ladder for giving access to a loft. When unt of use it rises up and is concealed by the trap door. See Attic: Loft; Step Ladder; Trestle.

LADDER FERN, The genus Nephro lepis, known as the lailder fern, includes useful ornamental ferns. The most popular in exaltata, which may be grown in greenhouse or room window if potted in a compost of peat, loam, leaf-mould, and sand. As a bnsket plant the ladder fern is exce!lent. See Fern.

Ladder Fern. Ornamental pot or basket plant

LADLE. A lad!e is a large sponn used for serving soup, sauce, and other liquids. Ladles are made of silver, electro-plate, and various
 alloys. Others are of china and earthonware, generally being made to match the
spring. They are propagated by sowing spores in pans of moist peaty and sandy soil in a cool greenhouso See Fern.

LADY GRASS. Ribbon grass and gardener's garters are other popular names for Phalaris arundinacea variggata, an ornamental grass, 2 ft. high, with green and white leaves. It flourishes in ordinary soil and is increased by division in autumn An annual, to which the name Pinalaris canariensis is given, supplies the birrlseed which is in demand by those who lieep enge-birds
Hy permission of the Director. Victorla a
dinner service and lit the sauce boats. Examplas of silver ladles are found dating from the beginning of the 18 th century. These inclurle ladles used for tilling glasses from the punch bowl, many of which had handles of whalebone or a dark wood. Some were ornamented by fitting a coin in a hole cut in the hottom of the bowl; but collectors should beware of spurious examples. See Cutlery; Sauce Boat; Spoon

Lad's Love. This is a name of the plant also known as artemisia, old man, and southernwood. See Southernwood

LADYBIRD. There are about 30 specics of the scarlet and black sputted beetle known as the ladybird. and all are of assistance to the gardener in destroying

Ladybird green $\mathrm{fl}_{\mathrm{y}}$. The larvae are known as garden crocodiles. The most common species is the scven-spotted ladybird.

The larvac live for a bout three weeks, hatching out from buff-coloured eggs laid underneath leaves, efterwards turning to pupae, and in ansther three wepks emerging as mature heetles. The crocodiles are each able to destroy hundieds of aphides in a short time.

LADY DAY. This is the name given to March 25, the reason being that it is the feast of the Annunciation of the Virgin Mary. It is a quarter day in England and Ireland, but not in Scotland.
LADY FERN. The name is applied to a very beautiful hardy ferm belonging to the genus Athyrium The actual lady fern is A filix-foemina; there are numerous fine- varieties. They thrive in ordinary soil to which leaf-mould has been added, and they like shade. Free watering is necessary in dry weather. The dead fronds should not be cut off until

Lady Fern. Delicate fronds of this beautiful hardy
fern, very suitable for indoor decoration

LADY'S FINGER: The Biscuit. To make these rich biscuits, take 4 eggs, \& lb castor sugar, and $\ddagger \mathrm{lb}$. flour, also 1 extra yoll: of egg. Work the yolks of the eggs, alter separating from the whitc, with the sugar until of a creamy appearance, and add the flour and any essence desired

Whip the whites of the eggs to a stiff froth and fold lightly into the mixture. Fold a shect of kitchen paper to make in it three divisions, lay it open on the board, and pipe the biscuits evenly in rows between the dividing lines. They should be 3 in . long by $\frac{1}{t}$ in wide. Cover them with sugar, lay the paper on a thick baking sheet, and bake in a muderate oven to a light fawn coluur.
To remove the biscuits from the paper, lay the whole sheet on a board or cloth wetted with hot water: the warm moisture will enable the paper to be peeled off without breaking the biscuits

LADY'S FINGER : The Plant. This is the popular namc for anthyllis, a rock-garden trailing plant which bears pea-shaped flowers in early suminer. It necds well-drained soil and a sunny place and is increased by sceds sown in late summer, or by division in autumn or spring. The best is Anthyllis montana, which has greyish leaves and rose-pink flowers. Another name for the plant is kidney vetch.

LADY'S MAID. The duties of a lady's maid vary, but she must be n good necd!ewoman, able to keep her mistress's cluthes in repair, to renovate or alter any garment, and to make from patterns or copy garments when required

In addition she will be expected to know something about hair-dressing, manicure, and face massage. Her employer's wardrobe is entirely in her charge, and she is responsible for its care and for the setting out of the toilette to be worn. She assists her mistress to dress, and may also be expected to do some of the finer washing, such as lace, gloves or evening handkerchiefs.

In many cases the lady's maid is a kind of travelling companion, whose business it is to look after the luggage, get the ticketa, and save her mistress from all the routine work of a journey, either by sea or land. Packing and unpacking are included in her work, whether sho accompanies her mistress or not. A competent lady's maid oan cominand high wages. See Packing; Servant.

LADY'S MANTLE. The name is given to a genus of hardy herbaceous perennials, Alchemilla, of which a few species only are grown. Alpina is a British native with silky hairs and leaves which are silvery on the under surface. It is about 9 in high, and suitable for the rockery.

LADY'S SLIPPER. The popular name of the Cypripedium group of orchids is lady's slipper Some of them are hardy; others need
grcenhouse treatment. The name ts derived from the shape of the lip or lobe of the blossom, which resembles that of tho toe of a lady's slipper. See Orchid.

LADY'S SMOCK. The name of Carda mine pratensis (cuckoo flower), a familiar wild plant with pale lilac-coloured flowers in spring. The double varicty is a pretty plant

LAELIA. One of the most popular forms of hot-house orchids is the laelia. The pseudobulbs must be placed in pots, pans, or hanging baskets in a mixture of peat, sphagnmm moss, charcoal, and sand. They should be watered frecly during the summer inonths, given plenty of sunshine and air. and kept at a temperature of about $70^{\circ}$. In winter the thermometer may be allowed to drop to $(3)^{\circ}$
There are many species and hybrids, with flowers that range in colour from white through pink and lilac to purple, and new sorts are produced every year by orchid growers. Propagation is effected by division of the pseudo-bulbs at potting time, or when new growth is dereloping. Sec Orchid
LAGENARIA. A hardy annual climbing plant, with bottle-shaped fruit, lagenaria (bottle gourd) is an excellent climber for covering fences, trcllises, etc, and belongs to the same family as the gourd ( $q$ v.) It is best raised from seeds sown in April in a hented greenhouse and planted out in carly June
LAGER BEER. Of a pale amber colour, bright and sparkling, full and pleasant in Havour and entirely free from acidity, lage, beer is not so strong as English beer, and contains a smaller quantity of alcohol. In brewing it, not only fewer hops but from 20 to 40 per cent less malt is used than in most English beers

Most of the Austrian beers have a mild and soft flavour, and it is rarely that any of then are as bitter as English pale ales. Pilsener beer, brewed at Pilsen, in Czecho-Slovakia, is exceedingly pale in colour as well as remarkably light. It is coven weaker than Vienna beer, but it has a sharp, almost medicinal, bitter llavour due to Saaz hops. See Beer.

LATD WORK: In Embroidery. Laid work is used chicfly in Chinese embroidery, for filling backgrounds and large spaces in designs, or when copying 17th century Italian work in which gold and silver thread are couched down with tiny stitches. A thread is laid. either following the outline of the design or in straight rows across it, or in some filling pattern when the background is to be decorate with laid work, or following the lines of the ground material.

Laid work is emploved for designs when the embroidery is wanted in high relief, and where the working medium cannot be drawn through the ground material in the ordinary way, as in the case of cords. chenillc, and

Lady's slipper. Flowers and leaves ol a lavourite greenhouse orchid (Cypripedium)
heavy silver or gold threads When em broidering with metal thireads this work has the advantage of using less of these expensive materials, ns they are not taken through to the wrong side of the fabric but only caught down on the surface.
Designs are frequently first padded all over by means of stitchery in coarse, soft crochet cotton Floral designs may have leaves and llowers stiffened or still further raised by means of cardboand shapes. The Iatter can be prepared by transferring the required portions of pattern on to a sheet of cardboard and cutting out the shapes with a sharp knife. Sometimes such cardboard shapes are pasted on to the fabrio to be embroidered : in other work they are stitohed over with the raised padding cotton to give a more raised effect. The metal thread is wound double on to a spindle; this facilitates the even laving of the thread. For raised designs in which the effect of satin-stitch is desired the double metal thread is taken backwards and forwards across the padded leaf, or other figurc, and secured on the opposite side with a tiny

Laid Work. Fir. 1. Simple couching stitch used in this form of laid work
back-stitch Laid work is employed for designs embroidered on leather, suède and felt, and also in conjunction with appliqué.
Couching Stitches. Several forms of laid work are accomplished by means of different ways of placing the laid threads, and variations in the couching stitch used. In its simplest form couching stitch is shown in Fig. 1, holding down the double thread. Such a stitch has been used for the gold laid wark on the embroidered cushion shown

Fig. 2. To keep the metal threads in position a little couching stitch has been worked across them at intervals of $\frac{1}{d} \mathrm{in}$. 'This design has not been raised by padding, but is laid down directly on to the black satin. In the central leaf ornaments the beauty of the design is made by the variations

L,aid Work. Fig. 2. Black satin cushion embroidered in gold thread couched down with small stitches in black silk
in laying of the goldthread with the veined coucls. ing in black silk going in acontrary direction.

In Fig 1 the couching stitch is shown in black, and is left rather loose so that the position of it can be plainly seen but in the actual work it is drawn duwn closely. so that it is almost in visible. It is quite permissible to work

To work, the laid thread can be caught down at the beginning to keep the end in position, then bring the working thread to the right side of material, after fasten ing it on the wrong side, just above the laid thread, which is on the outline of the design, draw the thread through, and put the needle hack under the laid thread in a perpendicular line. Now bring the point of needle through but set wide apart.
this stitch obliquely acruss the laid thread when working an ordinary outline, but when working couched filling, and over very round laid threads, as in the gold embroidery on the cushion illustrated, the stitch should he quite straight and uniform. In couched filling the stitches come exactly inidway between two stitches of the lirst round. ground material again about $\frac{1}{A}$ in. to the left, or large spaces such as bold fruit designs and just above the laid thrend, and draw through, conventional flowers.
when a perpendicular stitch will be seen across the laid thread. The illustration shows the needle in working position, and it will be seen that it is like is hemming-stitoh,

Scaled couching is formed with loops couched down in the centre, and arranged so that the loops of succersive rows begin in the centre of a loop of the previous row and linish in the centre of the next loop of the previous row, so making the forma. tion of scales.
In veined couching, when the first threads are laid in the form of leaf out. lines, these are often only caught down with a tiny stitoh on either side, but the veins are laid in a reverse direction to the foundation threads, and each vein is couched down as it is leid

Fig. 3. Showing laid threads couched down with oriental filling
with the stitch used in oriental filling and thus holds the first laid threads in place

Oriental Filling. This filling is an importunt stitch in laid work. Used for a back ground, it is illustrated in Fig. 3. It is shown, worked in silk, following the lines of the soft canvas groundwork, and it is worked here more open to illustrate the stitch better. The work can be done over the fingers, or in a frame for large pieces To work, proceed as follows: After joining the silk on the wrong side bring the needle up through the material to the right side at the lower edge of the design and pass it down again exactly opposite on the upper edge of the design. Bring the neeedle up again a little to the left of this lail thread, about $\{$ in. down. Insert the ncedle exactly opposite to the right of this laid thread and bring it out to the left again about $\ddagger$ in. down, as shown.

When it is drawn through, a little stitch will be formed across the laid thread. The needle is again inscrted to the right of where it last came out, and brought out again ou the left about $\frac{1}{}$ in down. Repeat the procese to the bottom of the thread, after which another thread is laid close up to the previous one, and so on in succcssion until the background is covercd closely so that no material is visible.

Diamond and Diaper Stitch. Other fillings are of threads laid with diaper stitoh, and also with diamond stitch. They are both used as embroideries for covering backgrounds

Laid Work. Fig. 4. Showing how the small stitch is made at the crossing of laid threads in diamond stitch. Fig. 5. Diaper stitch. showing position of needle at the second balf of the stitch

In the form of laid work utilizing diamond stitch the foundation threads are first laid in a sloping direction from left to right, the second lot of threads crossing these in the opposite direction. This is best worked in an embroidery frame to make sure that the threads are taut without being drawn too tightly.

The second process is the making of the little stitch at each crossing of the threadr. and this sets the diamond pattern. Fig. 4 shows this stitch in progress. The needle comes through material to the left of the crossing, and is put down again in a straight line to the right of it. With one movement it can be brought up again to the left of the next crossing. When the needle is drawn througli a little stitch is formed whioh holds down the two threads of the foundation.

In diaper stitch the foundation threads are also laid obliquely, first in one direction, then across the reverse way. The points of the crossings are then couched down with diaper stitch, whioh resembles cross stitch, but is mide and placed differently.

The first half of the stitch is worked acrona the junction of the two threads, letting it extend at each side of the main threads, so that it is a distinctive stitch in itself and not a little couching stitch only. The lirst half of the stitch runs parallel with the warp threads of the material, then the work is turned and the second half of the stitch
worked in the same way and parallel with the weft threads. Fig. 5 shows the second nortion of the stitch in operation Se: Embroidery.

LAKELAND TERRIER. In size the specimens of this breed are similar to the fox terrier, but in colour are fawny brown. The coat should be of a wiry texture and close.

Lakeland Terrier. Specimen of this tamay-brown wire-haired terrier., bred for fox bunting Ihoto. Thos. Fall
as these dogs are used for going to ground to bolt fox or badger. They are active and game, therefore must have sound and level leeth, strong jaws, and small eyes. The best weight is a bout 10 lb . See Dog.
LAMARCKIA. A hardy, low-growing annual ornamental grass, lamarckia has silky golden folinge, and when dried is useful for the purposes of indoor decoration Seed may be sown out of doors in springtime. The grass should be cut and dried during August.

LAMB: In Cooking. The flesh of the lamb is both delicate and digestible, and is of a lighter tinge than mutton when cooked. It takes longer to cook than beef or mutton, for, Whether it is roasted or boiled, every portion of the joint should be thoroughly done and frequently basted. When roasting lamb it is necessary to lower the temperature of the oven after the first 10 or 15 min . to prevent the flesh being scorched or hardened. Allow 20 min to each pound and 20 min . over. Roust lamb is served with clear gravy and nint sauce. New potatoes and green peas, when in season, are the usual vegetables. English house lamb can be obtained by the end of November or the beginning of December. Grass Inmb is fit for the table by April, and lasts all summer and enrly autumn.

When purchasing, one of the chief points to observe is that the lamb is fresh. To judge the fore-quarter, see that the vein of the neck is eitlier ruddy or bluish in colour : if it has n green or yellowish tinge it is not good. The quality of the hind-quarter can be determined by the feel of the knuckle and the state of the kidney; this latter must he small and perfectly sweet and the knuckle should be quite stiff: the Hesh should be firm to the touch. In foreign lamb, the best quality of Canterbury (New Zealand) meat is excellent if well cooked, but the joints should adways be of a clean appearance and the fleah a good colour.

Lamb is cut up first into hind and fore quarters, and these are again divided into legs, shoulders, loins, necks, and breasts. The pluck, known ns lamb's fry, is served as a brenkfast or supper dish, while the liver, heart, brains, sweetbrends, ears, tail and feet can be used in the preparation of side dishes.
Lamb Blanquette. This is an entréc composed of seallops of cold roast lamb heated
in a rich white sauce with the addition of mushrooms. Cut some thick scallops of ment from a cold roast leg of lamb, keeping each one as much as possible the same size and giving them a neat rounded appearance. The quantity required is about 1 lb .
For the sauce, melt in a stewpan $1 \frac{1}{2}$ oz: butter, and mix with it 1 oz flour. Cook theso together without browning, and then moisten with pint clear while stuck Add 6 oz . mushrooms which have been prepared and cut into strips, and a pinch of grated nutmeg. Stir over the fire for a few minutes, then add the ment and heat it in the sauce.
Bent together the yolks of 2 eggs with 2 ta bleapoonfuls of cream, remove the hlanquette from the fire, add the liaison and cook all gently 3 or 4 min . to take the rawness from the eggs and cream. Take care that the sauce does not boil after the mixture is added. Season with salt and cayenne pepper, and squeeze in a little lemon juice. Serve with cronttons of fried bread.

Chops and Cutlets. Before they are conked, lamb chops should be well trimmed and all skin and supertluous fat removed. They must be grilled or boiled, and served with a pat of maitre d'hôtel butter on each one. Sometimes the maitre d'hôtel hutter is omitted and plain butter is spread over, with a seasoning of pepper and sa!t and a good sprinkling of chopped parsley. Lamb chops are usually small, and it is well to provide sufficient for a second helping.

Lamb cutlets should always be cut and trimmed as described for mutton cutlets, and with all cutlets a good shape should be of the

Lamb Cutlet. Dish of cutlets fried in egg and bread-
first importance. They are good simply broiled and served with fried potato straws. After hroiling they need brushing over well with butter and plentifully seasoning. They nay also be egged, crumbed and friod, and served with a marnish of peas, or one cutlet as $n$ casscrole dish. For this fry the cutlets for n few minutes in butter, then remove them and cool the butter. When cool mix it with the
yolks of 2 well-beaten eggs and add seasoning. yolks of 2 well-benten eggs and add seasoning. into white breadcrumbs and laid in a casserole. Pour a little good geravy over them, add seasoning, 4 tomatoes cut in halves, and the juice of half $a$ lemon. Stew gently for $\frac{1}{2}$ an hour. Serve on a bed of pens and strain the gravy round.

Slices from the centre of a leg of lamb can be made into an excellent dish of cutlets if stewed with good stock to which has been added a bouquet garni and a little spice tied up in muslin. Stew the cutlets 20 min ., then take them up, skim the fat off the surface of the gravy and remove the bouquet and the spice.

Lambeth Ware. Lambeth Delft mug; with the arms of the Leathersellers Company, and ingcribed Bee Merry
and Wise, 1880

Thicken the gravy with butter and Hour made into a roux. and add 8 forcemeat balls, $\$ \mathrm{lb}$. mushrooms, prepared and fried in hutter, a pinch of ground mace and the yolks of 2 egga beaten with 4 tablespoonfuls of cream.
Stir the mixture of eggs and cream into the gravy and cook, but do not let it boil Hent up the outlets in the sauce, and serve them with some neatly cut beetroot. One ounce each of butter and flour would be sufficient to thioken I pint or more of gravy.

Lamb Pie. To make lamb pie, procure a neck of lainb, remove the chinc bone, and saw of the breast part, so that the bones of the cutlets remaining will measure only about 3 in. Separate those neatly and pare off any superthous fat. Put the spine bones and trimmings into a stewpan with an onion stuck with 2 cloves, a grated carrot and turnip, a few peppercorns, and salt. Cover with cold water and boil at least 1 hour to make stock. Place the prepared cutlets in a ment pie-dish, nrranging them in circular form round the side, aeason them, and fill the centre with peeled, uncooked, and rather small new potatoes or old ones pared and shaped in balls. Pour over these and the meat sufficient stock to three parts fill the dish. Cover with a rich crust as for meat pies, and bake $1 \frac{1}{2}$ hours When the pie is baked add more stock. and serve hot or cold
Lamb's Head. To make a tasty dish o lamb's head, remove the brnins, blanch and boil them, then chop them and make them ints) a forcement, adding the same ingredients as for veal stuffing. Soak, binnch, and boil the head with the tongue and the liver, if procur able. Cook gently for an hour, remove the bones, and lay the flesh neatly on a well greased Yorkshire pudding-tin. Skin the tongue and cut it into dice with half the liver: mix these with the forcemeat. Cover the Hesh of the heal with the mixture, and grate over a little lemon rind. Bake in a good oven for 20 min ., and baste it well with dripping.

With the liquor in which the head was boiled make a rich gravy, thickening it with butter and Hour and flavouring well. Dish the head with the stuffing covering it, strain the gravy round, and garnish with fried bacon and the remainder of the liver cut in thin slices. The bacon and liver can be cooked by the side of the head in the baking-tin. See Carving: Cutlet; Hot Pot; Mutton: Pastry.

LAMBETH WARE. A sharp distinction should be drawn between the two great classes of decorated pottery for which Lambeth is famed. For about $n$ hundred yeara after the middle of the 17 th century several factories in that vicinity produced glazed faience of the style introduced at Delft, in Holland. This Lambeth delft was painted in blue and other colours and comprised tiles, wine-bottles, oval dishes, candlesticks, and mugs.

Pieces much prized hy collectors consist of sets of six plates, each bearing a line of a daggerel verse describing a Merry Man. As this ware seldom has a factory mark, it is often difficult to distinguish from contemporary delft made nt Bristol or Liverpool, and even f́rom Dutch ware itself. A rosy tinge, showing up the dark clay body through the thin tin-enamel, sometimes helps to distinguish it.

Lambeth faience is n name given at the Doulton works to a form of art pottery consisting of $a$ coloured hody painted in decorative designs and fired under the glaze. See Delft: Doulton; Faience.

LAMBREQUIN. This word is now used tor a drapery, usually of embroidered linen or some rioh material, found on bed testers of the time of William and Mary and of Anne. The carved wood is closely oovered with the fabric, which is fastened on and elaborated by festoons of drapery and hanging tassels In some beds made to-day for period rooms this type of drapery falla from a wooden corona. The name Inmbrequin is also used for the Viotorian arrangement of festooned drapery on mantelpieces and over doors. See Tester.
LAAMBSEDN. Skins of young or pre maturely born lambs are tanned with the Heece on and treated as furs, which are used in the Near East to make caps, coats, and cloaks, and are also employed by western furriers Imitations are made in mohair yarn plush in cream culour for babies' woar as well as in dyod shades with ourls of different pattern, length and lusire. The fabrius oan
be washed like woollens, and the light colours cen be re-dyed to darker shades by the use of wool dyes. See Fur.
LAMB'S HETHUCE. Tho leaves of lamb's lettuce or corn salad, a quick-growing salad plant, are valuable in winter and spring. Seed is sown in late summer in drills 0 in. apart, the seedlings being thinnod to 5 or 6 in. from each other The fresh, young leaves are the best to eal.

LAMENESS. Many oauses may produce lameness, inoluding oorns, bunions, deformities of the feet or other parts of the lower limbs whether present at birth or aoquired subse quently through injury or otherwise, and diseases of the joints or of the nerves or muscles The symptoms should be investigated at once in any oase and treatment will vary with the cause. See Club Foot ; Foot : Hip Disease ; Infantile Paralysis.

## Lamps: Oil Gas and Electric

## Latest Ideas in Practical and Decorative Lighting

This contribution deals with the various forms of portable lamp, and also with gas and electric amps which are fexibly connected to the malna and may be moved from place to place. Other lghting articles Include Acerylene; Alr Gas: Burner; Electricity; Gas; Lighting: Oil. See also Bent Iron Work; Lacquer Work: Standard Lamp

The three main kinds of lamp used in domestio lighting are oil. gas, and oleotria. When oil lamps are used it is generally beosuse neither gas nor eleotrioity is available though some people profer them, especially for reading purposes, beoause of their soft light. Formerly vegotable or animal oils, suoh is colza and sperm. were burnt in them, but these havo now been superseded by mineral oil.
In an ordinary oil lamp the wicke by which the oil is suoked up from the reservoir and supplied to the llame are either flat or oircular: in duplex lamps two flat wicks are placod side by side. Whether flat or oiroular, the wick should be of a size to fit the burner exactly and long enough to allow of about 2 in . being coiled up on the bottom of the reservoir. When so much of it has been burnt away that its lower end only touches the bottom, the wick should be dis. carded and replaced by a new one. It should be kept trimmed as evenly as possible For this purpose it is tumed down until it is nearly level with the top of the burner, and then the oharred portion is gently rubbed away with a rag. This operation should be repeated every time the lamp has been usod. Cutting the wiok is rarely necessary.

In lighting a lamp, turn the wiok down low and wait a little time before turning it up again after putting the glass chimney in place, lest the glass be cracked by the heat. If the wiok is turned up too high the flame will smoke and not burn olear. The funotion of the chimney is to create a draught and supply the flame with sufficient air for proper combustion. By fixing a talc or glass shield, of whioh various
patterns are sold, on the top of the ohimney the current of hot air rising from the thame may be deflected and spread, and blackening of the ceiling a hove the lamp reduoed.
Some lamps are provided with a lever, whioh when pressed extinguishes the flame. In the ordinary type, when it is desired to extinguish tho light, the Hame should be turned down low and either allowed to go nut by itself or put out by blowing sharply across the top of the ohimney, not down it. Some times there is an arrangement whioh automatically extinguishes the flame should it be overturned or tited far from the vertioal.

Kerosene lamps should be kept sorupulously alean. The oil reservoir ahould be of metal not glass, beosuse if the lamp is knooked over, the glass breatos, and there is serinus risk of firo. The reservoir should be kept fairly full the lamp not being burat oontinuously for so long a time that the oil is exhausted. The older type has been superseded to a great extent by lamps in whioh an incandescen: mantle :s used.

Incandescent OII Lamps. There are several types on the market some in which a wick conveys the oil to the special burner, and others in which the oil is vaporised under pressure before mixing with air at the burner In the latter type a pump is incorporated in the reservoir, or an attachment is provided to which a small nir pump (e.g. a cyole inflator)

Lamp. Fis. 2. Preasure oil lams with rase in coloured elased pottery. Pis 8 Aaddin table lamp, in which a wiok convejs the oil to the special burner rlley Lamp Co.: and Aladdin Industries, Led
can be oonneoted when starting the lamp Figs I and 2 illustrate pressure lamps and Figs. 3 and 4 the other type. The pressure lamp: shown hrild enough oil for about 10 burning hours, and the makers state that a gallon of paraffin oil will give a light of 300 o.p. for 04 burning hours. The intensity of the light is governed by the air pressure at which the lamp is worked. The average candle puwer of the lamps shown in Figs. 3 and 4 is given as 80, and a gallon of oil laets about 70 hours.

Gas Lamps. When gas is spoken of in con nexion with the lighting of houses, the coal gas or town's gas supplied from public gasworks is usually understood To a limited extont: however. in plaoes where a publio supply is not available, other kinds of gas are employed suoh as acetylene and air gas. The former can be utilized in portable lamps for indoor use and a useful type of acotylene table lamp is shown in Fig. 6. Another type, whioh might be used in a shed or outdoor workshop. is illustrated in Fig. 0.
Those who rely entirely on coal gas for lighting are not debarred from using table lamps, since it is possible to obtain useful and decurative gas lamps which take their supply from n.gas plug point on the skirting, through a floxible metallic tube (Fig. 7) Their use calls for a certain amount of care in the disposal of the Hexible connexion, so that it is out of the way, and does not pull on the lamp. and the latter must bo placed so that its heat cannot cause danger to fabrics or woodwork.

Electric Lamps. In addition to the many kinds of electric flash lamp or torch, dosigned only for intermittent lighting, there are

Fig. A. Aladdin brackot lamp, shom. ing the incandesoent mantle, whieb produces a pare white ligat baitery oper. atcd hand lamps which will give continuous light for a few hours These are relatively expensive to work, since the dry bat tery ithust be oftcn replaced, so that electric hand lampa arehence a dapted rather for use in any emergency that arises.

Eleotric table lamps for flexible connexion to the mains are made in all styles, from $n$ desk lamp to the more ornate and decorativo types with suitable lampshades. The Sunray lamp shown in Fig. 8 gives out warnith as well as light.

Plug Points. When connecting or disconnocting a lamp at the plug point make sure that the switoh at the lamp and the plug are turned off. In a safety type of switch-plug (described in the article on l:lectric Light Fittings the switch is interlocked so that the plug cannot be withdrawn until the switch has first been turned off.

Vases for Lamps. Glass, metal or pottery vases, provided they are narrow at the neck, can be converted into table lamps by means of a cork, a piece of wire an electric bulb holder.
a plug. and a few yaids of flex. The cork is shajed to fit the neck of the vase and the piece of stout galvanized or copper wire can be cut to the required length by means of pliers or wiro cutters Failing these tile a notch in the wire and bend it till it parts at the notch. The ends can be sharpened by neans of a tile so that they will penctrate the cork after the wire has been hent in the middle to form the circular support for the bulb holder shown in Fig. 9, which remains in position by means of its lower ring, when this is screwed up tightly from below the wire circle. The electric bulb is then placed in the holder. The holder, flex and the plug, to fit the existing plug point in the room, can be obtained from any electrician.

The effect is particularly good when these vase table lamps are anitably shaded, and many helpful suggestions will be fuund in the article on Lampshades. It is often possible to repeat the design or part of the design on a pottery or china vase by tracing it on to a parchment shade and colouring it. Lovely lamps can be made from cut crystal vases of rounded shapes or even from those of plain glass when these are lilled with water dyed to a colour which is repeated in the design of the shade

LAMPREY. Similar to the cel in general appearance, the limprey is in scason during March, April and May. Lampreys are usually stewed in the same way as eels, or they can be made inton pic See Eel Fish

## Lampshades: Their Materials and Making

## An Arcictic and Proftable Occupation for Leisure Hours

Among the various articles in our work containing other helpful ideas In connexion wilth this decorative art are those on Appliqué: Candle Shade: Embroidery: Lacqucr Wor's Stencilling: Woodwork. Sce also Electric Light: Lamp. Siandard Lamp

In most liomes Inmpshadey arc an cssential decorative fenture. IV lien chosen with due regard to their surroundings they can grently aid the appearance of a roon by day, and are still more important by night, as they can be cleverly employed to make subtle clinnges in the quality of lighting effects Even where wall or coiling fittings are of metal and glass, parchment or silk shades are probably required for table lampa and standards. Artistic shades for ceiling fittings can also be made in simple pagoda and inverted whapes by the home worker, while many wall brackets are furnished with pendant lampshades or shiclds for candle lamps.
There is economical and artistic pleasure in producing for a trifling cost something that looks exactly right in the roum, and as if eapuecially designod at an cxpensive shop To achieve such a result considerntion must naturally be given to the particular lamp or fitting and also to the matcrial, colouring and atyle which will harmonize best with the particular surroundings. When redecorating a room, table lamps or floor standarils which have hecome shabby can be brought into the new scheme of things by restaining and

Iacp. Fig. 5. Acetylene table lamp. Fig. 6. Acetylene lampuseial for a shed or outdoor workshop. Fig. 7. Gaj lamp sopplied from a gas plur point through flexible metallic tubing. Pir. 8. polishing, or into colour relation by being painted with cellulose, enainel or inequer brush paint Various idens fur the decorntion of lamps and shades to match are given in the articles on Lacquer Work and Lamp

Materials Obtalnable. The way of the Inmip shade creator is now cased by the great variety of practical materiala available for her assistance Ready-made imitation vellum or parchment paper shades arc vcry chcap in the smaller sizes and are also obtainnble ill n variety of larger sizes suitable for lloor standards. Packets of cut-out lamp shaclos in assorted shapes may he hought, or, for those who prefer to cut out their own slicets of imitation vellum and coloured parchment papers are sold. Special lampshade paper is also made for pleated shades and therc arc coloured strip horders. Wire frames are obtainable to suit all sizes and shapies in standand, pendant and gimbal fittings

For making-up purposes, galons by the yard in black and gold, to be sewn or cemontal on the edges of shades, and leather thongings or coloured silk braids for lacing then, are provided Glass ornamental drops for corners of pagoda shaped shades and brightly coloureal tassels of wooden beads in various sizes, silk cords and plain or shaded fringes are all obtainable as decorative furnishing touches.

There are also certain fancy mnterials cut into shapes and perforated for lacing with thonging. These materials have marbled, mother-of-penrl, or opalescent finishcs. A large assortment of lampshades with designs already transferred and only needing to be coloured are obtainable in many sizes. Separate transfers for designs adapted to various styles of decoration, mandarin and other inka and also lampshade colours, for painting on parchment or, with the correct medium, on silk, brushes for use with these, clear varnish and cement can all be either purchased or ondered in a good art department, or from firms which specialize in materials for this decorative work.
In practice it is often found that better quality Chinn or Jap silks are prefernble tn those sold for the purpose of Lampshade making. The latter are too thin to form a satisfactory basis for painting, or for trimming with rows of fringe Linen is nlso used nud is particularly suitable for shields to shade electric candlí lamps.

Pleated Paper Shades. Simple to make nnd yet most decorative are shades of pleaterl paper. They are popular for modern table lamps, either on a plain pottery vase shape. or for the wooden type illustrated in Fig. 1. A chnrming effect is obtained by employing two colours, one for the lamp, the borders, cord and tassels of the shadc. and the other for the pleated paper, which accent colours in the room. The part of the shade through which the light actually shines should be one of the beconing tints ranging from cream to npricot, or from pale pink to dcep rose. The exception is green for a reading lainp. On the mahogany lamp stand in Fig. I, the effect of peach-coloured paper, chestnut hordery and silk cord finished with brown and gold hearl tassels is dignified and uncommon.

Any gond quality of firmly textured nind yet finely grained paper will hc suitable for pleating A amall-patternel wall paper which answers this description can be used, but most makes are too brittle for successful pleating. The beat paper is of the same description as $n$ cream-laid or boud notepnper. The easiest bordering is one of the specially made stijps

Lampsnade. Fig. 1. Pleated shade lor mahogang table lamp. It is of peach-coloured paper bordered with chestnut brown ribbon a passe-par the pencil.
tout, but $a^{8}$ thin silk rib bon can be sewn on, as used for the shade in Fig. I, with a fine needle and sewing silk to match
When cut. ting the paper for a pleated shade, first measure the frame. Two and a half times the circumference of the base will be the length ol paper re quired for pleating, and two inches extra should be allowed for the depth. To get the required length. scveral widths of paper may have to be joined. They should Lo decorated and pleated first.

For this style of lampshade, either a plain border may be used for top and bottom, as in Fig 1, or a good effect is gained by applying two strip borderings in a broad and narrow width, the lower one about 2 in . from the base of the shado: or stripes may be painted in mandarin inks either side of a pasted gold border Cut-out motifs can be applied but these are not really so successful for this style of shade as the plainer borderings.

To pleat the paper, baving allowed any paste used to apply decoration ample time to dry, fold in sections of about $1 \frac{1}{1}$ in wide, pressing each fold down firmly with the thumbnail. The folds must be in concertina fashion and afterwards are folded again backwards and forwards to make them each f in widc. The pleats can, of course, be larger or smaller, according to the size of the shade. Pleating can be practised on a spare picce of paper to be sure that the size of the folds will give the effect desired.

The next process is to punch a row of small holes through which the cord or narrow tinsel ribbon is passed, about 2 in . below the top border of the shade. In some of these shades a lower row of holes is punched for a second cord and tassels. This ensures that the pleats will be held in place, and two rows look well when no other decoration is used The holes must be out an cqual distance from the edge of each pleat Before threading them, the lengths of pleated paper must be pasted together and the shade joined. Then the cord or ribbon is threaded through and the shade adjusted on the frame before drawing up, tying and finishing off with ornamental tassels or glass pendants.
Parchment and Vellum Paper Shades. The number of other varieties possible in paper shades makes selection quite difficult. Natural coloured vellum paper is attractive when decorated with a border or a painted design. For those who like to do as much of the work themselves as possible, white parchment paper or imitation vellum shades can be made from sheets of prepared paper.

In order that the shade shuuld set properly it is essential that it should be cut out as shown in Fig. 2, so that the paper used for the shade is a segment of a true circle. Whatever the size required, it should be carefully measured out for depth and cut in this way, with the help of a pair of compasses formed of a pencil, a short piecc of string, and a drawing-pin, to which one end of the atring
pasted on, or is attached while the other end is fastened to
pin tho paper at ita lour corners down to a flat-topped table, or a drawing-board, and mark out the segment for the shade with the compasses. If an elaborate design is to bo painted, it is ensier to decorate before cutting out Ordinary water colours may be employed, or lainpshade colours, or inks. The use of special lampshade colours facilitates putting in a smooth background if it is desired to colour the shade all over. Trace or draw in the chosen design. Work the background to $a$ finish before putting in the culours of the design. A little mediun is mixed with the lampshadc colour selected and a flat squirrel hair brush is used to wash in the backgmund. A swab of soft white rag is necessary to smooth the culour over the shade, wiping it off with a light, circular movement.
The use of the medinm and rubbing with the rag produces a good surface on which to finish the work. When the background is quite dry the design can be painted in. After this work has been completed the shinde can be cut out with sharp scissors and stuck together with strong lampshade cement. Weight

a border of dull gold paint halt an inch wide top and bottom, which makes a good finishi. This method of decoration is especially suit able for n lacquered standard lamp or for small shades in a room with lacquered furniture. Designs for Chincsc scencs can bo adapted from those employed for lacquer work,

Fig. 7. Inverted shade of vellum
paper for a ceiling fiting shades to be made of natural coloured vellum paper, the original tracing or drawing can be outlined in heavy black waterproof ink, and this-pattern can betraced under the vellum paper, which being oiled is semi-transparent and skows the design clearly through. This method, while facilitating the drawing for the amateur, does away with pencilled lines on the surface of the vellum paper, which gives the

Once the shades are coloured, and tho edges joined, making up is simple. For a pendant to be used on a bracket the shade is placed over a wire support as shown in Fig. 3 For a table lamp a gimbal litting is uned Turn the joined shade on its head, paste the wire of the top of the frame, and the lower ring in the нame way. Allow time to set, and then lightly stitch the wire rings to the frame. Take a pair of very sharl scissors and cut off any edges of the shade which come beyond the wircs, and then bind the wired edges with a fancy galon sewn on with a fine

The empire shade for a Hoor standard lainp. which is illustrated in Fig. 4, is loound with black and the geometrical design is worlied out in wine, yellow, green and black colourngs. This intereating design would suit a moderu wooden standard. Such ull-over de. signs lend themselves to painting with waterproof inks, as these are traneparent, leaving the natural vellum for a few of the lighter portions of the pattern To dilute these inks distilled water should be used, or rainwater, or water that has been boiled and allowed to cool. Do not use cold water from a tap. Sable or camel hair brushes are best for painting with in this nedium, the former for tine work The other empireshade shown in Fig. 5 has a delightful orientally inspired
landscape de sign. Moist tube water colours are best used for this type of work as they give a softer effect than any other kind of painting, while waterproof inks are best where brilliancy of tone is re quired, as in a hard, conven tional design This shade has been varnished with clear map varnish on con pletion.

An nttractive touch is given to a lampshade with a booder design if the vellum is treated with la
The colour should The oralour should be shaded from deep rose on to coarse needle and passed through the or orange at the top to a pale tint, as this shadc and round the divisional wircs Such a forms a delightful background on which the shade would look particularly well in a study design at the base of the shade stands out well. Applied designs may be used for these shades Very simple, but effective, is a border of frieze banding, cut out and applied to a tinted parchment shade, which is afterwards varnished. Clintz or cretonne floral sprays can be cut out and pasted on in the same way, but such decoration is apt to look spotty unless kept to borders leaving the light to shine through the softly-tinted parchment. Silhouettes are purchnsable in black and gold or can easily be cut out from black, silver or gold paper to make a good decoration In the same way coloured scraps may be used for nursery shades to form nmusing borders Charming colour effect is obtained by staining the electric bulb amber or orange with transparent glass painting colours.
Many-Sided Shades. Lampshades with many sides are cut to fit special frames. Fig. 6 shows a vellum shade decorated with coats of arms and laced with leather thonging. Having selected the frame, pieces of vellum paper are cut exactly to fit the sections, holes are punclied abuut $\frac{1}{2} \mathrm{in}$. from the edge of each

Fig. 11. Sbade in a special taucy material suitable for a cut placs lamp Courtexn of Welbb "Corbelt

eparate panel, and the thonging is threar shadc and round the divisional wircs Such a or library, and designs can becopied from book. plates. Fig 7 shows the same method of thonging utilized for an invertel shade. The decoration in this case is a geometrical design on the base carried out in cobalt blue, orange and black inks. The inside of the shade is painted orango.

Very quickly decorated arc parchment hades cut out in panels, perforated for thonging and traced for painting uith waterpronf inlis, as illustrated in Fig. 8. The correct placing and size of perforations is clearly scen here as a guide to those who wish to punch the panels for themselves. With the ready prepared panels the frame to fit must be purchased at the same time.

Other materials made up with thonging are obtainable in these shaped panela. The marbled cffect scen in the lampshade in Fig. 9 looks well on a pottery lamp, and also on a wonden standard, lacquered in the way described as marbling in the article on Lacquer Work. The inother-of-pearl and jade imitations are also particularly decorative in these fanoy lainpahade materials, and require little or no further ornament than the thonging, except in the case of a handsome shade like the one in Fig 10, which is of Pancy vellum with a watered surfacc. the pancla being laced tw the frame with a narrow gold braid instead of leather thonging The design, which is painted in inks to resemble Jacobean embroidery, is particularly effective.

The cut glass lamp in Fig. 11 has a beautifully accordant shade in a fancy material which resembles ground glass. The hackground is softly-tinted for a sunset sky, leaving a border of grey-green water at the base from which the reeds spring. The birds are painted in blue and brown, and the shade is thonged with silvered lenther.

Many-sided and dome-shaped shades can also be made up by sewing the varicus panels or sections to the divisional wires of the frame, and covering the ;oins with a fancy

Fig. 12. Painting a shade after the sectlons bave been stitched together to fit the canbric-bound frame
braid or gimp This mothod is a:so used for making up silk or linen shaides The frame must first be covered with nainsook or similar cotton materinal cut on the cross in strips I in witle All downward lines of the fiame are covered lirst. In Fig 12 n frame ready prepared is seen, and also $n$ shade stitched on to it cut to fit the various sections When the painting has been completed, the stitched joins wil! be covered with a light gold gimp.
The vel!um or ailk is tirst cut out a little arger than the divisional section of the frame. Taking one piece at a time, cut it nently to fit the ourved top of the frame Sow th:s piece on with blanket stitch, holding the thread with the left hand whice each stitch is being taken, to prevent ang knotting. Hating stitched round the ton curve. adjust the acctions of material neatly against the frame and cut round the base so that it exactly lits, and sew this also to the cotton binding Make these stitches about $\frac{1}{2}$ in. apart. Having trimmed the sides to the shape of the wire, leave this panel until the next one has been attached top and bottom, and then stitch the two panels together on to the frame These must not overlay, but just meet on the frame. Continue in this way until all the aections of the frame are covered, and then if a design is to be painted this may be done before stitching the braid or gimp on to hide all joins and to edge the shade. Cover the downward seams first and then the top and back. Panels may bave the designs traced on them before stitching to the frame, but in case of tearing a section during the process of sewing together it is better to do the actual painting after stitching has been done.
Some prefer also to sew on the gimp first, but there is little likelibood of tearing the paper while doing this if reasonable care is taken

In Fig. 13, prints of birds have been used to make the decorations of central panels for a set of shades bound with ribbon, which would look most attractive in a man's room.
Silk and Linen Shades. When making a silk shade in the manner just described, the binding on the frame nust be very tightly wound round the wire, so that it is impossible for it to turn or slip when the silk is sewn on. The silk should be cut to fit with the lines of the grain going horizontally. The panel section nust be pinned to the cambric bound frame, stretching the silk so that there are no wrinkles. Sew the two sides down with fine tight stitches and keep the matcrial very taut. Then sew top and buttom with rather less tension or the silk will sag in the middle of the panel Trim closely when the sewing is done and then begin the next panel. When the frame is covered bind it with gimp, taking care to sell this through to the cambric

Lampshade. Fig. 13. Group of shades with coloar prints of blrãs used as decorative panels
covering the frame. When. a coloured material is used for the covering the binding on the frame should match in colour.
Silk lampshacles may be trimmed with rows of silk fringe either arranged as a border or almost covering the entire shade. A drawing. room standard lamp may have a shade on which narrow frinyes, tintel in gradations from deep rose to pale pink, are sewn in zigzag lines round the top and likewise again at the base of the shade.

When covered correctly so that there is not a single wrinkle to spoil the surface silk shadea aro easily decorated with Inmpshade colours, using the special medium for painting on silk. Inks can be also used in flat washes and the shading and details of the design finished of with tube water colours. The dome-shaped shade in Fig. 14 has a charming conventionalized design on a mottled backgmund. The panels, top and base are ribbon hound. Such a shade would look well on a table standard in a drawing room.
Shields for electric candle lamps or wall brackets are made on small semicincular wire frames, which are first bound in the manner described, so that no part of the frame is visible, except the wire for fastening it to the electric light socket. Such shields can be of vellum, ailk or linen. The last-named is particularly attractire with a bordering design in brightly coloured wools. A medium conrse linen should be used. Tho stitches must be very nent on the wrong side, or they will not look well when the light shines through the shade. The embmidered linen is well pressed, interlined with thin buckram and lined with pink or orange silk. The edges may be left untinished and neatened after the work has been stretched and fitted to the frame. The shade must not sag in any way. Having pinned it on to the frame as described in the making of a silk shade, the edges are trimmed and oversewn with ornamental blanket atitch or turned in and sewn down with invisible stitches.

LANCASHIRE CHEESE. The toasting properties of Lancashire cheese form onc of its most popular attractions. This good quality is thought by some makers to be due to the fact that it is moulded when in a colder and more pasty condition than are other cheeses.

Lampabade. Fig. 14. Shade made of silk stretched on a wire irame and hand palnted

The great difference in the method of making Lancashire and other varietics of cheese is that it is made from curds of different ages, usually of three different days. Thus the acidity is developed more slowly than with other hard. pressed checse, and the mixing of curds at differont stages of acidity causes the loose, friable curd in the resulting cheese.

Lancashire cheese is usually made in two shapes, one of which is large and rather Hat, and the other like a small Stilton. The former usually weighs from 44 to 50 lb . and has a diameter of from 13 to 15 in . The smaller size usually weighs about 12 lb. has a diameter of about 7 in ., and is about 9 in. high. See Cheese; Welsh Rarebit.

LANCERS: The Dance. The lancers, n set or square dance, is an adaptation of thic quadrilles, and of English origin. For it at least four couples are needed, though occasionally six dance. Each couple faces inwards, the first (nearest the band) opposite the second, the third on the right of the first and opposite the fourth couple. Tho women stand on the right of their partners. There are five figures in the lancers, and the correct way of dancing these is at walking pace; but usually people onc-step, or fox-trot, or waltz. The first four figures open with an introduction of 16 bars of music, during which there is no dancing.
First Figure.
The first voman and second man advance to the centre, turn, and return to thicir places. The first and second couple advance and exchange places, the firat leading through the second couple. They then return to their places, the second couple in this case pasaing through the irst. This occupies eight bars. Set to corners and turn. Here all the partners separate and the men turn with the nearest women to the left. The movement is then repeated from the beginning three times, the second woman and first man leading off, then the third woman and fourth man, then the fourth woman and third man.

Second Figure. The first couple advance and valse round the centre for 16 hars and return to their places. The side couples divide and join hands with the first and second couples to form tiwo lines, top and bottom. The lines advance and retire. All turn their partners in their places. The figure is repeated with the second couple leading off, then the third couple, and then the fourth. In the case of the side couples the lines are formed at the sides, the first and second couples separating. Third Figure. The four women advance to the centre and wait. The men advance and join hands in a circle behind the women, while the latter curtsey and pass under their raised arms. The women place their hands on the men's wrists and alf dance round in a circle, finishing in their places- 16 bars. The four men then advance to the centre, turn back to
back, and bow to partners, who curtsey. The four men give their left hands across, put their right arms round their partners, and all cliassé round, finishing in their places. Thi women repeat their lead, and the men follow.

Fourth Figure. The first and second couples valse or one-step up and down the centre for 8 bars. They stop and are joined by the third and fourth couples respectively. In two groups of four they give the right hand across, woman to woman, man to man, then the left hand - 8 bars. They cross hands and swing round to the left- 8 bars; or half-way left and balf-way right. This is repeated, the first and second couples finishing with a different side couple. Third and fourth times side couples lead.

Fifth Figure. In this figure there is no in troduction except a prolonged chord when all face partners, present right bands and bow. All then lead off with the grand chain, which occupies 16 bars. Women walle round in a circle to the left, men to right, giving first one hand and then the other, going in and out until own partner is met half-way round, pause and bow, continue the circle until meeting own partner in own place. The first couple or top then lead off with a waltz or one-step down the centre and return to places- 8 barsfinishing in own place but facing outward Side couples fall in behind-third couple, fourth and then second, or bottom couples.

All chassé, cross over, women passing in front, men behind They return to the other side in the rame way, women following the leading woman, and men the rame- 8 bars. The leading woman turns off to the right, men to the left. lcaders up the centre, others fol. lowing- 8 bars. All fall back, form lines and advance and retirc, turn partners- 8 bars. Grand chain is formed again, after which the other couples in turn lead round. The grand chain occurs between each lead round. The figure finishes with grand chain or a general chassé round. See Dancing.

LAND: How to Buy. When purchasing an estate or a piece of land there are several matters that require careful attention. There must be a writing, signed by the other party, to evidence the contract; i.e. the purchaser requircs a writing signed by the vendor before he can sue him; and the vendor requires one signed by the purchaser. The writing need not be formal: it may be contained in a letter. The signature may be by initials, or even a printed bill-heading.
On an open contract, i.e. one not containing any express stipulations to the contrary, the vendor muat be prepared to show a good titlo for 30 years back in himself or his predecessors. He must also show a title unencumbered by restrictions. The vendor must next submit to the purchaser an abatract, or epitome of the deeds and documents of title, for investigation, and allow the originals to be inspected. If, on looking at the abstract or the deeds, the purchaser finds that the vendor has only a defective title, he can refuse to carry out the contract and clain damages. For this reason contracts are generally drawn up by solicitors, in which the purchaser bars himself in advance from taking certain technical objections; and binds himself not to claim damages if the contract goes off. The conveyance must be by deed. In all these matters a solicitor should be employed

The purchaser of land should always be careful to see if there are any easements or public right over it-such things as rights of way. If he is buying a farm, but without the minerals underneath, lie ought to be cautious how far he gives the mineral owner the right to let the surface down. A man who buys a farm must remember that if it is in the occupation of a tenant he will, if the tenant leaves, have to settle for tenant-right ; but if the owner is in possession there is no tenant-right.

Therefore a farmer or market-gardener who sells a farm which he both owns and occupies must make a special bargain with the purchaser if the latter is to pay for unexpired manurial values, standing crops, and the like.

The purchaser of land who intends to build a factory, workshop, or other business premises there will be wisc to examine the title to sec that it contains no restrictive covenants by a former owner which would prevent him from carrying on the business he wishes 10 start. Unless mineruls are expressly reserved by the reller, the sale of a piece of land carries with it everything underneath. As our ancestors used to say, the owner of land owns down to the centre of the earth and

## Landings: Decoration and Arrangement

## How to Solve a Difficult Furnishing Problem

## This article connects those on Hall and Staircase. to which the reader is referied, and also to such headings as Carpct; Linoleum: Wallpaper

It is probahly due to the difficulty of making landings and passages attractive that so little attention is given to their furnishing, except to hang pictures and ornaments that are considcred out of date and unsuitable for the living-rooms. This is quite disastrous from the decorative point of view, which requires hall, staircase and landings to form harmonious parts of an important section of the house which must be properly related to the whole.

Landings in terrace houses often present particular difficulty in furnishing and decors tion, owing to the narrow floor space and comparatively high walls. If added to these drawbacks darkness has a!so to be contended with, well placed lighting fittings, a large mirror which will reflect any natural light from windows, and a pale colour chosen for wallpaper, or painted panelling of hall, staircase and landing will help. In sume casos it is impossible to have any pieces of furniture on a landing except one piece that will fit into an angle. Corner cupboards arc most useful in this connevion Very long mirrors are better raised from the ground, and a chest, narrow table or some low stand with plants placed in front of them. In this way they give the same sense of space, but no one is likely to try to walk through them.

Treatment of Walls. High walls require careful treatment to make them interesting. In selecting the decoration for the hal!, which may be quite well lighted by a good staircase window, such as the one shown in.the first illustration, thought must be given to the landings above, which may be merely dark passages. In this instance the temptation to choose a heavy patterned tapestry paper or brown panelling effect which would not be suitable throughout has been resisted. Light artificial silk for curtains, plain tinted paper. deep cream paintwork and ceiling, the polisned surfaces of tloorboards, stair rails and chest, patterns confined to the oriental design of the stair carpet and the well placed pictures: all give $\boldsymbol{r}$ feeling of light and space. The landing appears furnished, though actually there is only room for the grandfather clock in the stair angle and the oak chest.

The halls illustrated in pages 574-575 may be studied for suitable ideas of wall decoration The applied landscape motif shown with a light marbled paper is especially suitable for repetition on narrow passage landings. When panelling, either real or simulated, is used for the hall it is possible to reduce it to a dado height for the staircase and landings. It is a good plan to fix a rail similar to a chair rail and to cover the lower part of the wall with the panelling. The upper part of the wall above the chair rail should remain light in colour. This is a suitable method of decoration where there is much traffic on staircase and landings. Where lincrusta panelling is used,
up to the aky. If land is hounded by a river or stream, in the absence of evidence to the of the bank, each taking to the middle of the bed of the stream. It should be borne in mind that in law a river or a pond is simply so much land covered with water. See Building: Contract: House.

LANDAU. This is a four-wheeled carriage. It has a divided top, so that the whole can be either open or closed. The word landaulette is sometimes used for a small landau, hut these carriages are not often scen to day. The diminutive landaulet, or landaulette, was sometimes used of a small landau or coupé See Carriage; Driving; Horse.
heavy this kind of stain is not so servicoable, as it quickly wears

Care is necessary, when dealing with landing flonrs that are polished, to see that no lonse mats are placed near the top of the stairs This difficulty can be overcome by sewing special press-stud fasteners to each corner of the mat; these clip into fasteners that are screwed into the floor. The landing lloors of old cottages are often very worn and irregular. Fibre matting and dyed string carpeting are both suitable coverings in such cases.

For upper landings in a sunal! house a piece of oak, which furnishes a passage without overcmivding it, consists of four drawers on a raised stand, surmounted by a large but shallow cuphoard. Where space is limited, a corner of the landing may be fitted with a hanging wardrobe. Houses not providel with hot linen cuphoards will need some gool store for linen, and where there is sufficient room the upper landing is a most convenient place for either a large chest of drawers or a cupboarl, in which to keep linen, provided it is placed against a ilry inside wall.

Larger Landings. Roomy entresul landings give more opportunity for the effective placing

Landing. Fir. 1. Small landing, rendered individual by the curved stair-head, polished oak chest, and grandiather clock set in an angle of the stairs. Fig. 2. Wider landing into which extra light penetrates thrgogh the glass-panelled doors of the sitting rooms which open of it

Fig. 2, Humplirey \& Vera Joel
of a few pieces of furniture, more particularly if thore is a good wide window across the recess. A window seat upholstered with cushions covered in cretonne. printed linen, or artificial silk, and matching the curtain fabric, gives a restful appearance, while a book table is both useful and attractive. Such a space may often be converted into $n$ small extra lounge if a radiator is placed behind a grill under the window seat for winter use. Either side of the recess hookoases inay be fitterl, stepperl in modern fashion, with the addition of
one or two amall easy cliairs, a brightly coloured rug, which tones with the curtains and staircarpet such a landing can look most inviting from the entrance hall

For a squarer type of firat floor landing the second illustration shows the possibility of achieving brightness and a spacious fecling by means of glass panelled doors through which the sitting rooms on either side are visible. The glossy light-refecting texturcs chosen for the upholstery of the cleverly designed divan. for the foor coverings and painted walls, together with the well placed anglel glass lighting fixtures, decorate and furnish this landing space without any crowding or superfluous ornament.

Country house landings are usually easier of treatment. They are either definitely light and spacious or intended to be somewhat cramped, full of the nooks and corners made by the inequalitics of floor boards, odd steps, and cross passages. In the latter case, as much light should be admitted as possible from the casement windows, and heavy curtains or jutting out of pieces of furniture should be avoirled. Niches are nearly always effective on landings and provide a safe place for a Hower base, well coloured piece of pottery, or lamps. Any niche or recess lined with mirror glass in oblong sections will reflect the light decoratively.

LANDLORD. Neither the landlord nor the tenant (except in the case noted below) is bound to repair a house unless he has contracted to do so. A tenant is liable for waste, that is, for damage done by him or his family to the house.

If a landlord has agreed to repair, he cannot be sucd on his agrecment unlcss the tenant has given him notice of the want of repair, and he has failed within a reasonable time to put it right. But a tenant is liable without notice from the landlord, because he is on the spot and can see when repair is necded

Rent Restriction. A landlord can always suc for his rent, and can distrain at common law, but under the Rent Restriction Act he must first get leave from the county court. The same act limits the rent which a landlord may charge for houses within the Act to the standard rent, that is, the rent at which the premises were let on August 3, 1914, or the first let thereafter, plus certain increases up to a maximum of 40 per cent. of the standard rent. Notices of these increases must be given

The Housing tct, 1925, imposes on the landlord of working-class property a liability for repairs, and he cannot rid himself of this liability by making any special arrangement with his tenant. The act applies to houses in London let at $£ 40$ a year or under, and houses elsewhere let at $£ 26$ or under. There is an implied condition that such houses are in all respects reasonably fit for human habitation when let. There is also an implied condition that the landlord shall keep them so fit during the tenancy.

If the house is let for a term of three years or more on the terms that the leasec will put it in repair, these conditions do not apply, unless the lease is determinable, at the option of either party, before threc years.

In the casc of such houses as above, the local authority, if satisfied that repairs are needed to make a house fit for human habitation, may serve a notice on the landlord requiring him within a certain time specified in the notice to execute all necessary works. The time named must be a reasonable one, and not less than 21 days. The landlord has an appeal to the Ministry of Health. If he fails to do the work required, the local authority may do it and ane the landlord for the expense incurred. The name and address of the local medical officer of health and of the landlord must be written in the rent book or given in writing to the tenant of a house that comes within the Act.

When premises are dangerous or injurious to health, the local authority may make a closing order, and if the tenant has to remove, the landlord is liable for his removal expenses See House; Lease; Rent.
LANDRAIL. A plunip delicate small bird, the landrail, commonly called the comerake, is in season from August 12 to the middle of September. It is usually roasted. When
trussing, draw the head under the wing and skewer the thighs close to the sides. The hird should be plucked, drawn, and wiped inside with a cloth dipped in hot water, and before trussing lay inside a good lump of butter with a little clopped shallot and parsley. The time varies for rossting from 15 to 20 min , but the bird must be well basted Serve with rich brown gravy, on fried crumbs.

## Landscape Photography <br> A Fascinating Branch of a Popular Hobby

In addition 10 a general article on Photography our work has articles on various kinds of photography, e.g. Colour Photogra hy, and on the choice and use of photogriphic apparatus, e.g.
Fur satisfactory landscape photography it satisfactory alternative, particularly if the is almost essential to have a camera which has photograph is to lie taken with the camera a focusaing sereen or a direct vision fincer and one that can be set upon a tripod for time exposuros. The camera that posseases only the amall so-called brilliant view-finder is almust useless, for the picture which can be seen in it is not only mislexdingly bright, but it is far too small, and rarely shows accurately what will be found on the plate. The hest help) in composing a phutographic picture is given by a focussing screen with a hood

Composing a picture photographically means nothing more than selecting the best view point. To do this it is necessary not only to see how it looks to the eyes, but what the camera sces-which is a very different thing. The eye will miss objects in the foreground which, on the focussing screen, will be found to be too prominent, or to he out of focus lecanse they are tou near the camera. An insignificant bush, or even tall, waving grass may cover part of the plate with an out-offocus blur. With a brilliant view-finder they wou!d not be noticell, and the photograph would be spoilt. If the camera has no focussing screen, a direct vision finder, through which is seen the actual portion of the view which will appear on the plate. provides a fairly

ald at the level of the eye
The size of the camera is largely a matter of convenience. Such good lenses can be obtained with the modern small camera that satisfactory enlargements can be made from $3 \frac{1}{2}$ in. by $2 \frac{1}{2}$ in negatives up to 12 in. by 10 in . Ā good tripod is essential in order that lengthy exposures may be given when occasion requires. A light aluminium one is best if much tramping about the country is to be done. It should be fitted with a ball and socket head so that the position of the camera itself may be adjusted without having to move the tripod legs with every chanye of position.
The amateur will find it best to use ortho. chromatic plates or films if he does not use panchromatic, which are generally preferred. Whichever he uses he should have one or two light filters to resider the different tones If he uses panchromatic plates or films, light filters are essential. The advantages of panchromatic plates or films are explained under the heading Panchromatic.

Only flat, white, toncless skies can be obtained with ordinary plates or films. Even if brilliantly lighted clouds are not present the tone value of the aky will he better represented on orthochromatic or panchromatic plates. No sky is completely toneless, whatever the weather conditions, and a photograph which represents it as a blank white space is false and inartistic.

For photugraphic purposesall landscapes should be viewerl as series of different tones. The beginner is very apt to he taken with the beauty of the colour in the view hefore him, forgetting that the camera can only record the colours by monochrome tones of varying depths.

Some Useful Hints. The following hints will he of use to the amateur in landscape. hut he should remem ber that the best reaults are only to be olitained by practice, by cultivating an eyc for the composition or making of a picture. by severc criticism of his own photographs, and by the study of the work of others.
A common failing is a lack of sharpness of detail in the foregrour:d of a photograph. The
eye insists that objects near at hand should be sharp and clear to bre convincing or satisfy ing Fuzziness or woolliness of fore ground objects betrays enrelessness in the photographing, or failure to observe that some objects are too near the camera and out of focus. This does not mean that every object from the fore ground to the farthest distance should neces. sarily be sharp and hard. An all-over sharpness destroys the ntmosphere of the pic ture and brings its distant parts forward in an unpleasing fashion Do not thore fore atop duwn the lens two much in an effort to get sharpness.

Do not attempt to get too much on the plate at once Con Hicting interesta particularly should be a voided, as scen, for example, in the photograph reproduced on page 431. A primary rule in composition of any kind is to concentrate the interest. Everything in the view chosen should therefore be in harmuny with, or subordinate to, some main feature. The view point should be shifted until the best possible composition is obtained.

The eye should the led on from the forcground through more or less clear iniddle distance to the more distant part of the scene, which should be comparatively soft. The best method is often that knuwn ns differential focussing, which, with molerately good lenses, gives very pleasing results. This means that while the foreginund is moderately sharp, the focussing is so arranged that the more distant parts are progressively, though perhaps alightiy, out of focus Thus the planes of a picture can be separated and a feeling of distance gained.

The aninteur should not be nisled by the grandeur of a great open space or of towering hills. Thoir small size in the resulting photograph is inevitably disappointing unless something is contained within the photograph to suggest distance or height.

The foreground of a landscape photograph should always have something to concentrate the interent and lead the eye onward. An example of this is seen in Fig. 1, where the cart tracks and sun on the beeches are the principal points of interest in the foreground. This is also a case of differential focussing. Had the trees in the farthest distance been as clear as those in the foreground all sense of depth in the wood would have been lost. Another method frequently adopted in huilding up a landscape photograph is to get the foreground intereat and to make the distance recede by using trees as a frame. An example is seen in Fig. 3. This framing effect is the secret of much of the charm which photographs of scenes thmugh archways often possens.

Finally, the amateur landscape photographer will be well arlvised to attempt no photographs unless the sun is shining. Grey weather inevitably gives grey and flat photographs : the best times are perhaps early morning and Inte afternoon, when the shadows are long and the light contrasts are great. At these times a suggestion of mist softens distances.

LANGSHAN. This is one of the best all. round breeds of fowl, noted for comhining goud laying with excellent tahle qualities. Though

Fir. 2. Open landscape view from a hill-top in which the eye is led from the foreground by the chalk road. Distance is kiven by differential focussing. The three subjects reproduced are from panchromatic plates
principally bred in black, there are white and blue varieties, the plumage of the first-named being of a heautiful metallic green alieen.

It is conspicuous by its stately carriage, and the legs are slightly feathered, the feather line running down the outside of the legs to the toes. The hens are quiet and docile, making reliable sitters. and they lay a good-aized dark brown egg. The hardiness of the breed adlapta it to all climates, pos
also does excellently in contincment. See Fowl; Poultry.

LANOLIN. Lano. lin or hydrous woolfat, which is obtained from sheep's wool, is a commonly used basis for ointments. As it is readily absorbed through the unbroken skin, drugs to be absorbed through the skin, especially mercury, are frequently incorporated with it. Lanolin is softer than ordinary woolfat, and as it penetrates into the skin it is a favourite basis for wrinkleremoving creama, skin foods, etc.
LANTANA. A shrubby plant, with verbena-like flowers of various colours, lan. tana is suitable for the greenhouse and for planting out of doors for the summer months. In autumn the plants must be lifted, potted and kept in a heated greenhouse. A conipost of loam. leaf-mould and sand is suitable. Propagation is by cuttings in August ; if repotied in spring they will be ready for use in summer flower beds early in June. The tops must be cut off to in duce the development

Fir. 3. Tree used as a frame for a view from a billside. giving botb foreground effect and throwing distance into proper perspective

of side shoots. If the plants are kept for several years they should be pruned and repotted in spring.
LANTERN. A lantern is a transparent case enclosing a lamp or source of light, and it is found in numberless designs and types. The Chinese lantern, made with decorated paper and provided with a candle or nightlight, lends itself also to illumination by electric lamps. The hall lantern lighting fitting, examples of which are seen in pages 415 and 520, is commonly made with inserted panels of glass, suitable for gas or electric light, as well as oil lainps or candles.

The bull's-eye lantern has a small lens that throws a concentrated beam of light to a considerable distance. These are usually made with a device to cut off the light by turning the top. which turns an inner piece shaped like a tube and pierced with a hole for the passage of the light: thus when the tube is turned the light is obstructed.

Various types of folding lantern are anitable for campers and for holiday purposes, as they can be packed into small compass: they are available for oil or for candle illumination. Magic lanterns are optical projectors

The first attention required with lanterns is to keep them clean. This applies to all types, but more particularly to those in which paraftin oil is the illuminant. Paraffin has a natural tendency to croep and cover everything with a film of oil. and unless this is removed with $a$ dry cloth the lamp will smell in an objectionable manner, and the light will also suffer. The wicks should be kept well trimmed by amoothing them with a piece of Hat wood wiped over the top of the wick when it is just above the level of the wick tube. To get the beat illuminating resulta, the glasnes must be kept in a perfectly clean condition

LANTERN SLIDE. A lantern slide is a photograph on glass intended for showing on an enlarged acale on a screen by means of an optical or magic lantern. The standard English size of a slide is $3 \ddagger$ by 3$\} \mathrm{in}$. Plates of this size are sold coated with lantern or transparency emulsion. They may be obtained of either gaslight or bromide emulsion.

Lantern slides are made from photographic negatives. If the negative is a small one, or if only a portion of a large negative is to be utilized for the lantern slide, the latter is made by contact. The negative is placed in an ordinary printing frame, a sensitive lantern plate laid film to film with it, and, after the two have been pressed firmly into contact by apringing in the back of the frame, the negative is exposed to the light of an electric bulb or incandescent gas for a time ranging from a second or so to several minutes, according to the density of the negative and speed of the lantern plate.

If the whole subject of a larger negative is to be included in the lantern slide, the reduction process is used, the large negative being photographed on to a lantern plate, using any convenient camera. A usual plan is to fix the negative in a frame attached to one end of $a$ board; at the other end the camera is secured by means of a screw passing through a slot in the board, so that the position can be adjusted for focussing. The plate is then developed, fixed, washed, and dried
Formulae for the solutions are given in the instructions for every commercial lantern plate. To complete a lantern alide, a black paper mask is attached to it so as to cut off some of the margins, and give an exact shape to the picture. Two white paper disks, about $\frac{1}{} \mathrm{in}$. diancter, are stuck on the part of this mask above the picture. They are required as a guide to the lanternist when showing the slides. A clean cover glasa is bound to the lantern slide with a gummed strip of paper. See Gaslight Paper: Optical Lantern; Photography.

LAPAGERIA. This is a Chilean evergreen climbing plant with slender stems and bearing large rose-red or white drooping tubular Howers in spring and early summer. It likes cool conditions and thrives in a greenhouse facing north or east. A winter temperature of 40-45 degrees is high enough. In mild districts it can be grown out of doors on a partially shady wall. If trained on wires beneath the greenhouse roof it is very beautiful when in bloom.
LAPDOG. Among the small pet doga fav oured eapecially by women and often termed lapdogs is the King Charles spaniel (q.v.), the pug, the toy black and tan terrier and the Yorkshire terrier. The first-named is the black and tan variety of the old English toy spaniel, the others being the tri-colour, ruby, and Blenheinn, which has rich chestnut red markings on a white ground.

In later times the Pomeranian came into fashion, at first too big to justify the appellation lapdog, as well as the Brussels grifion which is quite small. The little Japanese at one time looked like becoming very popular, but was nusted by the Pekingese. Attempts have been made to acclimatize the papillon, or buttertly dog of the Belgians, so called from the characteristic shape of his ears. See Dog.
LAPEL. The lapel is that part of the breast of a coat or overcuat that is turned back.

The exact size and ahape of the lapel, both on men's and women's coats, varies with the fashion, but their corrcet set is one of the marks of good tailoring.
LAPIS LAZULI. This is a mineral which has a very beautiful azure or ultramarine blue colour. Sometimes the stone is Hecked with white spota and bands. It takes a good polish, and is used for ornaments and for chains of beads In jewelry it is best suited for daytime wear, as it appears almost black by artificial light.
LAPPED JOINT. In the simple form of joint known as lapped joints, one part overlaps the other, and the tivo are glued or nailed together. The lapped joint has been developed in manv directions, as, for example, the

Lapped Joint. Showing how to set the two parte ol the tramework square and true before bammering in the naila
lapping dovetail, in which the overlapping portion is dovetailed to the other portion. A lapped halving joint is one in which the one piece overlaps the other, and half of the substance of each is cut away so that their surfaces are Hush
Assuming that an ordinary lapped joint is to be made at right angles, the angle may be attained by the use of a square, as shown in the illustration The upper piece of wood is set in place by the edgc of the square, which is applied to it as a guide. The first nail is then driven and the accuracy again tested with the aquare, and if all is in order the jointing is completed by driving the remuining nails.

Screws are put in on the same system, but in this case the gimlet is used to make the hole for the acrew. and the work tested as before. In cither case the parts can be adjusted by tapping them with a hammer or inallet th set them square after the first fixing has been made. as the two parts of the joint wil then huld together by the friction between their faces.

When a square-cornered frame is to be made, as for a packing case, it is preferable to make the joint between two ends first, thus making two L-shaped parts, and then to join up these two, rather than to attempt to join up all the corners and then to expect them to come square. If the former inethod is followed it is known that the two opposite corners are syuare, and it is then an easy matter to adjust the remaining two corners. See Amateur Carpentry; Dovetail Joint; Juint, etc.
LAPPET, The name denotes the process by which the goods are woven on the lappet loom, fitted with a special attachment. Lappeta are cotton muslin with white or colnured dots. sprigs, or other simple designs formed by one continuous thread, and lonking as though they had been embroidered on the cloth. They are considerably chesper than muslins embroidered by a separate machine. Lonse ends of thread are left at the end of each pattern. They are used chiefly for summer wear and are suitable for windluw curtains.

LARCE. The common larch (Larix europea) is a hardy non-evergreen tree which is ornamental in spring, when the young growth contrasts with the brown trunks and red cones:
it reaches a height of 70 feet or more It is good as a plantation lree, apart from the value of its clean, straight stems. In damp sites and on stiff soil it is particularly liable to the attacks of a fungus.

A closely related tree is the golden larch (Pseudnlarix kaempferi), so called because of the antumn leaf colouring.
Uses of the Wood. The heart-wood of the European larch varies from a yellowish white to a reddish brown, and is usually atraight grained. Its lightness and durability have brought it into use for alecpers, pit propa, scafold poles and ladders, wnile in carpentry it has the merit of being compara. tively free from large loose knots. Its straight stems are welcome to the flower gardener for pergolas and arches or rustic hridges. Old pieces of larch with the base charred, creosoted or otherwise treated with a preservative, last many years. See Arch; Wond.
LARD. To be genuine, !ard should be clear nnd colourless, but firm to the touch. It is ubtained by melting in a pan over boiling water the inner fat lining of the pig, and also the fat surrounding the kidncys. As it melts it should be poured off, leaving the sediment. It is used for making cakes and nastry, either alone or mixed with butter. For all kinds of light frying, lard can be employed with advantage
It is frequently adulterated by the aclmixture of the fat of other portions of the :ig, also with veal and mutton fat. Laid should be kept ill a conl piace in a covered dish. S'ee. Dripping: Frying.

LARDER. In country and the larger types of town houses larders are often allotted a good floor apace In some of the modern houses they are replaced by a ventilated food store, which is practically a big, well arranged cupboard, augmented by a refrigerator. In very small flats perishable food is kept in a meat safe, and storage room is often merely supplemented by a kitchen cabinct and vegetable rack. Wherever possible, a baby refrigerator should also be installed.

When the larder is separated from the kitchen it should be placed conveniently near. A northern aspect is always desirablc, as it is essentially a cool room. If the larder has two windows, one may have glazed glass panes and the other be covered with a tine galuze wire or perforated zinc to exclude flies and dust, and allow free access of freah air. If there is only one window, it should be kept open with a piece of white muslin fastened over it, which can be secured with drawing pins. The window sills may be lined with tiles or have fitted porcelain enamel covers. The ceiling should be whitewashed, and the Huor of concrete, red tiles, or Hags. The walls should be tiled, or, failing this, they can be cither distempered of painted with sanitary paint or plainly whitewashed. If there is not sufficient ventilation by means of windows, it is a good plan to have a few perforated bricks let into the wall, and the panels of the door replaced by sheets of perforated zinc or wire gauze.

Suitable Equipment. The larder must be well equipped with shelves. Many modern larders have shelves of slate, marble or stone. Fixtures should include strong iron hooks fixed from the ceiling or hanging from iron rods running from wall to wall. Small hooks should also be fixed to the shelves.

In a good sized larder there may be accommodation for vegetables, which may take the form of either special wooden rack shelves or a wire rack hanging from the wall. Some wire covers of different sizes for covering cold meat are nccessary, and a few hanging meat safes consisting of muslin stretched over wooden hoops will be useful, also plates, disher and basins and a large carthenware
vessel for milk. A piece of muslin weighted by beads at the corners should be provided for covering the milk. Butter should be kept in a butter cooler, or in a bowl of salted water.
In a small house or flat where there is no special larder, and a cupboard has to do duty. it is best to set aside certain shelves for fresh foods and to cover such shelves with American cloth, or, better still, with slabs of slate. Meat must be placed in a special small safe. The table safe described in the article on Kitchen is the most suitable for a larder substitute.

Perfect cleanliness is essential in the larder, and the floors and shelves should be wiped daily with a damp cloth When thoroughly cleaning, all food should be taken out and the woodwork or floor scrubbed with hot, soapy water to which some disinfectant has been added. See Kitchen; Refrigerator; Store Room, etc.
LARDING. The process of larding consists of running strips of fat bacon through meat by means of a larding needle. Diy portions of meat, such as the breast of poultry, beef fillet, liver, etc., are those most usually larded. A special kind of bacon can be bought for the purpose, but if preferred the fat of ordinary bacon may be used. The strips, which are usually about 2 in . long, should be threaded through the needle and the latter put in rather deeply across the grain of the meat. A small stitch only should be made and an equal length of fat left at each end. About in in. should be left between each stitch.
The Larding Needle. This is a length of hollow, graduated steel. The thin end is pointed and the thick end is slit into four for the purpose of holding the strips of larding bacon called lardoons. These needles vary both in size and length and are from about 5 in . to 9 in . long.
LARDIZABALA. An evergreen climbing shrub, Lardizabala biternata is familiar chiefly to dwellers in the south and west of England as it is not hardy in cold districts. It should be planted in spring or autumn in well drained loam, peat and sand. Its purple Howers are borne in early winter, and it may be propagated by shoots struck under glass in autumn. It is chiefly suitable for the greenhouse.
LARESPUR. This is the name popularly used for the annual delphiniums, of which there are some beautiful varietics. The pink larkspur is particularly attractive. Seeds are sown out of doors in April when the plants are to bloom in summer. See lelphinium.

LARVA. The term larva is applied to an insect emerging from its egg-stage in the form of a caterpillar, which may devour the foliage, stems, or roots of plants. Although most of the damage to crops results from the activities of larvae, the prudent gardener will not fail to wage war against the adult insects, be they beetles, moths, or butterflies, because it is during this stage that they deposit their eggs upon growing crops. See Insect; Insecticide.

## LARYNGITIS

 Inflammation of the larynx is caused mainly by cold or excessive use of the voice, the chief symptoms being

Latch. Fig. 1. Mochaniam of the secret latoh. Fig. 2. Gate latoh with part of woodwork cut away to show structure of latch. Fig. 8. Gothic lateb for an ontrance door. Fig. 4. Thumb lateh combined with door-handle
and hinged, and on this the bont is tashioned. The leather inner sole is placed upon the bottom of the last, and the boot upper, all ready and sewn together, is tacked to the inner sole, thus fashioning the upper to the shape of the last and forming the base for the middle and for the outer sole.

Lasts are made in all sizes, with as many as eight different fittings or sub-sizes to each size. Regular customers of a bootmaker frequently prefer to have their own last, in order to ensure a perfect fit. The foot is measured with a tape or a pedometer, which gives such exact measurements to the lastmaker that he can produce a perfectly anatomical model of the customer's font in wood. Plaster casts are often used for a crippled or otherwise abnormal foot. See Boots.

LASTING. Exceptionally firm, strony an ll heavy cloths resembling linings are known as lastings. They are generally black, but can be made in other colours. House boots and slippers are sometimes made with lasting, instead of leather, uppers. Hard, smonth and unstretching, lasting is useful for the binding of account books.

LASTREA. The shield, male, and buckler ferns belong to Lastrea (nephrodiuni). Most of them need greenhouse culture, but a few are hardy. The indoor species need a penty soi! and a shaded corner of the greenhouse. Hardy kinds are best when grown in a shady corner in soil to which leaf-inould has been added. The common inale fern, of which there are many beautiful varicties, is Lastrea (nephrodiun) filix-mas. I'ropagation is by spores sown under glass

LATAKIA. ( )ne of the most costly items in the totacen blender's store is the dark, almost black, aromatic leaf which is grown in the neighbourhood of Iatakia in N. Syria. It imparts a distinctive Havour to the more expensive mixtures sold in Grent Britain, and also makes for cool smoking, but it is not liked by all smokers, and consequently retailers generally supply mixtures without latakia as well as with it. It is treated by fumigation before it is ready for the market. See Tobacco. Pron. Lat-a-kec-a.

Latania. This is a grcenhouse palm with bright green, fan-shaped leaves. It needs the same treatment as kentia (q.v.).

LATCH. The latch is a device to keep a door winclóis; or other movable part closed. and does not as a rule reøuire a special key. as in the casc of a lock. Simple latehes are made in the form of a pivoted bar that drops into a slot, other forms being actuated by a handle or a spring. Some varicties combine the functions of a latch and a bolt ; several types of spring lock are known as latches, such as the night latch, which is closed by shutting the door, but can only be opened from tho outside by a latch-key.

The Norfolk Latch. One of the best known types for the home is the Norfolk latch. This comprises a handle, and a plate that is screwed to the door: above the handle is a thumb latch which when depressed raises the other end of the lever of which it forms a part, and this in turn raises the catch which is screwed to the other side of the door, and drops into a striker or notched plate attached to the door frame. Variations are the Suffolk and the Canadian latches, both of which are in substance the same as the Norfolk, though the C'anadian has a somewhat shorter catch.

A Secret Latch. The secret latch is a pattern that is useful on cabinets and other furniture, shop fittings and the like. It is a simple spring latch, and is relcased by pressing on a circular

plate let in Hush with the surface, so sa to be inconspicuous. Fig. 1 is an example of this type of latch

Other Types. The gate Intoh which is illustrated in Fig. 2 is made in ceast iron, and screus to the surface of the gate. The striker is made as indicated to fix to the edge of $n$ frame, or with a flat plate to fix to the face of the gate post. Patterns are also made to build into brickwork. and for stone or concrete gate posts.
A pattern of latch that has developed from the same style is illustrated in Fig. 3, which shows a typical Gothic gate latoh. It is made of malleable imn. finished in Berlin black, and varieties have ring and other shaped handles There is a square hole in the boss or hub to which $\Omega$ short shaft is fitted. This shaft passes through the door and connects with the boss of the handle on the other side.

The thumb latch seen in Fig. 4 is of the Norfolk type; it is used with the Gothic gate latch, and takes the place of the drop or ring handle and cross shaft. The how latch shown in Fig. 5, still used in old houses is a link between the earlier varieties and the modern type of night latch. It has a pivoted lever actuated by a handle, which is shoun separately, and the latch is pressed down by a spring. The handles are fixed to a square shaft that passes through a hole in the end of the lever; when the handle is turned the lever is raised and the door released. There is also a holt which can only be actuated from the inside of the room. When shot, it slides hehind the round-headed knob that projects froin the striking plate. The lever drops behind the top of the same knob, which thus does duty as a frastening for both lever and bolt.
The rim Intch, shown in Fig. 6, is a development of the bow latch, but is enclosed in a case; it has a spring-pressed latch which can be drawn back by the handle and is controlled by a separate bolt and a slider. The night latch is made in many forms; for example, the pin tumbler type, Fig. 7, and the mortise night latch, which tits into a recess or mortise cut into the edge of a door. A handle is fitted on either side of the door, and these are attached to a squared shaft by means of a setscrew or a fixing pin; thus, when the handle is turned the latch is drawn back. In some varieties there is only one handle, on the inside of the door. and a key is needed to shoot back the latch from the outside; in others the outside handle is not attached to the shaft, but directly to the door. See Door: Gate ; Lock.

LATH: In Building. The principal use of the lath, which is n thin, narrow slat of wood or other material, is to construct a lath and plaster partition in a building Laths are
raquired for the repair of ceilings, and are useful in the home for such purposes as making packing crates and chicken coops, and also for trellis-work Laths are usually 1 in . wide, and are made in lengths up to 4 ft .6 in The sizes are: lath $\frac{3}{16}$ in thiok, lath and a half $\frac{1}{}$ in thick, and strong or double lath $\frac{8}{16} \mathrm{in}$. thick.
In making a lath and plaster partition a firanowork of timber is provided to which the laths are nailed. The frames should be so positioned that there is a support for the laths at a distance of not more than 12 to 14 in apart, when they are at right angles to the studding or framework. The laths should
always break joint; that is, the ends should
 not all come over each other. This may be done by fixing, say, 8 or 10 laths, with their joints on the middle stud, the neat set should come on another stud, as in the illustration. If this were not done the vibration would he !ikely to cause the plaster to crack along the joint, since all the lathing would then bend along the same

Lath. Showink how the lutns are nailed to
the wooden studs or uprights in the construction of a lath and plaster partition
sary to fix lathing to a wide piece of wood, as, for example, to a boarded part of the work, the lathe inust not be nailed directly to it, but to a set of underlying laths or hattens at right angles to the face laths This is done to provide mom for the plaster at the back of the laths, as the plaster has to be pressed through the gaps between the lathing to form the key that prevents the plaster breaking away.

Netal lathing is used for the same purposes in the form of a shect of perforated or expanded metal, the interstices providing the key for the

Latch. Fig. 5. Mechanism of the bow latch. Fig. 6. Rim latch which is enclosed in a case. Fig. 7. Constituent parts of pin tumbler type of night latch planter. This lathing is fireproof, and valuable for many building purposes.

Lath Nail. This is a wire nail witha fairly large, round, Hat head, used principally for nailing laths to studding, in the early stages of making a lath and plaster partition or other structure. Common sizes are line. The laths are fixed about $\frac{1}{}$ in to $\frac{3}{b}$ in 1 in and $1 \frac{1}{4}$ in. in length and No. 16 gauge apart, and the best nails to use are ordinary in thickness. ## LATHES FOR AMATEUR WORK

## Describing the Different Types and their Uses

This article is complementary to those on Metal Turning and Wood Turning. Sec also Amateur
Carpcnery, Centre: Chuck; Drilling: Mandrel : Milling, etc.
A lathe is an indispensable tool to the and extending from the floor to the bed itself. amateur oraftsman, as by its aid all manner Means of driving or rotating the mandrel of circular objects can be produced within have to be provided. This usually takes the the capacity of the tool. Fssentially, the form of a hervy fly-wheel with steps or gronves lathe consist.: of five parts. The head stock comprises a spindle, called a mandrel, which turns in hearings formed in the hody of the head stock. The spindle is provided with a Hat or V-shaped pulley, generally with several steps oi different dianmeter. The end of the mandrel is screwed for the attachment of various devices for holding the work.
The head stock is fixed at the left-hand end to a har known as the bed. A movable part, called the tail stock, is usually provided with a spindle, which can be pushed in and out of the tail stock body by means of a lever or hand wheel and screw. The tool rest is also movably attached to the bed, and is used as a support for hand tools. More advanced types of lathe have a mechanical tool-handling device, known as a slide rest. The next feature is a stand or support of some kind, and may take the form of short feet projecting from the hed and raising it about 6 in . above the surface of the table or bench to which they are screwed; or preferably strong legs well braced together
turned upon its rim, varying in diameter, and corresponding with the proportions of the steps on the mandrel pulley. In the case of a hench lathe, that is, one which is screwed to the top of the work bench, the Hy-wheel is mounted upon a light stand complete with a treadle, forming a foot motor. On other types the Hy-wheel is mounted on a spindle attached to the left-linnd standard. A Hat or round belt transmits the motion from the fly-wheel to the mandrel. Motion is imparted to the lly.wheel by pressing upon the treadle with the foot, working ulways with a regular, steady motion, so that the lathe revolves at a uniform rate.
Types of Lathes. These range from simple wood-tuming machines to elaborate screwcutting lathes, which have a set of gear-wheels and a long threaded steel shaft known as a lead screw. This is connected to the slide rest, which is frec to slide along the bed, and has an independent part known as a top slide, which also has a little lead screw of its own
and propels the tool holder. The tool is has a bed of hollow, clamped into the tool post on the top of the circular form, enclosing tonl holder, and it is possible to traverse the the lead screw. The tool along the length of the bed, an operation height of centres is 4 in . known as sliding. By turning the top slide lead screw, the tool is traversed acrose the hed. Twisting the top slide at an angle to the bed causes the work to be turned to a taper, and is known as angular turning. Turning at right angles or across the bed is known as surfacing.
Screw cutting is effected by connecting the lead screw to the mandrel by a train of spur gears, and arranging their ratio so that the lead screw makes a certain predetermined number of turns per minute, while the mandrel makes another number of turns. Consequently, if the tool is mounted in the tool post and hrought into cut, so that when the point of the tool touches the work it will remove shavinga, a long, continuous groove or screw thread is formed upon the work held between the centres of the lathe.

Modern amnteur lathes. of which three are illustrated, include a variety of mechanical devices. In all lathe work, whether turning wood or metal, the work has to be held in one of two ways. It may be bolted or otherwise attached to a disk of motal screwed on to the mandrel nose, and called a face plate, or in some other form of chuck, in which case the turning operation is generally known as chuck or face-plate work. The other method, especially applicable to the case of relatively long spindles or rods, is to mount them het ween centres. This means that onc end of the rod is supported by a point centre placed in the end of the mandrel, the opposite end of the work heing supported by a similar centre in the tail stock spindle. The ends of the rod have to he drilled and countersunk to form a hearing for the ends of the point centres. The next step is to fix a clamp called a carrier to one end of the bar, and to screw on to the mandiel nose a small, flat plate with a peg projecting from it and called a driver plate. The peg engages with the hack of the carrier, and when the mandrel is rotated thereby rotates the work. The tuol is either a hand tool, or a slide rest tool mechanically held in the slide rest.

Generally speaking, all wood turning, as far as the amiateur worker is concerned, can be carried out with hand turning tools. Metal turning is usually effected by the use of the slide rest, although a great deal of work can he done with the ordinary hand tools.

Figs. 1 and 2 show a Drummond lathe with 34 in . centres. The leading fentures are indicated in the diagram, Fig. 1, which shows the lathe arranged as a hench machine. A lathe of another type, especially adapited for the model maker. is shown in Fig. 3. This

Fig. 4 showa the Verschoyle mandrel, an inexpensive portable Inthe for light wood or metal turning. It clamps on to the edge of table or bench occupying little space, and when dismountel can be paoked into small comprss. It swings 6 in. aloove the bod and takes 12 in hetween centres. By adding an extra length of bed and another bracket the turning length may be increased by 20 in.

## Essential Points.

1ig. 4. Verschoyle mandrel for lipht wood or metal turning Courlest of George Adams

Points that should be looked for in any and the centre of the tail stock should always lathe include the following. The mandrel be in the same line, no matter into what should he made of highest class steel, and position the tail stock is moved. For wond rotate easily hut without the least trace turning, the fly-wheel should be large in of shake in adjustable bearings. The nov- diameter and the mandrel pulley small, as high ing parts should operate smoothly, casily, speed is essential. For metal turning, the flyand without shake. The centre of the niandrel wheel should be smaller and the mandrel

Lathe. Fig. 1. Drummond back-geared lathe, with the principal parts explained

Lathe. Fig. 2. Drummond $3 \frac{1}{2}$-inci treadle lathe. the principal parts of which are indicated In Fig. 1 . Fir. 3. Drummond 4 -inch model maker's lathe

Courtesy of Drummond Bras.. Lid.
pulley larger. There should be a difference in the stepping ratios, that is, one large diameter step on the tly.wheel and a small diameter on the mandrel pulley for wood turning. The intermediate position should he provided, and in addition a small step on the fly-wheel, in conjunction with as large a diameter on the mandrel pulley as possible, for turning cast iron. Metal-turning lathes, intended for turning cast iron, are preferahly fitted with a mechanical apeed-reducing arrangement known as a back gear (see Fig. 1). The treadle should be so arranged that if the foot is accidentally placed heneath it the connecting rod will automatically he thrown off the crank pin, otherwise the foot may be severely injured.

The lathe as a whole should be stiff, rigid, and atrong, so that when in use it does not vibrate or shake ahout, as this is fatal to good work. Chucks, tools, and accessories can be added to it from time to time as occasion demands. The hearings must be kept free from dirt and frequently oiled.

LATHER. Soap and hot water atirred together form a thick froth or lather. It is used in laundering certain fragile materials
which would suffer if rubbed with soap, the garments being squeezed in the froth until they are clean. A lather is also necessary for shaving, special soaps being prepared for the purpose. A quick method of producing a lather for washing is to shread some soap into a bowl, pour boiling water over it and stir with a stick. This will be found satisfactory for most purposes. See. Water Siftener; Laundry; Shampoo; Shaving.

LATTICE. A lattice is an openwork structure of wood, metal, or other material, formed by crussing or interlacing strips of material Such a structure is often used to cover a window, to form a screen, or to protect a doorway. In lattice work all that is necessary is to cut strips of material to requisite lengths and, if working in metal, to drill them at regular intervals for the rivets. When wood
is used it will suffice to nail the strips together. To ensure uniformity, the strips may be guided in position by means of a simple space jig, made from a batten having notches cut in its edge at regular distances corresponding to the desired spacing.
In use, one set of strips is laid on the bench or other support, and spaced by placing the notched batten upon them, so that a strip is beld in each notch. The first of the next series, which run in the opposite direction, is laid up against the batten, and nailed to the first set of strips. The batten is then removed and turned at right angles, and one of the notches placed over the strip just nailed on. The other strips are put into position into the notches and similarly nailed and fixed. The batten is then removed towards the end of the strip and the joints nailed together.

## LAUNDRY WORK AT HOME

## Suggestions for Lightening a Domestic Task

This article will be helpful to the housewife who wishes to economize by doing the laundry work at home. See further the entries on Clothes Line.; Clothes Peg; Copper: Dolly ; Mangle; Soap : Starch, and those on the materials washed, e.g. Cretonne ; Lace; Linen; Silk. See also

The laundry work tor a large family can only be satistactorily done with space and equipment and a place set apart for its performance. The floot should be of concrete, tiles or brick, with a fall to one corner where there is a drain or outlet, so that the floor can be washed down at ang time. There should be good light and ventilation, together with sufficient space for the various appliances. It is sometimes pussible to arrange a small laundry in the acullery by converting the kitchen into a combined kitchen and scullery, fitting a new sink and connecting the waste-pipe to the nearest trapped gully. Due regard must be paid to the by-laws of the local authorities. Scrupulous cleanliness is essential in any laundry and the walls should be finished with tiles or washable paint.
The first requirements for this task are an ample supply of hot water and a convenient means for boiling. These requirements can be met in most cases by a portable copper, which is placed in a corner, and the smokepipe taken to the nearest flue, or carried out through the roof or walls. The hot water can be drawn off from a tap fixed in the lower part of the copper, while the cold supply is provided by a separate pipe terminating in a tap over the top of the copper. Many varieties of copper are available for heating with solid fuel or gas: it is best to choose one with a galvanized case and tinned copper pan.
A strong bench should be fixed along one side of the laundry for the washing-tubs, if hand-washing is to be undertaken. If a washing machine is used, less space will be required. There is a large variety of these appliances both electrically and gas driven and also non. gas. The task of washing is lightened by these machines. Compact machines can be purchased from about three to ten pounds by means of which rubbing the clothes by hand is eliminated, the hot soapy water being forced through the fabric automatically. Afterwards the garments are re. moved for rinsing.
A mangle or wrin. ger is also an asset, and small compact mangles can be used oven when laundry work has to be done

Laundry. Arrangement of a lanndry, for which a
basement room or an outbuidding conld be used
in the kitchen. One variety of mangle fits on to the kitchen table. A wringer is obtainable which is fitted with a table top. Another useful type is combined with a washing machine. Four castors enable this machine to be easily moved about. It has rubber rollers, and pressure is secured for wringing or mangling by screws which operate through powerful double springs.
l'robably the chief difficulty for the housewife is the drying of the clothes after they have been washed, especially in bad weather. The most economical plan is to fix cords, or smooth wooden slats, across the ceiling and as near to it as possible, supporting the ends of the slats by ropes which run over pulleys fized to the walls. By means of the pulleys the slats can be raised or lowered without diffi. culty. With such an arrangement, if a small amount of ventilation is provided near the top, a heating stove can be lighted overnight and the laundry closed, the clothes being generally dry by the morning without further trouble. Ready-made ceiling drier fixtures are obtainable

Another plan is to make a cupboard-like structure, preferably with asbestos cerrent sheets, and hang the wet clothes in it. Hotair pipes should be led around the interior of this cupboard, and may be heated by means of a small oil stove, gas ring, or other con. venient means, much on the lines of the heated linen cupboard. The apparatus may follow the general principle of construction adopted for greenhouse heating, and hotwater pipes can be used instead of hot air.
Other SImpler Appllances. For laundry on a big scale wicker baskets are required for storage of the clothes. Where sufficient space is availablea good solid table should be provided, and if possible should be of such a size that one or more of the laundry baskets can be stored beneath it. The irons, soap, scrubbing brushes, etc., should behoused in a cupboard. The use of electric or gas irons not only saves the cost of a heating stove, but keeps down the temperature. Besides the more important
urnshing equipment the home laundry requires one or two galvanized tubs, an ironing table or board, sleeve buard (essential when ironing sleeves), enamelled basins for washing smaller articles and for starch, a wooden spoon, clothes line, clothes rack or horse and clothes pegs. A wooden dolly and tub may be useful where there is no washing machine. A small washer is obtainable which has a strap that fits over the hand and a surface that squeezes out the dirt without damaging the material. but thus saving the knuckles. The indoor clothes line illustrated is a convenience to the housewife who only has a small kitchen in which to do the washing. The required length of line is drawn out of the container and fastened temporarily by the ring on to a hook on wall or dresser. By a device the bandle fixes the line tautly. An attachment with arms is pricurable for the clotbes horse.

Practlcal Suggestlons. Unnecessary stooping must be avoided by taking care that washing and rinsing tubs are not placed either too high or too low. Washing machine, rinsing tubs, mangle or wringer should be placed near lugether to avoid unnecessary steps to and fro.
Select one day a week or fortnight for laundry work and avoid doing any other unnecessary housework on that day. Either a Monday or Tuesday is the best day to choose, as when the weather is bad for drying it leaves several days in which the drying, ironing, and airing can be completed before the week-end.

Mendall clothes before they are washed; this prevents rents and holes from becoming further torn during the washing process.

Make soap solution and starch the previous day, if possible. Ecru starchis obtainable which tints and starches curtains, otc., at the same time. Keep in stock hard soap, borax, and washing powder. Soda turns white materials yellow.

Soak any badly soiled clothes overnight in cold water. Remove any stains that may be on the clothes. Prepare the copper and light the fire early. While the water is getting hot, sort the clothes in the following heaps: white and coloured woollens; silks ; fine things and table linen, handkerchiefs, bed linen, and upstair towels ; coarse things ; coloured articles

If the entire wash is to be done on one day, the silks and woollens should be washed first, so that they may be dried quickly, followed by the coloured things. F.ntirely fresh water must be used for the white wash, or the clothes will not be a good colour.

Softening the Water. The softening of the water is a problem which must be solved by every laundress before dirt can be removed from the clothes. Where a water-softening apparatus is not installed, some housewives prefer to use borax, others rely on one of the prepared soap powclers.

Whichever method of softening is selected, it must be remembered that no cleansing can take place whilst the water is hard and soap curd is visible. All the soap that is rubberl on to the clothes or added to the water, as

Laundry. Indoor clothes line : the handie can be fred so that any
length of line is made tant
dissolved soap or jelly, combines with the dissolved minerals in the water and forms soap curd. More soap must be added until there are no minerals left with which it can combine: the surplus soap forms a lather. A lather is merely a sign that free soap is present in the water. When washing new garments that contain dressing soap curl may appear in water which previously was very soapy Should this occur additional soap must be added to the water.
Alwrys wash the cleanest things first. Any new clothes and handkerchiefs should lee rublied out separately in a little soapy water. This economizes washing waters, as they do not get dirty so readily Where no washing aids are available, prepare two baths of soapy water. Rub the garment all over in the first bath: when clean, wring out, turn garments and pillowcases on to the wrong side, and wash again in the second hath of clean water. Any very soiled parts, such as collars, cuffs, and neckbands need special hard rubbing. Wring the things from the second water and rub on a little hard soap before rinsing.
When washing woollens, fine work or coloured articles. soap llakes arc usually the hest cleansing agent. Coloured things can be kept without fading if the snapy lather is allowed to cool hefore use The garments should be washed quickly, never wrung out if of fine - materials, but wrappel separately in clean cloths and the water gently squeezed out by a kneading procesa

## How to Wash Delicate Fabrics

Small lace handkerchiefs, gerrgette collars and cuffs, can be putinto a preserving jar with a screw top, filled with a warm, sonpy lather and ahaken vigorously. When clean they may le rinsed in the same way. This method obviates any damage by rulibing the delicate fabrics. Chiffon or net can be washed in a clean muslin bag by placing it in warm, soapy lather and gently squeering out the dirt. Afterwards the articles are rinsed in the bag by placing it in clean, warm water. Rinsc again, in fresh water, until no soapy moisture comes from the bag when it is kneaded.

Onily handkerchiefs, kitchen cloths and the heavier white cotton and linen articles should he hoiled to keep them a good colour Under. clothing or table linen should not be boiled in the same water as soiled kitchen cloths or towels, etc. Arrange for two boilings. The water in the copper should contain plenty of soap, and it should not be hoiling when the clothes are first put in. but should be allowed to reach hoiling point moderately slowly. Boil for 20-30 minutes
The next process is the rinsing and blueing. Take the clothes from the hoiler, and rinse them thonoughly in plenty of clean, warm

water to remove the soap. If a large wash. is in progress it is better to rinse first in warm water, then in cold. Prepare a bath of blue water, and blue one or two things only at a time, as if garments are left in the blue water the colour settles in streaks and is diflicult to remove. The same thing reaults if the blue water is inade and left to settle before used.

After blueing, wring and hang those things out to dry that do not need alarching. Whilat these arc drying, starch table linen, collars. aprons, etc. Things that do not actually require alarching, such as pillow-slips, sheets, and lace-trimmed mats, etc., may yet lie improved in appearance by passing through atarch water, which gives them just a alight firmness Exactly which things should lie starched depends on individual taste.

Damping and folding are the final stages Take in the clothes when nearly dry. Thoso things requiring careful ironing will need further damping with cold water, but woven underwear, towels, etc.. can be folded ready for ironing. These will naturally require a a little damping if they have been allowed to get bone dry. Roll up all fancy things tightly and leave for several hours before ironing. preferably overnight. The labour of imning is minimized if large thinge that can he folded fat are mangled after dainp. ing: this removes a large proportion of the creases in the garments. The clothes are then ready for ironing.

LAUREL. The laurel is grouped by botanists as a scction of the group or genus Prunus which includea the almond, apricot, plun and cherty. The commin laurel (Prunus laurocerasus) is a vigorous shrub with large evergrcen leaves, often used to form a hedge: it. impoverishes the surround. ing soil and is not suitable for small gardens. Old over. grown hedges may be cul hard back in April. Cuttingi form roots if inserted in sandy soil in a frame in August. The Portugal laurel (Prunus lusitanica) and its myrlle-lcaved variety are handsome evergreens. The best time to transplant Inurels is in May or September, and it is advisable to put in small specimens, because they become established more quickly than large ones.

Lavender.-carple heads of th
sweet-scented garden plant

survire the winter in heavy soil. but is raised from sceds sown under glass in spring

LAVATORY. A lavatory is a place for wasbing. The word is sometimes used in the lome, but more usually cloakroom is the term employed for it.

The Lavatory Brush. II. though chemical salts and acids are availahle for dealing witls the closet pan when it becomes discoloured or furred, the use of the lavatory brush will keep the pan in sanitary condition. The two standard designs are a long, round handle with a done-shaped brush at the end, and a flat brush similar to a long-handled bath brush. If preferred a Hat brush is obtainable with a half-round dome end. Stiff bass, hassine, fibre, or cocon-fibic are the materials used, a serviceable quality being a mixture of bassine and libre known as union. See Basill: Brush; Water Closet

LAVENDER: The Plant. Thu sweet-scented garden lavender is $\Omega$ half-shrubby plant, with greyish leaves and purple Howers. Its thick. ragged. barked stem, 2 ft . high, branches alove into a broad LAURUS. Laurus nobilis, the sweet bay, bushy head. The flowers are produced in a favourite evergreen shrub with fragrant long, ercct spikes. It makes an admirable leaves, is not very hardy. It is usually grown hedge. For the purposes of perfume manufac. in large pots or tubs, and if placed out of doors ture it is grown by the acre in Ensex and for the summer must be brought under cover before winter and kept safe from frost. In mild districts it may be planted out of doors. l'ropagation is by cuttings in sandy soil in a frame in August.

LAURUSTINUS. This haidy evergreen shrub (Viburnum tinus) grows 5 to 6 ft . high and bears pink buds which npen to white Howers in autumn, winter and early spring It flourishes in ordinary soil.

LAVATERA. The rose mallow (Lavatera trimestris) is one of the most beautiful hardy annuals. There are several improved varieties, e.g. loveliness, which has large, rose-pink Howers on plants 2 to 3 ft. high. Sceds are sown out of doors in spring for summer flowers. The tree mallow (Lavitera olbia) is of vigomus shrubby growth, forming a bush 4 to 5 ft . high and bearing carmine rose Howers for many summer weeks. It may not

Kent, and to a lesser extent in Surrey.
As a garden plant lavender thrives best on warm light soils, and may be planted either in spring or autumn. The plants ahould be about 18 in. apart every way. Lavender is propagated by cuttings inserted outdoors or in a frame in September. The proper time for gathering lavender for distilling or crying is when the flowers are fully expanded and fresh. The munatead lavender blonms very freely and blossoms earlier tian the common kind.

Domestic Uses. Lavender sloould be ent when it is in full bloom and spread out to dry on a newspaper, either in the sun, on the rack of the kitchen range, or in a hot linen cuphoard When quite dry it may be masie up into bags, sachets, or whatever form of scent. container is required.

Lavender bags may be inade from organdie or butter muslin. This is cut to the size
required, and the sides run up in the ordinary way. A bunch of lavender is inserted, heads downward, and the opening made fast with cotton firmly stitched, or tied with narrow mauve ribbon. The stalks are then cut neatly until only a few inches remain This method has the advantage of retaining the perfume longer than if the stalks were removed.

Lavender Vinegar. A refreshing toilet proparation with inild astringent property ie made by mixing 6 parts of rosewater, 1 part of spirits of lavender, and 2 parts of Orleans vinegar. It can also be prepared from freshlygathered lavender Hower tops Thesc are

## The Lawn: Its Maring \& Maintaining

How to Get the Best Results with this Desirabie Garden Feature
The amateur gardener who is intereated in this subject should consult aiso the aricies Garden
Grass ; Soil and others of that kind, while. when the lawn is made, those on Croquet Lawn Tennis will be found useful. See also Drainage; Edglng ; Sp rit Level

The lawn is an expanse of turf in the garden, level on top, and sinking it further until generally adjacent to the dwelling-house. If exact level between the two is secured, carryit is to look well and wear well, the laying-out ing on in the same manner the whole length and maintenance are matters requiring careful of the line, when a true centre lovel will result. attention, especially in regard to soil and Cross levol must drainage. Heavy soil in which clay pre- next be ascertained, ponderates will speedily stagnate if water does not drain off easily, therefore road grit and leaf-mould should be added while digging proceeds. Light sandy soil requires manure. so that moisture may be conserved and parch. ing prevented during a season of drought.
Large lawns which become sodden should be drained by pipes, laid in the way shown in the diagram. The pipes should be laid about 12 in . deep and slope gradually to a sump or outlet. Where branch pipes meet the main drain they noed packing above the junction with slats, tiles, or stones. Open ends of drains must not be near the roots of trees or strong-growing oreepers, as these eventually choke the inlets.
Levelling. Levelling a site is not such a difficult task as it appears to be. The implements necessary, with the exception of a true spirit lovel, are a number of wooden pegs ; a straight-edge board, 6 ft or more in length ; and a strong garden-line. First ascertain the centre level by stretching the line from top to bottom of the plot. Then drive one of the wonden pegs into the highest end of the site to just above the surface of the soil, following this with another peg down the line at a distance something leas than the length of the traight-edge. Do not drive it far in at firat. but gauge the relative depth by placing the straight-edge on the two pegs, with the spirit

Lawn: draining and lovolling. The arrowe show alope to ontiall. $1.8 i m p l e$ levelling : A, straigat-edre board : $B$, sorewod-on apirt level; $C$, levolling pega : 1. Another method of pipe drainare: A, inlote. S. Pipe drainaging for large tipaces plantain. Turves are usually obtainable in lengths of 3 ft by 1 ft. , and it is easy to estimate the number required, allowing for spoilage.
If a lawn is not immediately required, seedsowing has much to recommond it. Any seed. however, will not suit overy kind of soil ; a mixture that is excellent for dry, light land may fail on moist loam. Consequently it is advisable to order the seed from one of the reliable seeds. men who specialize in grass mixtures, mentioning the particular class of soil for which it is required. Provided there has been thorough preparation of the plot, and a suitable mixture of grasses obtained, excellent lawns may be secured economically from seed, 2 lb . being sufficient for about 30 sq . yd.

The best time for sowing is April or working on the rame principle across the garden, and securing the level from those pegs already in the ground. The whole procedure is made clear in the accom. panying diagram.
Grassing. The two best methods of grassing a plot are by laying turves or by sowing seed, the former possessing the advantage of forming a sward almost at once. It is essential, however. that turf should be of good heart, and free from such weeds as daisy, crowfoot andelion and
dried, placed in a stopped bottle and steeped for a week in Orleans vinegar. Every day the bottle must be shaken, and at the end of the weck the liquid is drained off and filtered through white blotting paper or through a filter paper bought frum a chemist.

Lavender Water. This toilet preparation is easily prepared at home Into a quart. bottle are put 1 uz essential oil of lavender, 1 drop musk and $1 \frac{1}{1}$ pints spirit of wine. These three ingredients are well mixed together by shaking. The mixture is loft to settle, shaken again in a fow days, then poured into perfume bottles with airtight stoppers. See Scent.

August-September. The soil must be dug over, levelled and made "fine" on the surface. Choose a calm day for sowing, acattering the soed with a swinging motion, first down the plot and then across.

Strands of black cotton should be tied on sticks a fow feet apart. as well as with rag flutterers and rattles of tin and glass, to scare away the birls. Cutting should nut be attempted until growth has reached a height of 5 in ., and then only light topping with a scythe until the roots are strong enough to stand cutting with a mowing-machine.

The most suitable time for laying turves is between autumn and spring. laying them ovenly down so that they join lightly tugether. Fit them in pusition so that open seanss will not uccur, and dump them firmly with a wooden beater as pictured in the diagram. This useful implement can be made at home. To keep the lawn at its best, watering must be done freely in dry weather and always in the evening. When a lawn is established and growing vigorously, the mower without its collecting-box may be run lightly over the grass, leaving the slight trimmings as they fall
to act as a muloh, and as a protection during hot days. As a rule mowing should be performed when the grass is dry.

Lawn Sand. A preparation of sand and chemicals, known as lawn sand, acts as a destroyer of certain lawn weeds, and as a fertilizer to stimulate the growth of lawn grass itself. Lawn sand may be purchased prepared, but may be made, if desired, by thoroughly mixing $\frac{\mathrm{lb}}{\mathrm{b}}$. of finely pulverized sulphate of iron, $1 \frac{16}{} \mathrm{lb}$. of sulphate of ammonia and 15 lb . of ordinary sand. It should be applied at the rate of 2 oz . per sq. yd. The grass may be discoloured but will recover.

LAWN: The Material. The materials known as lawns are predominantly made in cotton. Sheer lawns are plain white linens with no lint on the surface, bleached in the cloth and made with fine or very fine yarns, in this way resembling handkerchiefs. Whito Lawn is the traditional material for bishops' sleeves. Boiled linen lawns are not so free from fibre on the face of the fabrios. Linen lawn costs considerably more than ootton, wears better and does not soil so quickly. It feels cooler, and is preferred upon that ground for summer underwear.

Cotton lawn is a superior calico about the same fineness as good longcloth. A good quality of raw cotton is taken to make lawn cloths. Cotton lawn is almost always worn white, and it makes up well into underwear and summer frocks.

## Lawn Mowers and Their Care

Machines Suitable for Large and Small Gardens
The various implements needed by the Gardener are dealt with in this work, among them being Dibber; Fork; GerJen Roller: Spade. See further Gurdening; Gear

Lawn nowing machines act on the scissors principle, by means of a fixed knife ncross which blades, set at an angle, revolve ns the machine is propelled. The moving blades are fixed together so as to form a cylindrical cutter, which is caused to revolve on its axis by gearing connecting it to the wheels on which the machine mins. The knife is fixed to the frame of the machine, and the lieight of the knife above the ground is determined by an adjustment which has the effect of tilting the machine hodily. A gear case is fitted on most types of machine to prevent the teeth of the spur wheels from hecoming clogged with grass cuttings, and a detachable box is fixed in front of the machine to catch the cut grass ns it flies off the cutter blades

Back Drum Mowers. There are two main types of lawn mower, one working on the back drum principle, and the other by means of side wheels. The former has a drum of large diameter, extending the full wilth of the machine, which drives the rotating cutters by toothed wheel gearing, though a chain dive is used in some designs Tho cutters and the knife across which they pass are disposed forward of the drum, and a roller is placed in front of all; twin handles are generally fitted. The axle of the cutter is carried in journal bearings at the ends, and these are capahle of being raised or lowered by means of screws.
The position of the cutters must be ad justed with thesc screws, so that as they revolve they just scrape the knife or hottom blade equally all along; if the outters are slightly too high they will only tear the grass instead of cutting it cleanly, and if too low they will hammer on the knife and blunt both theinsolves and it. Should the axle be at all slack in its bearings, the half bearings must be taken out and filed carefully on their small Hat abutting faces till the slack is just eliminated.
The double spur wheel, which is driven by the drum and Irives the cutters, is mounted with its axle in a slot and has a nut to lock it in position. After the cutters have been adjusted into correct relation with the knife. this nut should be slacked ofl and tha axle of the inter mediate spur wheel moved in its slot and secured by tightening the nut when it is so placed that it is in mesh with the pinion on the cutter shaft

Gear whecls inust not be en gaged so decply that the tops of the teeth of one wheel reach down to the hottoms of the gaps in the other. The hearings of the drum are designed so that they can be moved a little and re-secured ; this adjustment is provided to enable the depth of meshing of the main spur wheel and the intermediate pair to be corrected, but this is seldom necessary. The brackets carry: ing the roller are arranged to slide up and down in the frame of the machine. This is the means provided for regulating the length to which the grass is cut: the effect of raising the
 for sma!l lawns. The former has the roller placed behind the cutters, which is an advan-

Lawn Mower. Fig. 1. Side wheel mower Lawn Mower. Fig. 1. Side wheel mower signed on the bact drum principle Courtext of thunsomes sinus \& Jclleries. It
pattern, owing to the arrangement of its priate machinery. A lesa expensive proces: design, is considerably cheaper than the is to sharpen the cutting parts at home with back drum machine and is commonly used emery powder without removing them The tage for cutting long grass, machine is turned upside down so that it rests with the handles on the ground and the knife on top. the knife blade being on a slope with its cutting edge lowest. The cutters are adjusted up to scrape the linife, but not sc hard as to prevent the mechanism being turned by the palms of the hands pressing on the drum. The cutting edge of the knife is then smeared with a thin paste of fine emerv powder moistened with a mixture of oil and paraflin, and the drum is turned by hand to grind the blales
The grinding paste on the kinife must be frequently added to, as it soon gets dull and loses its abrasive power ; this can easily be done by putting the new supply on the inclined face of the knife, when it will llow down to the edge. When the grinding process has procecded so far that the drum becomes casy to turn, the blades should he ratised up a trille so thiat the action may continue. The sharpening must go on till all the blades rub equally throughout their length on tho knife: the sound, as the mechanism is turned very slowly, will be found to be a sufficient guide

Some machines are arranged so that a handle can be screwed on to the first spur wheel, and this makes the operation less laborious, but it is not essential. Emery powder of suitable grade is on sale as kinife polish. Care is needed that a finger does not cet caught among the rotating blades. The above refera particularly to the hack drum type; side wheel machines are sharpened in an exacily similar manner, except that when turaed over the machine must rest on the cross-bar of the handle and on a block placed under the front frame cross-bar, so as to leave the side wheels of the ground and free to revolve.

Useful Hints. Mowing machines require
types has its special advantages. The side wheel
rollers is to tilt the front of the machine down and bring the linife nearer to the ground, so that the grass is cut shorter than if the rollers werc lowered.

Side Wheel Mowers. The other type of mower is operated by side wheels provided with internal gear tecth meshing with pinions on the cutter shaft ; no adjustment of depth of meshing is provided, as none is required. In this class of machine the roller is behind, and its height is adjusted to regulate the length of grass cut as in the back drum design The adjustment of the blades to scrape the knife, however. is reversed, the knife heing the movable member in this case. The knife is mounted so that it can be rocked by slacking one piair of screws and tightening another pair, the edge being thus hrought closer to or farther from the cylinder blades

Each of the two main
Lawn Mower. Fig. 3. Motor mower with 4d h.p. four stroke petrol engine. By de-clutching cutting cylinder the machine may be used as a rolle Courles"l of Dennis Bros . Ltd., Gulldford
 one wheel that is on the turf. Both patterns are perfectly capable of doing their work and lasting, with fair treatment, for many years
Sharpening the Knives. Mowing machines are designed to he sharqened by temoving the knife and blades and grinding each on appro-
 overhanging the edge of the lawn. When cutting at the edge with the side wheel type, on the other hand, a strong twist has to be maintained by the hands so as to prevent tilting sideways, and force the machine to run firmly on the roller and the
 -
$\qquad$

ground is then very moist after the winter, under which conditions the wheels give a lot of trouble by skidding and consequently cutting up the ground.
The back drum machine, though the more costly and henvier, is free from the skidding trouble. and has the advantage thet it will work without any tronble with part of the cutter blades of the blades and knife should be wiped the cutter blades clean after use. The bearings require oiling
vccasionally. If the mower runs heavy, the correctly; if this fails, sharpening must be meshing of the gears probably needs adjusting. If the blades sometimes fail to revolve when the machine is wheeled forward, the ratchet action must be taken out, scraped clean and oiled.

In the case of back drum machines the ratchet gear, usually fitted in duplicate, is located inside the drum; in the side wheel type the ratchets will be found inside the pinions on the cutter shaft, and can be got at by taking off the side wheels. If the grass is not cut cleanly, or if the blades clog, the cutters must be readjusted to scrape the knife

When the machine is put away at the end of the mowing season the bearings and gear teeth should be given a good oiling, and the blades and knife must be wiped clean and dry and well greased; neglect of these precautions will cause rusting serious enough to involve heavy grinding to get the blades sharp in the spring. Stones on a lawn are apt to blunt the blades, or even chip them ; the only safeguard is to keep a sharp look-out, especially where the grass is alongside a path

## Lawn Tennis on Grass and Hard Courts

## Eints on Playing this Popalar Outdoor Game <br> r Gam

## This work contain 3 articies on the outdoor games that are played in and about the home, such Inciuding Badminton ; Bowls; Croquet. See also Lawn

There are two forms of lawn tennis, singles it and doubles. In singles two players are pitted against each other : in doublos four take part, two against two. It is also possible for one person to play two others. The game is as suitable for women as it is for men, and mixed doubles, as they are called, are very popular.
The pame is played on a court, usually of grass, ou't "often of eregrel, asphalt, sand, cement or some other hard substance. The former kind is the most popular, but the latter, which is coming more and more into favour, has the advantage that it can be used in winter and almost at once after a spell of wet weather ; in such conditions grass courts are unsuitable for play. In general the game is faster when played on a hard court.
Balls, Racquets and Net. ' The implements required are a net to divide the court, a racquet for each player and a number of balls. Each player provides his own racquet, choosing one that suits him or her. The main considerations in making this choice are weight, balance, the size and feel of the handle, and the thickness and tautness of the gut. As regards weight, a man's racquet will weigh about 14 or 15 oz . For most men a light one, say 14 oz ., will be quite heavy enough, but others will prefer a heavier one. Women should not use a racquet weighing more than $13 \frac{1}{2} \mathrm{oz}$., while one of 13 oz is probably heavy enough for the majority. The rules of the game place no restrictions upon the size and weight of the racquet.
To test the balance of the racquet the following method is suggested. Place the racquet on the first finger just about where the screw passes through its neck. The racquet will then either sink at the handle or the head end, or will renasin halanced. One that will remain balanced is the most suitable for an ordinary player.
If, however, a player wishes to concentrate on driving from the back of the court, a racquet that sinks at the head should be chosen. If, on the other hand, a player wishes to devote hinself to volleying. one that sinks at the handle is advised. As regards the handle, a fairly thin one is usually preferred. For a woman this should not exceed $4 \frac{i}{i n}$. when measured below the leather, and it need be no more than $4 \frac{5}{8}$ in. For a maan it must be somewhat thicker. The handle shoulld be fairly rough; if

Lawn Teania. Diarram of the conrt marked for boum siagies end doables. Por the farmer itu width is only 27 th, the sibe boundaries belar tho inneer of the two línes nhowa
it gets smooth and slippery it is a good plan Some players like a rubber covering for the handle, and in some cases this certainly prevents slipping. Persons with moist hands should, however, avoid these grips. Other grips which they may use are made of adhesive surgical wrapping. If a grip is used it should on no account be more than 6 in . long.
Gut for racquets is either thick, medium, or thin, the medium being best. It is important that a racquet should be tightly strung. This can be tested by flicking the nails across it, when a good one will give forth a musical sound. In addition to these points the buyer of a racquet should take it firmly in the hands and see how it feels in the grip when swung.
If it is not absolutely comfortable and easy, it should not be bought, however good a racquet it may be. A racquet should be kept in a press when not in use.
After the Great War a new kind of racquet was introduced, aluminium wire taking the place of gut. For a time this was popular, but after a trial many players abandoned it and reverted to those made of gut.
The balls are of rubber, covered with flannel or cloth. The rules of the game order that a tennis ball shall not be less than $2 \frac{1}{2}$ in., nor more than 2 f in . in diameter, and shall weigh between 2 and 2t oz. The court, whether hard or grass, shail be a rectangle 78 ft . long. For the singles game it shall be 27 ft . wide, and for the doubles game 36.
These measurements are shown by white lines marked on the grass or gravel. It is customary to mark out a court for the double game, and if a single is played to regard the $4 \frac{1}{2} \mathrm{ft}$., which is marked on either side, as outside the area of play.
By the rules, the court must be divided across the middle by a net suspended from a cord, the ends of which shall be attached to, or pass over, the tops of two posts, 3 ft . high, that shall stand 3 it. outside the court on either side. The height of the net shall be 3 ft . at the centre, where it shall be held down taut by a strap not more than 2 in . wide. There shall be a band covering the cord and the top of the net, not less than 2 in . nor more than $2 \frac{1}{4}$ in. in depth on each side.

How to Play the Game. The aim of a tennis player is to drive or place the ball over the net into the opponent's court, in such a way that the opponent, or
opponente, cannot return it, or, if they can, they return it wildly, and therefore send it out of play. Each game is opened by a service, the player serving, each throughont a game, in turn. Serving consists in landing the ball in what is known as the service court, behind which one of the server's opponents stands ready to take it. The server himself stands just behind the back line. If he fails to land it correctly at the first attempt he is allowed a second ; but if he fails in this service also, his opponent scores a point.
As soon as a correct service has been delivered the ball is in play and any player can hit it. A hit is correct if the ball is either volleyed or taken on the first bounce, provided that it lands across the net and within the court. The players return it from one to another as often as they can, this being known as a rally. When one side fails to return it correctly, the other side scores a point. The score is called at the end of each point, that of the serving side being put first. Thus $40-15$ means that the serving side has scored 40 and the opponents 15 , while $15-40$ means the reverse. If the two sides are equal, the score is called with the word all added.

Method of Scoring. The score is reckoned thus: 15, 30, 40, and game. A game can, therefore, be ended after four rallies, or even by four strokes. If, however, both sides reach 40-deuce, as it is called-one side must win two points in succession before a game is secured. This is done by a system of advantages, or vantages.

The score that immediately follows deuce is either vantage-in or vantage-out, the former if the server wins it, the latter if his opponent does so. If the side that won the vantage wins the next point, the game is theirs ; but if the other side wins, the score reverts to deuce and play goes on. As, therefore, a game can theoretically go on for ever, and as in actual fact games do last for a considerable time, the players in friendly games sometimes agree to deoide a game by the issue of a single point.

A set, which is the unit generally played in lawn tennis, consists of six games. Here, again there is an arrangement similar to that for the advantages in a game. If the combatants reech five all, a set must continue until one side is two games in front of ite opponenta. Thus a set may go to 6 all, 7 all, 8 all, and only end when 10 or perhaps more games have been played, with a score of $10-8$ or 11-9. Players usually toss as to which side of the court they shall play. The one who wins, chooses, and the other side takes the first serve. It is customary to change from one side to the other at the end of each odd game, i.c. 1, 3, 5, etc. This applies to both singles and doubles.
Such is the game in brief outline, but fuller particulars can be obtained by reference to the laws drawn up by the Lawn Tennis Association and accepted by lawn tennis players everywhere.
Advice on the Game. To be proficient in the game a lawn tennis player needs the quickness of eye, hand and foot that is essential to success in most ball games, a knowledge of the various strokes and constant practice. Primary rules are that he should keep his eye fixed on the ball, and by correct footwork should make the best use of the weight of the body. He should remember that the amount of pace imparted to a stroko depends upon the speed of the racquet when it meets the ball.

One authority lays it down that every stroke in lawn tennis can be divided into three separate and distinct actions, which should, however, in practice be blended harmoniously into one movement. The first is the swing hack of the racquet ; the second is its swing forward and its hitting of the ball; and the third is the end of the swing after the ball has been hit. the follow-through, as it is called.

The thind, far from being unnecessary, contruls the balance of the player's body. To some extent the play of men differs from that of women, but this distinction does not affect the main principles of the game.

The lawn tennis player must finst of all learn how to serve. The service most finvoured to day largely as the result of the example of American and Australian players, is the high overarm one, delivered at a very rapid pace and usually made additionally difficult to take by the spin that is put on the ball. The first service is usually delivered at the utmost possible speed; the second, if such is necessary only a little less fnst

This high overarm service is used by most men players and by the best women players. Figs 3, 4, and 5 show a grent player in the act of delivering it, which he does by hitting the ball with the racquet at the full stretch of his arm, thus getting the greatest possible power on to it, and then letting his racquet follow the hall right through the stroke until it comes to rest near the right leg. The ball should be thrown up over the right ear and struck the second it comes within reach of the centre of the racquet.
When beginning the serve, the weight of the body will be on the right foot, but when the ball is hit, it should be transferred to the left. To impart the necessary spin, he draws his racquet across the ball at the moment of impact. This scrvice can usually be acquired by men of ordinary agility and strength, provided they practise. They should not hesitate to throw the ball up to a good height when serving; many serves are quite spoiled because this is not done, and therefore the ball cannot be hit with the racquet at the player's utmost reach and power.

To receive a service of this kind the player should atand well behind the back line, dizgonally to the server. He should watch carefully for the break of the ball, and, if it has this quality, should mect it sn that it breaks towards his hitting arm, not across his body. It should be hit hard, preferably with a little top spin, as this will kill the spin the ball already possesses. The return strokes generally used are the drive acruss the court and the one down the side line. If these strokes are made with the forehand drive and a spin is put on the ball they are very difficult to return.
The Chiei Strokes. It is fairly generally agreed that there are five strokes, apart from the service, that are of major importance, the others being varintions of one

which cannot then be hit as strongly or as necurately

Equally impurtant is the correct use of the weight of the body. This sloould remain, as far as possible, on the right foot until the stroke is half completed, when the player should begin to transfer it to the Icftone. It should be entirely on the loft or front foot as the stroke is finished and the player swings the racquet round for the follow through The right or back foot should never be lifted from
line with the forearm than at right angles to it. The head of the racquet, as a general rule, should be parallel with the ground. It is well for the player to separate the forefinger from the other fingers, as he will get a firmer and more comfortable grip. The thumb should lie across the handle, not tightly round it.
There are several varieties of the forehand drive, the names, such as the chop drive, the cut drive, and others, given to then suggesting slight variations in the way the ball is hit. One that is most practised is the horizontal drive. In this the ball is hit either with the racquet at right angles to the ground, i.e. without spin or cut, or hit with a racquet that moves upwards a little and turns overafterthe ball hasbeen hit, thus giving what is

Lawn Tennis. Overarm service. Fig. 3. Beginning the serve, racquet being shown at its lowest point. Fig. 4. Raising racquet and tightening arip. Fig. 5. Position of racquet after ball has been bit, showing full cxtent of Beginning the stroke the player seginning the stroke, the plag
being aideways to the ball called top spin to the ball.
To make this drive sucscssfully it is the ground before the ball has been hit. It necessary to have the body in a correct is understood that these instructions refer position. The player should stand sideways to to persons who hold the racquet with the right the net with the left foot in front of the right, hand; for left-handed players the position of the feet being parallel to the base line and the feet must he reversed. about 15 or 18 in. apart, according to hia height. The reason for this position is that without it the player cannot swing his racquet freely, cannot use his weight properly, and cannot keep his eyes so easily on the ball.
The drive should be made with the arm straight or almost so and the ball taken as high as possible consistent with the horizontal position of the racquet and when it is at a point about the middle of the player's body. In this way racquet and arm, moving together in one long, straight sweep, put the greatest possible power into the stroke, the analogy being that of a straight stick, by which a harder blow can be struck than with a crooked onc. forwards parallel with the ground, and the bali' A common fault is to should be hit as far away as possible from the get too near the hall, hody, provided that there is no loss of balance

The ideal place to h:t it is at a point a little below the line of the waist, that is, lower than that taken for the forehand stroke.
When he begins this stroke tho player should have his weight upon the back foot. from which it should be transferred to the front one as the racquet comes forward and makes the hit, and it should be wholly upon the front foot as the drive is completerl will be of assistance to the follow through if he lifts his left foot from the gmund as soon as the stroke is made. Tho wrist should be quite rigid when the ball is struck.
In playing this stroke good players make use of the left shoulder. By means of this the body is turned as the stroke is made, and the rotary movement thus given helps the swing and power of the drive. If a player is unable to play this atroke with a horizontal incquet at right anyles to the ground, or wants a variation from it, he can play it with the racquet slanted back somewhat. This will then pass under the ball, and so give back spin to it , thus causing it to hang a little after pitching.

## The Smash Stroke

The smash stroke is played with very much the same action as the scrve, and players who are good at the latter are usually good at the former. As this strake depends for its success very largely on power, the harder the ball is hit the better. In some cascs a ball hit in this way can hardly fail to score.
To play the smash well a player must get into the correct position, and with the arm stretchal to its fullest extent must bring the racquet down with its utmost force just as the ball is on the middle of it. The stroke must not be hurried, and the weight should be transferred from the back to the front as it is finished If the right position has been taken up, this movement enables the full weiglit of the body to be put into the hit. If this cannot be done the player has probably misjudged his pusition.
In addition to this, the usual form of the sunash stroke, there is a backhand smash that can sometimes be used to good purpose. To make it the racquet should be held with the backhand grip, with the thumb along tho handle to give control. It should be made with the forearm, the ball being taken above the left side of the head and hit with a sweeping action round it. As with the ordinary back. liand stroke, the player should lave his body sideways to the net and his feet parallel to it and apart. The wrist should be rigid as racquet and ball meet.

Volleying. Volleying, which means hitting the ball before it has touched the ground, is one of the most effective of lawn tennis strokes It should only he attempterl when the player is quite near the net and in position to dash the ball down at great speed. In this stroke the wrist plays the dominating part, little or nothing depending upon the weight or swing of the borly and the sweep of the racquet. The wrist must be as firm as possible and the racquet held in a strong grip. If this is not done the racquet will turn in the hand and the stroke will consequently be a failure. The volley derives its power from the pushing action of forearm and wrist and its speed from the pace of tho ball when it meets the racquet. Accuracy of aim is secured by keeping the head of the racquet supported above the wrist.
To make a volley it is not necessary for the player to put himself into a position sideways to the net, as he should do for a drive, although this position is recommended by some authorities, who assert that a harder return is thus secured. Most players volley facing the net with the feet more or less parallel to the side lines. One reason for this is that there is less time to prepare for the volley than for the drive.

There are scveral forms of the volley. A forehand volley is made with the racquet held in the forelinnd position. The ball should be hit about the height of the shoulder, and the head of the racquet kept a little above the horizontal, with the wrist pressed down. A variety of this stroke is necessary when tho ball drops below the height of the net. The danger of driving it into the net can be avoided by stocoping down and keoping the head of the racquet up, so that the ball is hit slightly upwards and clears the not.

Volleys, like other strokes, must be placell if they are to score. This is done by turning the wrist one way or the other. For instance, if a player is near the net in the centre of the court, and he wishes to volley to the left of his opponent, who is alnost facing him. he must turn his wrist out, i.c. away from the body, and slant his racquet in that same direction. The ball will then be volleyed to the right, which is the opponent's left.
The volley is sometirnes made with a back. hand stroke. For this the grip should be shortened and the thumb placed down the back of the handle. The player should take up a position sideways to the net, and shuuld stoop down so that the head of the racquet is about the height of the waist. As for all other volley shots, the racquet must be held tightly and the feet planted firmly on the ground. It is not necessary, however, to swing the racquet for this stroke.

## Use of the Stop Volley

Very useful on certain occasions is the stroke known as the stop volley. If properly delivered it makes the ball drop just over the net, and, is, therefore, often played when an opponent is at the back of the court. It can be made in two ways. One is to hold the racquet loosely at the moment of hitting the ball, and the other and better way is to slant it, thus giving the ball the necessary spin.
The same purpose, i.e. placing the ball just over the net when the opponent is well away from it, is fulfilled by the drop shot. To play it the ball must be hit crossways, the racquet being almost parallel with the ground. It hits the bal! underneath from right to left in order to put on it the spin which will prevent it from louncing far when it drops wer the net. This stroke is mallo with the wrist and arm. The player does not put any of his weight into it, neither does he swing the racquet for it nor follow it through. as he does with most other lawn tennis strokes.
The stroke known as tho half.volley is worthy of attention, although it should only be played in an emergency. It is something between a volley and a ground shot, and is useful when the ball comes in such a way that the player can neither volley it nor drive it. It should bo played with the racquet quite firmly held and in as horizontal a position as possible, the ball being hit as soon as can be after pitching. It differs from volley shots inasmuch as the racquet should be swung to the ball and should follow it through as far as possible.
The Lob. The last of the five main strokes is the lob. In this the player lifts the ball over the head of an opponent so that it pitches just inside the base lines, or at least in the back part of the court. It is a very easy stroko to play, though it cannot be played with the necessary accuracy without a good deal of practice.
In order to play a lob properly the player must be in a sicleways position. just as for the forehand drive. The racquet should be slanted back and be swung from undernenth in a firm grip. Care must be taken to lift the ball high over the opponent's head otherwise it will be smashed back. The lob can also be delivered with a backhand stroke, and it can be inade
with spin on the ball. Its prime easential, however, is accuracy, as inaccuracy cannot in this case be compensated for by pace, as it can with the drive.

These and other lawn tennis strokes are played in the same way for singles as for doubles. In singles the player's task is quite simple; ho must himself return every stroke to tne utinost of his power, but in doubles the two players must have an understanding on the subject; otherwise confusion and luss of points will be the result.

Tactics for Doubles. In men's doubles the tactics of the best players are as follows. The server, having delivered his service, dashes up to the net, where his partner is already stationed. Each in his own half of the court, they will then be in a position to smash or volley a large proportion of the returns. They must be prepared to run back if a lob is threatencd, each watching his own side of the court : but otherwise the nearer the net the better is quite a goorl rule. Players in this position shuuld always be moving. or appearing to move, towards the centre of the court, in order to cut off an opponent's return and also to keep him in a state of uncertainty.

When it is the turn of a player to receive a service, he and his partner should both be on or behind the base line, the best playels having abandoned the idea of having the one not receiving the service at the no!. W'hen a return justifies it they should go forward together, kceping in line and the same distance from each other, so that they will cover as much of the court as possible. One authority suggests that the striker-out should occasionally send a drive straight at his opponent at the net, as a stroke of this kind, if delivered about waist-high, is usually very difficult to return, cither forehand or backhand.

In mixed doubles different tactics are desirable. The accepted formation is for the man, when not serving, to be at the net and his partner on or near the base line, the best position for most women players being a little outside the line and not far from the corner of the court. In this position the woman player can make two effective shots, the drive across the court and the drive down the side line. When the man is serving, he dashes up to the net as soon as he has delivered his service.

In most cases this formation is doubtless the best, but there are exceptions. For instance, if the lady is a goorl volleyer it may be advisable for her to play the same game ns a man would do; but if she is not., her partner, being at the net, should hit on the volley everything that comes within his reach.
Handicapping. In lawn tennis tournaments, and sometimes in friëndly games. players are handicapped. This is carried out by giving strokes to the weaker players, and making the stronger ones owe strokes. For instance, a player may receive 15 points, or 30 or 40 . This means that he has one, two or three strokes in hand when the game begins. If, on the other haml, a player owes 15,30 , or 40 points it means that he must win one, two. or three strokes before he can begin to count, 15. 30, and so forth. Thus, if a player owing 30 plays one who receives 15 , the latter only requires threc strokes to win, unless deuce is reached; the former requires six.

The nore usual way, however, of handicapping is to give or receive strokes represented by sixths of $1 \mathbf{5}$. These odds are re. coived in each group of six games of a set : in the first place in the carliest possible even games. That is to say a player who receives onc-sixth of 15 receives a stroke in the second game of each group of six: a player who receives two-sixths receives a strokic in each of the second and fourth games, and a player who receives three-sixths roceives a stroke in the second, fourth and sixth games.

IAE : Of Smoked Salmon. A special preparation of smoked salmon, lax may be served as hors d'oeuvres, being cut into thin slices, covered with dressing and garnished with parsley or chopped pickle. Lax is also served as a savoury on small buttered biscuits. It should be freed from the oil in which it is preserved, moistened with salad oil and lemon juice and then seasoned with pepper. It should be allowed to stand for some little time so that the oil etc., may soak in. Parsley may be used as a garnish. See Hors d'Oeuvres; Salmon.

## LAEATIVE.

 The mildest cath. artic or opening medicines are known as laxatives or aperients. The principal laxatives are cascarb sag. rada, sulphur, euonymin, manna, magnesia (magnesium oxide), castor oil, olive oil, and liquid paraffin. Many fruits have a laxative effect, particularly stewed prunea, figs andLAXTONBFRRY fruit raised by cross-breeding between the raspberry and the loganberry; it needs the same treatment as the latter. As the flowers are partly self-sterile the laxtonberry should be planted near other berried fruits.
LAYERING. This is a method of increasing stock of carnations, roses, and other shrubs and plants. The idea is to prevent the return of the sap from the extremities of the leaves and branches to the ronts by means of a cut in the stem. The sap bleeds, the wound hardens, throws out roots, and eventually the branch becomes a separate plant.
To take a layer, a suitable low-lying branch or shoot must be chosen, and all the leaves stripped off below a selected joint. The joint is sliced half-way through with a sharp knife, at a very acute angle. Thc partially sovered branch is bent upward and pegged firmly down into the ground in a patch of very sandy soil.

Pegs, in the shape of inverted V's, are pressed down, with one leg on either side of the layer, in order to keep it in position. Hair-

LJAD: Its Uses. Lead, which is one of the heaviest and softest of metals, has many uses in the home. In the form of pipes it is extensively used in sanitary systems, for waste pipes, and occasionally for hot and cold water services. In sheets, lead is used in the construction of gutters and for covering flat

Layaring Methods. 1. Lajeriag stolons of 8t. Bernard's Lily. 2. Maltiple Lajering of Lapagaria!: $a$, soil: $b$, Abre: $c$, gtaging. 3. 8trawberries lajerod into (a) planged pot and (b) boz. 4. mof surfaces, the lining of sinks, and in numer by the weather, and does not rust or corrode under the action of water.

Lead can be soldered, or joints formed by burning, this process consisting in melting the lead at the joints so that it fuses or burns together. Lead is often used for decorative
purposes in the form of garden ornaments, rain-water heads and pipes, and in some forms of ornamental statues, generally those used as a centre ornament for a fountain

In the home lead is used for keeping carpets in place at the edges. or for weighting the bottom of a table-lamp stand or other structure It has the advantage of occupying less space for its weight than any other convenient metal.
Polsoning by Lead. The presence of lead in water or food may lead to poisoning, but it is most commonly found amongst persons whose work involves the use of lead. such as, for example, plumbers, painters, and potters. The symptoms are sickness, acute pains and diarrhoea. While awaiting the doctor induce vomiting by tickling the Dack of the throat or by an emetic. If it is at hand a dessertspoonful of Epsom ssits should then be given, followed by milk and white of egga. A hot poultice on the abdomen will help to relieve the pain.

In chronic lead poisoning the first symptoms may not appear for months, the most prominent being colic, with agonizing pains in the region of the navel. There is a blue line along the gums at the junction of the teeth. also anaemia and muscular weakness. Thorough medical treatment is required. Ser: Casting: Flashing: Gutter: Plumbing : Sink.

LEAD ARSENATE. This is a poisonous and dangerous compound, which may be purchased in paste form in jars for mixing with water in the proportion of $\frac{1}{2} \mathrm{lb}$. of paste to 10 gallons of water. It consists of a combination of acetate of lead and arsenate of soda, and special precautions must be taken in its use. the maker's instructions being strictly followed.
The wash is valuable for clearing fruit trees from the larvas of such pests as the codlin, vapourer, winter, lackey, and currant moths, gooseberry slugworm and sawtly, and also caterpillars and biting beetles. See Fruit: Lackey Moth : Spraying, etc.

## Lead Art Craft for Home Decoration

## How to Make Incepensive Leaded Windows and Mirror Frames

Thls article deals with the various forma of ornamentation possible by means of prepared lead strips.

Many people like the appearance of leaded lights for their homes, but are deterred from installing them owing to their cost. By the use of prepared lead, obtainable in coils, a special cement. brush and sponge, the amateur can for a trifling sum convert a plain window into one with leaded panes.
This lead is manufactured in thin strip form and in various widths. It is extremely pliable, easy to use, and is coiled to facilitate handling and for convenient packing. A particular feature of the lead is that it adheres to tiled surfaces, metal, wood, or glass. It can be used for framing pictures or mirrors, and is one of the easiest materials for applying with cement as a moulding. It can be paintod with cellulose quick-drying paint when employed to outline tiled surfaces in a bathroom or kitchen.
Designs for decorating glass screens, glazed doors for wall cupboards, bookcases or overmantels, can all be carried out by the amateur, while the lead can also be employed for name plates on front doors and gates. The cement to be used with the coils of lead is specially prepared to withstand all weathers. Various outfits are obtainable for this craft. including one which contains glass colour stains for use on windows, etc., in ruby, amber, blue, and green.

Simple Leaded Windows. A small window on the staircase or landing may be selected on which to experiment. It will be found that after applying this form of decoration the
window is quite easy to clean. The strips do not work up, however much they are rubbed. if the special cement is used for fixing them on to the single panes of the ordinary vindow.

The first task will be to measure off the correct length of lead. Hold an end of the lead in one hand at the top of the window and allow the coil to unwind and fall perpendicularly (Fig. 1). Then nick the lead at the desired point with the thumb nail and, taking it from the window, snip it off at that mark.
Measure off and cut all the lengths for one window before proceeding any farther; then take the brush and the tin of liquid cement and paint each strip of lead on one side only with a thin but even coating of cement (Fig. 2). Treat two or three strips of lead in this way before attempting to affix any to the window, as the cement must bo on the lead for fifteen minutes before applying. This will ensure that the cement has partially dried and is slightly "tacky," and therefore more adhesive. Pencil-mark the window frame to ensure the strips being laid on straight. Now take the strip of lead which was ccmented first and lay it against the glass in the position required.

Having made sure that it is exactly straight, press it firmly and evenly with the ball of the thumb (Fig. 3), and with a linen rag damped with petrol or turpentine gently sponge away any cement which has boen pressed out from under the lead on to the glass. It has been found better to start

Lead Art Craft. Fir. 1. Measuring lentth ol lead required. Fig. 2. Coating joint. Fig. 5. How to bend strip lead. Fip 6. Smoothing inner buckled edse
the desircd curve, doing a little piece at a time (Fig. $\mathbf{j}$ ). The lead is now neatly curved on the outer edge, but the inner edige is buckled. Pro. ceed, therefore, as follows: Lay the curved strip on a flat surface. Hold lirmly in position with fingor and thumb of one hand and gently press the buckled surface witl the ball of the finger (Fig. 6). Practically all tho buckling will then disappear, and by gentle rubbing with the linger, which should be protected by the corner of a linen rag, a completely llat appearance will be ensured

For making a number of curvos of the saine size it is easior to work with a template. This is a thin piece of cardhoard which is cut to the exact curve required. Tack this template on to a smooth pioce of wood. Next tack the metal strip to be curved just above the top of the teinplate; then gradually ease the load round the elge of the template with the lingers by means of a gentle pulling and pressing movement.

Glazed bookcases can bo treated in the same way as windows. Books appear attractive bchind leaded panes, and so do china and glass. Recessed oupboards on landings or in halls often look well if the upper with the horizontal strips, but leaving the top portion is gla\%ed and decorated in this way. and hottom horizontals until last. They will Fig. Is shows a simple design for a bookcase serve to frame the others and keep them in or cuphoarl. Coloured glass effects may be position. Many people leave the spare cement introducod by means of the specially prepared on the edges of the lead, preferring thic stains. but requires discrect usage. appearance of age which the resulting irregnlarity affords. The strips may he applied to both sides of the window, as the cement stands all weathers.
similarly, opinion is divided upon the question of overlapping. Some prefer to overlap the strips of lead, for this method is easier and quite attractive. Others prefer to cut each rection flush with the next, giving a soldered-joint effect (Fig. 4). Nistakes are easily rectitied. If a strip of lend is applied incorrectly turn up the edge with the point of a knife and the whole strip can then be pulled off quite easily. After experiment. ing with a aquared pane effect, diamond panes (Fig. 7) will he found equally easy to simulate.
To imitate the Gothic or Norman arch, as seen in Fig. 8. or to insert panels of heraldic designs, etc., the amateur must learn how to hend the lead. Hold the strip mo that the side which is to become the outer. rdge of the curve is "ppermost, and gently pull the lead round to

Fix. 7. Diamond pane effect. Fir. 8. Imitation of Gothic arch. Fig. 9. Design for bookcase or cuphoard

The prossibilities of lead strips for framing pictures and mirtors are well worth noting. By this means a permanent frame js procured with little more trouble than the temporary one made with phsse-partout paper. A groove in the particular form of strip sold for framing purposes allows the lead to ho bent on to the lack of the picture
or mirror inount. r mirror mount. lining.

Figs. 10, 11 show this simple process, while in Fig. 12 may he seen the artistic effect of a perfectly plain mirror framed in lead.

Designs may be heavily drawn in pencil and placed under glass to be outlined in lead for ornamenting panels for screens or other articles. A special form of very narrow lend strip is sold for the purpose of outlining such designs.

House Name Plate. One of the most effectivo uses to which lead strips can he put is to make the lettering and framing for house name plates. Under a rectangular piece of glass of the sizo required for the plate, the name, having heen written or printed in ono of the various types of lettering suitable for this purpose, is placed and the letters are double outlined

Lead Art Craft. Firs. 10 and 11. Two stares in the use of grooved lead strips lor Iraming purposes
with the narrowest width of lead strip obtain. able. The lead must he alowly ensed along, the forms of the letters showing through the glass, and one end must be steadied with the left hand so that the forms alieady made will not be pulled out of shape. The worker must not proceed tou fost if the letters run on, or the first letters of the name will not have il chanco to ndhere properly.
Metallio paint may be applied on the back of the glass, so that the letters appear golden in the centre and outlined with lead. Another piece of glass of the saine size and sha pe as the lirst picce is then laid over the leaderl letters, so that they are protected on either side by glass. To provido for safe suspension of the plate two thin pieces of hrass are each cyeleted at onc end and slit at the other, su) that tho slit euls can be bent up, one to the front and the other to the back, to form resting places for the two pieces of glass. Having placed these on the upturned euds of hoth pieces of brass, hind logether with strips of the passe-partout width of the lead, thus binding in the brass with the bottom of the plate and leaving the two eyeleted ends projecting at the top, where this is in turn bound with the passe-partont. In order to a void the danger of moisture con. densing between the two pieces of glase, the under edge of the passe. partout fram. ing should be pierced in several places to provide ventilation. The lead strips are oltainablo in "illthe of from $\frac{1}{}$ in. to in. St randed for finc out.

## Leaded Lights for the Home

## An Old-World Attraction for the Modern Home

Other articles that deal with the decoration of the home arc Enamel: Paint; Panelling; Parquet.
Sec also such entries as Casement; Class; Stainced Glass; Window and those on the matcrials and processes. c.g Cement; Soldering

The old form of decoration known as leaded light work consists in the use of pieces of glass to form a pattern, in which they are held together by calms, or strips of lead. These are soldered together at the joints, and the whole fixed in a framework. Leaded lights form a pleasing fenture of some styles of decoration particularly in houses furnished on the Tudor or Jacobean models. In many cases it is possible for the amateur to take out existing casement windows and replace them with leaded light panels. or add lead panela to the framework.
The nmateur worker is recommended to study the article on Glass nad Glazing The tools required for making leaded lights are one or two good glass-cutters, cither a diamond or one of the newer types of wheel cutter. On a rippled or variegated surface it is $p$ mhable that better result will be obtnined from the use of the whecl, but in large sheets the diamond is less likely to cause a breakage, as it requires less pressure to effect the cut. A board upon which to out the glass, a T-square and set square, and straight edge are required, as Well as one or two linives for cutting the lead, a pair of pliers, and soldering iron
One or two special implements are noeded, including the lathykins, made from a piece of hardwood or bone a hout 7 in . long, and shaped as shown in Fig. 2, which shows a group of the tools required. The point is used for opening up the llanges of the lead hefore inserting the glass, while the prepared flat end is used for pressing them down agnin when the glass is in position. Machine-drawn lead calmad can be ohtained ready for use from various firms specializing in this material The smaller sizes are generally solid lead, while the larger are often reinforced with a steel core.
The types of glass in common use are the ordinary sheet glass, such as is used in windows, and which may be ohtained in various colours, and obscured glass, which is made in different grains or surfaces. One of the cheapest kinds that can be used for tints is rolled cathedral glass; it is made in a variety of colours, is non-transparent, and is very useful where some obscurity is required, as for the panela in a screen or a hall lantern

A number of glasses are graded under the heading antique, and include pot, flashed. streaky, Venetian, and opal. In the jot metal glass the colouring medium is introduced in the process of manufacture, and consequently the glass is coloured right thmugh. Flashed glass is only coloured on the surface. Streaky glass exhibits a variety of atreaks of different colour. Venetian has a strongly marked pattern, and is n very brilliant glass; opal hlass has anl opaque white surface.

Preparing the Design. When preparing a design it is necessary to bear in mind the nature of the material and the restrictions it imposes. For example, it is impracticable to introduce very thin lines, except those which are formed by the lead, as obviously there is a limit to the breadth of the glass in the sense that it is extremely difficult to cut a very narmo strip The desired effect should be olitained therefore fmm breadth of treatment rather than detail. This only applies to selfcolour glass, for when stained glass forms part of the composition the design may he treated in a more decarative and detailed manner For example. the body of a window made with
plain glass of various colours could linve a central panel introduced in stained glass which may have some particular fenture, such as a heraldic shicld or emblem. The hest models of such windows should be studied, as it is easy, when dealing with stained glass, to introduce a garish or cheap effect into a window by the use of poor design and colouring.

Taking as an exainple the light for a window composed of pieces of clear glass, the first procedure is to make full size drawings showing the exact arrangement of the separate pieces The lines upon the drawing should represent the heart or centre of the lead (see Fig. 1) The size to which the glass is cut must then be smaller hy the thickness of the heart (i.e half the thickness for each side). Sometimes the drawing shows also the thickness of the calm itself.
When it is necessary to cut up a number of

Leaded Liphts. Fig. 1. Diagrams shoming three varieties ol lead calms employed in this decorative work
squares or lozenges of the same size, the glass is first cut into strips of the desired width, a nd then cut across to form the squares, etc. Test the first strip) by placing it between odd pieces of calm and observing that the centre of calm registers with the centre line on the full-size drawing.

When the glass has heen prepared and the requisite quantity of lead is at hand, the framing is placed flat upon a level table or board, and lathe are nailed down on two sides of it in register with the line of the rebate of the window frame, as shown in Fig. 3. The outside lead is then arranged so that half of it will protrude from the rebate and show inside the sight lines

Inserting the Glass. Before using the lead it should be slightly stretched to straighten it The lead is la il upon the bench and the gronves slightly opened with the lathykin on both sides. The requisite number of pieces of lead are cut to the length and breadth of the light and laid on one side ready to hand Sufticient pieces of glass are then inserted into the

lead and built up in the vertical direction of the light. The glass is inserted into the grooves in the lead and tapped tightly in position with the handle of the lead knife. As each piece of glass is inserted, it is temporarily fixed by driving n nail lightly a little way into the hench with the side of the nail against

Leaded Lights. Fig. 2. Above. cutting board. T-square and soldering iron ; below, other speciai tools required
the edge of the glass. Short pieces of lead murt be inserted between each piece of glass and cut to such a length that their ends will butt against the vertical strips, as in Fig. 4.

When the first set of glasses has been inserted a long strip of lead the requisite length for the vertical strip is slipped over the edge of the glasses. To do this will necessitate lifting each glass separately from the hench, for which purpose the hent knife is required. This is pushed under the glass and raises it just enough to allow the Hange of the vertical lead to he held hetween the glass and the hench. The temporary nails are removed while the lend is inserterl, but fixed behind the lead to present it alipping off again. Each nail and separate piece of glass is treated in the same way until the whole length is complete. The light is continued until all the glasses are in position The remaining two outer leads are placed in position and temporarily secured by nails to the bench. The whole is then pressed tightly against the laths, and afterwards secured by two additional laths.
Before driving the nails into the bench to secure these laths test all the dimensions. Should the panel be oversize this may be corrected by tapping the edge of the Inth and driving the picces of glass more closely to gether. Corner angles should be tested with a set-square, and when all is in order the second set of Inths may be fixed and the joints carefully soldered.
Soldering the Joints. The soldering tool must he tinned before using The surfaces to be soldered are rubhed over with a composition candle and the solder flowed on to the joint Neat joints are best obtained when the soldering imn is at the right lient. The face of the iron should be placed only on the joints and held firmly until the solder runs into place. as shown in Fig 5.

When all the jointa are soldered the panel aliould be turned over very carcfully. Two of the laths can he removed and the panel drawn forward on the surface of the table until it projecta sufficiently to allow the hands to be inserted beneath it. It should le grasped between both hands and the projecting portion laid on a strip of wood, while thant part of the light resting on the hench is raised with the left hand until the panel is vertical, as in Fig. 6, when it should he turned round and rested against boards which are slanting backwards. The bench is then oleared and the panel lifted by means of boards, laid in a vertical position, tilted over and pushed on to the table. The second side is then soldered us hiefore.

For cementing, a small quantity of white lead may he used. Another cement is composed of whiting, plaster of l'aris, boiled oil and turpentine, coloured with lamp-black, and with the addition of red lead and patent driers.
The object of cementing is to fill up the grovies and crevices between the glass and the lead so that the panel becomes one solid structure. A good way of doing this is to apply the cement with an ordinary paint brusil which has been much worn and has got strong in the bristles, and to brush the cement well in under the finnges of the lead, as indicated in Fig. 7

The corners should reccive extra careful attention: proper cementing is evi. lenced by the cement working right thmugh from the top to the underxide of the worl: Lift the light from the bench occasionally and see if the cement

has worked through. Surplus cement should be wiped off with cotton wasteor clean rag, the light turned over and the cement brushed in on the other side. The whole sur-
face of both sides should then he wiped over to remove surplus cement, and the surfaces dusted with whiting. The panel should he set against a sloping board to harden, and allowed to stand for 12 to 24 hours, when it may be cleaned by dusting it over with clean, dry sawdust and the use of n acrubbing brush. Any cement adhering in the corners should be cleaned out with a pointed piece of hardwood. The panel is then set aside to dry and harden for several days.

Fixing the Panels. Leaded light panels are fitted in different ways according to the nature of the frame. A simple method is to fix the panel into a rebate in a wooden frame secured with little battens of wood screwed or bradiled. In the case of large panels, strengthening bars of iron or copper have to be fitted, soldering a little hook of copper wire to the leads and twisting it round the iron bars. On outside work the rebate should be loaded with putty or cement prior to inserting the panel. If the light is to be fitted into a window with a stone mullion or framework having a rebate, the holes for the supporting hars will have to be chipped out with a mason's chisel and the light bedded in mastic cement, which may be composed of lime, sand, and a little litharge.

Repairing Lights. Repairs to leaded lights are effected by a process known as stopping in, and presuming only one or two small pieces of glass are broken, these are removed by levering up the flange of the lead with the aid of a lead or putty knife, until the pieces can be removed easily. The new piece is cut to shape, inserted in place, and the lead pressed down smooth again. If this necessitates cutting the soldered juints at the corners, they will have to be resoldered. If several pieces of glass are broken, the best plan is to cut away the whole of the damaged part and replace it with now lead and new glass, soldering and cementing as if the whole were new work.

LEADSALTS. When applied to ulcers or broken skin surfaces lead salts act as an astringent and help to arrest bleeding. They are oommon ingredients in douches and lotions, and are sometimes of value for itching. Preparations comnonly employed are strong solution of subacetate of lcad (Goulard's extract) : dilute solution of subacetate of lead (Goulard's water). the most convenient liquid preparation for external use : glycerin of subacetate of lead: ointment of subacetate of lead; lead or diachylon plaster.

LEAF. Leaves perform important funo. tions in the life of a plant, but cannot be called absolutely es. sential organs, branches some. times performing similar offices, as in the case of cacti and other plants. Nevertheless, if leaves are denuded from plants, the plantswill quickly die or else have their vitality greatly

Leaded Lights. Fig. 3. First stage In the work. Fig. 4. Tbree pieces of glass in place, the calms held by ping. Fig. 5. Soldering the joints. Fig. A. Turning panel over to solder other side. Fig. ${ }^{7}$.
Brushing cement into joints with an old paint brush
injured. The function of a lenf appears to be a combination of lungs and digestive apparatus, which enable a plant to absorb air and nourish. ment from the atmosphere. In the case of evergreen plants these functions are performed for years, but in deciduous trees and plants leaves cease to funotion after a short period, and the withered lenves fall.

Transpiration with plants varies according to temperature and growth, and this explains why they do not require so much water in cold weather or during the period that blossoms ripen into seed. Frec transpiration is essential to the health of plants, and consequently it is important to keep the leaves clean so that they can function properly.

Directions for drying the leaves of herbs for culinary purposes is explained in the artiole on herb.

Leaf-Mould. Leaf mould is one of the constituents of nearly all potting composts, and in conjunction with loam and sand it forms an ideal rooting material for plants. It also helpa to lighten the soil.

The decayed leaves of oak. elm, and beech make excellent leaf-mould. especially oak leaves. Evergreen leaves, such as those of the holly and laurel, are not good for the purpose All leaves of the right sort should be preserved by the gardener rather than burnt. Decnyed leaves arc the origin of the bulk of the humus which is found in the soil. Thev should be swept into a heap. or heaps, in corners as sheltered from the wind as possible. As a precautionary measure it is well to cover them with a thin layer of coarse soil, in order to prevent them from being blown. See Begonia: Compost; Loam. Mould; Potting.
LEAK: How to Stop. A leak is recognized by the escape of the contents through failure of some part of the container. In the hoine, a leak is most common when water pipes burst owing to the action of the frost, and, if neglected, mny result in the Hooding of the premises.
The pipe should be blocked at some point above the fracture, so that the water cannot How through the pipe and the leak is stopped Repairs are effected according to the nature of the material of which the pipe is made. In the case of $n$ lead pipe, this is done by making $n$ plumber's wiped joint, and in the case of an iron pipe, by fixing a new section in plece of that which is danaged.
When rain finds its way through a roof or guttering, the leal usually is cansed by a broken or misplaced tile or slate, a small hole through the gutter, or through the roof covering if of some material such as bituminous sheeting. The remedies arc to replace the dimaged tiles or slates with new ones and close up the fracture in the sheeting. There are several patent compositions which are often effective in curing a leaky roof.

The remedy for a leaking water tap is generally to fit a new washer in place of the old one. Directions for this will be found in this work in the article Tap (q.v.) See líost; Water Supply.
Lean-to Building. This is a simple form of erection which leans against another building. See Greenhouse : Shed.

LEASE. A lease is a grant of property either at will or for a period determinable on notice, or for a fixed period by a person who has a greater interest in the property. The person who grants the lease is called the lessor. and the other who receives it the lessee. That which is left to the lessor after he has granterl the lease is called the reversion. The lessor need not be the freeholder. He may be himself a lessee froin another lessor, and in such a case the lease which he granta to his own lessee is called a sub-lease, and he is usually spoken of as a sub-lessor, and his lessee as a sub-lessee. A lense is usually given in consideration either of a sum of money paid down or an nnnual rent in money, or both, but it is not necessary that there should be any monetary consideration.

A lease for three years or over must be by deed under seal, but if anyone has an agreement for a lease in writing, and goes into possession of the house or other property on the strength of it, he will be considered a lessee, and cannot be turned out so long as he is prepared to execute a lease if required, and to obscrve the terins of the lease which was to have been made. The ordinary lease taken by a householder is for a fixed term, varying from 3 to 21 years. Sometimes it contains an option to terminate the lease nt certain fixed periods by giving a certain notice, or to renew the leasc on notice. The person taking advantage of the option should be carcful to give the notice atriotly in accordance with the terms agreed upon

Rates and Taxes. In leases of houses and other buildings, especially in towns, the landlord very often insists upon certain covenants and conditions being inserted in the
lease. The most common of these are that the tenant shall pay all rates and taxes, except landlord's property tax, which the tenant cannot agree to pay: a covenant to repsir the premises; a covenant to pay the rent, and very often covenants not to use the building for certain purposes. A covenant to pay rates and taxes is simple enough, but sometimes it is put in the form that the tenant shall pay not only rates and taxes, but "al! impositions whatsoever," and this sometimes reaults in a tenant being obliged to pry unexpected burdens whioh may be placed upon the property by the local authority.
Restriction of Use. It is quite common for leases to contain covenants restricting the use of the premises. Thus, when a landlord oorns a roiv of shops, he sometinies desires to keep the shopkeepers from cut-throat competition : so he decides to let one shop to a butcher, another to a baker, a third to a tailor, and so on, and he inserts a clause in the lease that the butcher shall use his shop as a butcher's shop and for no other purposes without his consent.
Another form which this covenant may often take is that the tenant shall not use the premises for businceses which the landlord considers to be ohjectionable, or which might be a nuisance to the neighbourbood: e.g. it is common to find a stipulation that the premises shall not be used for a fried fish shop, or ins a soap boiler's, or as a public-house This is, of course, partly to preserve the value of the property and partly to protect the neighlourhood against nuixances. A third form is to be found in the case of houses on a residential estate.
In some neigh bourhoods the residents object to lodging houses and boarding houses and schools and the like occupations which can be carried on in a private house. To protect himself against depreciation the owner of the estate inserts in his leases a clause to the effect that the house shall not be used as anything but a private residence. The courts interprot this clause very strictly; and have even held that a person who established a home for girls out of work, to whom she made no charge at all, way carrying on a trade or business within the meaning of such a covenant.
At common law every lessee is ontitled to assign his lease or to underlet the premises or any part thereof to suit his own convenience. The tenant sometimes agrees not to assign or underlet without oansent.
An express covenant is always put in a lease that the tenant shall pay the rent, and this is done to make the tenant take or send the rent to the landlord. If there is no express covenant by the tenant to pay the rent the landlord cannot distrain upon the premises or sue for the rent unless and until he has made a legal demand for it. A legal demand must be made after the rent has become due, and upon the premises themselves between the hours of sunrise and sunset.

Breaches of the Covenant. Where a tenant is guilty of a continuing breach of some covenant which is not innmediately remediable by the payment of a sum of money, the court will injunct him fmm continuing to do it. In the case of a breach of a covenant to repair, the landlord can always get ns damages the reasonable cost of doing the repairs But nearly every lease in these days contains what is called a condition of forfeiture and re-entry. whereby it is stipulated that if the tenant shali fail to pay the rent or to perform and observe the oovenants contained in the lease, then the lease shall be forfeited and the landlord shall have the right to enter upon the premises and take possession of them again.

Before taking the step of trying to eject the tenant the lessor must, however, give the lessee notice of the breach of covenant complained of, requiring him to remedy the breach, to pay compensation for it, also to pay the costs of the
landlord's solicitor and surveyor in connexion with the matter. After the notice is given, the lessee must be allowed a reasonable time irithin which to comply with it, and if he does not do so the lessor may then take action.

It should be observed that the forfeiture of the lease does not exonerate the lessee from paying damages. Even after the lessec has failed to oomply with the notice and the landlord has brought his action in the court, if the lessee comes forward and expresses his willingnces to comply with the covenants and pay reasonable compensation, the court will not allow his lease to be forfeited, but will suspend the action to give him time to do what he ought to have done at first. The lessee will also have to pay all the costs of the lessor.

An esception to the rule about giving notice is when the tenant has failed to pay his rent. In this case the lessor can bring his action for forfeiture without giving any previous notice or requiring the lessee to remedy the breaches of which complaint was made.
If a lessee of premises continues in occupation of them after his lease has expired he is said to hold over. The tenant who holds over and pays to his lessor rent on a yearly basis becomes a yearly tenant upon the same terms as the lease, and his tenancy will be only determinable by six months' notice on either side, which notice must expirc at the end of a current year of the tenanoy.
The Rent Restriotion Acts, so long as they continue in operation, entitle a tenant under a
lease to hold over after the expiration of his lease, but if be pays rent to the landlord no presumption arises that the landlond has accepted him as a yearly tenant. He is what is oalled a statutory tenant. The landlord can raise his rent to the amount which the statute allows by giving a month's notice of bis intention See Agrcements: Building House
LEASEHOLD. This is the name given in England, Wales and Ireland to land that is let on a long lease for huilding purposes, not sold as is freehold. It is usually leased for 99 or 999 years for an annual payment known as the ground rent. At the end of that time the land, and also any buildings that have been erected thercon, revert to the successor of the one who granted the lease Such buildings must be handerl over in good condition lt should be noted that leasehold property is regarded us personal, not as real estate.

LEASH: For Dogs. Some form of leash is desirable for dogs when they are taken out for a walk. The various leather leads that can be purchased are undoubtedly the most satisfactory, and they can be had, either round or Hat, suitable for almost any breed. See that the swivel at the end has a strong spring; otherwise it will continually be coming off the collar. The leather may be preserved by rubbing occasionally with Mar's or castor oil. For very powerful animals a chain may be preferred, but it is much heavier and less comfortable for the hands. See Dog.

## Leather \& Ornamental Leather Work

## The Necessary Tools and Simple Methods Described

The following article contains many useful hints on materials and accessories required for this decorative craft. together with practical directions for modelling and colouring lcather.

Sce also the entries on Boot: Glove: Lacquer Work
When choosing leather for an important leather made from hide splita and known as piece of worlk such as a fire screen, large bag velvet splits. Plain skivers are cheap and or blotter, it is advisable to purchase a quarter useful lining leathers. These are the upper skin of medium growth. Older skins are grain of split sheepskins. The under or flesh coarser and young ones cut to waste Merchants charge more in proportion for supply. ing panels of frawless pieces, and if there is a surplus of material after cutting out the required amount for the work in hand, the extra pieces can be made up into sinaller articles. Skins are usually sold by the square foot.

English calf skin is the best leather for plain or modelling purposes. It can be prepared so that embossed work retains its sliape without padding. Kip calf, or East India kip, is a less expensive leather with a coarser grain, but is also good for modelling work. Cowhide is a useful leather for large pieces of work such as a screen or a shopping bag. It models, stains and wears excellently. As the skins are very large these leathers are obtainable at the lower rate in eighths as well as in quarters and ha|ves. A clieaper underhide is obtainable in narrower widths. Russian leather has a beautiful surface for bookbinding work. Morocco is made from the finest selected and hand-dressed goat skins. Pigskin is light, but very tough and durable. The reptile skins, crocodile, alligator, lizard and snake, make ornamental but expensive leathers.

Lining and Imitation Leathers. Persians are hard wearing and made from foreign sheepskins. They are obtainable in browns and several other colours. Velvet persians are a fancy form of this leather with a suede finiah. Persians are used extensively for tining firstclass work. Degrained persians are a superior form of suède, finished leather used for golf conts and other dress wear. Velvet sheepskin is similar in appearance to velvet persian, but coarser, and is used for making bags and blotters, etc., required with a suede finish. Less expensive for smaller articles is a strong
split is called chamois, though only an imita tion of the skin of that almost extinct animal. Skivers should be strengthened by pasting to leather, linen or board. They are not suitable for pockets or gussets, as they tear easily. They are obtainable in plain coloura, in fancy shadings and in nappa finish White kid is used for glove making and linings, and lacing calf for thongs and gusseting for pocketa.

Imitation morocco is made from sheepskin with a grained instead of a velvet surface. Polished crocodile. in large or small grainings, and velvet crocodile are copied well in hide. These are strong and effective leathers for shopping bags, pochettes and undecorated blotters. Lizard grained sheepakin is also an excellent imitation of another reptile skin which can he most successfully made up into handbags.
Tools and Accessories. Simple outfits are best for the beginner. There are many excellent ones on the market which vary slightiy in their contents. A useful set of tools comprises : a transparent set square for correcting angles and cutting the various parts of the work to fit: being marked with inches and quarter inches it takes the place of a rule; sharp knife for cutting leather and turning edges (Fig. I, D) ; double edged ball tool for embossing, i.e. pushing up the design to raise it from the back: combination tracer-model. ling tool, used for tracing and modelling the finer parts of a design (B) ; pliers punch for punching holes in the leather before thonging (A); boxwood mallet for Hattening out corners and pressing the eiges of finished work (K). A large-eyed blunt noedle is required for use with leather thongs (G). A rug needle will do.

A Dresden tool is often used for hackgrounds and completing delicate detail. One
end is shaped like an inverted $V$ and the other forms a semicircle. Both these work. ing ends are thin and smoothly finished. A purse crense is a useful tool for finishing the orges of leather work. It is heuted over a gus jet and held vertically. The gmove in the creaser lits over the edge of the leather. To round corners it is important to move the article round to mect the creaser. A well finished smoothly indented crease is thus ensily made. A brass holing gange (Fig. I, F) is a detachable device for

Leatuer Woik. Fig. 1. A simple outft. A, six-hole punch pliers. B, combined modelling and tracing tool. C, paring scissors. D, cutting knife. E. stitch tool. $F$, hollng rauge for pliers. G, needle for thongling. H. nwl. J, press button punch and die set. K, boxwood mallet
holes accurntely at equal distance both from the edge of the article and from hole to hole.

A brass die outfit (J) for fixing press studs and eyelets to bags nod other articlea can also be ohtained, and press buttons can be hought in various sizes and colours. Each press button consists of four parts: two upper pieces, cap and cap cuelet; and two under pieces, spring and spring eyelet. Directions for the use of these outlits are sold with them, but if the amateur wishes it is possible to get press studs put in work by a leather merchant or adler. Jatting punches for ornamiental work are used for simple forms of decoration instead of morlelling the leather and are sold with a number of fittings.

Many other helpful accessories are obtain able. Metal corners can lo hought ready for lixing in wallets. Vip fasteners, hag mirrors, frames and locks for bags and metal elges and tabs. Made-up bag linings are also supplied with patterns showing the exact sizes of the outside colers required to fit the inners Inners for wallets, blotters, pochettes and other neticles can be fitted to tho panels embossed or decorated by the home worker. Frames are obtainable for tire-screens in onk, mahogany or walnut. Rublier linings are made for leather tobncco pouches. Thongs are prepared for use in various widths and lengths of persian and calf.

Aniline spirit dyes are chiefly used for colouring leather work. A special jolish is wold to give a brilliant finish; manilla board is used for stiffening purposes and pattern making, and a cement or Hour and water paste for fixing linings, etc. Bronze powders and silver and gold leaf are suitahle for decorating lcathers, and may be supplemented with transparent lacquer colours. Jesigis and patterns are obtainable in great variety for decoration and articles in lenther.

Modelling or Embossing. Hnving cut out piece of leather to the requined size, damp it with a clean sponge and water, place it on a drawing bonrrl and fix the selected design over it lyy means of drawing pins, beyond the edges of the leather to obriate marking this. Having traced over the whole design with the tracing tool, remove the paper and trace the design again firmly with the tracing tool on the lenther itself.

To raise into relief portions of the work from the back, if the panel is a large one, the leather is held in position by the left arm, the first finger and thumb of the left hand limiting the particular portion of the design boing raised. while the right hand underneath the panel pushesup theleather, between the left finger and thumb, with a ball modelling tool, working it to and fro. Care must he taken not to stretch the leather too much. High relief does not look well in leather except in rare instances, when it is usually filled with a padding of cotton wool pasted to the liack of the leather and covered over with paper, pasted on before affixing the lining. Merlium and low relief should require no filling out if a good quality of calf or hide is used for this work. All the raising work required is done from the back hefore any modelling is begun on the front of the leather.

Having completed the raising, lay the panel Hat on a piece of plate glass; or, if a soft surface is requireil. pin several shects of

Leather Work. Fir. 2. Useful book or shopping bag in hide decorated with a modelled conventional design
hotting paper on to the drawing honrd Then holding the modelling tool at an angle of about $45^{\circ}$, press the wholo design down into position along the traced lines. Use the tool in one direction only and with sweeping strokes, to produce a distinct groove, without creasing we hackground. The heavier the leather the more frequent will be the damping required to keep it soft. Having thus completed the raising and depressing of the principal portions of the relief, work is now clone with a Dresden tool on the detail nnd hackground Using the same long. swepping strokea, the whole design is thrown up by this menns into varying shades of relief. |in really good leather craft. designs are not overworked, but accomplished with a minimum of witrokes nnd curves. Jatting punches are often used for lackgrounds to give them variety of texture The whole of the ground must be covered and the punch is held upright, the sane force being given to each blow of the boxwood mallet on to the punch. Where very low relief is ic. quired the background is merely pressed down without raising the design from the brack.

Staining. In all decorated leather work it is essential that the surface should he absolutely clean bofore using any stain. When the design is completed the whole piece of leather should be damped over with a clean sponge moistened in witer, and then oxalic acid solntion is applied with a pad of cotton rool. When this is dsy, colouring may lie proceerled with. An antique effect in obtained ly apply ing a coat of bichromate of potash to the leather after it has been cleaned. Choose spirit stains of the requirerl colours and mix them with methylated spirit to the tint suit. able for the particular work. In some cases the entire surface of the leather is stained one colour, in others several shades are used to bring out the designs. The leather must first be dainped before applying stains.

After the article has been colonred (exclud ing the design if that is to be multi-coloured) and the stain allowed to dry, begin to paint in the design with a camel-hair brush, working quickly to avoid hard lines, as these atains dry rapidly. Several contings of n stain may be required for dark colours. For large surfaces stains are applied with Hat wash brushes or with parls of cotton wool. Shading and tinting reguire practice. Several colours may he merged into one another by painting them on with small, rather dry brushes If the effect is cruile when linished, a softer one can be produced by a quick wash of very thin background colour over the whole design. Stain. ing may he used to colour designs without embossing, and embossing without staining. as forms of decoration in leathes work. The natural colour of calf is beantiful in some modelled work. Suall pieces of leather may be utilized to make artificini tlowers. Once modelling and colouring bave lseen graspell these call he effectively copied from real or imitation llowers. Skivers and suede are mostly used for this work, and Hower centres nud other accessories can be bought for it. (See Artiticial lilowers.)
Thonging. Lacing leather by ineans of narrow thougs threadal through a rug needle is a simple method for fastening, and is also used for ornamental edging as seen in Fig. 7. If thonging is to present a work manlike appearance it is essential that the spacing between tho holes is accurately gangerl.

Using a lacing of $\frac{1}{N}$ in wide, the holes should be $\frac{3}{18}$ in from each other and from the edge of the article By means of the holing gauge device already mentioned, marking and measuring are rendered superfluous

In use it has been found that shorter lengthe of thonging are the most practical. Dragging more than 30 in . of lacing through a large number of holes merely to avoid joining is not only waste of time and energy, hut also is apt to spoil the look of the work and to tivist the thong To start, fix the end of the thong between the lining and the leather with paste, and sew as if overstitching. To join thonging. pass the old and new piecc through the sane hole at the actual join, the old one from the back and the new one from the front, and paste about $\frac{7}{3}$ in of each under the lining. cutting of the superlluous tength of the old piece. Another method is to shave off each end and paste them together, hut this is not so durable.

Hide Book Bag. A most useful bag for books or for holding oddments when travelling is illustrated in Fig. 2. It can he made from two pieces of cowhide each 14 in by 11 in .; two pieces of brown persian or of skiver for lining of the same size; two pieces of persian calf 14 in by $1 \frac{1}{2} \mathrm{in}$; one piece of hide for the gusset 36 in . by 3 in . (the gusset is without joins); one piece of lining for saine; four pieces of hide for handles, $11 \mathrm{in}$.by 3 in ; brown stain, pastc and thongs.

A conventional design is traced on the upper portion of the bag. Any good oblong formation which comes to within about 2 in of either side and $1 \frac{1}{2}$ in. from the top will be suitable. The background of the design is pressed down, but the latter is not raised from the back for this piece of work: it is lightly modelled with a modelling tool from the front. Both sides of the bag are stnined dark brown.

When cutting the $36-\mathrm{in}$. strip of persian for lining the gusset, allow 1 in . for turning at either end to neaten and strengthen. Turn
down firmly and then paste the lining to the

Leather Work. Fig. 3. Fire screen of painted leathe:, mounted on a 3 -ply wooden backing and tramed in oak
gusset Paste the lining to the back and front pieces of the hag Lay two pieces of leather together for each handle, and thong them all round on loth sides. lix the handles on to the back and front pieces of the bag temporarily with paste, and paste over them the two strips of persian calf, $1_{2} \mathrm{in}$. wide, to neaten and strengthen the top of the bas. Thong along the top of the bag through lenther and lining and through the handle pieces and strips, to fix them firmly to the bag. Trim the sides of the bag pieces quite evenly and see that they are of exactly the same size.

Now thong the sides and the gusset strip together, working from the top corner all round the front pieces, and then do the back piece in the same way. Stain the thonged edges brown to match the rest of the bag.

Fire Screen. The panel for the fire screen illustrated in Fig. 3 relies on colouring and not on modelling for its decoration are obtainable which would be suitable for such a screen. Having traced the design in he manner already descrihed and gone over it lightly with the modelling tool, the spirit stains are applied, using dark brown for the gull's wings and tail, tipping them with black or with white to bring out the feather markings. The top of the hody and head are also white, the eye is black, and the beak and legs scarlet. The curves of the sea are in white and gradations of hlues and greens, while the lish are in browns and white. The sky is left the natural fawn colour of the leather.
The leather panel when painted is covered with a thin layer of paste und affixed to a 3-ply wooden backing. This is allowed to dry thoroughly before framing. It is kept in position by hammering gimp pins through the beading to the sides of the screen. The panel is pulished with a special leather polish to give it a glossy surface. Sicreen panels are also sometimes thonged to frames which are furnished with screw eyes.

Embossed and Coloured Blotter. To make the blotter illustrated in Fig. 4, cut out the panel in calf skin or hide, $22 \frac{1}{2}$ in. by 14 in ., this heing the size when opened out. Chnose a bold, conventional design, and after damping the whole surface that is to take the design; trace this ns directerl

Fig. 4. Front cover of a blotter in calf skin or hide, embossed in a bold The inner fltings are shown in the next page
in the gencral instructions for leather work: tracing. Now proceed to carry out the instructions given for modelling leather and for punching the background; then to stain the emhossing in different colours, proceed as directed for staining.

When the design has been completed and the skin is ready to he made up. cut out a piece of skiver $f$ in. smaller than the calf-skin and place this over the inner sidc. The skiver can be obtained to match the bacliground colour of the blotter. A better article results from using a plain persian lining. The finished cover can be sent to a leather merchant to have an inner fitted to it if desired.

Fold the calf-skin over the skiver and paste down securely. Cut out two triangular pieces, 2 in . by $2 \frac{1}{2} \mathrm{in}$, and paste these across each of the right-hand corners. Now cut out a piece of skiver 10 in . by 16 in . and fold over one edgc of the wider aide $\frac{1}{4} \mathrm{in}$., pasting securely. Cut out nnother piece 14 in . by 7 in . These pieces make the inside flaps. Turn the edge of the smaller piece to make a $t$ in. hem and partc down. Now place the smialler llap over the langer, bringing ilie hottom edges together, and machine them together through the centre, thus making two pockets. Machine the sides of the smaller pocket on to the larger. Place the bottom edges to the edgc of the blotter and the sides of the larger flap to the sides of the hlotter. The extra inch on each side of the larger flap must be folded in, gusset-wise, and flattened down.

Now open the blotter out flat and machine all the way round, joining the edges of the skiver to the outer akin and joining the two Ilap prockets on also. Care should be taken that all the parts are exactly in position before being machined, as the work will probably be apoiled if the machine stitching has to be undone. A in strip of calf, stained to match the lining, cut the length of the blotter must

Leather Work. Fig. 5. Interior of bloter of embossed leather, the front cover of which is shown to the previous pare
heen thonged, after the model. ling has been completed, with silver in the central motive and at the bottom, also on the outer edge. The back ground has been gilded with gold bronze powder Tu make the cover, the calf to be de corated is cut out in one piece to fit the book, allowing ? in over for the edges to project. For a telephone book cover the panel ol calf required would be $20!\frac{1}{2}$ in. hy 12 in , and the skiver for lining would be cut 21 in by $12 \frac{1}{2} \mathrm{in}$. to allow for turnings when paster
be sewn recurely at the top and bottom edges at the exact centre, inside the blotter This forms strap for the blotting paper to be slipped through This strap should be glued in position before the machining is begun, as it can then be machined in with the lining and pockets. These are shown in l'ig. 5 .
The blotting paper sheets should be cut $\{$ in. smalier than the blotter and slipped under the narrow strap the whole width of the blotter. Turn all the blotting paper sheets over on to the right side and slip the corners into the triangular pockets The whole blotter can be finished off by wax polishing. To do this, put a small quantity of pulish on a piece of flannel and rub it carefully into the whole surface using a circular motion. Continue this until an even polish has been applied. Leave for a short time and then rub over with a soft flannel
Decoratlon with Silver and Gold. When the methods of modelling and staining have been successfully practised there are several forms of decoration which give beautiful and antique finishes to leatherwork Lanellé is a form little known in England It derives its name from the silver thongs used in the decorating. These are often interlaced to form a kind of mesh Lanellé is used in conjunction with modelling. To carry out this work, thin strips of silver are cut $\frac{1}{8}$ in. wide. The leather is placed on a board and boles punched with a single thonging punch at the points where it is desired to thread the silver.

Thesilver is threaded from back to front, and is tapped with a tiny hammer so that it shall lie flat. It is threaded through the next hole from front to back, and so on, until the design is completed. The silver is out off and pressed flat When the silver thonging is finished it must be tapped at the onds and at the back with the hammer to ensure that it will lie flat. Most of this class of work is thonged inund the edges when tinished, but the example shown in lig. 6 is finished with a crease made by the purse creaser already described
The design for the loose cover for an A.B.C. or telephone hook illus. trated in Fig. 6 has

Fig. 6. Design for a telephone or zeference book cover in gilver thonged or lanelle work inside the cuver. For an A. B.C cover the calf would measure $12 \frac{1}{2}$ in ly $8 \frac{1}{2} \mathrm{in}$, and the akiver for lining 13 in by 9 in . When making up, eyelet holes are punched into the back of the cover top and bottom for a thong, or cord, to be passed through which holds the book in place

A fascinating form of lenther work is Vene tian lacquer on leather This may be worked with gold or silver leaf, but it is simpler to employ bronze powders. These are ohtninable in small tins the upper part of which holds the silver or gold powder, and the lower contains the special medium for using with it. The diary or address book cover in Fig 7 has a raised and modelled design which has been ornamented in this method Fint brushuork is also possible, and very beautiful effects are carried out on leather with a flat design painted in bronze powders and transparent lacquer colours
The modelling of a raised design is first completed with the exception of punchingif it is deaired to work up the background in this manner-which is done after the gold has been applicd. Mix a little gold powder to the consistency of cream with the medium in a small container or tinting saucer. Pass this mixture evenly over the surface of the leather, using a flat-topped Japanese stencil hrush. Work in circles to avoid streaks. Cover over all the leather, and if necessary give it a second coat after allowing 16 minutes for the first to dry. No sizing is required. Now leave the work for half an hour to dry, then coat over the parts to be left plain gold-in the case of the cover illustrated the back and the horderwith a thin coat of apirit varniah. Then on the central unvarnished portion of the fimnt wherc the design has been raised the colouring is applied with transparent lacquers. Yellow is a pplied first for the hackground, and then blue is put quickly over it to make it a green colour, while the raised design is worked up with yellow first and then red for shading, so that it has an orange effect
When the paint ing is completed the diary cover is ready for mounting, and the thonging must be painted with
gold powder. When the making up is linished the thongs are painted over again with gold. To make such a cover the worker will need 1 piece of calf $8 \frac{\mathrm{~d}}{} \mathrm{in}$. by th in., l piece of per sian for lining 9 in by 7 in., 2 pieces of calf. finished persian 3 in . by $6 \frac{1}{2}$ in The two last pieces are used to make the pockets into

Fig 7. Diary or address book cover in Venetian lacquer on leather which the diary covers are slipped to keep the book in place Stick the lining to the finished calf panel, turn ing in the edges of the former to match Turn in the edges of the neatly pared pieces of persian calf for the pockets and stick them lown with paste. Lay these pieces to the elges of the cover and thong all round.
LEATHER CLOTH. This cloth, as its name implies, is a substitute for leather, and is used mainly for upholstering. Manufactured by a patent process, it is obtainable in almost every colour with a variety of grains, morocco, antique leather, and pig and buffalo skins being among the leathers simulated. The cloth is dampproof and fadeless, and requires na sjecial cleaning. Dust or stains inay he removed with a damp cloth without destroying its lustro. Leather cloth may also be used for panelling walls See Panelling: Upholstery.
LEATHERJACKET. The larva of the daddy long legs or crane fly is popularly termed a leatherjacket. The grubs of this fly are about I in. long, two or three times as thick as the wireworm, brownish-grey or black, and exceedingly tough. They have hard black heads and jaws. They are very difficult to reach undergmund. Watering with a very strong solution of nitrate of sorls has bern found harmful to them Special preparsions are sold by seedsmen for the destruction of leatherjackets See Crane Fly Insecticide
Leaven. In its household application leaven is ured as a synonym for yeast (q.v.).
LECLANCHE CELL. This is a primary cell used for converting chemical into electrioal energy. It is largely employed in electric bell work. A single fluid cell, it consists of an outer glass vessel containing the electrolyte or chemical fluid, which is a saturated solution of sal-amınoniac.
Standing in the solution is a porous pot, made of a kind of earthenware, and filled with a mixture of hlack oxide of manganese, or manganese dioxide, in the form of a coarsc powder. In the centre of the pot and surrounded on all sides by the oxide of manganesc is a plate of carhon. The top of the pomus pot is closed with a layer of pitch, or similar material. The carbon plate comes up ahove this pitch, and has attached to it a brass terminal for connecting to the conductor, or wiring system

In the space hetween the outer vessel and the porous pot is placed a zino rod, usually circular in section, and terminating ut its unper end either with a terminal or with a short length of insulated copper wire soldered to it (see illus. page 70.) This class of cell has an electromotive force of it volts, and is suitable for supplying an intermittent current. It can be left on open circuit for a long time without
deteriorating, and has the property of recuperating when not used for a time.
The chemical action results in the zinc rod being consumed, and at the same time the anl. ammoniac is used up. For each oz. of zino consumed 2 oz of sal-ammonine will he used up, so that whenever the zinc rod has to he replaced the electrolyte should he renewed After about four zinc rods have heen eaten away it will he necessary to replace the porous pot and its contents
Leclanché cells should be recharged by thoroughly oleaning all the parts, putting in fresh zinc and refilling with fresh asl-ammoniac solution. The solution is made by putting into clean, preferably distilled, water as much sal-ammoniar as can he dissolved, but no more. The proportions are ahout 3 oz . of salaminoniac to 1 pint of water

Too much of the sal-aminoniac must not be used, or a deposit will form around the bottom of the cell and impede its action. Local chemical action may be set up, resulting in the rapid deterioration of the zinc. Since the deterioration takes place more at the top of the zinc than at the bottom, there is littla difficulty in finding out whether the cell is too heavily oharged with sal -ammoniac. Leclanché cells are used for batteries, several cells being connected in series to increase their voltage, or in parallel to increase their amperage In the former case, the wire from the zinc rod of onc cell is connected with the carbon on the next. In the latter, all the zincs are oon nected together and all the carbons together See Battery: Bell; Sal-ammoniac.

LEECH. Though now rarely employed, the leech was formerly much used for removing hlood to relieve local congestion, e.g. in certain eye disesses, etc As a rule. they drop off when surfeited: hut when they remain too long, the application of a little salt will make them quit their hold Bleeding from the bites is usually easily arrested by pressure Care should he taken not to apply a leech over a vein, too close to an eye, or not in any case to persons prone to bleeding.

LEEDS WARE. As the Leeds pottery was active for 120 years after its estublishinent about 1760, there is no scarcity of examples of this heantiful ware. The principal body was a

Leed, wate, urt will duracage amall figure dating from about 1780
fine creamware with $a$ rich arsenic glaze, in clined to $a$ grecnish tinge.

Manyof thebest pieces,except in the hlue. printed ware are unmark. ed. Among themarks used are Leeds Pot. tery, sometimes cross. wise; Hartley, Greens \& Co., for the best period; L.P.; and after 1863, R.B. \& S. The pieces to look for are those decorated with quiet enamel colours, together with the large class of per. forated or basket ware.

LEEK. This is a valuable hardy winter vegetable; the edible part is provided by the hlanched stems for ordinary purposes seeda are sown out of doors in March or April in shallow drills on a seed bed. If the seedlings are not overcrowded they may remain undisturhed until July, when they are planted finally. Deeply dug and manured soil is necessary Holes 8 in deep should be made with a dib ber one seedling being placed at the bottom of each hole, and the mots covered with $\pi$ sprinkling of soil. As the plants develop they will become blanched, and more aoil may be moulded up to produce a grenter length of blanched stem. The holes ought to be 8 to 8 in. apart and the rows 15 th 18 in . from each other

To obtain the finest leeky with a good length of blanched stem, the seedlings should be raised under glass in February and planted in early summer in trenches dug on rich ground. As the plants progress the trenches are filled in with soil to blanch the stems. Another method is to plant the seed. lings on the ground level and to blanch the stems by means of stiff paper bands. Two excellent varietics of leak are the Mussel. burgh and the Lyon.

How to Cook. The leok is used either as a vegetuble, as a garnish or as a Havouring for soups etc.

To stew lecks. trim and wash them, out them in half lengthwise, and then leape thein to sonk for about half-hour in a bowl of cold water to which a little vinegar has been added They should then be drained. cut up again if necessary and put into a pan containing enough wtock or salted water to cover them. Stew them slowly with the lid on the pan for ahout half-hour, or until they are tender. then season, and before serving add a sinall lump of butter White sauce is often served with leeks, or they are excellent if, when cooked, they are covered with a good cheese

Legs for Furniture: stock patterns which the home worker can procure. 1 , cabriole cabinet. 2, cabinet. 3, 4, dining table. 5, kitchen table. 8, table. T, tapered. 8, cabriole stool. 8, Jacobean table. 10, 11, swinger and leg tor gate-lér table. 12, dining table. 13. sidehoard
stock patterns in sets from timber merchants, and their use saves the home worker a lot of trouble. We illustrate a group of designs photographed from the stock of Messrs. Handicrafte, litd.. London, N.W.5. It will be noted that tapered, turned, twist, and cabriole legs are included, and in the case of those for gnte-leg tables the necessary swingers for the gates are available en suite. See Cabriole Leg: Chair: Furniture ; Stretcher: Table: Turning: Woodcarving.

LEGACY. A legacy is a gift of personal property by will. A gift of real property is called a deviso. Legacies are of three kinds: specific, demonstrative, and general.
A specifio legacy is a legacy of a specifio thing, e.g " my gold wateh" or "my $£ 200$ london County Council Stock." A demonstrative legacy is a legacy, not of a specifio thing, but where the testator points out or demonstrates the fund or property out of which the legacy is to be made, e.g. "I give to my son John $£ 1,000$ out of my Great Western Railway Stock."

A general legacy is the legacy of a sum of money in general terms without indicating any particular fund or source from which it is paid. l.g. "I give to my daughter Mary the sum uf $£ 500$." The advantage of a specific legacy is that if the testator's property is not sufficient both to pay his debts and to pay the legacies, the executor must resort to specifio legacies last or, as it is sometimes said, specific legacies do not abatc.

Demonstrative legacies share in the advan. tages of specific legacies in that they do not abate, but if the fund pointed out for payment of a demonstrative legacy is not in existence when the testator dies, the legacy is payable out of the general funds of the estate. A specific legacy, on the other hand, goes altogether if the thing bequeathed is not in existence when the testator dies.
Two Examples. For example, "I give to my son John my gold watch." If I sell my gold watch before I die, John gets nothing in lieu thereof. J3ut if I say "I give to my son John $£ 500$ out of my money standing to my credit in Barclays Bank," and when 1 dic I have no money in Barclays Bank, John gets his money out of the general fund if there is any ; in other words, it is just as if I said "I leave to my son John $£ 500$ " On the other hand, if I do lcave money in Barclays Bank when I die, iny executors must pay niy debts out of other funds before resorting to tho Barclays Bank money.

To give a complete example, a testator bequeathed $£ 1,000$ to John, $£ 1,000$ to Mary, $£ 1,000$ out of his money at Barclays Bank to Susan, and his gold watch to Isaac. The watch is worth $£ 100$. The debts and funeral cxpenses amount to $£ 2,500$ and the testator's total assets arc only $£ 4,000$, including the above legacies. The debts must be paid, so the exceutor, who has $£ 1,000$ besides the legacy money, requires another $£ 1,500$ to satisfy the debts and expenses, and this he will take out of the general legacics left to John and Mary, viz. : $£ 750$ from cach. He will not wuch cither the demonstrative legacy left to Susan, or the watch left to Isaac.

The Legacy Duty This is a tax paid in Great Britain and many other countries by persons who inherit money either under a will or on intestacy.

In Great Britain the duty varies according to the relationship of the legatee to the dc. ceased. Husband or wife and relatives in lirect line, i.e. parents, children, and grandchildren, pay I per cent. ; brothers, sisters, nephews, and nieces pay $\dot{5}$ per cent. ; while other relatives and strangers in blool pay 10 per cent. Relatires of the husband or wife of the deceased are regarded as strangers in blood. Legacy duty is not payable by a widow or child under 21 who inherits a sum
of $£ 2,000$ or less, or by a husband or any relative in the direct line who inherits $£ 1,000$ or less. Moreover if the whole estate does not excced $£ 15,000$ in value, legaoy duties are not oharged on money inherited by a husband or wife or by relatives in the direct line what. ever the amount they receive.

It is the executor's duty to pay the legacy duty out of each legacy before handing over anything to the legatecs. If the legacy is payable " free of legacy duty," the executor must pay the legacy duty out of the general funds of the estate, and not out of the legacy itself. See Estate Duty: Executor: Probate: Will.

LEGAL TENDER. This phrase is used in English law for the coinage which a oreditor is bound to accept when payment of a debt is offered to him. A creditor is not bound to accept a oheque unless that method of payment has been customary between the parties, or a large sum of money in shillings or other silver ooins: he can legally refuse to take it, and the debt will rensin unpaid until the debtor returns with the money in legal tender.

Legal tender consists of Bank of England notes and gold to any annount. Silver ooins are legal tender up to 40 s . and bronze coins up to 18., provided they are those issued by the royal mint. Bank of Eingland notes, it should be said, are not legal tender in payments made by the Bank itself. In Canada, Australia, and other parts of the British Empire the same principle prevails. Gold is legal tender to any amount and other coins up to a certain figure. In C'anada the gold coins of the U.S.A. are legal tender.

LEGGINGS. Leggings, usually of leather or canvas, are sometimes worn in bad weather and by those who work in the open air, by sportsmen, chauffeurs, and others. Leather leggings are usually either black or tan in colour, and are fastened either with buttons or with straps, the former being the more general. Canvas leggings are usually light in colour, drab being a common shade for them.

Leggings are sold in sizes, the lengths usually stocked for men being $11 \frac{1}{2}, 12,12 \frac{1}{2}$, and 13 in. Their calf measurements vary also. If leggings are ordered by post it is well to give the measurement round the centre of the calf, and to state whether this is bare or over tho breeches. Leggings and boots in one piece are known as Wellingtons. Leather leggings should be cared for in very much the same way as bonts. Canvas leggings can also be kept clean by brushing. See Buots; Gaiters.

LEGRORN: The Straw. Leghorn is a finc, soft straw used chiefly for children's summer hats in its natural colour. It wears almost indefinitely and requires very simple trimming. See Hat ; Straw.

LEGHORN: The Fowl. This breed undoubtedly stands first as an egg producer. It lays a large, white-shclled egg, is a nonsitter, and possesses no merit as a table bird. From an economic point of view it is cheaper to keep than most breeds, as it consumes a smaller quantity of hand. fed food in comparison with its output of eggs.

Apart wom this, it is one of the most attractive denizens of the poultry vard, its plumage, be it white, black, brown, or cuckoo, contrasting vivill!. with its yellow shank and bright red comb and Wattles. See Fowl: Poultry.

LEMON. The Plant. The lemon is a greenhouse evergreen shrub which will flower and mature its fruits in a glasshouse having a
minimum temperature of $50^{\circ}$. The plants should be placed in pots in a mixture of loam, enriched with manure, crushed bones, and charcoal. They should bo watered freely all the summer. The temperature during these months should range from $60^{\circ}$ to $65^{\circ}$, but may be dropped 10 points during the autumn and winter.
The Howers, which are white, appear in early summer, and are followed by the fruit. Lemons which are formed in one season, however, will not ripen until the following year Lemons belong to the Citrus family, which inoludes the orange, lime, and citron.

LEMON: In Cookery. A squeeze of lemon juice is an improvenient to fried fish, to a dish of mince, or meat rissoles. It is preferred to vinegar by many for salad dressings. The juice is used to whiten various dishes as well as for Havouring, e.g. for ices or when mixed with icing, for cakes. It is also useful for softening the fibres of tough substances. thus making them more easily digested. Lemon is often substituted for milk or cream in tea. It is cut into thin slices, one being put into each cup of weak tea, sugar to taste being added. This is known as Russian tea. The juice of a lemon in a tumbler filled up with soda water and swectened to taste is known as lemon squash.

Frum the rind, lemon essence, candied peel, and oil of lemons are prepared. The lastnamed is used both in cookery and scent making. The white pith below the rind is avoided in cooking, as it is very bitter. The rind should be pared very thinly or grated. In making custards and creams Havoured with lemon, the thinly pared rind should be added to the milk or creain preparation and brought to the boil. The rind is removed when the preparation is taken from the pan. In making lemon cakes or puddings the rind is usually grated. Slices of lemon cut across diagonally are used for garnishing cutlets, fried or boiled fish, veal, pancakes, and several madeup dishes.
To preserve lemuns, smear them all over with the white or yolk of an egg and place them on a shelf to dry, or keep them in a jar of water, renewing the water daily. Another method is to put them under clean dry salt in a box, which inust be kept in a cool, dry place. Lemon peel may be preserved if grated, put into bottles and covered with salt.
Many afternoon tea cakes, pueldings and sweets are flavoured with lemon. This Havouring is also a favourite one for an icing (q.v.) for cakes and sponge sandwiches with various fillings. The recipe for making lemon water ice will be found in page 615.

Lemon Bun. To make lemon buns, allow $\frac{1}{2} \mathrm{lb}$. flour to 3 oz . butter or margarine, 2 oz . castor sugar, 2 eggs, a teasporonful of grated lemon rind, and a teaspoonful of baking. powder. Add the baking-powder and lemon rind to the Hour, stirring them in lightly. Beat the butter and sugar to a smooth cream, gradually whisk into them 2 beaten eggs, and

Lemon Bung, an acoeptable addition to the afternoon tea-table

Lemon Squeezer which screws on the edge of the table. The bandle rotates the centre piece and the juice drains into $n$ basin
into $n$ greasel pio•dish and hake for ahout an hour. or put into a greased pudding hasin and steam for about two hours. Serve with a plain sweet nauce or $n$ sauce llavoured with lemon if the pudding is steamed. If baked, sprinkle it with castor sugar.

A different kind of lemon pudding is made in the following way. Line a pio-dish with puif paste. Mix if oz. bread or cake crumhs with 4 oz . castor sugar and a table. spoonful of grated lemon rind. Add 4 oz . butter or margarine and simmer all together for ahout 10 min . Put the mixture aside until it cools. Add the juice of 2 lemons and the heaten yolks of 2 eggs. Whisk the egg
then fold in the llour, etc. If the egga are amall and the mixture seems too stiff, ald a little milk to obtain the right consistency of a smooth batter. Grease some patty-tins and drop the mixture in, thout twothirds filling the tins. Bake them in a hot oven for about ton minutes. If liked, the huns can be covered with lemon icing when cold
Lemon Cake. Lemon cake is made in the following way. Take $\mathbf{6} \mathbf{~ o z}$. Hour, $\mathbf{4} \mathbf{~ o z}$. butter or margarine, 3 oz. castor sugar, I teaspononful baking-powder, and $!$ lemon. Beat the butter and sugar to $n$ creain. Grate the lemon rind on to the butter and sugar, and stir in. Beat up the eggs very lightly. Add $n$ little of the beaten egg to the hutter and sugar, then a little of the llour, and whisk lightly with n fork. Continue heating in the eggs and flour alternately, and at the last add the juice of the lemon and then the baking-powder, which must be lightly atirred in but not beaten. Pour the mixture at once into a greasel cake-tin and bake in a moderate oven for about one hour. Let the cake cool on a wire cake stand, and then ice it with lemon icing.

A lemon anndwich cake is made liy preparing 2 thin rounds or squares of sponge, ns described under jann sandwich (q.v.), and spreading them, while hot, with lemon cheese

Lemon Cheese. This is made by beating well together in front of the tire 3 oz . freah butter and ${ }_{4}^{3} \mathrm{lb}$. White sugar. When this is soft and melted, add the grated rind and strained juice of 2 lemons, and 4 or 5 new-laid eggs, well benten, and mix them thoroughly Stir the cheese over a slow fire until it is thick and crenmy, but do not let it boil, then put it into small jars and tie down when cold. Keep it in 2 conl, dry place until needed. It is used ns a preserve for sandwich filling or for ojen tarts and cheese cakes (q. q .)
Lemon Cordial. For this boil I lh. sugar and 1 pt . Wrter together for 15 min . and leave to cool. 'Then mix 1 oz. citid acid with $\frac{1}{2}$ dr. essence of lemon and add these to the syrup. which must be hottled for nae. To n tumbler of hot or cold water add 1 or 2 tablespoonfuls.

## Lemon Drops. See Acid Drops.

Lemon Pudding. An economical pudding that can be haked or steamed is made from $\frac{f}{6} \mathrm{lb}$. Hour, 6 oz . suet, 2 oz . breadcrumbs, 8 oz . castor sugar, 2 teasponfuls baking. powder, 2 lemons, water to mix. Chop the suet and mix it with the breaderumbs, tlour and baking-powder. Add the juice of the lemons to a cupful of water for mixing. Nix the sugar with the grated rind of the lemons and add these to the dry ingredients. Nix sill to a loose, moist consistency. Put
whites and add these at the last. Vour this mix.
ture into the prepared pie-diah and bake for about 40 min . It ahould be served with crean and sugar or, as an alternative, a sweet sauce.

Lemon Sjueazer in coloured pottery suitable for making lemonade at table. The top bas holes through whlch the juice runs into the cup

A verv dainty lemon puading is made by boiling the thinly pared rind of 2 lemons in $1 \frac{1}{2}$ pints milk until the peel is soft. Pound the peel with 4 o7. butter and pour the milk over $\frac{1}{4}$ lb. Savoy biscuits. Stir the butter into the mixture and add $f \mathrm{lb}$. castor sugar, the juice of 1 lemon and the yolks of 3 eaga well whiskerl. Pour the misture into a buttered pie-dish and bake for abrut 40 min . Whisk the whites of the eggs to a stiff froth and pile rough!y over the top of the pudding. sifting castor sligar over the fioth. Turn the oven to a slower heat and leave the pudding in for alout 10 min ., or until the froth is crisp and pale fawn in colour.

Lemon Sponge. This is made from I pint of water, 2 oz castor sugar, 1 oz . yelatine, 2 lemons and 3 egga. Pare the lemon rind very thinly, and mix it with the sugar and the strainel juice of the lemons. Dissolve the gelatine in the water over gentle heat. W'hen dissulved, strain the gelatine into another saucepan and add to it the sugar, grated lemon rind and lemon juice. Simmer or about 10 min., then place on one side to get quite cuol. Separate tho whiles of the ogys and whisk
them up very stiffly with $n$ pinch of salt. Alde these to the gelatine, etc., and whisk al together lightly. Pile in rough herps on a dish or set in a mould rinsed out in cold water Turn out when firm. The sponge should be kept in a cool place until required. If the sponge is serverl in a dish it should he garnished with erystallized cherrics or violets and pieces of angelica.

A lemon cream sponge is made thus. Add to a pint of cream the grated rind of a lemon and a little castor sugar and sot it on the stove to heat slowly, but nat to lnoil. Dissolve rathes more than $\frac{1}{2}$ oz of gelatine in a little milk, atir it into the Havoured cream and set it aside to cool. Then add the juice of $1 f$ or 2 lemons, and the benten white of an egg. and whisk the whole until it is stiff.
Lemon Squeezer. This is designed for the purpose of expressing the juice of lemons without the admixture of pips or pulp. The simplest squcezer is of glass, formed like a pyramid with a channel round the base and a spout on one side. The half of the lemon should be pressed, cut side down, on the point of the pyramid, and as the pressure takes place the juice flows down the sides into the channcl These are obtainable in aluminium and glass. An improved kind has n glass cup beneath the squeezer, the hase of which is perforated so that the expressed juice is collected in the cup. and several lemons can be squeezed in motation and the juice is strained at the same time A juice extractor which clamps on to the side of a table is the most convenient form of нqucezer und atrainer combined
LEMONADE. When making lemonade allow two gnod-sized lemons to a pint of water The juice should he squeezed into a jug with a lemon squcezer, and about \& lh. of loaf sugar added. Pour on a pint of boiling water and stir until the sugar is dissolved. A little thinly pared lemon rind may be added, to be removed before tho lemonade is served.

When the lemonade has cooled it should be strained and then more sugar can be added. if desired, and more water if it should be too strong. It should ho put aside to get quite cold hefore being served. A stronger solution can be made by using double the quantity of lemons and sugar. The lemonade can then he diluted with water as required. For an effer vescing drink 1 teasponitul of bicarhonate of sodn should be added to a tumblerful of the heverago and stirred quickly in. Sce Gilass.

LEMON GRASS. This is the common name of a hothouse grass, Andropogon schocmanthus. The leaves give off fragrance when pressed with the fingers. It thrives in a compost of loam, lpaf-mould and wand: and is jropagated by division of the tufts.

Lemon Squeezer which is useful yhen only a few drops of the juice are required. A perforated alumininm tube is first pushed throurb the lemon, and with is perforated tobe is again ingerted, the juree straining perforated tabe is akain inserted, the juce straining ps at a time Cuarleis e! Blaines liuulpment Co

LEMON-SCENTED VERBMNA. This favourite small shrub (Lippia citriodora) is valued for its fragrant leaves. It is not very hardy and needs the shelter of a greenhouse in most lucalities in winter. In mild districts it may be planted at the foot of a sunny wall where it will reach a height of 3 or 4 feet. It is propagated by cuttings in summer. Moderate pruning is necessary in spring.

LEMON SOLE. This is a kind of plaice sounewhat resembling a Dover sole and oocasionally called the sand sole. The flesh is not so plump, neither is it as firm as the true sole.
It is better not to attempt to broil or grill this fish, and it is not well adapted for being fried whole, but if skinned both sides and filleted it oan then be egged and crumbed and fried in boiling fat.
Fillets of lemon sole are also very good conked with a stuffing and baked in a deep fireproof dish in the oven. The dish should be greased with butter, and the fillets, after being filled with stuffing, should be laid in it, seasoned and covered over with a buttered paper. About 15 min . will oook them and they will look white and creamy. Serve with a well-favoured sauce poured over them.

Stuffing the Fish. The stuffing may consist of a plain veal forcemeat or it may be made with 0 mushrooms, chopped fine, 2 oz. butter or margarine beaten to a cream, 1 oz . fine breadcrumbs, a pinch of nutmeg, a teaspoonful of grated lemon rind, seasoning of pepper and salt, and 1 large egg to bind it. Heat this mixture until the egg is set, then cool it and lay a portion of it on one half of the fillet, fold the other half over and proceed in the same manner until all the fillets are stuffed.

Lemon sole tillets, stuffed or unstuffed, may also be baked with tomatoes, to which should be added 2 chopped shallots. They must be laid in a deep dish with 1 oz . butter, and with the tomatoes round them. Baste them while cooking with the liquor which runs from them, and keep them well covered with thick greased paper. When cooked, coat the fillets with fried crumbs and sprinkle over them grated cheese. Return to the oven for 2 or 3 min . to brown the cheese. Serve very hot. See Sole.

## LEMON THYME. This is an attractive

 variety of the common thyme (Thymus serphyllum) named citriodorus. It has fragrant leaves and purplish pink flowers in early summer, but grows only 5 or 6 in. high. Propagation is by cuttings in summer: if set in sandy soil and oovered with a handlight they will soon form roots. The golden-leaved (aureus) and silver-leaved (argenteus) varieties colour well if they are planted in full sunshine in poor sandy soil.

Lemon Thyme, a fragrant garden plant

## Lenses and How to Choose Them

## An Important Consideration in Amateur Photography

A reference to the article on Camera la suggested by this contribution, which is another step in making our work an Encyclopedia of Photography. The reader is referred also tó Developing; Enlarging: F/Number: Focus: Photography: Stop, and other articles dealing with the sublect

The amateur photographer thinks when he and accordingly needs knowledge for handing sees a photograph which is sharp in detail all it to the best advantage. With his fixed-focus over and bright in appearance that it must lens in a box-form camera all objects from have been taken with a rery good and, therefore, expensive lens. This is quite a mistaken idea, for cheap lenses, used within their limitations, can give a picture whioh is sharp in every detail. The outstanding difference between a cheap and an expensive lens is its speed, that is, the length of exposure it requires. This factur is expressed in a figure representing the a perture of the lens, or its $\mathrm{f} / \mathrm{number}$. Thus a lens working at $f / 8$ requires twice the length of exposure of a lens working at $\mathrm{f} / 5.6$ to give the same properly exposed negative.

Cheap cameras necessarily mean cheap lenses with comparatively small apertures $\$ / 8$ or $\{/ 11$. which can only be used for snapshots or so-called instantaneous photographs in the bright light of a summer day. All good types of cameras are supplied with various lenses,
 Lons. Fis. 1 (left). Diagram of admplo achromatio IV. Fig. 8 (right). Rapid rectillinear for gym
according to the desire of the purchaser, so that the price of a particular camera may vary with the lens with which it is fitted. The idea that special lenses are required for different kinds of photographic work may be dismissed entirely, with the partial exception of portraiture ; any good modern lens will meet all the requirements of the amateur photographer.
There are three main typos of lenses used in photographic work. The simple colourcorrected or achromatic meniscus lens, the rapid rectilinear lens, and the varieties of anastigmatic lenses. The simple achromatic meniscus lens type is seen in section in Fig. 1, in which two meniscus lenses, one of ground glass and one of flint glass, are cemented together. This type gives good definition if it is stopped down to about $1 / 16$ or $\$ / 11$. The whole of the lens cannot be used, because definition is lost tuwards the edges. The rapid rectilinear, sometimes called symmetrical, shown in diagram Fig. 2, is a great improvement and gives good delinition without disturtion at $f / 8$, though its definition at this aperture is not equal to that of an anastiginatic lens of equal aperture.

The chief points about an anastigmatic, one type of which is seen in diagram. matic form in Fig 3, are that with stopped down definition is perfect over the a case a wide-angle short-focus lens must be whole of the plate which they are designed to cover, and also that they are much faster than meniscus or K.R lenses.

Having obtained a good lens, the amateur nay be disappointed to find at first that he does not get as good results, from the point of view of definition, as he did with his cheap. probably fixed-focus lens. The reason is that the modern lens is an instrument of precision,
without being focus a narrow-angle long-focus lens. In such 2 or 3 ft . away up to the farthest possible distance, called infinity. were automatically in focus, and no question of focussing arose. With the anastigmatic lens, on the other hand. the greater the aperture and the focal length the shallower is the field of focus.

From one point of view this may be regarded as a disadvantage attaching to the speed of a lens, but in practice it will be found that at least with a moderately large aperture, say $\mathfrak{f} / 6$ or $\{/ 5.6$, more artistic and pleasing results will be obtained. So long as objects in the foreground of a picture are not blurred or fuzzy, those in the distance may be softened by being slightly out of focus.

It is largely a question of understanding the capacities and limitations of a particular lens in use and practice in its accurate focussing ; the wider the aperture and the shallower the field of focus the greater the necessity for care in focussing.

Two other questions which arise in the choice and use of a lens are its focal length and its angle of vision. In the average lens short focus means a wide angle giving a large field of vision on the plate, while a long focus means a narrow-angle lens giving a smaller field of vision on the plate with detail on a larger scale. A lens of short focal length and wide angle throws a larger amount of the object on to the plate than one of long focus; that is, it covers a wider field and reproduces it in smaller detail. On the other hand, a lens of long focus and narrow angle, covers a smaller part of the field, does not focus the object until it is farther away from the plate than the short focus lens, and accordingly gives the detail on the plate on a larger scale.

Not only has this the advantage of getting objects in comparatively large scale. although the camera is at some distance frum the object being photographed, but it has the very valuable property of giving much truer perspective than the wide-angle lens. The familiar case of the amateur portrait in which the hands are larger than the rest of the sitter's body is an exposition of the disadvantages of the wide-angle lens. Again, the wide angle lens sees more than the human eyes at one glance, and consequently the photograph given by it seems to lack actuality. Examples of this are seen on page 431, where the upper illustration is a wide. angle short-focus picturo and the lower a narrow. angle long-focus picture.
On the other hand, it will sometimes happen that a building or other object is to be photographed in a street or confined quarters street or conhned quarters
where it is impossible to get far enough away to used. In earlier days photographers carricd a complete selection of lenses of different anyles and types to meet such circumstances. With the modern lens, however, this is overcome, either by adding temporarily an extra lens to shorten the focus, or, more satisfac torily, by making the lens convertible.

This means that the lens is so designed that either of the two principal components seen
in Fig. 3 may bo used as a separate lens. Thus the complete lens may have a foca length of $5 \frac{1}{2}$ in for a quarter-plate camera If the back portion alone is used the focal length will be, say, 8 in ., while if the front portion alone is used the focal length may be 11 in. We have thus three lenses in one. each of which is a guod anastigmut. Of courso when a portion of the lens is used the effective aperture is considerably reduced, so that, if the complete lens works at $/ / 6$ the back and front components will probably be equal to $\mathrm{f} / 11$ and $\mathrm{f} / 16$ when used separately

To use a convertible lens in this way it is essential that the oninera should have at least double extension, that is to say, that the front must be capable of being racked out twice the distance required when the complete short-focus lens is used.

If a convertible lens cannot be acquired a sound rule in choosing a lens for general photographic work is to select one whose focal length equals the diagonal of the plate it is to be used with: for instanco, for a $\&$ plate camera the lens should be $5 \underline{d} \mathrm{in}$. focal length.

For the hest results in portrait work specially largo lenses are designed with considerable fucal length, so that the camera may be a good distance away from the sitter The aperture in some cases is ns large as f $1.5, \mathrm{f} / 2$ or $\mathrm{f} / 3$, with n focal length of 16 or 17 in . for a whole plate camers.

Camera lensos should be kept free from dirt and damp, and when not in use they should always he covered up. Under no circumstances should they be cleaned with anything but a camel-hair brush, special lens paper, or a piece of old, well-washed, soft linen. Lenses are easily scratched, and while a scratch will not be visible in a photograph, yet several scratches will reduce the amount of light which passes through the lens, and in bad cases will impair the definition. Of course no polishing substance of any kind whatever should be used. In the special kind of glass used in making modern anastigmatic lenses small bubbles will sometimes be observed these are unavoidable in the manufacture of the glasy and havo no effect on the brilliancy or definition of the lens.

The Lens Hood. In the modern folding hand camera it is rarely possible to provido any whade or hood of considerable size for the lens, owing to the lack of space. The result is that on bright days a certain amount of light from the sky enters the lens beyond that which comes from the ohject or scene being photographed. This light tends to be scattered over the negative and reduces the brilliancy of the picture, the negative being, in fact, more or less fogged.

Much more brilliant photographs will be obtained by the use of a sky shale or hood for the lens. The simplest form is a pieco of thin card about $2 \frac{1}{2}$ in. long by it in. wide, conted with a dead black varnish. It is held in place on the top of the Lens Hood, consist lens by means of an elastio ing of clipand hinged band. A black card is not sufficient, ns its slightly shiny surface reflects back the light

Another form consists of a stiff wire frame fixed to the lens mount at an angle and arranged to fold down when the camera is folded up. Over the frame is draped a small piece of black cloth. A third form consists of a clip which fits the lens llange with a metal shade hinged as shown in the diagram. It should be treated with dead blark.

When a shade is fitted it is essential to test it to see that no direct light is cut off from
the lens. Thiscan be efferted by focussing on a near object and examining thr image on the focussing screen See that there are no dark shadows at the bottom of the focussing screen. If no locussing screen is fitted to the camera, a test exposure should be made

LENTEN ROSE. There are some beautiful tlowers anong the varieties of Lenten rose (Helleborus orientalis), a hardy herbaceous perennial, 12 to 18 inches high whioh blooms in spring. The plants like partial shade and losmy soil with which decayed manure has been mixed A few of the finest varieties are Isolde, rose: Qucen of the North, blush-white; and Rohert Froebel, reddish crimson. It is unwise to disturb the plants unnecessarily, but propagation may be effected by lifting and dividing the clumps when the flowers are over.
LENTIL. The lentil is hardy annual bean, the seeds of which may be sown in sunny borders in April in rows nbout 1 ft. or 18 in npart. They should be put in about 2 in. deep and the same distance apart. The Howers appear in June and July. After flowering the tiny seed pods about 1 in. in length by 3 in. wide. are formed Each of these contains two seeds. The plants should be left in the ground until they are yellow. They should then be pulled up, thomughly dried in the sun, and the pods stripped ofl and stored in a dry place.

How to Cook. Largely used in vegetarian cookery because they posseas all the strengthening qualities of ment, lentils sometimes tako the place of a sccond vegetable, and are also made into soup or used us the foundation of side dishes. Lentils should not, however, be served as a vegetable in the case of a heavy meat dinner, but rather when the meat course is scanty.
The Egyptian red lentil is used most commonly; it requires soaking overnight, and must bo thoroughly washed and picked over in the morning, all pieces of black being removed. If to be rerved as a vegetable, boil it in plenty of salted water with an onion peeled and cut in strips. Add a little dripping or some other fat and boil for if hours. It is better to cook lentila n little too long than not enough. When done, drain the water away and add another 2 oz . of dripping. Season well and mix in the fat thoroughly by stirring over the fire. Serve with chopped parsley sprinkled over
Lentils may alao be served with bacon, and in this way inake a good supper dish. To prepare this, cook the lentils according to the directions given in the previous recipe, and, just before they are ready to be drained and dishod, fry 3 oz. atreaky bacon and out it into dice. Dish the lentils und bacon together, and serve with them $\frac{1}{2}$ pint of any good brown sauce and a few sippets of tonst or fried bread
Lentll Soup. One pint of red lentils, soaked overnight, nre required to make lentil soup. Prepare it by melting 2 oz. butter in a sauce pan, adding the lentils, a sliced onion, 2 sticks of celery cut into small lengths and a bunch of herbs, stirring the whole over the fire for 5 min . Pour in 2 quarts of stock and boil the soup until the lentila are soft; then take out the herbs and rub the soup through a fine sieve. Reboil it, scason it carefully, and then and

Leopard's Bane. Long-stemmed of doronicum

1 gill of cooked peas and 2 oz cooked ham cut into dice, if liked Serve the soup in a hot tureen, shaking in some powdered mint. This quantity is sufficient for about 8 persons. See Soup. Vegetarian Cookery

Lent Lily. This is the popular name of the wild dafiodil(q.v.)(narcissus psendo-narcissus)

LEOPARD MOTH. Also known as the wood leopard moth. this is a long-bodied insect bearing white wings with black spots Its larvie penetrate the interior of the branches and trunks of applo, pear and pluni trees, besides several other ornamental trees.

The presence of Inrvie in trees may bc detected by holes, but owing to the extensive turnings and galleries bored it is difficult to get at the pests. The only remedies are to push n hot wire in the hurrow with the hope of killing the caterpillar, or to squirt carbolio acid or paraffin emulsion into the holes Where the injury is confined to a single branch this should at once be removed, if the nbove remediey fail.

## LEOPARD'S BANE.

 This is the common name of doronicum, a liardy herbaceous plant 12 to 24 in. high. It beara large, yellow. dnisy-like flowers in spring and will Hourish on a shady border. It thrives in ordin ary soil and is easily increased by division in September. The finest of all is Doronicum plantagineum excelsum (Harpur Crewe), with long-stemmed blooms which are most useful for cuttingLEPTOSIPHON. This pretty, hardy annual, 3 to 8 in . bigh, is useful as a llower border edging or in the rock garden. A mixed packet of sceds will yield thowers in rose, yellow and ot her colours. Seods are sown out of doors in April where the plants will bloom in summer.

LESCHENAULTIA. This family of Australian evergreen greenhouse shrubs is in bloom from June till September. They thrive best in peat and sand in a sunny glasshousc, and like plenty of ventilation in tine weather.

LESPEDEZA. This is a Japanese shrub, 4-5 ft. high, which has attractive pinnate leaves and heara purplish pea-shaped flowers

Lespedeza. Leaves and clusters of pea-like purple flowers of this bardy shrub for a sunny border
in carly autumn. It is suitable only for planting in mild districts. The branches ehould be hard pruned in spring. Propagation is by sowing seeds or by division of the rootstock in spring.
LETTER: How to Write. There are a number of formal matters which those who wish to write a good letter should know. The writer should see, first of all, that his own correct address and also the correct date are stated at the top of the letter. If there has been a change in the address, whether temporary or permanent, and the existing paper is atill used, the new address should replace the old one ; if it is a temporary one it would be well to add the date at which it will cease
Methods of Address. The method of addres. sing the person written to varies according to the degree of intimacy. For persons of rank there are recognized forms of address, but relatives and intimate friends will discard these. For letters on business matters the usual olpening is Dear Sir if to an individual, or Gentlemen or Dear Sirs if to a firm. As regards others, there ean be no hard and fast rule, as so last rule, as so
much depends
won the personal yyon the personal however, not to take a familiar tone with persons who are only acquaintances or with those, not intimate friends, who are of high social position. The phrase, My dear, suggests an intimacy not present in the ceremoninl Dear.
The subscription to a letter also takes many forms. P'ersons use yours truly and yours faithfully indifferently; yours affectionately implies a close personal relationship. while yours respectfully and yours obediently suggest a request or a formal letter to a superior. Yours sincerely or yours very sincerely is the subscription most commonly used to acquaintances or friends.
If a letter is an answer to one received, the correct date of the latter should always be given when replying to it. If to-day or to-morrow is mentioned, the day of the week should be added; othcrwise a person may be in doubt whether it refers to the day on which the letter was written or the one on which it was received. If a day is mentioned it is well to add the date again in order to avoid a possible confusion. It is a good plan to read a letter over carefully after it has been written : this will prevent mistakes due to hasty writing. such as, for example, the omission of the important little word not.
Formal and Ceremonlal Letters. Convention or etiquette decrees that letters shall be written to friends, and in some cases to acquaintances. on certain special occasions. Letters of condolence are written to the relativesgenerally to the nearest-of a dead person. Letters of congratulation are written to persons who have received some honour or appointment; to persons whose engagement is announced. and on other occasions of rejoicing, such as the celebration of a silver wedding or a birthday It is also customary to write a letter of thanks to one's hostess after a stay in her house.
When writing to a stranger, perhaps one who has asked for the character of a maid, sonle persons write in the thind person. This kind of letter has the advantage that it need not contain expressions of friendship, which seem incongrunus in the case of a stranger, nor be signed. Care should be taken, however, that the third person is maintained throughout the letter. See Ink; Notepaper.

The Letter Case. This is a case for holding $\mathrm{E}, \mathrm{F}, \mathrm{K}, \mathrm{P}, \mathrm{U}, \mathrm{V}, \mathrm{X}, \mathrm{Y}$, and Z arc slightly
envelopes, writing paper, blotting papcr, pens, narrower : $\mathrm{B}, \mathrm{L}$, and S are much narrower. envelopes, writing paper, blotting papcr, pens. and all the necessaries for writing letters. The covers are usually of leather, or one of its imitations, and can be fastened by a Hap, made safe by a lock or snap, or both. See Ieather.
LETTERING. There are so many uses for lettering in the home that a knowledge of the various styles will be useful. Good letters must be readable, simple, and distinct. They must be proportionate and pleasing in form. and suited to the purpose for which they are employed.
The Roman alphabet is the basis of all lettering. The simplest form is the line letter illustrated at Fig. 1; the proportions are the same as in Roman, but it is drawn with fine strukes of the pen or pencil. A development of this style is the block letter shown at Fig. 2 : this may be done with a wide pen-nib or outlined and filled in with ink or colour. Decorative letters suitable for various purposes are

Fig. 2
$A D \longrightarrow$
Fig. 4

the (iothio and the Old English, shown at Figs. 3 and 4. For letters over $\frac{1}{2}$ in. high, a reed or canc pen is most suitable, but smaller work can be done with a quill or one of the steel pen-nibs sold for the purjose.

Preliminary practice will soon enable the writer to form the simple strokes. He slould commence with glazed paper, and with a pencil rule faint guiding lines. The paper should be supported on a board as about an angle of $45^{\circ}$, and the ink should be applied to the pen by a brush rather. than the pen dipped into it. The pen should be held lightly and horizontally to the paper, with the nib always in contact with the paper. Thick strokes aro vertical, thin strokes are horizontal.
The correct spacing of half-uncials, as the small letters are called, is important ; as a general rule two
curved letters should be close together and two straight strokes spaced well apart. The space between words should be exactly equal to the height of the letter.
In inassed writing the usual distance spart of the writing linos is three times the height of the letter o, and the up and down strokes of the small letters are, with the exception of $t$, twice the height of the
o. The uncials, or

Lettering. Fig. 5. 8 mall lettern, some capitals and pano-
tation marks of a simple but decorative form of lettering
Lettering. Fig. 5. Small letters, some capitals and pano-
taation marks of a simple but decorative form of lettering and $M$ and W wider. The same proportion applics to line letters, but block letters have. as a general rule. more or less the same width as they have height.

Dealing with the suitability of letters for various purposes, the line letter should be used for marking ink on household linen and clothes, but if the name is stitched the block letter is more effective. Small notices, menu cards. and programmes look well if uncials and halfuncials are used. The use of margins should be considered in spacing out lettering in this connexion.

Proparing Labels. Labels used for boxes, bottles, canisters, and other purposes should be in block lettering. A special pen is made to enable a thick line of ink to be drawn on labels and parcels, but a grod substitute will be found in a camel-hair brush with the pointed end cut off or one of the flat bristle brushes used in oil painting. Large notices may be done in the same way, but it is advisable to use thick ink or water-colour paint. Trunlis and other travelling cases should be painted in block lettering with Brunswick black or paint mixed with varnish. Roman letters are suitable, but look better when painted on attaché cases, and lend themselves to brushwork better than any other form.
Cutling Stenclls. For cutting stencils it is customary to use block letters with properly situated ties to hold the metal together. Incised letters in wood and stone are usually executed in Roman type; it is not a difficult matter to cut capitals in hardwood with a veining tool. The letters should be drawn in pencil or ink direct, or they may be traced on with carbon paper and then cut as far as possible against the grain. It is essential that the veiner employed in making the $V$ cut is kept perfectly sharp in order to leave clean edges ; the correct depth and width should be tooled in one cut, not worked out bit by bit. See Drawing ; Stencilling.
LETTER PLATE. A metal framework with a hinged flap is used for closing an aperbe coupled thats, or capital letters, shonld not metal fittings of the door. Usually the flap is o, the spacing may o, the spacing may be wider apart. To the flap working smoothly the bearings should mence with letters about if in. high and gradu- tension of the spring increased by unfastening ally reduce to about $\frac{10}{} \mathrm{in} .$, and always work one end, giving it another turn, and thell to ruled lines. Indian ink should be used in refixing it. See Door. preference to any other.

The Roman capital is distinguishable from the line and block letters by the endings of the strokes, known as serifs; the thin stroke should, ss a rule, be $t$ the wirlth of the thick stroke, and the latter about $\frac{1}{\text { \& }}$ of the height. It is equally as effective drawn in outline as filled in. The letters $A, C, D, G, H, N, O, Q$, $K$, and $T$ are about the same width as height.
orming words, and hung on two pivot bearings, and it is shut

LETTERS : Games With. Collections uf letters with which a variety of games are played can be bought or made at home. Bristol boarl, or any thin cardboard with a smooth surface, may be used. Squares are cut to any size required, the most usual being about $f$ in. square, but the actual size is immaterial if all the letters are uniform. They should be Roman capitals, done Bristol board, or any thin cardboard with a
livered, and is known as a letter plate. A usual variety is made of cast iron and painted with Rerlin black, or coloured. Better qualities aro made in polished and lacquered brass either plain or ornamental.

The letter plate should be chosen with regard to the appearance of the front door or to the entrance of the house, and the design should har. monize with the monize with the
Usually the flap) is hung on two pivot bearings, and To shut be oiled occasionally, and if necessary the
either in ordinary black ink or in Indian ink, and though the number required for each letter varies with the size of the set, the following mny be taken as a uscful proportion for a small set. There should be at least 25 of each rowel, and prefernbly 30 for $A$ and $E$; most of the consonants need 20 , but $Q$ and $Z$ can he cut down to 5 , and $X$ and $Y$ to 10 . $D N, P$, $R$ and $S$ may very well have 25 . A set made round about these figures should keep four plavers amused for $n$ considerable time

The games played with these letters arc very numerous. Word making and word taking may be mentioned first. Rules and directions are sold with every hox of letters purchased. Another game is for each plaver to draw a given number of letters, say 30. and with those to make as many words as possible in a fixed time. The letters must be well shaken up before drawing.
The players may be given letters forming one polysyllahio word, such as incomprehensible, and be told to form as many other words as possible using only those letters. It is usun to stipulate that no word must contain less than three letters. Another variant is to have the letters piled up in a henp in the middle of the table. while the players turn them over at their will, making as many words as possible in a given time. The rule mentioned ahuve holds good in this game also, and plural and singular are not allowed as separate words.

Another form of letter game is the adjective letter, in whioh a letter is written with all the adjectives omitted. Only the writer knows its contents, but the players arc then asked to suggest adjectives in turn, each of which is filled in by the writer in the order chosen As the adjectives arc chosen haphazard by a number of players, the result, when the letter is road aloud at the end, is always amusing by its incongruity. If possible the letter should be written mefore the guests arrive.
LETTUCE. This favourite anlad plant is grown chiefly for summer supplies in the average garden, but it can be ohtaincd in spring, summer and autumn by making successional sowings out of doors and under glass. Lettuce must be grown on rich soil and during dry weather needs watering very freely. There are two types, the tall upright cos, and the flattish cabbage lettuce, and numerous varieties of cach type. The cabbage lettuces are grown largely for late and early supplies and the cos lettuces for summer: the latter are more difficult to grow really well than the cabbage lettuces and should not be attempted on poor soil.
The first sowing out of doors should be made in March or early April as soon as weather and soil conditions allow of the seed being sown. The drills should be 12 in . apart. It is most necessary to thin out the seedlings hefore they become crowded; if necessary some of them may be trans. planted to form fresh rows which will be ready later.
Successional solf. ings are marle in Jlay and June to mect requirenients. As leituces are only pala. table when fresh it is

Letfuce. How to krow them successiully. 1. Correct soil preparation : a, fine soil: $b$, soil: $c$, manure ; $d$, vegetable refuse. 2. When thinning, $a$, snows correct distance apart : b. too crowded 3. Result of Rood toinning 4. Growing cos lettuces : $a$, neglected plant : $b$, plant with leaves tied round to blanch the beart. 5. Caich crops on celery ridges. 6. Forcing under
cloches on botbeds. 7. How to grow fer soring supplies: $u$, fine soll: $b$, soil preferable to sow a short row every fortnight and boil it for 5 min . cool it, part it in the
than to make several large sowings. Lettuce centre nad fill with a good forcencat. Tie it is often grown as a cstch crop between rows together again and braise it gently on a bed of of pens on in parts of the kitchen garden wherc room can be found among other crops.

Seeds sown out of doors in July will pro vide lettuces in autumn, and for winter and spring supplies seeds are sown in August and September, the plants being lifted and set in a hed of soil in a frame in the autumn Sonse of them may be planted on a wirm sheltered border in March if protection can be given in cold wenther. A further sowing in a heated glasshouse in early spring will provide scedlings for planting out in March.

A few of the best cabbage lettuces aro Herculcs, Wonclerful, Continuity, Commodore Nutt, Standwell and Ideal. Favourite cos lettuces are Superb White, Exhibition Cos and Jumbo. Varicties most suitable for sowing in August and Septemher are (of cos lettuce) Black Seeded Bath, Winter White, Hick's Hardy White, and Brown Cos. Of cabbago lettuces for autumn sowing Hammersmith and All the Year Round are fovourites.

Pests of the Plant. One of the ohief peats to guard against is the lettuce fly, n brownish. hlack insect with black wings, which lays its eggs in the blossoms and interytices of the lettuce in eurly summer. The effective remedy is to uproot infested plants and burn them. The lettucc root aphis cannot be dis. covered until the plant hegins to fade and droop. Usunlly a lot of coltony looking insects will he found to he olustered ahout the roots. The bidd plants should be at once destroyed, and the lettuco patch treated to u dressing of lime The other chief pest is caterpillars.
The cabbage lettuce is in season earlier than the cos, and is more delicate in texture and llavour. It is, therefore, more suitible for salads; for other purpuses of cookery the cos lettuce is the kind preferred.

Preparing for the Table. Lettuce is valued by cooks as a foundation for salads. It must he thoroughly cleansed before use, and all leaves carefully looked over, in case insects should be lurking in them. When preparing a salad lay the lettuce in water to freshen, then sprinkle it with salt and leave it for an hour or two ; wash it in two or three waters, shake well, and lay it on a hair sieve or a piece of clean cloth to drain.
Lettuce may be malle into a stew. Tie together a large cos lettuce after preparing it.

together again and braise it gently on a bed of vegetables with good stock for 20 min . Dish the lettuce. strain the gravy, reduce it by hoiling, skim and pour over the ettuce. The stuffing may be omitted, but the gravy must then be thickened and flnvoured with Worcester sauce and lemon juice See Salad

LEUCOJUM. This is the name of a group of spring and early summer Howering bulbs. The heat known are the spring snowthase (vernum), 6-7 in., which bears white. green-tipped Howers in April, and the summer snowflake (aes. tivumi). 18 in., Which has white Howers in May. The bulbs should be planted in autumin and left undisturbed; they

Leucojum. Drooping whit adreen fowers of the thrive in ordinary welldrained soil. An in croased stucle can be raised by means of offsets taken off the bulhs when the lenves have died down or in autumn.

LEUCORRHOEA. A discharge from the vagina commonly called whites is termed in medicine leucorrlicea. It occurs most frequently in women who have hurne children, but is also found in children and unmarried women.

Infection by microbes is the most common cause amongst ohildren, aggravated often by want of cleanliness Threadworms sometimes produce a discharge both in very young and older girls. The parts should be washed four or five times a day with warm water and an antiseptic lotion npplied, suoh as a weak solution of permanganate of potash.

Leucorrhoea may occur in voung women who work in close, hadly ventilated rooms or stand u great doal. It is very common in ansemin and chronic oonstipation. Married woinen often make the mistake of not consulting their doctor early enough. The cause may ho inflammation following childbirth. Ittention must bo directed to the general health, and the doctor may order an astringent or antiseptic douche. The patient should take no alcohol, and tea only in moderation. Sulticient rest is often of importance.

LEVER: In the Home. In the domestic sense n lever mny be considered as a rod or bar which can be inserted under or behind an object in such a manner that it is possible to prize it along, or to force it from its position. In most cases the word lever is employed in order to indicate some rodlike part of a machine which is provided in order to ohtain a mechanical advantage.

Supposing that the fulcrum, or that part about which the lever turns, is so placed that one part of the lever is four times as long as the other. Four times the pressure exerted at the long end is imparted by the short end, but the long end will travel four times the distance of the short end. When a bent lever has one arm which is jointed to another portion of the mechanism by means of a pin somewhere near a right-angle corner, it is known as a hell-crink nad will then transmit motion from one point t" another at right angles to it. See Handspitic

LEWISIA. This describes a group of rockery plants having fleshy lenves and summer flowers of various colours. They need rather special treatment and should be planted in full sunshine in well drained soil of peat. loam and sand. They must be protected from wet in winter by glass fixed a few inches

Lewlsia in bloom, with rosette-like cluster of leaves
ahove them on wires Howellii, rose pink, and Tweedyi, salmon rose, are two of the best varieties of the plant.

LEYCESTERIA. This is an attractivo hardy flowering shruh, also called the pheasant berry. It thrives in ordinary soil, grows 3-4 ft. high and in summer bears red bracts and cream coloured flowers, which are followed by black fruits. It is not recommended for planting in oold districts. Propagation of the leycesteria is by cuttings in autumn. Pruning takes the form of thinning out weak or crowded branches in spring

LHASA TERRIER. Some specimens of this small, rough-haired dog, found in Bhutan and other hill countrios adjacent to Tibet, have been imported into England. They have engaging manners which make them pleasing pets. The body is covered with a profusion of soft. shaggy hair, and the plumed tail is carried over the back, as with the Pekingese. The legs should be straight and short, and the colour white and black, silver, grey, or coffeecoloured. See Dog.

LIBEL. Libel is both a civil wrong, giving rise to an action for damages by the person libelled, and a criminal offence. Seditious libel and hlasphemous libel are criminal only. The one consists of publishing words onlculated to bring abuut discontent against the king's government or the king; and the other of writing againat religion in an irreverent and indecent manner.

LIBERTIA. In gardens only three species of the hardy evergreen perennial libertia are generally found. L. formosa, with its slender, grass-like leaves, height about 18 in., bears some resemblance to the iris. It retains ita frealiness throughout the winter if grown in a sheltered, sunny place, and in light, sandy loam, peat and loam, or other friable soil The white flowers appear in May. Grandiflora and ixioides are taller plants and fower rather later; both are white They reach a height of from 2 to 3 ft . The plants may be separated into pieces and replanted in spring, or seeds can be sown in the autumn in a frame.

LIBOCEDRUS. Name given to certain evergreen conifers. The most generally useful is Libocedrus decurrens, a magnificent tree of narrow, upright, columnar growth which will reach a height of 40 to 50 ft . in time. It likes deep, moist. loamy soil and minkes a splendid lawn tree.

LIBRARY: Bow to Furnish. There is no room more conventional in its furniahing than the library. Its model comes down from the 18th century as preserved in many country and town houses. Decorative schemes are aimple and dignified. The books in themselves form amplo variations in oolour. In a small
roons the shelves may reach to the ceiling, but of interior decoration which has been revived in a more apacious library panelled walls are in prasent day libraries.
in keeping with the period of the original model and look particularly well in natural coloured wood, wax polished The same wood is used for the bookoases and parquet for the floor.

It is important in a library to prevent the accumulation of dust : for this reason there should be either rugs on the floor or the carpet must not come to the edge of the room. The surround should allow a space of nt least $1!f t$. from the bookcases.
The conventional deak or bureau is a necessity, hut it is ureful to have in addition a substantial table placed in a good light on which work can be apread out This table is all the more useful if it is provided with drawers. Large makes of book tablea are also appropriate, since they are oomposed of several tiers divided into sections which hold journals, magazines and reference works, besides books in use taken from the wall shelves

Any bureau or writing table must be placed so that the light falls from the left-hand side. A good reading lamp is essential: several should be provided if the ronm is to be used by more than one person habitually Convenient wall lighting fixtures, and, for a large mom, a central ceiling fitting are alao advis. able. Velvet in a rich yet quiet shade is partioularly suitable for the ourtains and upholstery of a library, with a comfortable leather armohair or two. Heating arrangements must also bo well thought out in order to maintain a pleasantly equable temperature, which is important not only for the occupants of the room, but niso for the preservation of the books. A tapestry panel, one or two bronzes or good pieces of pottery, a handsome writing desk set, are suitable in a library, but anything superfluous or inerely pretty seems out of place.

Care of Books. Built-in bookshelves are usually open. Sectional bookcasos sometimes line one wall, for such volumes as are better kept behind glass. If the shelves reach to the ceiling library steps will be necessary. Dummy backs of books on simulated shelves are sometimes used to cover the doors of the cupboards or of the room so that the line of the bookshelves may bo unbroken. This is an old form

Books require careful handling, especially under modern conditions, when bindings are less mbust than formerly. A feather brush thoroughly used once a week will keep them ressonably clean, if pamphlets and other unbound books are placed in folders properly la belled, a supply of which can easily be made at home. Once a month a methodically arranged oleaning is necessary. A vacuum cleaner is best for the purpose, but if this is not available the hooks must be taken out and the books and shelves thoroughly dusted. At spring and autumn cleaning a real overhauling must be undertaken, when books which are no longer useful can be weeded out, and those which are in need of rebinding can receive attention. See Bookcase: Burean; Writing Table

LICE : How to Remove. There are three forms of lice, the head louse, the body louse, and the crab louse. They lay many egga per week, and these nits mature in about ten days. Applications which destroy the lice may have no effect on the eggs There is itching, anmetimes intense, of the paris affected, which may be the scat of eczema Treatmient of infestation with head lice is dealt with in the article Hair (q.v.).

Body lice live in the folds and oreases of the olothing A warm bath, followed by rubbing in sulphur ointment for several days. will cleanse the body of any egga that may adhere. The underclothing and bed linen should be boiled. The outhr clothes are to be imned on the inside with a hot iron.

Crab lice most commonly infest the hair in the pubic region, but sometimes they attack the armpits and cheat, and may reach cven to the beard and eycbrows. For this variety rub into the hair and the neighbouring parts equal parts of white precipitate ointment and vaseline. Or use the following application :
Betr-naphthol
1 dram
Cologne water
1
0
0
or
or
Nake into a lotion. Sop on to the affected parts twice daily. See Disinfection

LICENCE. In Great Britain the owners of carriages, motor cars, motor cycles, doga and guns, and the employers of menservants,

Library. Corner of room modelled on the conventional form of the $18 t \mathrm{t}$ century, wita recessed bookshelves and walls in panelled wood stripped and way polished. The girandole lighting fiztures, graceful
settee and oriental rug enhance the perloc decoration
llumphrey \& Vera doel
arc taxed on them, the tax taking the form of a yearly payment for a licence. Licences are usually taken out at a post office, and fines are inflicted if the articles in question are owned or used without a licence, which must be shown to the police if required.

In England, one of the wars of getting married is by licence.

A licence must also be obtained before a wircless receiving set can bc used. This costs 10s. a year. In addition to the receiving set, at the home of the licensee, it allows the use of a portable set. Sec Carriage; Chauffeur: Dog; Gun: Marriage: Motor Car; Wireless.

LICEEN : A Skin Disease. Lichen is the name applied to a group of skin discases characterized by the formation of papules There is itching, which may be severe. The cause is considered to he a generally run-down and exhausted state of the nervous system. If the general henith is helow par a course of Easton's syrup, or some other tonic, sometimes does good. Arsenic is often prescribed

For the itching a 1 in $\mathbf{4 0}$ solution of carbolio acid in water may be sopped on the spots. As a local application to the papules, the following prescription may lie made intoan ointment and applied locally twice a day

## Carbolic acld <br> lichloride of mercury <br> Zinc oxide ointment

LIFE INSURANCE. Persons can insure their lives for almost any sum of money from L:5 upivards. This is done through insurance companies or friendly socicties that transact business of this kind. The premiums, usually paid half-yearly. vary according to the age and condition of the person insured Full information on this point can be obtained from any insurance office.

In addition to the policies that provide for tho payment of a sum of money at death. all offices issue policies payable at a certain age, sny 60 or 65 . A certain measure of relief from income tax is allowed on money paid as premiums on life insurance policies. See Annuity; Friendly Society ; Income Tra: Insurance.

## Lift. See Service Lift.

LIGATURE. Ligaturea are cords of silk, catgut. or somo other material used for tying arteries cut accidentally or in the course of all operation, to stop, hleeding. See Bandage : Bleeding.

LIGHT : In Therapeutics. Light, which is $\Omega$ form of electrical energy, travela from its source in straight lines The lines of transmission only maintain their direction, horrever, so long as the waves are passing through the same medium, say air. When they strike another medium tho direction is changed, and the line is then said to be refracted If a beam of sunlight is made to pass through a glass prism, n har consisting of a succession of colours is produced, the order of the colours nlways bcing the same, namely, red, arange, rellow, green, blue, indigo, and violet
This bar is called the solar spectrum, end represents the disintegration of visible light into its constituent parts, or colours, this disintegration taking, place because these different rays of which white light is composed have different wave-lengtha the longer having greater difficulty in passing through the prism, and therefore being more refracted. The longest waves are at the red end of the spectrum, and they become progressively shorter townrds the violet end

Beyond each end of the spectrum ravs are jussing. although they are not visible, simply because the eye is adjusted for the range of the ordinary spectrum only. Beyond the red end they have a longer wave-length than red rays, and are the invisible heat rays
whilst beyond the violet end they have a shorter wave-length than those of the latter rays. They are called the ultra.violet or invisible actinic rays, and are the most powerful as regards chemical action
The ultra-violet rays have iniportant functions in the processes of life, and their effect on human health is far-renching. Those coming to us from the sun, however, are largely prevented from passing through the atmosphere by dust and moisture, and the supply is therefore very restricted in towns. Moreover, they are absorbed by ordinary window glass, so that they are not available in a room so protected. Arc lamps of various kinds are used to produce ultia-violet raya artificially, so that this method of therapy is readily available. The light from such lamps is sometimes described as artificial sunlight

Exposure to ultra-violet rays will kill micro-organisms, and this explains the longknown disinfecting properties of sunlight. It also largely explains the success of ultraviolet rays in the treatment of slin disorders. The rays are absorbed by the blnod, increasing its content of calcium, phosphorus and iron, and increasing its germicidal power.

Exposure to ultra-violet rays also increases the vitamin activity of foods. In consequence of this the rays nfford a powerful meana of preventing and curing rickets. They have, in addition, a general tonic effect on the whole body and a tranquillising effect in atates of irritability. Applications of the rays have cured sciatica and lumbago, headaches and neuralgia, and have been beneficial in a large nuinber of nther disorders.
Treatment by natural sunlight, or heliotherapy, is carried out at Alton and Hayling Island in connexion with the Treloar Homes, and elsewhere in Great Britnin, and at Leysin in Switzerland and other places aliroad. The value of light in the treatment of surgical tuherculosis was well established nt some of those places a long time before its other posaibilitios were grasped. As ult ra-violet rays form such a porrerfui weapon, however, their indiscriminate use, or, particularly when they are artificially produced, their overdosage, is capable of doing harm. Even moderate doses are eapable of causing quiescent tuherculosis of the ling to llare up into activity, and of doing other harm, so that this form of therapy is unsafc except under medical supervision.
LIGHT FILTER。 All ohjects whioh contain colour will be more accurately rendered in n photograph by the use of a light filter, which is known also as a colour filter, colour sereen or orthomatic screen. A light filter is a piece of gelatine. dyed yellow, placed in front of the lens of a camera to filter out inore or less of the blue light to which the ordinaryplate is unduly sensitive.

Thig undue sensitiveness is very niarlied in
outdnor photographs which include a portion of the sky. Although the sky miny he full of clouds nothing of them will he scen in the print inade from an ordinaly plate which is anything like sufticiently exposed. The hluc rays in the light coming from the sky have so much more effect on the plate than the mived rays coming from the objects in the Inndscapo that the aky portion of the plate is seriously over-exposed and without detnil. This is the causc of the harsh and unreal white skies scen in many photographs. A pale yellow filter overcones this defect by absorbing a part of the hlue from the white light passing through the lens.

A light filter has other adrantages Used in conjunction with orthochromntic or panchromatic plates, it permits the production of photngraphs in which colours are represented by differing tones in a scale of accuracy rising with the depth of colour of the filter used and the colour sensitiveness of the plate. For instance, an ordinary plate without a filter will represent a bright vellow as an almost black tone in print. The eye sees a ycllow tulip as a bright colour and therefore a light tone, hut the unaided plate is so much more sensitive to blue than yellow that the yellow of the tulip has little effect and is dark in the print. Again, the green varies in different trees, and when rendered into monochrome or one colour, in a photograph they should appear ns differing tones: this cannot be effected without $\Omega$ colour-sensitive plate, aided by a light filter.
An example of the difference in result ohtnined by the use of a mediun light filter is scen in the two illustrations. Fig, 1 was made on an ordinary plate without a filter; Fig. 2 was made on a panchromatio plate with a K if filter. It will be noticed how incorrectly the red and hlue look as represented in Fig. I; also the darkness of the yellows

Light Filter. Fig. 1. Photograph of a shelf of hooks made on an ordinary
plate, without a light Alter. Fig. 2. Same books taken with a alter on a panchromatic plate. The diference in res-لनts is obvious

LIGHTING: In the Home. Building by-laws lay down minimum requirements as to the area of the windows in every ronms which is generally taken as 10 per cent of the floor area in sq. ft .; hut this rule is only a guide, and the allowance should be exceeded when. ever possible.

The regulations tend to develop a tall window, which may be satisfactory on north, east, or west, but is not mo good ля a long, low window on a southern wall, as in the summer time, when the sun is high, the long window restricta the amount of sunshine that can enter the room, as the wall above the window casta a shadow into the room ; but in winter, when the sun is not so high in the sky, the rays of light pass more directly into the room The result is that full advantage is obtained of the winter sunshine, while the intense light of the midday sun in the summer is moderated without detriment to the occupants.

In planning a house, windows should be placed so that early morning sunshine can have access to all working rooms. When it is not possible to place the windows in this way it is often feasible to provide a reflector or to whiten an adjacent wall, and so gain the advantages of increased lighting. Another aspect of natural lighting is the effect of colour, eapecially that cast by the window hanginge. This is noticeable on the north side of the house even more than on the south, as the north light is always cold and cheerless. The use of brightly coloured curtains will correct this, as is easily proved by hanging flame-coloured curtains in place of white ones. Colours such as blue and grey on the south windows have a cooling effect, softening the glare of the sun.

Artiflcial Light. Artifícial illuminants are numerous, the simplest being the candle, which still hns its uses. Modern develop. ments of oil as an illuminant have produced highly efficient lampe with an incandescent mantle. Various types are used in the home, from the ornamental floor standari or table lamp to the small hand-lamp.

Coal gas has many advantages, not the least being that one installation is available for lighting and heating. The wide choice of artistic fittings, the use of inverted incandcscent burners, together with the by-pass system of control of the burners from a distance are factors which have greatly contributed to the value of gas as an illuminant. Gas lamps can be made movable by the aid of flexible metallic tubes, just as clectric lamps can by the aid of wires. The article on Gas should bo referred to for further information.

The great advantages of electricity as an illuminant are anfety and convenience; there arc no exposed flames, and the light is obtained or turned out with a simple switch. Moneover, electric lighting permits of decorative schemes which would not be practicable with an illumin ant having an exposed flame Useful information on this suoject is given in the srticle Electric Light Fittings (q.v.)

Other kinds of artificial lighting are provided by acetylene gas and nir gas, but as a rule these are only used where persons are unsble to get gas or electric light. Acetylene is sometimes used as an illuminant in farmhouses and detached country residences, as it can be produced by a small plant. It has, lowever, certain disadvantages. The producing apparatus must be housed in a building nutside the house that is to be lighted, and great eare must be taken that naked lights are not brought into this room Smoking, too, is dangerous there.

Air gas or peírol gas is another illuminant often seen in country dist ricts. It can easily be made by means of a small apparatus, and for it incandescent mantles are suitable. It is, however, dangerous if the proportion of petrol in it is hetween 2 and 5 per cent. On the other hand it is claimed that it vitiates the

Lightning Arrester. Device osed as a safety precantion, with booded insulator and enclosed rap
which breaks down at a comparativaly low voltage
atmosphere of a room lcas than any other artificial light except electricity

Theory of Illumination. Scientifio experiment has shown that the human eye cannot sustain a brilliancy greater than about $\delta$ candle. power per sq. in. of lighting surface, equal to the old-fashioned single-wick oil-lamp. The modern gas-burner and electric lamp have an intensity very many times greater, the high efficiency types of the latter reaching 3,000 candle-power and over per sq. in. For this reason the employment of proper shades and difiusing globes tuecomes a matter of the greateat importance.
Three ways of dealing with the problem are in general use. They are known as the direct, that is, when the lamps are protected by shades; the semi-indirect, where they are protected by translucent bowls through which the light is filtered and diffused; and the indirect. where the lights are concealed behind cornices, mouldings and ornamental screens.

With all theae systems the bulk of the light in the room is reflected from the walls and the ceiling. It is therefore very important that the light sources be placed in proper positions to give the most advantageous results. It may be assumed that indirect lighting takes twice the amount, and semi-indirect half as much again, as direct lighting, to produce equivalent lighting effect.

But the diffusion will not be similar, as the direct light is more concentrated, the indirect most diffused, and the semi-indircct the most pleasant for all-mund lighting, apart from the beauty of the fittings that are available on this system. Thercfore when a strong light is neederl in any particular part of a room the direct system is best, but for all genera' purposer the semi-indirect is preferable.

The colour of the wallpaper has an important bearing on the matter, as a dull or dark-colouren paper will take twice as much light for effi cient illumination as will he necessary when the walla are papered with a light reflecting colour See Acetylene; Air Gas; Electricity; Gas.

LIGHTNING: Injuries From. Injuriea due to lightning may be alight and temporary. or may consist of severe wounds and permanent damnge to the brain and other organs.
When insensihility results, it may last only for about 5 or 10 minutes, or may endure for an hour or two. In this condition the pupils of the cyes are dilated, the victim hreathea very slowly, and the pulse can scamely be felt. Except in immediately fatal cases the patient usually recovers in a short time.
A doctor should be sent for, and in the meantime rub the limbs and pile conats on the natient, if necessary, to keep him warm. If he is unconscious, put amelling-salts to the nose, and as soon as he can swallow a stimulant should be given, cither a little spirit, a teasponful of aal volatile in water, or hot coffice. When the patient gets to bed hot-water bottles should be put to the feet, and if there is collapse the foot of the bed should be raised. In case of almost imperceptible breathing artificial respiration (q.v.) should be practised

Lightning Arrester. This is a device used in conjunction with the aerial of a wireless apparatus. It is intended to protect the building from the effects of lightning, which might be attracted by the aerial and directed into the building.
The device generally comprises a small gap betwcen two conductors, which are joined to acrial and earth respectively. In the event of an atmospheric or lightning diacharge, the current goes to earth by way of the gap, in preference to the path of greater imperlance through the aerial circuit of the receiver.

Common types of arreater employed in liroadonst reception consist of a hooded insulator and an enclosed gap which breaks down at a comparatively low voltage. A bracket is provided by menns of which the device can be fixed to the window frame or wall outaide the housc. One terminal of the arrester is connected to the aerial lead-in, and the other terminal is joined to eartl. An arrester may be employed in conjunction with, or instead of, an earth switch.
Lightning Conductor. The functions of a lightning conductor are first to cause rapid leakage of electricity between a thundercloud

Lilsc. Fine head of blossom of the double white Madam Lemoine. See article page 723
and the carth, so that the charyo contained Central America. It in the cloud is reduced to such an extent is used in furniture as to be harmless; and secondly, if the making. In the 17th leakage action has only been partially success- century it was emful, to provide a safe path to earth for the ployed for marquetry lightning flash, so that it does little damage, if any, and that only to the lightning oonductor and not to the house it protects.

A charge of electricity leaks readily off a sharp point, and therefore the first requirement is met by providing three or four such points mund the top of the anain vertical lightning rad whose lower end is efficiently carthed The second requirement is met nine times out of ten by the same vertical rod, but practically certain protection is afforded if tho building is enclosed in an earthed metallic network This result is readily achieved by electrically connecting all such external metal work as rain-piper, gutters, metal roof-shecting or lining, metal casement frames, etc., to the main conductor. These onnnexions are known as subsidiary conductors.

The need for protecting a house is perhaps less if the adjacent housc is protected, but is certainly greater if the house is higher than its neighbours or stands a lone.

LIGBTS. The lungs of animals used for food are known as lights, and were formerly included in the fry, but are now only employed as food for cats and dogs. They should be well washerl, soaked, if nossible, boiled for ahout $\frac{3}{}$ hour, and then cut in pieces. See Cat.
LIGNUM VITAE. The hard, henvywond known as lignum vitas comea from $S$. and and was much used later for inlaid furniture by Sheraton and others. See Woorl.
Ligustrum. This is the botanical name for privet (q. v.).
LILAC. The hotanioal name of lilac is syringa, a word commonly and wrongly used to denote the mock arange or phil. adelphus. This hardy flowering shrub (Syringa vulgaris) is represented by numerous single and double varieties of various colours. It thrives in ordinary well-tilled soil, but is liable to

Lilies grown in the garden. 1. Good dormant bulb. 2. Same. starting rrowth 3. Planting lilies in gronps, bulbs resting on gand. 4. Another method ol be diapplointing if not dianting ; $a$, bulb festing on sand; $b$, covered with bine soil : $c$, manure pruned correctly. When the flowers are pulled up. It is bencficial to topdresa the soil over, old woak branches should be cut out to prevent overcrowding, and some disburlding or the removal of superfluous young shoots is necessary. Suckers, shoots which grow through the soil from the stock on which

Lily. Examples of liliea suitable for the rarden and the greenhouse. Pig. T. Tiker liy, orange-gcarle
Fig. 2. Japanese lily. Fig. 3. Speciosum rubram, white with crimson spola. Fig. 4. Madonna hily with manure in early sunimer. The best method of propagation is by lavering in summor. The common lilac attains i height of about 20ft. and has smooth, heart-shaped, oppositc leares.

Some of the best single varietics are Maric Legraye, white; Charles $X$ ruse purple: Souvenir de L. Spath, reddiah crimson Good double ones are M. Buchner, lilac; Charles Joly. reddish ; Mme. Lemoine, white. The Perainn lilac (persica) is an attractive shrub, $3-4 \mathrm{ft}$. high. bearing fragrant lilac-coloured blooms very freely.

For foreing, the lilacs should be potted up in autumn in the usual potting mixture and kept out of doors until they are neerled. They should then be taken indoors and kept in a temperature of from $50^{\circ}$ to $55^{\circ}$, and syringed daily. Increase the temperature when the buda burst. Prune back Howering shoots after hlooming, and place the plants out of doors They will be of no more use for forcing but may very well be used in the open. Fine grained in character, the wond of the common lilac is employed in inlaying and turning. Sec Flowers; Pruning; also illus. p. 722.

LIIY. The true lilies (lilium) are de lightful flowering bulbs, some of which must be regarded as indispensable in every garden. While a few need special conditions to ensure success, most of them are hardy and casily managed if given correct cultivation. The most popular of all is the Madonna lily (Lilium candidum), which bears white. fragrant flowers on stems 3-4 ft . high in June. The bulbs should be planted in August-September, 3 in. deep, in ordinary well-cultivated soil As this lily is liable to the attacks of a troubleanme disease the bulbs should be shaken in $n$ bag of sulphur before being planted, and it is wise to mix sulphur frecly with the soil.

Other showy hardy lilies to plant in late summer or early nutumn are croceum (orange lily), 3 ft., orange red, July; clegans, 12 to 30 in., yellow, red, June and July; Hansoni, 3 ft., yellow, June; Henryi, $5-\mathbf{d}$ ft., apricot, August-September; Martagon, 2-3 ft., reddish purple, June July ; pardalinum (Panther lily), $5-7$ ft., yellow and red, July ; pyrenaicum, 2-3 ft., greenish-yellow, May-June ; tcstaceum, 4-5 ft., light yellow, June-July; tigrinum (tiger lily), orange red, $3-5$ ft., AugustSeptember; umbellatum, 2-3 ft., orange red, July.

Bulbs of Lilium nuratum, white flushed with yellow, and speciosum, rose and white, arrive in Grant Britain in the Nelr Year, and are planted in February and March. There are

several fine varieties of these lilies; nuratum rubro-vittatum and speciosum melpomene are richly coloured.

All the lilies mentioned above (with the exception of auratum whioh often detcriorates

Lily of the Valley. Beautiful clump of this fragrant flower, grown in a pot
after the first year) will flourish out of doors if planted in deeply dug soil with which leafmould and sand have been mixed freely. In heavy land the bulbs should be set on sand. It is neccssary to set the bulbs at the correct depth, and this varies according to whether the lily beiongs to the stem-ronting class or not The following produce roots at the base of the stem as well as below the bulbs, and should be covered with 4-5 in of soil: nuratum, croceum, elegans, Hansoni, Henryi, regale, speciosum, tigrinum. The others named need a covering of only about 3 in . of soil.
Of numerous other lilies which are available for cultivation in gardens the most remarkable is Lilium giganteum, which, when establisherl. thows up a giant, leafy stem 8 to 10 ft . high and bears large. fragrant white Howers It likes purtial slade and moist, leafy soil.
remaining space is filled with fibre, which will be replaced with soil when the bulbs legin to grow. They should be placed in a frame from which frost is excluded. In summer the lilies may be grown out of doors or in the greenhouse. Lilies can be raised from sceds, but the seedlings of most of them grow slowly Lilium regale will blonn in two vears from seed sowing. Sce African Lily: Arum Lily Belladonna Lily : Guernsey Lily, etc.

LILY OF THE VALLEY. This favourite spring-Howering hardy plant flourishes in whady places in soil with which leaf-mould and decaved manure have been mixed frecly It is not a true lily, its botanical name is Convallarin majalis. The roots of lily of the vallev, which are known technically as crowns, should be planted in October, 3 or 4 in epart, the tops just below the surface of the ground. Anamnual top-dressing of leaf-inould in October should be given. In the course of years the plants will become overcrowded and fail to bloom freely; they should then be lifted and replented finest varicty is Fontin's, which has unusuallylarge hlooms, in one named rosea the flowers are tinged with pink.

There are many methods of forcing to provide early blooms under glass. One of the simplest is to put a bundle of crowns into damp moss and put them on hot-water pipes. Another is to place as many crowns as will go comfortably into a 6 in. pot in a compost of sandy loam and leaf-mould, and introduce into bottom heat. Good crowns will produce Howers in two to three weeks if plenty of tepid water is used.

Crowns alone need not he used in the culture of lily of the

The bulbs dic after Howering, but arc perpetuated by offsets.

The favourite lilies for cultivation in pots are auratum and speciosum and their varieties, tig. rinum and longiforum (white trum pet lily). The bulbs should be obtained in autumin, winter and early spring as they are available, and set singly in well drained pots 6 to 8 in. wide, using a compost of two thirds loam, one third peat or leaf mould (or both), with a free addition of sand. The bulbs must be set low down in the pots to leave room for top dressing with fresh soil later on: they nre partly covered with soil and the
valley under glass. Imported clumps may be potted in autumn, kejut in a frame for a few weeks and then put in the greenhouse. They will bloom in spring. Large Howered varieties are now available. Excellent lilies ó the valley for all purposes are available at any time of the year, by obtaining what are known as retarded crowns, and forcing them on. See Flowers.
LILY POOL : How to Make. Even in small gardens which possess no such facilities as running water, the cultivation of the water lily is not difficult, if a satisfactory pool can be provided Tubs, barrels, tanks, or old cisterns will serve the purpose if placed in an open, aunny aspect, with periodioal changing of water All that is required is a drain-off jlug and bottom foundation of brickbats, as illustrated in p. 725. A more permanent structure may be made in the form of a round, oval, or square pool with a good foundation of cement. April and early May are the hest months for constructing a pool, as the hardiest water lilies are then ripe for planting.

The two sectional diagrams 4 and 5 give the details for a pool of moderate size. Nate rials and implements required consist of cement and shingle, straight-edge, spirit level, spade, and a bricklayer's trowel. The bases of constructional work are excapation and lining of concrete, faced with cement mortar, trowel-finished and smoothed ; and a draining pipe with wooden plug as shown.
Draining the Pool. The conorete basin or poul should have a thickness of about 8 in its water depth may be something under 3 ft. On sloping ground it is quite practicable to associate two or more pools with pipes connected to the basin possessing an outlet pipe of sufficient size to permit quick drainage. This is important, as the plants will suffer if time is lost between emptying and refilling. A more ambitious design is shown in lig. if, which contains a centre pool with Hag-stone margin, rose beds, and grass Such pouls generally draw their water from a standpipe or tiap, and thercfore $\Omega$ convenient and suitahle spot must be selected for their construction.
After construction of the pool, when its components a ppear to be well set, fill it with water $t_{1}$ be the desired level, take careful register of depth, ind leave it for a week or 10 days If no rain has fallen, incasure the depth again, and if there should he any appreciable dmp from the original depth, drain of

the pool and give the whole another facing of cement mortar The cause of the leakage may be a crack or fissure, and in that case the necessary filling may be done and the pool tested as before It is essential that any leakage should be stopped immediately.
The Contents. It must be remembered that the plants are gross feeders, and an excellent compost for their needs is made of two parts mud from the bottom of a ditch or pond, two parta loam, one part coarse sand, and one part of rich manure free from straw. A layer of crocks should be placed on the cement floor, then a good layer of the above mixture, followed by mounds of the same compost for each plant with its apex 1 to 2 ft . below water level
The roots must not be planted too deeply, but simply covered sufficiently to allow the crown of the plant to peep through the soil. If preferred, the lilies may be planted in wicker baskets holding a few bushels of compost, and sinking each in any desired position. Suoh baskets sometimes rot away, but generally the plant roots form a network which holds the soil together. Planting operations are shown in the diagrams.

Amongst suitable varieties are the stronggrowing common white water lily, the yellow Ainerican species flava, the carmine-flowered sphaerocarpa, and the Asiatic dwarf species, pygmaca. See Water Lily.

Lima Bean. This is an alternative name for the butter bean (q.v.).

LIMB. The upper extremities or limbs are attached to the trunk by the shoulder blades and the collar bones, and the lower ones by the innominate bones. The shoulder blades are bound to the chest wall by muscles simply, and this allows of very froc movement, while the innominate bones take part in the formation of the pelvis, move little, if at all, and thus promote stability in standing and walking. Sec Bandage: Fracture.
LIME: The Tree. The lime tree or linden (Tilia vulgaris) is much favoured for town planting, and is met with in numerous suburban gardens. It bears yellow flowers in Jaly, with a rioh and rather cloying odour. The leafy, half-winged bracts which fall so abundantly with the accompaniment of moisture after the flowering are also a feature. The tree loses its freshness rather carly in autumn. Tilia petiolaris and dasyatyla are to be preferred to the common lime because the leaves do not fall so early.
The lime thrives best in substantial loan or friable olay, but it may be planted in most
thirds filling it with lump lime, covering it with water, and allowing it to remain for several weeks until it is a thick creamy mass It is then known as lime putty, and is userl in conjunotion with sand or other ingredients
Lime is purchased from builders' merchants and when ordering it is well to atate the purpose for which it is required For instance lime for mortar will be blue lias and lime for plaster-work pure or fat lime, these expressions referring to the setting properties. Rich limes are those whioh only contain about 6 per cent of insoluble impurities. and are used for plastering because of their readiness to slack, and their consequent non-liability to, blister as compared with hydraulic limes
The rapidity of setting of lime depends on the quantity of other substances it contains which render it independent of external agents for its setting properties The limes containing about 15 per cent of such aubstances are termed feebly hydraulio. Those containing about 25 per cent are moderately hydraulic, and those containing from 25 to 35 per cent are eminently hydraulic. The last

soils and in most situations thist are not dis. tinotly bleak or dry. Propagation is by layers in autumn. See Limo Juice.
LINE : For Building. Line is a natural cement, and there are various qualities and grades, of which those used for building are the blue lias, and the groy or chalk. Lime requires dry storage. Quiok lime, before it can be used, is slaked with water.
Lime is best slaked by spreading it out upon a board, covering it with a small proportion of sand, and sprinkling the whole with water from time to time, turning the lime over until it is thoroughly slaked. It should be allowed to stand for at least a month before use. For plaster work lime should be slaked by providing a tub, or by digging a hole in the earth and lining it with boards, two-

Lime: for bailding. protect it from rain. The lump lime is Jaid upon boards set upon bricks, and a little trench is dur round it Ga den. Lime is plication to new gardens and to old gardens which have been heavily manured for a long time Heavy soils are rendered more workable by its aid, and it also sets free various plant foods. In addition, it acts as a soil insecticide. To light soils lime is best applied in the form of chalk. A stone
(14 lb) of lime per pole is a good avcrage quantity to use.
Chalk may be applied to the extent of double this amount. The dressing may be repeated every three or four years Gas lime, ie. burnt lime, is an excellent thing to apply in autumn to vacant land which is ןest ridden.
Lime Sulphur. This is a useful spraying mixture for apples and pears in spring and varly summer The Ministry of Agriculture (Ieaflet 131) describes its preparation and usc.
It nay be purchased ready made in large or amall drumis. so that it is only necessary to dilute it to the proper strength For spraying against apple and picar acab summer strength lime sulphur, namely 1 gallon of concentrated solution mixed with 29 gallons of water, should be used. The lime sulphur should be poured slowly into the water, stirred well, and used at once. Spraying machines with copper parts should not be used for line-sulphur spraying. It should be noted that 'rox's orange pippin and James Grieve are particularly sensitive, and for these varieties, and also for Wellington and Newton Wonder, half summer atrength is necessary, namely 1 gallon to 59 gallons of water. See Apple; Bordeaux Mixture; Garden : Manure: Prar; Spraying.
LIME : In Medicine. Salts of lime form a most important constituent of our food. I'hey are required to provide thic earthy matter, or calcium phosphate, which imparts hardness to the bones. Calcium salts are necessary for the coagulation of blood, and in other ways they perform an important part in the body chemistry. Some foods are poor in lime; for instance, fish, neat, fruits, and potatoes Others contain it in abundance, among then being milk, eggs, oatmeal, wholemeal bread, and some varieties of green vegetables
The calcium compounds arc of great use in medicine. Calcium chloride, 5 to 15 grains, and calcium lactate, 10 to 30 grains, are remedies against bleeding. These are also good remedies to take for chilblains, and in some cases of urticaria, or nettlerash. Calcium hypophosphite, 3 to 10 grains, calcium phosphate, 5 to 15 grains, and syrup of lactophosphate of lime, $\frac{1}{2}$ to 1 drani, are good seneraland nervetonics. The carbonate of calcium or chall: has the same action and uses.

Lime Water. Lime water acts as an antacid and a mild astringent, and is often aken in milk for dyspepsia and diarrhoea. The lime water is added in the proportion of 1 to 3 of milk. It is often added to a baby's milk mixture to make it more digestible. It enters into skin lotions for weeping eczemas, burns. and other conditions For a burn in which the skin is not broken it may be mixed with an equal guantity of olive oil or of linseed oil (Carron oil)

Poisoning by Lime. Chalk is a good nntilote in poisoning by acids. In any cnse of line poisoning give draughts of weat vinegar and water, or lemon juice and water. Follow these with warm milk, cream, olive or cod liver oil, or barley water. Apply hot poultices or fomentations to the abdomen for the pain. The plysician should be called in at once.

LIME JUICE. The fruit of the lime tree eommon in tropical countries closely resembles the lemon, but is smaller and more sour. The jaice has medicinal qualities of an antiscorbutic character. It has a cooling effect, and when added to water or soda water makes a rf freshing drink. Several preparations of lime juice aire on the narkiet. See Lemon.

LIME PUTTY. Also known as plasterer's putty, this is made by slaking clalk lime, allowing it to stand in a tub with water for some weeks. It ultimately hecomes of a thick, creamy consistency, and is then used for making plaster. See Conrse Stuff, Fine Stufl Gauged Stuff ; Lime. Plastering

LIME WASH. Lime washing, or lime whiting, is the process of treating exterior or interior surfaces with a mixture of pure lime and water, which is applied hot with a stiff brush of
substantial proportions. In substantial proportions. In preparing the the go gauge, be

Limit Gaur
of a disk of steel
is made up with powdered chalk. See Distemper: Whitening.
LIMIT GAUGE. This is a measuring device used as a standard of comparison. The term linit means that the permissiblecrror is limited, or in other words that a piece of work to be measured with it must be within a certain prodetermined degree of accuracy. The one shown in the illus. tration is seen gauging the diameter of a disk of steel. The gauge has two sets of jaws, one a little larger than the other, and known as lime wash, a sufficient quantity of quick- the jaws. and the other as the not-go gauge, lime should be put into a tub or old box that because the article must not go into it. Thus is reasonably water-tight, and the lime covered the actual size of the article must lay between with boiling water. After it has dissolved, the two, and its absolute dimensions are sufficient hot water is added to make an easily workable mixture, a quantity of which may be put into a bucliet and stirred as reguired.

Before applying the lime wash, the surface to be coated should be washed down with soda water, and in the case of outbuildings, such as poultry houses and the like, a little soft soap can be added to the washing water. The walls should be sprayed with a strong solution of disinfectant, such as carbolic acid, diluted with water in the proportion of 35 parts of water to I part of carbolic acid, and sprayed on by means of a garden syringe fitted with a line rose head.

As soon as the carbolic is dry, the whole surface is coated with lime wash. and, to assist it to harden and adhere to the woodwork, a little common salt and sulphate of zinc may be mixed with the slaked lime. The proportions are 2 lb . of salt, and a bout twice the quantity (i.e. 4 lb .) of zinc sulphate to a bushel of lime. The best brush to use is a well-worn whitewash brush. and the wash should be applie.| vigorously, so that it is driven well into the surface. If necessary, two or moie coats may be given, according to the nature of the work to be done
-1 fter walls or ceilings have been repentedly coated with lime wash, the surface will show a tendency to Hake and chip off, and in such cases the old lime wash should be thoroughly well washed and scraped off. Lime wash should not be confused with whiting, which

LIMOGES: The Ware. The hard-paste porcelain which was produced at this ancient town in central France for about 70 years after 1780 was decorated on a highly glazed translucent body. An early mark is C.D. If com. bined with the Sevres mark it means that the hody was made at Liniogea, which had the ndvantage of its own china-clay beds, and was decorated at Sevres, whose own ware whs soft-paste. Biscuit figures and medallions were marked Limnges. The very large range of pigments introduced by Limoges chemists has been ndopted by other French potteries, and gives to these products their characteristic variety of colour.

Still another special development was the artistic treatment of the chromo transfer and the gold transfer, thereby inparting to decorated Limoges the effect of hand-painted wares. In the middle of the 19 th century American enter prise took the local inclustry in hand, and there is now a large output, by a score of factories, of modern limoges wiur. Among these the name of Pillivuyt survives from the early period.

That which bears the mark Haviland \& Cie is a strong ware, decorated in styles sometimes suggestive of Moorish art. There are also inexpensive dinner services and other useful pieces with floral and scenic designs.

## Linen for Household Purposes

## How to Stock and Arrange the Linen Cupboard

Other information of interest in connexion with this important fcature of home equipment will be found under Embroidery : Furnlture : Lace: Laundry : Mending: Starch: Table Laying. See also the cntries Rédspread: Rlanket: Cupboard: Tablecloth: Towel

Ohtained from the flax plant, linen is one of the most beautiful and useful of woven fabrics. Although the improvements in the manufacture of cotton goods have led to their employment for many household and dreas purposes in place of linens, the latter remain firmly in the housewife's favour on account of their superior qualities of texture and durability.
Time has little or no effect on linen, as ancient embroideries on this material prove, and it is not subject to ravages by moths. New methods of dyeing and the old ones of grass bleaching render coloured linens unfadeable and white ones fresh after their final laundering. Half-bleached linen is muoh in demand for embroidered lunclieon and dressing trible sets, afternoon teaclotha and cushions. This apparently natural écru shade should, however, be artistically achieved by dyeing which is guaranteed fadeless; when the shade is merely due to partial bleaching of the linen it is not permanent and washes out to a dirty cream.

The Nature of Linen, Flax stems are ahout ? ft. long; their middle parts furnish the best line, and the tops and roots become tow. The finer linens are made from the longer and hetter flax fibre, technically known as line. Thicker and coarser fabrics, such as crash and canvas, are made from tow. The long fibres are not nctually one and indivisible, hut are huilt up of shorter overlapping fibres if to 18 in in length, glued together by a natural com pound called pectose. In wear these shorter clements eventually come apart. Linen should not be hoilcd in soda, because washing soda weakens the pectose and disintegrates the filaments. It converts flax into Huff, and horax should be substituted as a water softener.

The strongest, hut not the smoothest, sew. ing thread is linen, and flax thread should be used for atitching carpets, boot buttons, and for any purpose in which exceptional atrength is demanded.

The expert eyc can discern easily the difference between linen and cotton materials; the feel is different, and whereas linen rips with a sharp sound and the edges of the tear look smooth, cotton tenrs with a dull noise and the edges curl. Linen does not ahsorh or retain moisture so readily as cotton. If a damp cloth is passed over a length of cotton material, the surface will look rough; but if the same is done to linen, the surface of the fabric will remain unaltered.

Linen is one of the hardeat textiles to dye because it is difficult to get the fast colour to penetrate far into the cloth. Successful methods are, however, absolutely guarantced, and in made up form or by the yard for embroidery or other purposes only qualities in coloured linens which are thus gharanteed to withatand both sun and washing should be purchased.

Table Linen. Although luncheon sets and dinncr set.s of mats and table centre are often liked because of the ense with whioh they are laundered at home and because of the decorative appearance which they give to the table when of coloured, entbroidered or lace trimmed linen, many housewives prefer an all over cloth for breakfast and for the formal dinner table. Coloured and checked linens are greatly liked for the breakfast table, and the latter kind are extremely chenp, effective and hard wearing, with a variety of borders in shades of blue, green, rose and yellow to tone with the breakfast service in use.

Fine linen damask has always a beautiful appearance on the dinner table. Double
damask is more expensive than the single kind, but its glossy surface is far richer and being more substantial washes and weara hetter. Coloured damasks ane also liked. especially for smaller tables. Used in harmony with glass, china and flowers or candles, rose, maize, green or écru cloths present a most inviting appearance at luncheon or dinner. Even more heautiful are tablecloths in ivory damank. Lace trimmed cloths are also used by their fortunate possessors for festive occasions Decorative examples in fine Irish linen trimmed with filet lace and insertions, or in coarser ivory linen with a peasant made lace, can give a handsomer effeot than any other form of table covering Nnpkins should match the tablecloths used, and any other linen in the room, such as a sidehoard runner, should also correspond in style.

Damask table linen in course of furnishing sometinies receives an injury which develops into a crack or cut and which does not appear until the artiole has been laundered once or
twice. As soon as such a crack develops it should be mended carefully, hut the better plan is only to buy linen from a firm which would replace such an unsatisfactory article All cloths sliould also be purchased fully shrunk, otherwise after washing they may run up in width to the extent of 2 in . in a yard.
Afternoon teacloths, tea napkins, bridge cloths, breakfast tray sets, cocktail sets and tray cloths are seen in almost endless variety and can be handmade in linen introducing decorations of coloured horders and appliqué embroidery, every kind of good washing lace made of linen thread, drawn thread work or crochet.

Bedroom and Kitchen Linen. Linen bed clothes-that is to say, sheets and pillow-slips, bolster covers and bedspreads-make for coolness and ease. Bad sleepers and invalids find the texture of linen welcome and soothing, but others prefer cotton, especially twilled cotton. Linen union and linen-finished materials are superior in appearance to the all-cotton ones.
Coloured sheets and pillow cascs are cxpensive in linen, but an excellent effect is given by faggoting a wide hem of coloured linen to plain white shcets and pillow cases in place of the ordinary hemstitched horder. The same method of decoration can he used for towels. Bolster cases are often dispensed with altogether, and a large pillow is substituted. To measure for pillow alips, run the tape measure along the pillow at the ends and sides, and allow an extra inch on hoth results for bulk. Hemstitched edges count as extrancous measurements.

Linen is the beat choice for face towela Fine linen huckahack with damask borders in white or colours are expensive, but wear well. Plainer towels can be trimmed at the ends with cross-stitched designs or with lace or cruchet. Einbroidered monograms and initials always give a distinctive touch to linen. Dressing. table seta look particularly well in colours with drawn thread work corners and hems, and large monograms embmidered in satin-stitch on each piece.
For round towels and kitchen cloths linen is undoubtedly the most economical purchase in the long run. It is also a far better fabric for dusters than ordinary cotton. Glass cloths should he of linen with a small percentage of cotton to soften the materinal.

Sales at reliable stores very often provide good opportunities for obtaining bargains in linens. Slightly shop-soiled articles are greatly
reduced, or cotton may be on the up-grade and linen down, thus enabling the store to purchase large quantities of goods at a low wholesalo price and retail them cheaply.

Printed linens for covers and curtains provide excellent wear and are usually of good design, though these linens as a rule do not show quite the brilliant colour patterns available in cotton
The Linen Cupboard. In house linen, as in other equipment for the home, space-saving ideas have limiterl the quantities considered necessary for the stocking of the linen-room or cuphosard. In smaller houses and llats there is usually a built-in cuphoard provided for linen, but, if not, a movable one should be installed. In some of the molern homes there is good accommodation for this purpose, and the hot-water pipes pass through the large cuphoard or room, which is also supplied with proper ventilation. Choose a spot near the landing radiator, kitchen range. or some other heating arrangement in the house to place a movable cupboard, if one has to be bought for the storage of linen.
Drawer accommodation should be provided for fancy tea cloths, mats, guest towels, and toilet covers which are not in constant use. Where a linen cupboard has only shelves, amaller articles can be kept in a series of cardboard boxes to ensure their freshness when required. Old shcets or discarded pillow cases make good linings for shelves, hut the more excellent way is to line the shelves with chintz or cretonne. Pieces of material are cut the exact width of the shelves but twice their depth, and these pieces are bound or neatly hemmed and attached to the wooden shelves with drawing pins in such a way that the surplus depth hangs over the edge of the shelf, ready to be turned back over the piles of linen when these are arranged in their allotted spaces

Various articles not of linen (abric are included in the term linen when it is used to denote the contents of the linen cupboard. Cotton sheets and pillow slips, bath towels, bedspreals of other materials, and hlankets are all counted as house linen. When arranging the atock it is well to keep articles that are not so frequently iequired on the less accessible shelves and reserve a separate place for each description of linen. With a large atock shelves may be labelled and their contents specified. Single sheets should he in a pile apart from double, cotton pillow and holater cases separated from linen ones, large hath towels from small, and the face towels in their sets. Articles newly returned from the laundry are naturally placed at the bottom of their respective piles.

When setting up housc in a small way, a useful list of linen is лs follows: For the bedroums, 2 toilct covers or dressing tahle sets for ench mom, 3 pairs of sheets for each hed, 3 pillow slips and 3 holster cases, or 6 pillow slips if bulaters aie not used, 1 mattress cover. 2 hedspreads, 3 blankets and I under blanket, and for each member of the household 4 face towels and 4 bath towels, with a dozen of the former and half a dozen of the latter in reserve. For the tahle, 3 afternoion tea cloths, 3 best dinner tahle cloths, 3 others or 3 sets of mats, 3 breakfast cloths, 3 kitchen table cloths, $1 \frac{1}{2}$ doz napkins, or sets to match various cloths, 6 tray cloths, 3 sideboard cloths, I set of dessert doilies. For the kitchen, 1 doz. each of dusters, glass cluths, tea cluths (not all to he given out at once, but in sets of 4), 6 polishing dusters, 3 oven cloths, 3 mller towels, 6 lavatory towels.

These figures will naturally require adjustment to individual household needs and the housewife's taste and discretion. With care and additions, as need arises, this amoint of linen should last for years In a large house-
hold the amount for each person may be lower either by fitting them in a hole pierced in the in proportion. Linen can be marked free of side stakes of the bottom as indicated, or by charge when ordered at any large store. A the method shown in Fig. 4. The corner book may be kept in the cupboard to chroniole purchases.
Good uses may be found for old linen. Face towels or pillow slips past ordinary service make excellent polishing pads for metal and furniture. Turkish towels when worn out may have the best pieces cut out to be made into lavatory or floor oloths. Old tablecloths are useful for laundry work, either for ironing cloths or for wrapping up damped linen. Ola sheets may be stored for spring cleaning or redecorating of rooms, when they are of value for protecting furniture from dust or paint.
LINEN BASFEST. The cane basket shown at Fig. 1 is not difficult to make. It should be about 24 in. high, 14 in. by 12 in . at the base and 2 in . wider at the top. Commence with a flat bottom with 12 stakes, as shown in Fig. 2, to a width of 12 in ., and carry to a height of 14 in . with single cane weaving. The stakes may be held in a block of wood in which holes have been made at suitable intervals. If the upright stakes for the sides are driven in the side as suggested in Fig. 3, the outside stakes of the bottom should be of stout willow ; but if the uprights are scallomed as in Fig. 4, all bottom stakes may be the same size. The upright stakes should be whole cane, No. 10 pulp cane will do, and should be at least 3 ft .6 in . long. The four corner sticks should be either stout whole cane, willow. or $\frac{1}{4}$. birch dowel. A No. 5 pulp cane should be used for weaving, but it will be advisable to use a fine whole cane for the commenoing as well as for the intermediate waleing.

The first stage in the weaving of the sides is shown in Fig. 3 ; 10 upright stakes are driven in, each alongside a bottom stake, and bent upright: 14 stakes are secured to the sides,
takes are 24 in. high.
Commence weaving the sides as shown in Fig. 5 by working three lengths of oane alternately. A commences behind No. 1, is carried in front of 2 and 3, and brought to the front from behind 4. B starts from behind 2, is carried in front of 3 and 4 , behind 5 and left in front of 6 . C goes from 3 , in front of 4 and 5 , behind 8 , and is left in front of 7. A is now picked up again, carried over the others in front of 5 and 6 , behind 7 , and left in front of 8. This is carried on until a corner is reached, when the method shown in Fig. 6 is followed, A representing the first length to be carried round the corner stick. Continue oompletely round the four sides and repeat for another two or three rounds.
Single rod weaving should now be done to a height of 2 or 3 in ., and another round of 3 rod weaving carried round. Follow this by about 10 in . of single weaving, then another 3 rod wale, as it is called, a further 5 in . of single weaving, another 3 rod wale, and finish with single weaving up to border height. Continual measurements should be made in order to obtain the necessary splay.
The lid should be made in a similar manner to the bottom, but carried to a height of 16 in. The outside stakes should in this case be stout and the ends finished off with lengths of similar stuff, bound to the outside weaving with pulp cane. Another method is to make a complete frame with stout whole cane and form the stakes by the acallom method shown in Fig. 7. This will take a little longer, but forms a much neater lid.
The handle is made by bending a length of whole oane to about 2 in . diameter, binding it with either round or split cane, and attaching it to the lid with the same material ; the lid is hinged by threading three or four rounds of cane under the two borders and seouring the ends in the weaving. A heavier foot may be worked by turning the basket upside doyn, driving short lengths of cane Fig. 6

Fig. 8

Fis. 7

Another method, with scallomed aprighte Fig. 8. Showing how the moaving of the oanes is begun. Fis. 6. Weaving roand corner gtate. Fis. 7. Boallom method of torming chates ior lid
 Lneniold decoration within a moulded framewort.
This exsmple was found in 8omersot, on the oak panolling of a 15 th century farmhouse By Dermisalom of the Direction. Vletoria and Albert
alongside the stakes, running a row or two of a three rod wale, and then turning down the stakes to form an ordinary border.

A Round Basket. A round linen basket may be made by commencing from a suitable bottorn and staking it up as shown on page 65. The sides should be filled up with randing with a three rod wale at intervals. The lid is made like the bottom, a border being formed by inserting short lengths of cane by the side of each sposke and laying them down as a border. Owing to the difficulty of keeping the stakes upright, this basket should not be attempted by the inexperienced. See Basket Making; Cane; Osier.

LINENFOLD. This is a form of deooration sometimes found upon furniture and the panels of walls, dating from the 15th century. It resembles folded linen and is seen particularly upon pieces of furniture and wainsoots of the Tudor period. See Panelling; Tudor Style.

Ling. This is the popular name of the common moorland heather (Calluna vulgaris).

LING: The Fish. Ling may be prepared according to any of the recipes given for cooking cod, a fish it somewhat resembles in appearance. The tongue and sounds of the ling are usually sold separately in a pickled form. See Cod; Fish.

Liniment. See Embrocation.
LINE. There are a number of applications of the word link. As a unit of measurement it equals $7 \cdot 02$ in., 100 links making a chain in land surveying.

In the valve motion and other parts of many kinds of prime movers, such as steam and gas engines, a link is a connecting-rod joining two parts of the mechanism together, and particularly described by a prefix, such as a vibrating link or a shifting link, the former performing a function in the valve motion, and the latter being used to transmit motion from one part to another

LINNAEA. The linnaes, or twin flower. is a very pretty, trailing evergreen plant. The leaves are borne in pairs and the pink, bellshaped flowers are in pairs on the stalk. It does well in moist peat in a cool part of the rockery. Propagation is best effected by means of division in autumn or spring.

## Linoleum : Plain, Inlaid and Other Kinds

With Directions for Laying, Cleaning and Polishing

The reader is advised to consult further the entries on Bathroam: Kltehen: Landing: and other rooms where Linolcum is used. See also Corper; Floor; Furnishing: Labour Saving

Linoleum is particularly suitable for hath rooms, nurseries, and kitchens, as its surface is impervions to moisture, grease, and dirt. nnd it is easy to clenn and is durable. If well laid. it has no cracks or crevices to collect dust, and the cork in its composition makes it a warm and quiet floor covering. There are, however, a few conditions which make the use of linoleum ns a flonr covering unsuitable. It renders the floor practically air-tight, so that it is not recommended for damp ground floors.

Dampners, combined with the absence of air, causes linoleum to rot on the under surface, a condition which develops dry rot in the woodwork of the floor. Worn and uneven floors, either of hoards, tiles, or bricks, such as are often found in old houses, should not be covered with linoleum, ns the unevenness of the anfface canses cracks to appear, thus making it anything but cconomical. Concrete, pmoided it is dry and smooth, can be covered with linoleum succesefully, when fixed with special linoleum cement.

In renovating old cottages and country houses it is sometimes necessary to convert a seconll kitchen or washhouse into a bathroom Linoleum or cork carpet is a suitable and warm fionr covering, provided the floor is fairly level. If it is badly worn it should be floated with cement, then covered with felt paper, and the linoleum glued in position. An underlay is obtainable which prevents water from penetrating through to the floor and is particularly suitable for putting under linoleums in bathrooms and sculleries. By using the same linoleum through several moms on the anme floor it is possible to gain unity and a feeling of greater space. This is particularly to be recommended for small houses. The rooms on the second floor often open from a centre landing or passage, and the general appearance is improved if a uniform floor covering is laid. This arrangement is also more economical, ns the linoleum cuta to hetter advantage, and good use can be made of cuttings left over.

The width of linoleum varies, but that for covering romms is usually 72 in . wide, the price being quoted at so much per square yard. To ensure buying the correct quantity this must he taken into account. Thus, supposing it is required to cover the entire flour of a room 9 ft . $\times 15 \mathrm{ft}$. This is $3 \mathrm{yd} . \times 5 \mathrm{yd}$.; therefore 15 sq . $y \mathrm{~d}$. is necessary. This nmount is contained in a length $7 \frac{1}{2} \mathrm{yd}$. long and 72 in . wide, $7 \frac{1}{2} \mathrm{yd} . \times 2 \mathrm{yd}=15 \mathrm{sq} . \mathrm{yd}$.

If a surround only is required, the amount can be calculated by deducting the area covered by the carpet from the area of the whole floor. Linoleum for covering stairs and passages can be bought either bordered or plain; the width varies, and for these purposes it is bought by length.

Varieties of Linoleum. Plain linoleum is of one colour, the price and quality varying according to its thickness. The advantage of this kind is that it goes well with either plain or patterned carpets and rags and there is no pattern of which anyone can-tire. Dark plain linoleums have the disadvantage of showing every footmark; on the contrary light shades of buff, grey, brown, or green are good colours where traffic is heavy. Inlaid linoleum has a pattern incorporating two or more colours, which cannot wear off, as it goes right through to the canvas. It is more economical to buy inlaid linoleum, although the initial cost is greater, for any floor aubjected to hard wear. When huying, examine the cut edge to see if the pattern is really inlaid. Such linoleums are made in
good tiled losigns and to imitate parquet flooring or with a marbled effect.
Painted or printed linoleum is plain linoleum with a design printel or transferred on to the surface with paint It is considerably cheaper than inlaid
Whatever the nature of the floor, it should be well "ashed and perfectly dry before the fluorcloth is laid. Any old nails or brads must he removed. Loose hoards must he fixed, and any uneven edges planed off. Holes and eracks should he filled with putty or plastic woud Linoleum is brittle, and difficult to handle without cracking in cold weather, so if the flocorcloth is being laid in winter, it is hetter to leave it in a warm room for 48 hnurs before unmlling it.
A better result is ohtnined if a waterproof underlay or one of felt paper is first placed on the boands. This can be fixed in position by the use of a little paste or glue The cffect is the same as a carpet underlay: it acts as a cushion, deadening sound, and makes walking quieter and more pleasant.
How to Lay Linoleum. To do this success. fully careful measurement and attention to detail aro necessary A plain lino shows defecta and bad joins more than a patterned one, but when laying the latter extra care is needed to match the pattern successfully. Avoid unneccssary joins, and if possible arrange that there is no join at the doorway. Lay the linoleum so that as little waste as possible is incurred. A good arrangement is to eut it to run lengthwise in the opposite direction of the lloorboards. The edges at the seams should be butted tightly against each other with the pattern carcfully matched. Pmper tacks without heads should be used, and placed about $\frac{1}{0} \mathrm{in}$. from the edge and at a distance of 4 in . apart. When knocked in, the top of the tacks should be slightly sunk into the surface of the linoleum.

To cut fairly long lengths it is hetter to rule a pencil. line and place a long ruler, preferably one with n steel edge, on the line to guide the knife. It is not necessary to cut right down to the canvas, ns. provided the knife has made an incisian, it will readily break when folded back. A sharp penknife or pointed cook's knife can be employed, but. if liked, a proper linoleum knife that has a curved end miny he used. Where much fitting

laid underneath them, thus ensuring a neater finish.

A certain amount of expansion or treading out always occurs after linoleum has been laid a short time. therefore it is customary to lay it at first temporarily, using a few taches, but only where they are essential, and not along the sides of the mom rdjacent to the skirting. After the linoleum has been walked on for abnut two weeks it should be trimmed again where necessary and tinally nailed in position.
A treatment which is even more satisfactory and practically makes a jointleas flooring is to provide a small triangular moulding to match the moulding on the skirting board The lino can then he cut $t$ in. or $\frac{1}{2}$. short of the skirting board. The moulding is tacked to the latter, and this keeps the lino in position and hides ita edges. Laid thus the lino can expand without buckling. The moulding should not be tacked to the Hoorcloth, but fixed to the skirting board in such a way that when necessary the lino can be drawn from under it.
Cleaning and Polishing. If properly cared for, linoleum retains its appearance is easy to clean, and wears well. Wash it over with warm soapy water, but do not add washing anda or any stming cleansing powder of an alkaline nature. Alkalis act on the oil in the linoleum, removing a certain amount each time they are used in the same way as soda water removes varnish on wood

Scrubbing is only necessary on worn and neglected llonrs It is best to wash only about a yard at a time, rinse off the soapy water, and dry with a foorcloth. If suspy water is allowed to dry on dark Hoorcloth. white marks appear. The aurface should not be awamped with water. The result of this can often be noticed by the Hoorcloth rotting and chipping along the edges and joins. After washing, the surface can be renewed by rubbing in linseed oil, cedar oil, or wax polish. The first is suitable when a polish is not desired : it preserves the lino as well as wax, but does not give a gloss
The best treatment to get an excellent surface is to rub wax in thoroughly. To retain the polish, occasional applications of paste or liquid wax polishes are necessary. A mop or an electric floor polisher with a long liandle makes the polishing easy. Slippery Hoors are caused by extravagant use of floor polish, insufficient rubbing off, or by using the paste too thick. This should be thinned in cold weather with turpentine.

Painted linoleum wears better and retains the colour if it is conted with varnish or white ahellac. All dirt must firyt be removed and the Hoor thoroughly dried. Apply the varnish as cvenly as possible, and leave it for at least 12 hours before the floor is used or the second coat applied. It is better to apply two thin coata, as then the varnish will probably only require renewing once a year. Varnished lino can be kept in good condition by mopping with a slightly oily mop).

LINSEED. In the form of a puultice linseed is a favourite housshold remedy for applying warmth and moisture to a part for relieving pain, and as a counter-irritant in deep-lying inflammation. Linseed is also largely used in the manufacture of painta.
is being done the knife requires fre. quent sharpening so that clean cuta can be made. Special care is needed in fitting lino round pipes, radiaturs. doorvays, and wall projections. Whenever possible fixtures should be disconnected so that the floorcloth can be

Linoleum. Fig. 1. Method of cutting, using sharp penknlfe or cook's knite and steel-edred ruler. FiR. 2. Use of curved lino knife for titing linolenm round

Linseed Poultice. To make a linseed poultice, to 2 oz . of crushed linseed add $5 . \mathrm{oz}$. of boiling water, or larger quantities if need be. Stir continuously while the water is being added. The poultice should be prepared immediately beforc use and should he applied
as hot as the patient can stand it. A fiannel bag should be roughly stitched together to receive the poultice, and this will retain warmth much longer if it is overlapped all mund by a piece of niled silk or jacnnet.

LInseed Tea. Linseed tea is an oldfashioned remedy in certain kidney diseases and ooughs. Put 2 oz . of linseed, $\frac{1}{2} \mathrm{uz}$. of liquorice, and a quart of boiling water in a jug Cover, and let it stand near the fire for four hours. Strain through fine muslin. Do not crush the linsced.
LINSEED OII. There are many uses for linsecd oil in the home, particularly for polishing furniture. If an old piece of oak or other furniture does not respond to ordinary treatment, it should be washed with warm water and soap and well rubbed with linseed oil daily until the desired effect is obtained.

Mahogany is subject to a cloudiness known as bloom: this requires gentle rubbing with hot water and vinegar, and then with warm water to which linseed oil and turpentine have been added in the proportion of a cleasertspoonful of each to a pint of water. Linseed oil oan be ueed for at ained and varnished floors. It should be allowed to soak in and then be rubbed of thoroughly with a clean cloth.

When whiting is uscd for cleaning pewter it should be moistened with linseed oil and turpentine. Bronze ornaments may be wiped occasionally with a cloth moistened with linseed oil and polished with a dry cloth or chanınis leather. Leather coverings of chairs are improved by polishing with linseed oil and vinegar in proportion of two to one. Creaky boots may be stood in a vessel containing linseed oil. See Paint.

LINSEY. When cloths were woven at home from linen and wool, linsey-woolsey was a coarse union fabric with linen threads in one direction and woollen in the other. Linen has been superseded for that purpose by cotton. Rag merchants still call wool and cotton stuffs linscys; as rags they are inferior in value to all-wool, and are sorted out separately.

LINT. A soft linen fabric, smooth on one side and shredded on the other, lint is used for applying ointments. Iotions, and liniments, and otherwise in surgery. Lint impregnated with boric acid, salicylio acid, and other drugs can be obtained at the chemist's. These form a con venient dressing for wounds, etc., applied dry or moistened with boiled water. When used on a broken surface, the smooth side should be applied, as it is less likely to adhere than the other. See Bandage; Dressing.

LINTEL. In a house the lintel is a horizontal bean which supports that part of the wall built over a doorway or window. It may be constructed either of wood, metal, stone, or concrete. As to size, if a new lintel is to be used, as in the case of a new window opening, the size for a wooden lintel should be at least $4 \frac{\mathrm{in}}{\mathrm{i}}$. wide and 3 in . deep for a span not exceeding 3 ft .

Ferro-concrete lintels are made by building a boxing of rough wood around the opening and filling it. with concrete ; 2 or 3 iron bars are embedded into the concrete, and should be about $\frac{f}{8} \mathrm{in}$. in diameter. Another method is to prepare the concrete lintel at least a month before it is intended to use it, making it up in a wooden mould. See Concrete.

LION'S TAIL. This is the common name of a greenhouse shrub, Leonotis leonurus, which bears whorls of scarlet fowers in winter. It is increased by cuttings in spring, and thrives in ordinary potting compost of loam with a little leaf-nould and sand. The plants may te placed out of doors for the summer, but must be brought into a slightly heated greenhouse in autuinn.
LIP. The lips are subject to certain diserses and affections, among the most ordinary being chapped lips. One of the best
applications for this condition is an ointment made of lanoline 1 oz and boric acid 1 dram, or one may use ordinary boracic ointment or a mixture of four parts glycerin and one part Friar's balsam. Chnpped lips should on no account be allowed to remain untreated.
Herpes of the lips is common in severe colds, little vesicles forming, which dry up after a time. They should not be pricked. Bathe with some warm boric acid solution, $\frac{1}{2}$ teasponnful to a tumbler of water, and rub over with vaseline or cold cream. In eczema the lips are often scaly. Bathe with a lotion of one teasponnful of glycerin to 2 tablesponnfuls of rose water ; or a pply cold cream, to cach oz. of which is added 5 grains of salicylic acid.

Cancer of the lip is chiefly met with in men. It is often thought to be due to irritation from the short stem of a clay pipe. Because of the supreme importance of early operation, any ulcer on the lip should be brought to a surgeon's attention if it seems slow or dilatory in healing.
LIQUEUR. The general term liqueur is applied to mixed, perfumed. or flavoured spirits, or certain wines and unsweetened spirits of superior quality remarkable for their bouquet. Thus a liqueur brandy or liqueur whisky is a brandy or whisky of age and quality. Cognac is the chicf liqueur of connoisseurs.

Alcohol, sugar or syrup, and flavouring matter form the basis of most liqueure. Tho highest class are produced by distillation, aromatic substances being mixed with strong spirits and distilled. Others are made by the essence process, or addition of resential oils. A third method is by infusion, in which alcohol and sugar are added to fruit juices. The alcoholic strength varies from close upon 80 per cent on some kinds of absint he to 27 per cent in milder liqueurs.

Among the many kinds of liqueur are Benedictine, Chartreuse, Cointreau, Curaçao, Créme de Menthe, Kummel, mostly made in France. South Africa produces a liqueur called Van der Hum, which in taste and colour somewhat resembles Benedictine but has a distinctive flavour of its own.

Many liqueurs are distilled from cherries, the best known of these being cherry brandy, cherry whisky, Kirsch, Maraschino, and Noyau. Other liqueurs are made from apricots, peaches, sloes, black berries, and black currants. Mint is used in certain liqueurs which are fannous for their digestive qualities, as crême de menthe, alsi caraway seeds in Kummel and

Lithospermum. The lovely blue flowers of
L . prostratam in a 8useez rook garden
anisced in Anisette. See Brancly: Chartreusc : Kummel: Maraschino, etc.

Llqueur Glass. This is a small glass made to hold liqueur. Such glasses are made in various qualitics, from the finest cut or engraved glass to a plain and cheap variety, and in several styles. They are often sold in sets of six with decanters and tray to match, and some of thesc sets are copies of antique patterns. Liqueur glasses, however, are themselves modern, their predesessors being the cordial glasses of the 18 th century. See Glass.
IIQUIDAMBAR. The best specics of this group of hardy shrubs is styracifiua, which is grown chiefly for its brilliant antumn leaf colouring. In time it develops into a large tree. It thrives in ordinary soil and is propagated by seeds or lavers. In its native country, the United States of America, it is a valuable timber tree.
MQUID MEASURE. This measure, used for milk, beer, and other liquids, is as follows: 4 gills=1 pint: 2 pints $=1$ quart: 4 quarts $=$ 1 gallon. See Gallon.

LIQUORICE. The extract of liquorice ront is used in medicine as a demulcent and as a flavouring agent. It covers the taste of ammonium chloride, cascara, and other drugs. The compound liquorice powder which is used as a laxative contains senna and sulphur. About a teaspmonful of it should be taken in a little water in the evening.
The liquid extract is a common constituent of ccugh mixtures, and the dry extract of cough rozenges. Sticks of Spanish liquorice provide the drug in a handy form. Small pieces may be broken off and sucked for the relief of an irritable cough. Dyspepsia may also be relieved by it.
LIRIODENDRON. A hardy, tall-growing, flowering tree, often attaining a height of from 70 ft . to 80 ft ., Liriodendron tulipifera likes a sandy loam, and is an ideal specimen tree for a lawn. The lea ves are large, saddle-shaped, and bright green in colour, while the greenish yellow flowers are fragrant. The shape of these flowers gives the liriodendron its popular name of tulip tree. Propagation is by sowing seeds.

LISLE THREAD. The wearing power of lisle threadl is well recognized, and the tops and feet of silk stockings, being the parts which receive tho greater wear, are frequently made in lisle. The thread is a well-spun cotton, owing its wearing power in large measure to its tightness of $t$ wist.
LITHARGE. Litharge is made by heating lead; it. has a straw-yellow colour, and is used in the making of various lead compounds. It is found in flint glass used in the pottery in. dustries. and also in certain classes of accumulator plates. Chemically it is known as lead monoxide. See Paint.
LITHIUM. The salts of lithium have long been used to remove utic acid from the body in gout. This they accomplish by replacing sodium urate by the much more soluble lithium urate. Lithium salts also act as diuretics, that is, they increase the flow of the urine. The preparations mostly used are lithium carbonate, 2 to 5 gr ; lithium citrate, 5 to 10 gr . ; and effervescing lithium citrate, 60 to 120 gr . The waters of Maden-I3aden, Carlsbad, Kissingen, and other places contain lithia.
LITHOSPERMUM. These hardy trailing plants need peaty soil and a sunny place in the rock garden. The best is prostratum, Heavenly Blue, an evergreen which hears beautiful blue tlowers in spring and summer. It is increased by cuttings inserted in sandy soil in a frame in July and August.

LITRE: The litre is the unit of capacity in the decimal or metric system. It is equal to 22 gallon and, mughly speaking, $4 \frac{1}{2}$ litres
make 1 gallon. See Mctre.

LIVE AXLE: Of the Motor Car. The wheel hubs After undoingthenuts, $\mathrm{B}_{1}$, that lock rear or live axle of the motor car is the final step in the drive hetween the engine and the back wheels, and on it dcpends in a large measure the road speed and efficiency of the velicle. It constitutes a rigid structure carrying the wheels and braking mechanism, supporting the weight of the car, and serving as a suitable casing for part of the transmission.
There are various patterns of live-axle rasings. The banjo design (Fig. 1) is all in

Live Aale. Fig. 1. Horizontal banjo type arle casing fited with underneath worm drlve
one picce, and is provided with a large inspection cover which, when removed, exposes the whole of the axle drive, so that it can readily be got at for adjustment of removal. Other typics include the three-piece pattern, constructed with a central enlarged portion and two tubular axle sleeves bolted to it. The central part is furnished with an opening towards the rear closed with a light cover (Fig. 2).
There are three main types of live axle in use, namely, the semi-flonting, the three-quarter-lloating, and the full-Hoating. The chief difierence in deaign between the three types lies primarily with the metlind by which the wheels, or, rather, the liubs of the wlicels, are mounted on or connected to the axle or axle casing. With the aemi-floating type the live axles, apart from driving the car via the road whecls, have also to
sustain the full weight of the rear of the greater part lies under the ribs on the right vehicle. The bearings in which the axle shafts rotate also act as the bearings for the road wheels. In the three-quarter-foating axle, intermediate in type between the semiand full-Hoating axles, the road wheels have their own bearings, which run on the outside of the axle casing. The weight of the car is thus transmitted directly to the wheels. The axle shafts are supported at their outer ends by the hubs of the wheels, to which they are secured as solid; therefore, although the road wheels are stabilized by the axle shafts, a very large proportion of the bending stress in the axle shafts has been removed.

Fig. 3 is the full-floating axle, and with this the location of the road wheels is in no way dependent upon the axle sliafts, as the lubs, $B$, are mounted on ball (or roller) bearings locatcd on the axle sleeves. A brake drum, $C$, and a di trohable wheel, D, are secured to each hub, B. The axle shafts, being suitably connected to the hubs, act as the driving medium only, and are not subjected to the bending streares to which the two former types are prone. The ends of the axle shinfta that enter the differential cose nind engage the differential sun-wheels are splined, and are kept in place by a spring ling, $F$, engaging recesses in teoth, $E_{1}$, projecting from the ends of the
side of the body. Above it is the diaphragm, which separates the chest from the abdominal cnvity; under the liver are part of the stomach and large inteatine. Attached to the under-surface is the gall bladder, the storehouse of bile which is manufactured by the liver.
wheel hubs After undoing the nuts, $B_{1}$, that lock
the shafts to the road-wheel liubs, and removing the spring ring, the axles can be drawn out.

Driving and Lubrication. Methode of driving the live axles comprise the bevel and worm types. In example of the former is illustrated in Fig. 3, and of the latter in Fig. 4. The straight form of bevel gearing is not now used in cars, but has heen superseded by spiral bevel gearing, as in the cxample illustrated. $A$ form of double helical genring is found on some vehicles. In the worm drive shown at Fig. 4 the worm is mounted in ball bearings, end play being resisted by a double thrust bearing.

Worm gearing is silent in action, even when it becomes worn, but is more liable to damage in the event of lubrication failing. Should oil run short the gear nisy be entirely ruined during a run of a few miles under such conditions.

The lubrication of live axles nust be so carried out as to ensure a proper supply to the working parts, while preventing any leakage from the ends of the axle on to the brake drunis. The axle casing sliould be filled with oil up to the proper level, which is shown by an overllow plug or a filling orifice arranged at a suitable height. This point is well below the centre of the axle. The creeping of oil along the shafts is prevented by providing baffles, $A_{3}$, in the axle casing, A (Fig. 3), and although some oil works along and serves to lubrica te the roller bearings, leakage is stopped by the felt packed rings, $A_{2}$ (Fig. 3). See Motor Car.

LIVER: Nature and Diseases. The largest gland in the body is tlie liver, which weighs about 53 oz . in a full-grown man. The

Live Axle. Fig. 2. General view of the Eumber live axle casing, one of the three-piece patterns

The hepatic artery brings blood for nutriment of the liver; the portal vein brings blood collected from the stomach and intestines which contain all the absorbed food except the fat. The hepatic veins carry away the whole blood supply of the organ, and the bile ducts convey the bile into the intestine. The bile ducts are so arranged that while part of the

Live Arle. Fig. 4. Dnderneath worm drive wlth radial and thrust ball bearings keeplag the worm in correct position
bile passes directly into the intestine another part goes to be stored in the gall bladder.
The liver is composed of millions of minute cells, each of which is a factory for the production of bile, glycogen, sugar, and urea. Bile, which is a reddish-brown or dark green Huid, is an important factor in digeation; it aids the pancreatic juice, especially with digestion of fats, and stimulates the movements of the intestine. The liver receives sugar in the blood coming from the intestines and converts it into glycogen ; this is stored up in large quantities after meals and is then given out as sugar to the blood as required. Urea, the poisonous substance produced from the disintegration of protein food (meat, egga, fish, etc.), is made by the liver, as is almo uric acid. These pass into the blood and are excreted from the hody chiefly in the urine. A further useful function of the liver is the filtering from the blood of poisonous matters iniurious to health.
Diseases of the Liver. These many or many not be accompnnied by jaundice. Some diseases cause enlargement of the liver, ot hers diminish

Fig. 3. Sectlonal plan view of full-floating bevel-driven llve arle: arle shafts can be withdrawn without disturbing road wheels, which are mounted on tapered roller bearings on ends of arle casing. Arle shafts do not carry any of the load. See terit
of causes, including the following. Fatty infiltration, occurring in oberity and chronic alcoholism ; acute inflammation, or hepatitis, due to the poison of a fever, alcoliol, etc.; chronic congeation, which may accompany indigestion ; passive congestion, occurring in advanced heart or lung disease ; a bscess, which may be due to amoebic dysentery; and amyl. oid disease, the result of degenerative changes commonly caused by syphilis.
Diminution of the liver occurs in alcoholic cirrhosis, in poisoning by phosphorus and other substances, and in certain other diseases, including acute yellow atrophy.
The term liverish feeling is synonymous with biliousness and is dealt with under that heading.

Liver Pill. Pills which relieve biliousness and increase the activity of the liver are popularly deacribed as liver pills. A large number of drugs have this action, including podophyllin, rhubarb, aloes, calomel, colocynth, sulphate of soda and others. The following is an example of such a pill : Extract of podophyllum, gr. $\frac{1}{4}$; extract of hyooyamus, gr. 2; pill of aloes, gr. 2. One or two to be taken at bedtime. See Digestion; Indigestion; Jaundice.
LIVER : In Cookery. The liver of the oalf, sheep, pig, and bullock are all much used in cookery. Calfs liver is generally considered the most delicate in flavour; bullock's liver is sometimes rather coarse. Liver can be fried, stewed, or served up in a number of made dishes.
To fry liver with bacon, wash 1 lb . liver in tepid salted water, dry it, and cut it into slices the way of the grain, about 1 in . thick, removing any skinny or muscular pieces. Cut off the rind and the rough brown akin from $\frac{1}{2} \mathrm{lb}$. fat streaky bacon, afterwards cutting the latter into thin slices.
Heat a frying-pan, lay in some slices of the bacon and fry them gently until lightly browned on each side. Take them out of the pan and keep them hot. Mix 1 oz . flour on a plate with a good seasoning of salt and pepper : draw each piece of liver through the flour and at once lay it in the hot fat in the frying-pan, and fry it slowly until it is well browned on each side. Fry a few pieces at a time, as they must not be on the top of each other. They will probably take about 10 min . to cook through.
When thoroughly cooked, lift the liver out of the pan and put it with the bacon to keep it hot. Add 1 oz . bacon or beef dripping to that in the pan, stir in $\frac{1}{2} \mathrm{oz}$. Hour, and fry it until brown. Pour in $\frac{1}{\ddagger}$ pint stock and stir this gravy over the fire until it hoils, then season it carefully. Arrange the liver neatly in a hot dish, the slices overlapping each other; strain round the thick brown gravy, and garnish with the fried baccon.

Stowed liver makes a cliange from fricd liver, and is more digestible. Soak in salted water about an hour, dry, and cut 1 lb . liver into fairly thick slioes. Melt 2 oz . drippingeither beef or bacon-in a saucepan, and when it is hot stir in 1 oz . Hour and 2 tablespoonfuls finely chopped onion.
Fry these a rich brown, and atir in 1 pint good stock or water and a little meat extract. When the whole has boiled and thickened, put in the liver, a good-sized carrot, cut into cubes, a bunch of herbs, a couple of sticks of celery, chopped into small pieces, and a small tea. spoonful of salt. Cover the pan and let the liver simmer for about 1 to 11 hours. When tender arrange it neatly on a hot dish, strain over the seasoned gravy, and garnish the liver with fried becon or hain, and some of the cooked carrot.
Bullock's liver added to stewing steak, in the proportion of l lb . liver to 1 lb . beef, makes the stew richer and more palatable. This is especially so when inferior cuts of beef are used.

An easily prepared dish is a fricassée of liver and tripe. Cut some cold, cooked tripe and some liver, equal quantities of each. into strips. Fry the liver, after suaking in salted water, and put it on a dish in the oven to keep hut. Dip the slices of tripe into seasoned Hlour, fry them, and add them to the liver. Next fry some sliced onions, and with them make a border round the dish. Over the whole pour some thick brown gravy or brown sauce, and serve at once.
Liver Forcemeat. Liver forcemeat is used for stuffing game, pigeons, quails, and other birds. It is made with lb. calf's liver, 3 oz fat bacon. $\frac{1}{2}$ onion, 1 shallot, 1 oz. dripping or butter, 1 teaspoonful mixed herbs, a pinch each of cayenne and nutmeg, and pepper and salt to taste. The liver and bacon must be finely minced and browned in the fat in a frying-pan, the onion and shallot minced, the herbs and seasoning added and all stewed gently until tender. The mixture is then pounded in a mortar, rubbed through a wire sieve, and mixed to a paste with the volk of an egg.
Llver Sausage. Boil 1 lb. moderately lean pork, then mince it finely. Wash and dry 1 lb . sheep's or calf's liver, mince that also, and mix it with the pork. Add and mix in very thoroughly 2 small onions, chopped very finely, a level teaspoonful pepper, a dessertapoonful salt, a gond pinch of powdered nutmeg and cloves, and a level dessertspoonful powdered mixed herbs, including sage. Melt 4 oz . land and add that also.
This mixture is then put into large sausage skins, but should only fill them very loosely. Tie them at both ends, drop them into boiling water, and let them simmer for about 40 min . Drain them and hang them up until required.
Value in Therapeutics. Treatment of anaemia by feeding with about half a pound of liver, raw and cooked, each day has had favourable results. The raw liver is given in sandwiches, or a reliable extraot may be chosen.

## The Living-room and Its Furnishing

## How to Combine Beanty with Comfort

The reader may consule the entries on the various liems of Purniture mentioned, e.g. Chair:
The reader may consule the entries on the various trems of furniture mentioned, e.g. Chair:
Setree: Writing Tabie, and those on the other rooms of the house. See also Carpet. Colour;
Cottage: Decoration; Electriclty: Fireplace: Flat; Gas ; House; Panelling
As its name suggests, the living-room should be the type of sitting room which people really want to live in and not merely to use on formal occasions. In choosing decorations and furniture extreme fashions should be avoided, unless they embody some particularly apt style for the room in question; as for instance, period reproductions for an oldworld setting. The largest, sunniest, and most convenient room in the house should be selected for the room in which the family will spend much of their tinie indoors.

In general, rooms that face south or southwest are the best lighted and most cheerful. Those with windows on two sides have advan. tages, whilst north rooms with a beautiful expanse of country in front are preferable to a south room that looks on to brick walls. Extension on to a loggia or a veranda is an asset to a suburban or country living-room.

Walls and Floors. The treatment of walls allows plenty of choice. Pleasing colours in paint, distemper; or wallpapers of good deaign oost no more to buy or to apply than ugly, drab colours. Where economy has to

LVERPOOL WARE. Earthenware and ohinaware ot Liverpwol origin fall mostly within the later half of the $18 t h$ and the earlier half of the 19th century. Among the earlier pieces were punch-bowls with maritime scenes, usually in blue, often made to commemorate some famous voyage, and tavern mugs with doggerel rhymes.
There was a large output of salt-glaze and delft, sometimes recognizable by its bluish tinge, as well as ware printed by Sadler. the inventor of transfer- printing. Blue-dash chargers are large dishes bearing crude devices of scriptural and royal personages, for cottage use. The creamware, bone-porcelain, and other Staffordshire atyles which were copied at the Toxteth Park pottery for half a century after 1794 frequently bear the works name, Heroulaneum. See Delft Ware; Lainbeth Ware.

LIVERY. As understood to-day a livery is the distinctive dress worn by eertain classes of male servants. An example is the serviceable livery of the chauffeur. This consista of coat or overcoat and peaked cap, with breeches and leggings, the coas of Melton and other cloth being coloured grey, black, dark blue, or dark green. Liveries are usually provided by the employer. There is no tax on the wearing of a livery beyond the annual one of 15 a for a manservant. See Servant.

LIVERY CUPBOARD. This is a type of cupboard in use in England in the l5th, 18th and 17 th centuries. With the allied court cupboard, it was the forerunner of the dresser and the sideboard. The livery cupboard is usually smialler than the court cupboard, and was sometimes, therefore. placed on the top of the latter. It had an open front generally decorated with a series of turned pillars. These cupboards were often placed in bedrooms so as to hold food which oould serve for the long interval between the evening and the morning meal. See Cupboard.
be studied, the decoration should receive particular care, seeing that it will have to last for years.

In many small houses and bungalows the woodwork is not painted, but merely dyed or stained to imitate different woods. A woodpreserving stain, such as solignum, should be used, and linseed oil rubbed in to make the wood water-resisting. Panelling is a favourite method of wall treatment in some of the modern as well as period living-rooms, and is especially successful when carried out in natural woods wax polished, rather than in a heavy imitation of Jacobean style.

Distemper in all shades is obtainable and has advantages. It is cheap, and can be renewed quickly without skilled labour; but for a living-room, particularly where there are children in the family, it is not always satisfactory. Even light knocks remove the surface and show plaster underneath, while fingermarks are not easily removed, and greasemarks are even more persistent. Distemper is not suitable for old walls the surface of which is bad. The better way, where it can
be afforded, is to use painf or enamel. Painted week-end or summer holiday house of this walls need no attention other than washing type. Wide surrounds of parquet or other for many years. Graincd and marbled sur- easily cleaned flooring are necessary in a room faces are particularly suitable for this type of sitting toom, as they provide a slight, pleasing variation in colour without the tiing effect of a definite pattern. All the plainer wall surfaces possess the adrantige of allowing the housewife to change the appearance of her ioom rompletely, without mural redecoration, by having a second set of curtains and covers for the lurniture, or by using loose cretonne covers and light curtains in summer and showing the upholstery fabric of some durable type that will not ensily soil in the winter, with curtains in a rich and warm shade of velours or velvet

These effects ol graining and marbling can be obtained in wallpaper if the expense of painting is too great Pale tones and unbroken surfaces are. however. still better lor the small room with a poor window allowance. Such treatment seems to push the walls away. Patterns or heavy panelling, on the contrary, have the effect of pulling then in the same colour, or a lighter tone of the same colour, as the walls. The absence of a cornice in many motern rooms increases their apparent size. Flush doors also seem to enlarge wall space, while decornted or panelled doors give interest to higger rooms Wooden pelmets to the windows, either in onk or stained or painted wood, are another detail which is a particularly liappy iden in the modern living-room. It ensures a neat window line, nnd the trouble of making or changing curtains is greatly lessened if there is no valance or fabric pelmet to lie considered each time of such renewal
A living-room can be uninteresting if there is too little colour contrast and pattern; it can be cut up and made tiresome and diaturbing with wrong choice of these, or with too many pictures and ornaments. It is usually safe to build up from the darkest colour note on the floor to the lightest on the ceiling. Where there are old oak beams or a modern version of these, the plaster between them should be kept to a warm cream, and if the wall treatment is dark panelling a wide frieze of light colour is essential in the ordinary. sized room.

Carpets are the most suitable covering for living.room floors. It is usually desirable to strike the note of comfort which n carpet gives, but which is lacking with other floorings. Choice should be limited to hard-wearing carpets in colours that do not show every footmark or are casily damaged by mud. A toopronounced pattern on a carpet will often destroy the harmony of a whole room. Imita. tion Persian carpets in velvet pile, or modern ones with geometrical designs, are suitable. The hard-wearing qualities of hair-carpet and its low price make it a most useful floorcovering where expense is of the first importance, and it is an excellent brctiground in its natural colour for ıuga. In a bungalow or cottage living-roon, fibre or rush matting may be substituted, especially in the case of the

Where there are no beams or supports which particularly witable to the country typo of visibly mark the ceiling it is restful to have this living.room. Bar grates can he modernised

Heating and Lighting. An open fire is the forourito means of heating, and it is more economical, especially for rooms that are in use during the wholo day. Gas-firea, it is true, do awny with the filling of acuttles and cleaning of grates, but they do not convey the sense of comfort and companionship that belongs to $n$ coal or wood tire The brick fireplace scems
 Living-room. Fig. 1. Window end of living-room in a small house near
London. A novel form of diffused lighting is provided by the ceiling fitting London. A novel form of diflused lighting is provided by the ceiling fitting of tubular glass attached to the cross beam at small cost, with $n$ barless front which increases the width of the grate nnd brings the hot fucl further into the mom. When new stoves are being fitted, the question of a sitting room stove with a boiler at the back is worth consideration. Ecunomy of fuel combined with increased confort is thus obtained. Stoves for use with open or closed fires which burs any kind of fuel and can be kept alight day and night are sometimes a suitable choice.
The comfort of the family also depends largely on the efficient lighting of the living-
ruom The diffused type of lighting tixture is not sufficient in a room wherc work is done, unless scparate small lampeare provided. The actual method of lighting is controlled largely by what is available Eilectricity is brith convenient and clean. incandescent gas gives good light, but the mantles neerl care or fie quent renewal will be necessary In districts where neither of these means of lighting is nvailable, lamps burning a mixture of air and petroleum vapour and producing a 250 candle.power light are most usoful for living roons.

Furnishing Ideas. The furniture required naturally depends not only on the size and type of room, but also on the size and tastes of the family. Bookshelves may line the walls where thic latter arc literary One writing table would not be suflicient where several nembers wished to use it a good deal. The addlition of one or even two sinall bureaus sulve the problem, and when shut up eneroach little on the lloor space. Plenty of cuphoard room is an excellent feature in moat cases, so that unsightly-looking working or amusement outfits can he stowed nway with a minimum of fuss If a living-room has to be used also nз a dining room it is simplest to have one end devoted to this purpose.

Our illustrations provide some excellent ideas for the decoration and furnishing of delightful living rooms. Jig. 1 shows a morlern type of roons in a small house nenr London Eissentially simple and without superlluity of pattern or ornaments, comfort is ensured by the lieavy pile carpect. and by the chairs and settoc up)holstered in the same style of modern design The window admits of abundance of light, and there is a door, visible on the righte, which leads on to a loggia The curtains are of a transparent, lightly patterned fabric for sum. mer use, which gives a beautiful quality to the light from the window. The walls are painted, finished with a glossy surface, and the ceiling is the same culour except for the wooden heanis. The lloor is of wood blucks.
The fireplace, at the other end of the room. not scen in the photograph, is a heantiful example of modern brick, in keeping with the beamed ceiling, and is without fender or mantelpiece. Its decoration lics in the design of the brickwork on the surround and raised hearth. The writing-desk and bookcase by the timplace

Fir. 2. Old world living-room in a Sussex house. The simplicity of the wide hearth, massive beams and plaster walls is pleasantly contrasted by the comfortable armchairs and settees and enriched by the fine piece of tapestry
selected tor the low table in the window and for the floor standard scen in the picture

A contrast is provided in the second illustra. tion This living-room is in an old house in Sussex. The heavy cross beams are worn uneven, the walls and ceilings are roughly plastered. the casoment windows are diamond paned. Tho fireplace has a wide, tiled hearth and solid oak shelf on which are collected respoctively interesting specimens of hearth furniture and some beautiful old pieces of china, quite suitable for the room. Velvot is chosen for the upholstery and curtains, except for the cane-backed and cushioned settce on the right. which is covered with shot silk rep.

Pictures are not wanted on the low walls, and also they would detract from the tapestry above this settee, and there is little wail space left with the other window, door and accommodation for looks. Lighting fittings have boen woll thought out. There is a charining bracket fixture over the armchair on the right and the standard on the other side of the fireplace is equally harmonious in this room with its finged shade.

In Figs 3 and 4 two views of a morlern living. room are shown. For a comparatively small room in a town house or flat, the decoration and furniture are heautifully designed and chnsen The panelle! walls are finished in glossy enamel of a pale colour and the wide fricze and the ceiling are of the same colour, but finished with a mat surface. The fluted wooden pelmet fixture should be noted and also the beautiful window treatment of coloured net glass curtains and silk practical ones to tone with thi modern carpet. The loose covers have a geometrical pattern, and an interesting feature is the excellent accommoda. tion for books on shelves built into the space helow the windows. These shelves are divided by useful little cupboards. In Fig 4 the fire place is seen, with its attractive tiles, pillars and mantel treatment. The lighting fittings are particularly harmonious, with their plain shades and ehields. Eivery detail is charm ingly thought out and the placing of the pic tures should he noted, and of the ornaments on the windowshelf. The one richly decorated piece of furniture in the room is the paintel Czechoolovak eabinet on the left of the window

Living-room : thee views of a modern example. Fig. 3. A delightfully planned window treatment provides plenty of light and excellent shelf accommodation for books. Fig. 4. The tiled freplace piece and pictores. Fig. 5. The mirrored corner of the room, tiphly decorative in itsell, is cleverly designed to give light to the hall through the Rlass door of the living-roum
rig. 5 shows in detail the mirrored corner of this room, visible in the background of Fig. 4. This clever arrangement is not only an attractive decoration in itself, but it adds reflected light to the entranco hall through the glass panelled door of the livingmom. The low table in front of the mirme, the Empire watch clock and the reflecteil ornaments add to the charm of the view of the mon from the hall.

LOACH. The loach, sometimes called the stone-loach, is a fresh-water fish. It has a delicate tlavour. and is not unlike the gudgeon in shape. Loach is best stewed like carp (q.v.)
LOAM. This is a soil particularly valuable for garden purposes, and its texture may le divided into thrce olasses, heavy, medium, and light. In the former there is a good proportion of clay, with a smaller quantity evident in the medium kind; in light loam sand preponderates All loams are easily worked. and are made more fortile by liberal manuring. The heavy variety is greatly improved by an occasional liming.

For potting composts loans is invaluable, the best being the top 3 in. from old pasture land. This should be lifted and stacked with the grass downwards, sprinkling decayed manure bet ween each layer; it will he ready

ill 12 months. See Compost ; Cucumber; Gloxinia: Soil, etc.

LOAN. A loan may be either of a sum of money or of some article which is to be returned intect. The latter kind of loan is called a bailment in law; the borrower is called a bailee and the leniler n bailor of the ar ticle. The bailee is bound to take as much care of any article lent to him ns a careful inan would take of his own goods: if he does not dossiand the article is loat or damaged, the bailẻe is liable to repay the loss to his bnilor

A loan does not carry interest unless interest is agrced upon. If A agrees to lend B a sum of money and fails to lend it., $B$ cannot bring an action for breach of contract, because he has in the eyo of the law suffered no daniage. A moneylender must carry out all loan tranyactions in his registered name at his registered office and on a special form of contract, and not otherwise. The contract must show the date of the loan, the amount of the principal and the rate of interest per cent per annum, and must be signed by the borrower. A copy must be sent to the borrower within seven davs. If he transgresses this rule, the moneylender cannot recover his loan in court. Sce Building Society ; Debt; Mortgage.
LOASA. Most of the loasa group of halfhardy S. American plants are annuals. The seed should be sown indoors in February, and after once transplanting, the seedlings may be placed out of doors in June. The chief kinds are hispida, 12 inches, yellow, and lateritia, climbing, red. The last-named is known as the Chili nettle, because of its stinging hairs.

LOBELIA. The most popular forms of lobelia, which arc half-hardy garden plants are thoso used for edgings to beds and borders. They are often grown as annuals from seeds sown early in spring, in well-sifted mould, with a liberal mixture of fine sand, and kept in a temperature of from $65^{\circ}$ to $70^{\circ}$. The seedlings should be planted out in shallow boxes, 2 in apart, and hardened off in a cold frame.

Lobelias treated in this manner may be planted out early in June Old plants, if lifted and potted in autumn and kept in a heated glasshousc, will provide cuttings in early spring.
The herbacenus lobelias are handsome border plants, 2-3 feet high, which bloom in late summer. They are not very hardy. and in most districts must be lifted in October and stored under glass in boxes of light soil for the winter: they will provide cuttings in April, and may be planted out of doors in May. Fulgens and its variety Queen Victoria with bronze leaves and scarlet flowers are very showy. Of the latest novelties the scarletHowered Huntsman is splendid. Lobelia syphilitica has given rise to a race of plants with flowers of many colours-purple, rose, mauve, etc. : these need similar treatment to the varieties of Iobelia rulgens.

LOBSTER : How to Cook. It is hest as a rulc to buy lobsters alive, choosing those which are heavy in proportion to their size and rejecting any which have incrustations on their shells or are light and watery. The llesh of the hen lobster is inferior to that of the male, but the spawn is useful for colouring sauces, etc. The hen may be distinguished from the male lobster by its broad tail and fewer claws.
To kill a lobster, pierce the spinal cord with a skewer or a sharp knife at the joint between the body and tail shells. The fish is cooked in a pan of boiling salted water for 20 to 45 min ., according to size. If lobsters are hought ready cooked, their tails, should they be fresh, will opring back when straightened.

A good brand of tinned lobster can be used for made-up dishes or for salads when fresh lobster is unobtainable.

A boiled lobster may be dressed when cold by removing the two largest claws and cracking them, separating the head portion from the tail and splitting both down the middle. Take out the intestine, the stomach and the spongy looking gills and serve the lobster on a dish with the head in an upright poaition and the claws and tail placed round it. Salad may be used as a garnish, and oil and vinegar served separately.

To roast a lobster, cut it lengthwise through the middle, removing the intestines, etc., and place the pieces flesh side uppermost in a roasting tin in a hot oven. Cook the fish for about $\frac{1}{2}$ hour. Baste it with melted butter and season it. Garnish with slices of lemon and a ferv sprigs of parsley. Lobster that is to be broiled is prepared in the same wny, but is cooked over the fire. Tise pieces are basted as for roasting, and turned once. Melted butter sauce is served with it.
Scalloped lobster is prepared by cutting the flesh of a boiled lobster into small pieces, mixing it with melted butter sauce and turning the mixture into greased scallop shells. Sprinkle some fine breadcrumbs over them, and bake them in the oven until they are lightly browned.

To devil lobster, the flesh is first finely chopped. It is then placed in a saucepan over gentle heat with a little savoury white sauce, a dessertspoonful of mustard, and pepper and salt to taste. These should all be made piping hot, and the devilled lobster served piled on hot buttered toast.

The following recipes are of various appetizing savoury or luncheon dishes which can be
made up from cooked lobster. Such dishes arc also useful for buffet suppers, and when nicely garnished present a particularly attractive applearance.

Lobster Bouchée. Lobster bouchiées are made by cutting three slices of stale bread about $\stackrel{(i n, ~ t h i c k ~ a n d ~ t h e n ~ s t a m p i n g ~ t h e m ~ i n t o ~}{n}$

brush the cases and lids of bread with some beaten egg and coat them with breadcrumbs. Fry them a golden brown, and drain.
Fill each case with the lobster mixture. heaping it up slightly, put on the lid, and stick one or two pieces of lobster feeler in the top to give a decorative rffect. These bouchées may be served either hot or cold.

Lobster Butter. This is a savoury butter made either from lobster spawn or coral If the former is used, cook it in salted water until it assumes a bright red hue; then drain and dry it and pound it in a mortar with twice its quantity of butter Finally rub it through a hair sieve. When lobster coral is used the process is the same, except that the coral is merely washed and then dricd in $n$ cooloven.

Lobster Cream. Sniall lobster creams are made by pounding the fleah of half an avcragesized lobster with $\frac{3}{}$ gill sauce. rubbing the mixture through a sieve, and then adding 3 teaspoonful of anchovy essence, a little lemon juice and a small pinch of cayenne. Beat these ingredients together, adding $\frac{1}{2}$ gill whipped cream, and then turn the inisture into some rmall china cases. Whip another $\ddagger$ gill creani, put a little on the top of each, and then garnish with a little pounded coral of lobster rubbed through a sieve. The creams should be left to stand on ice before being served.

Lobster Cutlet. To prepare this dish, melt 1 oz butter in a saucopan, stir in 1 oz. Hour, and ald a gill of water. Stir the mixture till it leaves the sides of the pan, add a small tin of lobster, linely chopped, and seasoning. Mix well, and spread in a plate to cool; then turn it on to a floured buard. Shape it into cutlets, brush these over with beaten egg and cont them with breadcrumbs, and fry them. They should be served with salad if cold, or, if hot, with fried parsley and lemon. See Hors d'Oeuvres; Mayonnaise: Sulad.

## LOCKS: HOW TO FIT AND REPAIR

## With Simple Instructions for Cutting Keys

Thls contribution describes the mechanism of the chief types of lock and gives directions for fitting them to door, lid, or drawer. The process of cutting keys is clearly explained and fully illustrated. See further the articles Bolt; Lateh : Padlock; Safe

In the home a lock is usunlly a piece of sliding in the case. The key is inserted in mechanism by which doors, drawers, or lids the keyhole and touches the edge of a notch are secured so that they can only be opened which is cut in the bolt. As the key is turned with a key made to fit the lock. The three in the direction of the arrow it presses the main types are warded, lever and pin tumbler bolt outwards, as illustrated in Fig. 2. The locks, cach comprising the mechanism in a key must be long enough to reach nearly to case, a sliding bolt, and the key. In some the top of the slot, but not too long, or it will types the lock is operated from the outside only; in others from either side.

A drawback lock can be opened from the inside by aliding a knob; and with a letter bock, or combination lock, the locking is effected by moving two or more disks or their equivalent; the disks are marked with letters or numerals, and when the proper ones are opposite each other the lock can be opened, but in no other manner. The disks have a notch cut in the rim, and only when these notches are in line can the lock bolt be released, the large number of possible combinations rendering it difficult to open the lock unless the proper combinn!ion is known. This type of lock is available from the cheapest qualities to elaborate devices for a strong-room door or safe.

Warded Tumbler Locks. Figs. 1-7 illustrate the action of a warded tumbler lock. The bolt is shown in Fig. I as

Lock. Figs. 1-7. Diagrams showing the action of s warded tumbler lack. A qull explanation with a key to the
 Figs. 8-11. Action of the lever
Fig. 11A. Key for a lever lock not turn further, as it nust do to release the too much, and the lug will engage in the key on the other side of the keyholc line, as lower of the notches in the lever, consequently shown in Fig. 3. From this position the key the bolt could not be shot. Most good lever is turned until it can be pulled out of the locks have threc or more levers; the slots keyhole.

Two point are made at varying distances from the part nothing to prevent the bolt being pushed in all have to be lifterl simultaneously to such or out without the aid of a key, and any heights that all the slots arc in line hefore key that will pass the kcyhole will actuate the the lug can pass and the bolt be shot. For bolt, so long ns it can pass the top of the slot this reason the lever lock is one of the most in the holt. Wards are therefore introduced sccure of the ordinary domestic locks to prevent the key from turning unless it has Pin Tumbler Locks. The pin tumbler an aperture to allow it to pass the wards systen works on an altogether different

This is shown in Fig 4, where two pins, A 13, prevent the key from turning unless cut away as shown. In place of the pins a circular ward plate or ring is fitted, as at C, Fig. 4.
To prevent the holt from being moved
except by the key, another piece of apparatus shoots the is added. This is a tumbler, a flat plate of bolt when the netal hinged at one end to a peg, as shown at cylinder is A. Fig. 5, and pressed down by a light spring turned. The It is generally placed in front of the bolt, key turns the with its lower edge in line with that of the cylinder and bolt. A U-shaped slot is cut through the raises the tumbler, and a peg or lug, $B$, is fitted to the locking - pins. bolt, so that when the bolt is in, the lug rests These pins are in the inner end of the leg of the tumbler small pieces of slot. as at lig. 5.

When the steel rod that as hefure, and at the tumbler from its starting position to the ed in the two elevation, as in Fig. 6, thus bringing the slot parts of the in the tumbler in line with the lug on the bolt. mechanism, This allows the lug to pass, but when the key as shown in has been further turned the tumbler falls Fig. 12. and the bolt lug is then in the outer leg of tho One set of tumbler slut, as in Fig 7. The tumbler holds pins, of varytho lug, and so prevents the bolt from ing length, is being lorced back

Lever Locks. In lever locks the bolt is cylinder and secured diferently, and there is often $\Omega$ " fol another set in lower," which takes the bolt with it. In Fig. 8 the body, the the lever $A$ is shown "down" and the bolt latter pressed lug B is in the inner end of the slot in the lever. down towards The key has to raise the lever until the the cylinder central slot is in line with the lug, and no more, by the little
as in Figs 9, 10, finally allow. ing the lever to fall and enl. gage the lug, as in Fig 11. thus locking the holt So far the action: is similar to a tumbler, but there are differences. The key must raise the levers to the corrcct licight. and this is accomplished by shaping the top of the key accordingly, as at C, Fig. IlA: the prait of the key at $D$ throws the bolt over as before. Should the key be too long in the blank it will lift the lever principle. As can be seen from Fig. 12, it comprjses a body with a cylindrical hole, wherein turns a cylinder of metal, into which the key is inserted, the key slot being usually corrugated. Attached to the cylin. der is a connecting bar (not shown) which

Fig. 12. Pin tumbler lock, cyllider mechanism
coiled springs. The top edge of the key is notched to varying depths, and as it is inserted into the slot it raises the pins. A key suitably notched for the particular lock will raise each of the cylinder pins so that it is just level with the joint between cylinder and body. When the key is fully home all the pins are in line and level with the juint, consequently the key can be turned.

Fitting a Rim Lock. Door locks are made either right or left hand. When purchasing the lock should be held in the hand with the holt to that side which it will occupy when in place. Then see that the keyhole is the right way round, and that the lock can be fitted to the door. Many locks are made reversible to suit any door. Fig 13 shows the rim lock, a type which is easily fixed on the outside of a door. The first thing to be donc is to mark out the door and sink the flange of the lock plate into the cdge of the door by chiselling aivay the surplus wood. Having done this, hold the lock in position and carefully mark the position of the keyhole and the spindle hole with a bradaw on the face of the door. As nearly as possible the size of the hits for boring the holes for the keyhole and the spindle should he equal to the size of the keyhole in the lock plate and the diameter of the spindle. Thic lock is screwed on with round-headed screws, flat-headed screws being used for the cover plate.

The spindle knobs and escutcheon plate are placed in position, the last-named fixed with escutcheon pins. The box staple may be set

Lock. Fig. 13. Cover and interior viem of rim lock. Fig. 14. Mortise lock with cover removed, Fig. 15. Fitting morlise lock into door Fig. 16. Simple cupboard lock, screwed in place. Fig. 17. Drawer or cabinet lock, showing cover and screws employed
to $\mathbf{\theta z}$ it. Fig. 18. Cutting the recess for a drawer lock
in the door frame. or on a block. The lock is tested by shutting the door gently, when the bolt should shoot into the staple with a decided action and a perceptible click. There ought to be just sufficient room for the door to clear the front edge of the staple, and not too much space between the lock case and the staple when the door is shut, or the bolt may be forced open if the door is subjected to pressure

Mortise Lock. Fig. 14 shows a type of lock which is almost invisible when fitted, being mortised in the door It is widely used, although the deep mortise greatly weakens the door. locks of various shapes have been put on the market to obviate this defect; some circular in section, others conatructed with a narrow case, so that a fine mortise is reguired for their fitting. The door is first markel out and the centres of the spindle hole and keyhole marked and drilled. The mortise is Lock. Fir. 19. Showing method of fiting pin tumbler lock refully cut in the ordinary way, the lock llange being recessed into the edge of the door, as shown in Fig. 15, and the lock secured with countersunk sciews A striking platc fakes the place of the staple and is recessed into the edge of the frame. The holes for the lock bolts are drilled out and equared up with a chisel, and must be deep enough to allow the bolt to enter. When the plate is in line, and the bolts enter the holes properly, the plate is fixed in place with countersunk screws. The joiner uses a special long shanked chisel with a hookerl blade to cut the mortise in door (Fig. 20).

## Fitting Pin Tumbler

 Locks. Fitting this type of lock is similar to a rim lock, with the addition of a hole "hich has to be drilled through the door for the passage of the lock body, which is held! in place by two long screws passed through the door from the back, prior to fixing the lock case. A specially shaped washer plate is supplied to bear against the woodwork, which. by aid of the screws, clamps the lock body to the door (Fig. 19).Cabinct Locks. Iron cupboard locks seen in Fig. If are used for the doors of ment

Lock. Stages in Key Cutting. Fig. 21. Filing the blank to correct thickness. Fig. 22. Testing with calipers, to ascertain size of blank. Fig. 23. Cutting the blank to actuate the various levers. Fir. 24 . How key ghould fit a simple lock. Fig. 25. Warded key cut to clear ward ring and shown lifting tumbler. Fig. 28. How internal slots are cut in a key tor a warded lack. Fig. 27. Pipe type of key, showing alteration to seme to rendar
keyhole should be carefully ascertained and cut out with a bit and a keyhole saw, or a tine chisel. The lock is then screwed into place The bolt hole in the top rail of the drawer is next made. Its correct position is ascertained liy placing a little blacklead on the top of the bolt, pushing the drawer into the proper position, and turning the key so as to force the holt on 10 the surface of the tup rail of the drawer. If this is done several times, the shape and position for the bolt hole is clearly shown. The bolt hole may then be chiselled out to the requisite depth

Box locks are litted in much the same way, but the top plate carrying the lugs with which

the bolts engage, has to be fitted to the lid. This operation is easily performed when the link plate has pegs or spikes formed on the upper side, as the lock is first litted, the link platc inserted in the lock, and the lid shut down hard on to the link. The pins hold the link, and when the lock is unholted the lid is raised with the link in position. The recess is then marked and cut, and the link plate sccured with screws.

Padlocks are in a class by themselves, as they require no fitting; they pass though a staple or any place that is to be locked, as, for example, the wheel of a bicycle to the front forks. Varieties are made with lever, tumbler, and pin tumbler mcchanisu, as well as simple letter mechanism. Ot hers have a spring-hack bolt that is self-locking. Where security is of importance it is a mistake to buy cheap padlocks. For an outside door a type with a short stout shackle should he chosen, as this is diflicult to force, and the thick shackle would take some time to sever with a saw. It should he locked through a stout staple over a hasp. If a chain has to he used, its linke should be thick cnough to offer at least as much resistance as the shackle or staples. For owtside use all fastenings should be as strong as possible.
When locks reg,uire to be repaired, the chief items are the replacement of hroken springs, renewal of damaged pins, and rehushing of spindle holes. Most ironmongers stock a selection of springs, and their replacement involves nothing more than slipping into a notch, or retixing with a screw or rivet, according to the nature of the construction. Worn hushings can be replaced with new. or the hole can be enlarged and hushed with a ring of brass
tubing soldered in place and the faces cleaned "p true with a file.

Locks should be oiled occasionally, since this assists the smoothness of action and prolongs their life. The old fashioned method of using a feather dipped in oil is useful for a siniple plate or stock lock, but the only way of oiling the modern types of rim and mortisc locks is to take them out and unscrew the backplate in order to lubricate the whole of the parts. Locks should always be properly oiled before fitting.

Key Cutting and Fitting. The first requirement in key cutting is to understand something of the lock the key is to actuate, and the way in which it works The description of the $t$ ypes of lock in the foregoing pages should be studied, and the lock itself examined.

As a first attempt, suppose a key is to be litted to an ordinary rim lock of the lever type; this may be dealt with on the following lines: First of all a blank must be procurcd fron the ironmonger : a blank is a solid uncut key, and should be obtained as nearly the correct size and shape as possible. See also that the shank of the key is long enough for the door to which it is to be fitted, so that the bow can turn on the outside. In the case of a lever lock the key has first to lift the levers, and then to throw back the follower, which takes back the bolt with it. Therefore the next step is to file the blank to such n size that it will enter the keyhole and set against the backplate or back part of the lock case. This is accomplished by grasping the key in a vice with the blank to the left and the shank gripped in the vice jaws.

The top of the blank is then filed down, keeping it perfectly level at the top until it will just enter the keyhole. Sec that the pin or the holes in the lock-case do not stop the key from entering, and that the blank is not too thick; in either of these cases the blank must be carefully filed to fit (Fig. 21). The use of a pair of calipers (Fig. 22) will be found a great assistance in the progress of the work, as they can be used to test the thickness of the blank and the height from the shank to the top of the hlank.
It will facilitate matters if the lock be removed from the door and be taken to pieces, as the action can then be seen and appreciated, as is clearly shown in Figs. 13, 14, 25, etc.

The key is first fitted to the follower as described, and then the master lever found by inspection; it can be detected, as it is the one with the slot nearest to the lower edge of the lever. The end of the blank has then to be filed down at the spot exactly opposite this lever until it will taise the lever the required amount: the other levers may be removed while this is in progress (Fig 23)

Each lever is treated in the same way, and the series of steps thus produced on the blank are touched up here and there until the whole of the levers lift properly and the follower throws back nicely. The action should be perfect in either direction, shooting the bolt in or out with equal facility. The width of the blank may be such that it will have to be filed back or made narrower to allow it to turn when the cover-plate is replaced ; hut this is an easy matter, the main thing is to remove a little metal at a time from the blank, when the result of so doing can be seen and appreciated.

The usual files for this work are the thin warding files sold in many sizes; some thick and some thin ones should be obtained. They

Fig. 4
are used in the manner shown in the illustrations, which also show progressive stages in the fitting of a key to a lock.

A warded key is cut on similar lines, but it mny be noted that the blank can often be obtained with n number of the wards already cut, thereby reducing the amount of time and labour in fitting the key to the lock. In this case the key has to he cut away until it can be turned in the lock, as it will then throw back the follower and shoot the bolt, so all that has to be done is to tile away the parts of the blank that obstruct the free turning of the key (Fig. 25).

A duplicate key can be cut by careful calipering and comparing with the original. When the lock is accessible a film of tallow or beeswax may be applied to the blank, so that when the key is pressed against the wards they will leave a mark on the hlank, and thus indicate the parts to be cut away. It is alwnys wisc to proceed alowly, and to try the key in the lock several times to note the progress of the work.
Keys for the pin tumbler type of lock are perhaps best entrusted to the locksmith, who has n special appliance for the purposo. The pattern key is clamped in the machine, and the blank is nutomatically cut to the same notching by a grinding wheel of the proper shape and section.

A device to render a key, and therefore a lock, more difficult to copy is to cut off a piece of the pipe or hole in the key of a pin type of key, and to fix the piece on the peg in the lock, securing it with a touch of sulder (Fig. 27). Similarly, a pin can be fitted to the lock-case in those types of lock in which the liey turns on a peg. It is necessary to cut back and drill out the keys to fit on to the peg, but it is then more difficult to place the key in the lock.

When several or a number of locks are ordered at the same time, it is possible to arrange for a master key to be cut which will unlock all or any of them, each having, of course, its own individual key. This method is commonly adopted in hotels, boarding. houses, etc. A skeleton key is one in which houses, etc. A akeleton key is one in which
the major portion of the blank has been cut

away to clear the wards, and is thus easily ahle to open the lock, as there is no metal in the blank to obstruct the turning of the key, the only requirement then being that the height of the blank be sufficient to throw over the follower. But akelcton keys are useless against a good type of lever lock, as all the levers have to be raised to different heights; the use of picks made of thin, stiff wire is resorted to by the locksnith when a key has been lost. Most good class locks are, however, made with safety devices that render them almost proof against picking.
LOCKER. There are many uses for lockers in the home, either as internal fittings or as receptacles for holding odds and ends They are often provided with falling flaps, but these are only suitable when they are not more than 4 ft. or so above the ground level. The lower shelves of those filling a recess can be divided off and fitted with tlaps with turn-buckles or locks; they provide good storing space, and may often save building a cupboard.

Fig. I shows an example of a simple locker with a falling tlap secured with a padlock and staple, the whole, excepting the llap and hingeing piece, being of $\}_{\text {, in. deal. First }}$ prepare the two ends to size and cut and rebate them at each end deep enough to takc the false top and the bottom. The two latter are then cut out, and in length should cqual the width of the job less the thickness of the projections formed by the rebates on theends, as is shown in Fig. 4.

Glue and nail the job together, and nail on a back, 3 -ply being the best stuff to use The hingeing piece is nailed on to the front, as in Figs 2 and 3, and must be of the same thickness as the llap. The latter may be of one piece, strengthened on the inside with battens, or for a better job may be clamped. It is hinged with ordinary brass or iron butts, and a hole cut at the bottom to allow the staple to pass through It is better to fix this first, so that the position at which to cut the hole will be automatically marked The top is fixed by nailing down from the top, or in another method may be screwed from the inside through the false top. Fig. 5 is another form, having a sloping top which acts as a lid. It is most suitable to be fixed to a wall, for which purpose it is necessary to fix two battens to the back to allow for clearance when the lid is raised (Fig. 7). The front, back, and sides are rebated together, as in Fig. 8, extra widtll being given to the front

to allow for its heing bevelled off at the top at the same angle as the sides. It is easier to bevel it after the job is put together. The bottom is either nailed or serewed on from underneatl.

LOCKET. This old-fashioned piece of jewelry is made to hold a miniature or small portrait, or a lock of hair or other memento. See Pendant.
LOCKJAW. The cause of lockjaw, also called tetanus, is a microbe, the bacillus of tetanus, which is introduced into the body through some wound or cut in the skin, and produces a virulent poison. It is found in garden soil, stable sweepings and dust.

The first symptoms may be headache or languor. the muscles of the neck hecome stiff, then those of the jaw, and the jaws become fixed or locked. The face becomes tixed and the corners of the mouth are drawn back in a curious smile. The spasms extend to the body and lega.

As regards prevention, any dirty wound should be thoroughly cleaned up by a doctor, and according to the nature of the contamination he may consider it necessary to give a prophylactic dose of antitetanic serum.
In any case where there is stifiness of the muscles in the neighbourhond of a wound, or of the jaws and neck, the doctor should be sent for, and in the meantime the patient should be given a warm bath and put to bed.

Rest and quietness are of the utnost im portance. The patient when in bed must not face the window Draw the curtains, put a thick carpet on the floor, oil the door-lock and hinges, and remove all creaky chairs. Avoid nny sudden noise, such as the banging of doors. Do not let the patient speak unless it is absolutely necessary. Cover artificial lights with a blue shade, and keep the light, natural or artificial, always dim. Observance of these nursing rules will sprare the pationt nuch ngony and further his recovery.

The diet must be nutritious and Huid. The food must be given slowly, and with the greatest gentleness, to avoid causing a convulsion. The ealy usc of antitetnnic serum is important.
LOCK NUT. A lock nut is an ordinary nut used to check, or lock another nut which is screwed on to the same bolt, and prevent its further progress For example, if a bolt is to be screwed a certain exact distance into a hole a nut is placed on it, and when the boit has reached the required position the nut is screwed up tight, thus locking the bolt in position. Sometimes two nuts are screwed on a bolt together, the lock nut holding the first in position

Lock nuts are secured, when necessary, by means of various patented methods in which some special arrangement is used to prevent the nut unscrewing except under the action of a spanner.

## Locomotive: Building a Scale Model

## How to Construct a Replica of the L.N.E.R. 2-6-0 Mogul Engine

This powerful Gauge 1 Locomotive is built from
Mer of standard parts, and its assembly articles on Engine: Railway. Other allied

Model engineers should consult also the artictes on Engine: Railway. Other allied entries are Boat; Electric Motor; Yacht
The building of scale morlel locomotives is on the crank pins and secured by small screws. a fascinating pastime, but is generally re. The cylinders (2) are next taken in hand, garded as a hobby requiring considerable skill and a fair amount of experience in metal work. The Mogul locomotive for gauge 1, however, which is illustrated herewith, should present little difliculty as it is built entirely from finished standard parts olitainable from Mcssry Bassett-Lowke, Ltd., of Northampton. The simplest tonls only are required, such as soldering iron, screwdriver and pliers, and a careful inspection of the accompanying photographic illustrations will assist the worker considerably, as all the parts referred to in the following instructions are numbered. Only one example of each pair of frames, set of wheels, axles, etc., is show'n in order to a void confusion. Erecting the Chassis. The main frames (1) are acrewed at the lad. ing end to a cross bearer (30), and the smokelox saddle (32) is fitted between theframes by means of the lugs and slots provided Plate (34) is next soldered. llange downwards. to the rear end of the frames, plate (25) being similarly eecured at the front end, the flange being uppermost. The finnt buffer beam (28) and rear beam (18) are then soldered in place, the central lug on the latter extending backwards to take the pin of the tender draw-bar (5)

Axlc boxes (4) are next insertel in the slots in main frames, together with their respective axles (8), and driving wheels (11, 12). Wheela are fitted with crank caps (14), those marked (13) being used for the central coupled pair (11). which are made flangeless to facilitate running on curves. The caps (13) carry the return cranks which actuate the valre gear. The wheels are tinally retained by means of horn stays (21), the coupling rods (17) teing slipped

It will be seen that the vibrating lever (16) is pivoted on a screw at the top end to a small bracket on the main frames. To the middle of this lever a screw attaches one and of the value rod (7), which is pivoted at ite other end to the piston valve itself. The radins rort (9) connects lower end of lever (16) with the return crank (13).

The reverse lever brachet ( 20 ) is noxt screwed in position on the rear foot plating, the reverse lever and rod (23) lecing pivoted to the bracket and steam valve reverse arm respectively The reverae lever not only changes the direction in which the locomotive is running, but also serves to shut off stenm and to control the speed.
The beading ( 27 and 29 ) is next soldered in place under the footplating, and plates (31) are screwed in position over the central axlehoves to protect them from the flame of the lamp. The pony truck (19) is assembled by pressing on the wheel (15) to axle (3), the latter heing pushed through the bearing bushes shown, the addition of a second wheel com pleting the unit
The flame guards (24) are providerl with lugs which fit into slots in the footplating, a twist on the underside making all secure
'To complete the chassis it is then only necersary to add the buffers (22), coupling hook (26), and the footplate steps (33)

The Boiler and Fittings. The boiler (50) is supplied as a complete unit conaisting of a rolled sheet brass barrel with flanged ends and a stout central stay.

At the cabend are situated a steam whistle and a blow off cock, whilst on top of the boiler are two dummy snfety valves to preserve the scale appearance of the model. The working safety valve (and filler combined) are housed in a renovable dome. At the smokebox end of the beiler is attached a large displacement !uliricator. connected to the steam pipc, as shown. Handrail knobs (soldered into the boiler shell) are provided, with nuts on the inside, together with the handrails, which are cut ready to length and only require soldering in position.

The other items shown in the photograph are the complete smokehox (49) with funnel and handrails, the cab (52). and the vaporising spirit lamp (51), a twin gas burner of really efficient design and performance. A spirit measure and filling funnel are shown at Nos 53 and 54 respectively.

The mounting of the boiler on the chassis is a comparatively simple matter, as the bariel fits at the rear end in a circular hole in the cab front, the sinokebox and resting on the saddle plate (32) previously referrel to

The cab is accordingly soldered in posit:on on the rear footplating, the plate (35) being fixed between the frames at the front of the cab with the square cut-out piece arranged to provide a hole to accomnoolate the reverse rod. The steam whistle and reverse lever project through slots in the cab roof. The boiler barrel is free to slide in the cab opening to allow for expansion when hot.

The steam pipe is soldered into the steam control valve, thus holding the hoiler to the

Locomotive. Scale model of a Mogul engine which can be built from a set of standard parts. Above.
left, view of the chasgis. The separate parts are illostrated on the nert pare
chasais at the smokebox end. The exhaust pipe (6) is attachod to the boiler front by means of a soldered clip the steam escaping from the funnel The smokehox is completed by the addition of handrails and screw holt. the whole unit being a pushon fit over the front of the boiler.

The vaporising lamp fits into a recess bet ween the fraines and is retained by an L-shaped wire catch soldered to the rear buffer beam
Lamp brackets are attached by means ol small nuts and bolts in holes ready drilled in the front lootplating, anil scale nodel lamps arc provided nas a lurther contribution to correct detail and realism

Constructing the Tender. The tender is ol the six-wheeled type, and representative parta which are needed for its construction are shown in the accompanying photograph. The footsteps, handrail, knobs, buffers and rear coupling hook are similar to those on the engine Building the tender from these tinplate parts constitutes quite a straightlorward soldering job.
rounded corner. The plate (39) is soldered to the front of the tender with the flanges inside The completed sides with end plates arc then soldered to the sole plate Finishing touches to the tender include the fitting of the coal slide (55), the footplate (37) and the coaming plates (38) The tender is finally washed out with hot soda water to remove all traces of Hux used in soldering, and is completed by the addition of the vent pipes (40), the manhole (45) and a set of lamp brackets. The completed locomotive is then tosted under steam and finally painted in the colours of the chosen prototype.

Oil the axles, crank pins, valve motion joints, and other moving parts with typewriter oil, and fill the lubricator with thick cylinder oil. Fill the boiler two-thirds full with clean hot water The lamp needs a little care in filling with methylated spirit, and the measure which is supplied by the manufacturers should be employed for the purpose Carefully wipe off any spirit which may be spilled, or allow it to evaporate. before lighting lamp.

LOCOMOTOR ATAXIA. Uncertain gait may be one of the first symptoms of loconint or ataxia, a chronic disease of the apinal cord, which is most common in males. It may be due to alcoholism, sexual excess, syphilis. or injury to the spinal column.
The patient gradually finds that he is very liable to lose his balance unless he watches his feet. Walling becornes more diflicult, and the reflexes are completely lost. Two sticks have to be used, and gradually the power of locomotion is lost entirely, together with control of the hadder In many cases of lacomutor ataxia the optic nerve is affected and total blindness may speedily ensue
The patient should place himself under a doctor's care at the earliest possible moment All fatigue of hody and mind and worries and anxieties must be avoided, and the patient must live a simple, regular life. The patient should use alcohol very moderately or not at all. The diet should be nutritious, but not rich and stimulating. Secure a daily movement of the howels; guard against chills and wear flannel next the skin. Take regular tepid baths.
The remedy which has met with most success is the system of exercises suggested by Frankiel. These are designed to re-cducate the patient in making the necessary movements, and they may be commenced even when he is bedridden.

Locust Tree. The locust trec is a hardy summer-leafing flowering tree, better known as the false acacia (q.v.).

LODGER. A lodger is a person who hires a room or rooms or part thereof in the house of another He is in some respecta like an ordinary tenant. If he does not pry his rent, his goods are liable to be distrained upon by his landlord. His landlord's landlord can, in the first place, distrain upon all goods which he linds in the house, including those of the lodger. But the lodger can recover his goods by giving a notice in writing to the person who niakes the distress containing a list of the goods claimed and a statement that they are the goods of the lodger, the terms upon which the lodger holds. i.e. weekly, monthly, etc., and at what rent. and also how much rent he owes, if any

The lodger must pay to his landlori's landlord any rent which is overdue by him. He is then entitled to have his goords redelivered to him, and if the distraining landlord refuses to deliver them, application should be made at the nearest police court. As against his landlord, the lodger is not entitled to any special protection for his goods. He must take care of them himself. But the landlord must not be guilty of negligence, e.g. taking in a servant without a character who turns out to be a convicted thief.

A lodger should always stipulste what notice is to be given to determine the contract, and in

First the frames (36) are fitted, as shown, with the die cast axle box units (4I). the reverse side being seen at (43). The spigots behind the spring shackles are pushed into the holes already drilled in the frames and riveted over. The hollow bearing spigots are then expanded into holes in the frames, using a tapered punch The axle boxes are fixed on the same side of the frame plate as the flange, the semicircular slot being at back of the tender, provided to clear the nuts which sccurc the rear buffers to the buffer bean (42)

The frames, with axle boxes fitted, are next soldered to the sole plate (56). The wheels (47) are supplied complete on axies (44) and are simply sprung into position between the frames. The back (42) and front (46) bulfer beans are soldered into position on the sole plate. Handrail knobs are then bolted to the side plates (48) and handrails soldered in place.
The end plate (57) is soldered inside the side: plates, leaving a good fillet of solder to form a

Locomotive. Separate parts used in the construction of the model locomotive illustrated In the previous pare. They are described in the text, where directiong for agsembling them are also given
the absence of any express agreement he is entitled to a reasonable notice As a rule, where rent is payable weekly a week's notice is sufficient, and where payable monthly a month's notice. The notice must expire at the end of a week or month of the tenancy.

A ludger who takes furnished ronms is in exactly the same position as one who takes unfurnished rooms, except that under the Rent Restriction Acts a lodger who takes unfurnished rooms is entitled to the protection of the Act, and cannot be turned out except by an order of the court, which order can only be made for the reasons specified in the Act $A$ tenant of furnished rooms is not entitled to any protection under this statute; but the Iodger. even in unfurnished rooms, who by his contraot is entitlcd to attendance is also out side the protection of the Rent Restriction Acts

Lodgers, botlı men and women, are entitled to vote at both parliamentary and munioipal elections, a residential qualification being sufficient. See Agreements; Landlord; Tenant.
LODGINGS. When lodgings or furnished rooms are required in a town which the prospective lodger dnes not know, an inquiry addressed to one of the local newspapers will prohiably be of assistance By sending a stamped addressed envelope anyone may learn from the chief clerk of the classified advertising section which of the districts a re ocoupied by the better type of landlady and boarding house. It is then a simple matter to advertise for rooms in onc or other of these neighbourhoods, or, preferably, to make inquiries on the spot. Muoh can generally be learned about the character of individual houses by inquiries at local shops or from a policeman.
There are various types of lodgings, in ciuding the bed-sitting room, with or without board, in a private house, or onc or more bedrooms and a sitting room where more privacy is secured, at a higher price. Lodgings may be taken in a house where the landlady supplies no meals and has little to do with her tenants. For a man this method may prove rather expensive if he has to buy all his meals outside For a woman it often solves the problem of economical living away from home, as such ronms are usually provided with a gas-ring or some kind of gas lixture on which meals can be prepared. A third method of many landladies is to let each of the rooms of a large house at a fixed rent with breakfast, the meal being either sent up on a tray or scrved in the dining room as in an ordinary boarding house.

A person living in rooms should a void making complaints, whether about food or service, except to the responsible person. Heavy luggago causes trouble to servants and often injury to walls. If a good deal of luggage is necessary, packing can be ao arranged that the heaviest trunk may be put in a hox. room or basement. Alteration of furnishing arrangements should not be made without the landlady's consent.
Furnished apartments are alan of interest to the holiday-maker. Prices vary considerably, according to the season of the year, the highest heing usually obtained during July and August. Some landladies make a weekly charge, which covers board and lodg. ing, but the majority do the cooking and attendance, leaving the visitors to buy their own food.
Furnished apartments can be obtained by lonking down the columns of the local paper or by application to the inquiry bureau which exists at nearly every British watering-place, usually under the direction of the town clerk or other municipal authority. Those requiring apartments, especially in the summer months when schools are closed, should book their ronms at least three months ahead.
The letting of apartments as a means of gaining a livelihood is often the only career
open to a widow with a family, or to an unmarried woman who has been left with a wellfurnished house without sufficient inconse to run it. A house must be run on sound business principles to pay. Three important aids to success are absoute cleanliness, good conking and pleasant manners. it well-aired, well dusted house, creates a gond impression without elaborate furniture or expensive decorations. In furnishing rooms a landlady should nim at clean walls, simplicity in the floor-coverings, with staincd wood or linoleum surrounds which do not harhour the dust, good lighting suitably placed for reading, a gas-ring and a gas heating fixture where central heating is not in use, cunvenient bathrooms, and perfect sanitary arrangements. See Holidays.
LOFT. In general a loft means an upper room, a room situated above another. To-day it is used mainly for the vacant space at the top of a house, that between tho joists and the rafters, and for a similar space above a stable or other outbuilding. The latter space, provided it is propierly Hoored, is ofton used for storing hay or corn, or other accessories of the stable. It is sometimes used for pigeons, and on this account the term pigeon loft has come into general use. A loft of this kind can also be converted into a useful workshop or gymnasium.
In the case of a loft in a house the only dif. ference between a $\ln f t$ and an attio is that the loft may be without a boarded floor, the only Hooring being that provicled by the joists Such lofts are therefore useless. A loft can. however, be made serviceable either as a store-room or a lumber-room, or even as a study or a den, by laying down a boarded Hoor over the joists, provided they are strong enough, and making certain other alterations.
The oeiling joists, while presumably adequate for their proper purpose, may not he strong enough to carry additional loads. In. deed, some care is needed when placing lumber in the loft, to dispose the heavy articles on that portion of the joists which gets support from walls, partitions, etc. Expert advice should be obtained on these points. The conversion of a loft, or any similar work, may come under local by-laws, and the houseloolder should satisfy hinself about this before com. mencing any alteration
The entry into a loft is gencrally through a trap door, or through one of the upper rooms in the house. A disappearing ladder is a useful fitment. Types are illustrated in the articles

Loganberry Culture. 1. How to prepare the soil. 2. Shoots cut down after planting. 3. Mulching, $a$, in summer. 4. Training, $a$, new shoots for next fruiting ; $b$, centre supports for fruiting canes : $c$, wires: $d$ canes tied to wires ; $e$, posts with ground basestarred. 5. Propagating single shoot held down by stone, with cut bebind bud. 6. Multiple proparation Sboots pegzed down at buds to form roots

Un Attic and Ladder. The Hoor over the ceiling joists is laid with tongued and grooved flonrboards at least 1 in in thickness, which are nailed to each joist with $2 \frac{1}{2}$ in oval brads, driven in with a light hammer so as to minimize the vibration, which otherwise might damage the plaster ceiling undcrneath. Great care must be taken not to treal upon the lath

Loganberry. Spray of leaves and large fruit that and plaster work: some of the Hoorboards may be laid down temporarily and used to stand upon, or use may be made of any strong rough boards. Light might be admitted by neans of a skylight, a window in an end wall, or a few slabs of glass substituted for roof slates. See Attic; Ladder.

LOGANBERRY. The general culture of the loganberry is similar to that of the raspberry. The fruit is large, decp red in colour, and of excellent Havour when thoroughly ripe. It is valuable for cooking and preserving. The plants should be about 12 ft . apart when planted to cover a trellis or against wires, and if there are two or more rows the distance between them may be about 7 ft .

Tho loganberry is easily propagated by bending the tips of the canes to the ground late in sum mer, pegging them in , and then leaving them to root. When they have rooted the cano is severed near the top, and is ready to be transferred to its fruiting quarters. The method of prun. ing the loganberry is by outting out the old stems when the fruits have been gathercd; the new shoots are tied to the supports.

How to Cook. The fruit of the logan berry plant is used in tho same way as other cane fruits in the making of janis and jellies, and also for pies, pastries, etc. It is sensonable in July. The general directions aro the same as for raspberries.

When making jam use ? b . sugar and

Loggia Fig. 1. Loggla of a stone-built Wiltstire bause : it is furnushed and used as a garden room

The loggia can, if desircd, be furnished and made to serve the purpose of $n$ lounge. or even of a living. room, at least in summer. In this case its supports should admit of the fixing of soreening material in times of rain and cold The best arrangement is one embodying sliding or removable sashes that can be brought into use as required A loggia oan also be arranged so as to serve as an extension to one of the living-ruoms Its furniture should in teacupful water to every 1 lb . fruit. If the any oasc be well able to stand a guod deal of fruit is very large and juioy, no water is exposure to the weather; otherwise there will required. Loganberries can be mixed with be a constant carrying of chairs and tables to red currants and stewed, or made into jam, pics, etc. in the same way as raspberries They are also excellent mixed with apples.
In bottling lognnberries, use water or syrup; $\frac{1}{2} \mathrm{lb}$. sugar to 6 quarts water makes a sufficiently rich syrup. The time required for boiling is $1 \frac{1}{2}$ hours and the temperature should be brought up to $160^{\circ}$ for about 5 minutes See Jelly; Laxtonberry; Pastry; Raspberry

LOGGIA. A loggia is a pleasing addition to a house and can be put to excellent uses It is somewhat after the nature of a veranda
 and fro. The furniture of an ordinary sitting room oannot, for instance, be kept continually in a loggin without gerious damage reaulting.

Three Examples. The illustrations herewith show three loggias in styles specially well adapted to various types and sizes of English houses. Fig. I shows a loggia bolong. ing to a Wiltshire house. which is built of local stone. It is furnished as a garden room and can be used as an upen-air extension of a living-room for hot weather.

Fig. 2 shows the loggin of a Sussex house. this being a part of England for which this feature is very suitable. It is not put to any special use, but fol ling ohsirs and tables would quickly convert it into a sun parlour if required. The charmingly designed window shown at the far end gives on to the rose garden. The oil jars and lighting fittings are partioularly decorative. Fig. 3 shows another shelterod loggia which opens from one of the living-rooms. It is furnished in a more solid fashion. The benches and chairs afford plenty of accommodation when meala are taken in the loggia, while the side tables and plants suggest an air of homeliness and comfort.

These loggias are each part and parcel of a house, having been included in its original design, but it is quite possible in houses of a certain type to add a loggia to the existing building. Many houses in the country have a corner that could be roofed in at little expense. It is desirable that such $a$ corner shall get a fair amount of sunshine and that the addition to the structure docs not interfere with the ndequate lighting of the adjacent
being part of the actual structure of the house, and is an added attraction to a seaside bungalow. It is desirable that the loggis should stand well above the level of the garden. as in this way a clear out look will be assured. Obviously it should be erected on the sunnicst side of the house, but should be rarefully sheltered frum extreme winds. so that it may be a cosy outdoor room. If it is to be used for ineals it should be conveniently placed with regard to the kitohen.

Logria. Fir. 2. Charming paved lorgia of a Sussex house. Fir. 3. Sheltered loggia furnished for summer use
1 and 3. Courtesy of Country Life: 2. Humphiren, loet
rooms of the house See Garden Furniture House: Veranda.
LOIN : Of Meat. This is a prime portion of meat, but not considered economical on account of the excess of fat. It is that por tion of the animal that lies on both sides of the spine between the false ribs and the hip bone. In mutton and lamb, also in veal, this portion is sold as a joint and called the loin In beef it becomes the ribs and sirluin. In pork it is known as the hind loin and fore loin while in bacon it is called the back See Bacon Beef; Mutton: Pork
LOMARIA. Must of the family of ferns known as lomaria require greenhouse treat ment. They have feather-shaped leaves thrive best in shady positions in the greell house, and require plenty of water f́rom spring, all through the summer, till nutumn. Propagation is by spores so wn in fine soil in the warm house at any time of the vear. Lomarin (Blechnum) spicant is a hardy fern of which there are many varictics.

Lomaria. Feather-shaped fronds of $n$ lepn which requires greenhouse treatment

LOMBARDY POPLAR. A hardy de. ciduous tree, Populus nigra pyramidalis, the Lombarily poplar thrives best in deen, moist soil, but will Hourish almost anywhere. I। serves as a boundary screen, or as a quick growing lofty hedge if kept well trimmed For small gardens it is not suitable, owing to the extent to which its roots rob the soil of moisture and nourishment. See Poplar
LONDON PRIDE. One of the commonest of all garden plants, London pride (Saxifraga umbrosa) is familiar as an edging to shady borders. It has rosettes of evergrecen leaves and in May bears graceful spraye of pinkis'. Howers. It flourishes in ordinary soil and pieces may be detached and replanted at any time of the year. See Border.
LONGCLOTRE. This form of oalioo get. its name from the fact that similar cotton cluth imported 200 years ago frum India was put up in long Jengths, not in short pieces It is plain woven and made square with threads just as fine and as many in one direc tion as in the other, so that it is equally strong in warp and weft. Woven 28 to 36 in wide. longcloth can be bought either bleached ur unbleached, and it is made in standard qualities that are denoted by trade marks.
LONG MEASURE. This is in constant use for measuring lengths of materials, ground, etc. It is as follovis

| 12 Inchics | $=1$ foot |
| ---: | :--- |
| 3 fect | $=1$ yard |
| 51 yarls | $=1$ rod, pole, or perch |
| 40 mids | $=1$ furions |
| 8 furlongs | $=1$ nille |
| 3 mlles | $=1$ lengue |

LONGPORT: The China. This Staffordshire ware was produced at this suburb of Burslent in the 18 th century. In 1793 the Longport works rere acquired by the Davenport family. See China; Davenport Ware.

LONG SIGHT. Long-sightedness, or try to beat the last player's card If unable to hypermetropin, is generally due to the eyehall being shorter than the normal length from finnt to back. Consequently the image is

follow suit he must trump, nnd if the trick has already heen trumped he must over-trump if he can. The winner of each trick leads for the next, and must lead a trump if lie has one.

The Pool. The pool is divided in the proportion of one-third for each triok. If one player has taken two tricks, for example, and nnother one, the first takes two-thirds of the pool and the second one-third. The remaining players are said to he looed and place in the pool an nmount, with the new dealer's contribution. which totals the original mmount of the pool, to form the new pool If only three players play and cach takes one trick, the other players are not loosed, but the new pool is provided by the dealer. This hand is then usually known as a must, the meaning of this expression being that each player must play, whatever his cards may he, and the miss is not dealt.

LOOFAF : For Washing. The lenf of the oofah plant is used for washing nnd other household purposes. Its mugh surface has a stimulating effect upon the skin Lonfahs can he purchased as plain pieccs of any aize re quired, or made up into washing gloves or straps. In the latter casce they are bound with atrong tape or webbing to prevent them from tearing where they have been out to shape.

Inner soles made of Inofah for shoes are excelicnt wear both for summer and winter. In summer they keep the feet cool: in winter they keep them warm

Picces of Inolah may be put in kettics to prevent them from beconing furred. Such pieces can be bought from any ironmonger, and will last without attention for a long time When they become impregnated with chalk they should be taken out and suaked.
Looking Glass. See Mirror.

## Looms: For Home Weaving

## Constructional Details of a Workable Pedal Loom

Thls contribution describes a handy type of table loom, and tells the woodworker how to make a portable loom of a larger type. The home waver will find the craft clearly explained in the article on Weaving. See also Rur; Tapestry
Hand looms range from a board loom such clear. The uprights should he of well as that shown in Fig. 1, on which narrow seasoned hardwood, $2 f$ in. by $2 \ddagger \mathrm{in}$. They tapestry can be woven, to the table loom are connected by rails made of 1 in . beech shown in Figs 2 and 3, which permits of work dowcl rod, which run through and are up to 33 in wide, and the pedal operated loom (Fig. 4), on which a variety of fabrica up to 42 in . wide can be made.

Making a Pedal Loom. The loom illustrated in Fig. 4 differs from the conventional
focussed behind. instead of on the retina. Near objects cannot be seen distinctly; distant objects may, but this requires ancffort when thic long-sightedness is extreme. The cure is to wear convex glasses which will focus all rays entering the eye accurately on the retina See Lye: Spectacles

LOO: The Card Game. This is a game for any number of players, hut six to reven is the best number. It is played with the ordinary pack of 52 cards, which rank as in whist.

The dealer deals three cards one at a time to the players, and also an extre hand, known as miss. The next card on the top of the pack Finglish type in conis turned up for trumps, Each player in turn looks at his hand, and is asked by the dealer if he will play, or take miss, or pass.

If the player has a good hand he usually elects to play; if not, be oun either take the three cards in miss or pass. In the last case he signifies by doing so that he is not taking any further part in that round of the game. Every player in turn is offered the option of playing, taking miss, or passing. As soon as one player takes miss, those who follow have only the option of playing or passing. The player who takes iniss must play, no matter how bad the cards in miss may be. If only one player plays, he takes the pool. If all except the denler pass, the latter takes the pool. The pool is formed at the beginning by each player putting in a counter.

The eldest hand of those who have agreed to play leads. He must lead aocording to the following rules: If he has two trumps in his hand he is compelled to lead one. If he holds the ace of trumps he must lend it, or if the ace happens to be the turn-up and he holds the king he must lead the latter. If only two players are playing, the leader, if holding two or more trumps, must play the highest. Each player must follow suit if possible, and must
struction (see Weaving) and might at first inspection be thought somewhat slight for its purpose. Developed frome a simple Greek prutotype, it has been used constantly in a weaving atudio over a period of years, the design being modified as and when improvements were found desirable The frames are held together by dowels and pegs, so that the whole structure is readily erected or taken down.
Back, front and side elevations are given in Figs. 5, 6 and 7. In conjunction with Fig. 4, they make the method of construction quite

Loom. Fig. 1. Simple board loom, arranged for weaving narrow tapesirg. Figs. 2 and 3. Alston table loom, a compact portable appliance which takes warps up to 33 in . wide

rails which hold the reed The cap, or upper rail, is free to move up in the slot in the swords, mo that the reed can be inserted or removed The lower bar is fixed by pegs to the swords, and the cap also has holes for pegs, so that it can be secured when the reed has been inserted. The reed measures about 5 in in depth, and is held by the grooves in cap and lower rail. The slots in swords and the tenons on cap and lower rail must be accurately cut, and the peg holes in the upper part of swords should be evenly spaced, so that the batten hangs level from the roller. The rack teeth, too, must be acourately cut and spaced or the sleigh will not hang squarely acrose the loom. The whole of this part of the loom needs especial care, and the materials must be good seasoned stuff free from shake or twist. Fig. 8 is an end view of the sleigh, showing slots and the tenons of rails.
The hamess is shown dia grammatically at Figs. 11 and 12, and is represented as the simplest form, with two heddles. The laths should be made of oak, 1 in by in. section. The short upper laths are slung by a connecting them together permits the loom loop passed mund the supporting moller and to be dismounted and packed into small through $n$ hole in the centre of lath. The compass. If portability is not desired the endless cords connecting short laths to heddle end rails might vell be made of rectangular laths are about 40 in. long before making the section stuff inortised and tenoned to posts knots. The connexions to pedals are clearly in the conventional way.

The Rollers. The breast roller (Fig. 10) is turned from 2$\}$ in stuff, and one end is left square for a distance of 4 in Two holes for a turning stick are bored through at right angles, and the stick may be a piece of 1 in . dowel. The cane roller or warp roller is similar, but the squared end is at the opposite side. Both ends of this roller might be left square if desired. Both front and back rollers are grooved to take the cane which secures the warp in place. The groove, $\frac{1}{2}$ in square, is indicated in the diagram of the cane roller Fig. 4 shows how the mollers are mounted on the brackets the breast roller with its square to the right and the back roller with its square to the left, both viewed from the firnt of the loom (seat board). The diameter of the rollers, especially the warp roller, may be increased witli advantage

Sleigh and Harness. The aleigh or batten ( Fi izs. 8 and 9 ) consists of four parts, the two sides or swords, by which it is hung from a whler supported on the rack, and two grooved

shown in Fig. 12, corresponding part* Leing lettered $A$ and $B$ respectively A single cond might be taken from centre of lower lath to pedal if desired For clearness, the heddle laths are represented with two leashes only on each pair. Slip knots in the connecting cords piermit of any desired adjustment for length The medal boaida ae 4 ! in wide hinged by loops to the bottom front rnil, as shown in Fig 4, and provided with a serics of holes at the other end, in one of which the cord to lower heddle lath is finstened

The heddle leashes can be procured ready made in lots of 100, tied in 25's. A reed will be needed, and a raddle The warping boart can be made by the home worker, and fill instructions will be found in the artiole on Weaving, where also are the necessary instructions for making the warp, entering and beaning the warp, and setting up the harness. The accessories necded, and supplies

of yarn or other materials cun be obtained from the Alston Weaving Studios, 39, Jnmes St., Landon, W. 1 . LOOP. A dress. maker's loop is used instead of an eyelet or metal eye. To work it lay two or three threads along the material for about $\frac{1}{4}$ in., or according to the length required for the size of the hook. The threads are laid by catching up a little of the material at each end of the space, then a back-stitch lasi thread is laid to secure them. Fill these

Loom: construction of a pedal type. Figs 5-7. Back, front and side elevations Figs. 8 and 8. Details ol sleigh, showing groods to take reed. Fig. 10. Breast roller and cane rollep. Fig. 11. Leashes on heddle laths. Fig. 12. Connexions from heddles to roller and pedals

Courtexy of Aluton Wearino Studios liaid threads with buttonhole stitches and fasten them off securely into the material at the end of the loop.

LOOP HOLE. The term loop hole is ap plied to a series of doors or openings set verti cally above each other on the floor levels of a warehouse, as a means of passing goods in and out. As a rule, a crane is fixed above the topmost loop hole. It is also used to describe a long, narrow opening in a wall, which may be glazed or otherwise.

LOOSESTRIFE. The purple loosestrife (Lythrum snlicaria) is a familiar British plant often seen by the waterside. Lythrum virgatum Rose Queen is a valuable hardy garden plant ; it grows 3 ft. high, thrives in ordinary
soil, and bears ruse coloured flowers in summer Propagation is effected by dividing the clumps in autumn

LORDS AND LADIES. This is a common name for Arum inaculatum, a familiar wild plant also known as cuckoo-pint, wake robin, and Italian arum.

LORGNETTE. A lorgnette is an eyeglass or pair of eyeglasses made to be held in the hand instead of being fixed on the nose. Tortoiscshell is frequently used for the fittings of long-handled lorgnettes, and gold for the more old-fushioned types, with springs for folding, or hinged between the glasses. These lorgnettes can be fitted with convex glasses for rearling and with concave ones for distant work See Eyeglass; Spectacles.

LOST PROPERTY. The law relating to articles lost and found is, roughly speaking, that a person who finds an article can keep it against all the world except the true owner; but if the true owner turns up he can either clain the article or its full value. An honest man who finds anything will endeavour to discover the owner: but in law he is not entitled to any reward, nor even to the expense to which he has heen put.

No one is entitled to anything found on someone else's ground, not even if that ground is a railuay station or a railway carriage. Articles lost in such places belong to the owners of the ground as against everybody except the true owners. In London and a number of other large towns there are local latws making it ohligatory on the conductors of omnibuses and drivers of uther public vehicles to take any articles they may find to a police station, and at Scotland Yard there is a special department to deal with property lost within the London area. Individuals who find lost articles often take them to a police station, while those who have lost valuables may offer a reward for their return, publicity to this being given by the police. Anyone who keeps for himself any article he finds, believing that the owner could be found, is guilty of theft.

Railway companies have lost property offices where application should be nade by persons who have lost anything while travelling, or left it in a railway carringe. The lost property will be returned to the applicants on payment of a fee.

LOTION. A liquid preparation of a drug for external application is known as a lotion. It is made to dry quickly by adding alcohol, and slowly by the addition of a little glycerin. lotions are classificd as antiseptic, antipruritic, astringent, soothing, and atimulating.
To apply an antiseptic or other lotion, soak a piece of lint in it and lay the lint on the part with the smooth part downward. Over this place n picce of oiled silk or other waterproof material, which must project about $\frac{t}{\text { in. all }}$ round the lint. Cover with a laver of cotton wool and bandage Antiseptic lotions are also used to cleanse ulcers and wounds, $n$ piece of lint or sponge being dipped in and then squeczed over the wound.

An evaporating lotion is used for conling some parts of the body. It may be very grateful in lieadache, especially brow ache, in sprains and strains, and in scute infainmation of the skin from whatever cause. Alcohol or weak acetic acid or vinegar in water is generally employed for the purpose.

LOTTERY. A lottery is a distribution of prizes by lot or chance. If there is in the scheme such an element of skill ns removes the matter from being an affair of chance entirely it cerases to be a lottery. A sweepstake where the names of the winners were drawn by pure chance, is a lottery, and the courta have held that a competition in which the names of the winners in a race were to lic correctly given in a coupon is a lottery and therefore illegal.

As it is an offence to hold a lottery at all, it is also an offence to advertise a lottery, or print or otherwise be concerned in the publication of the proposals for a lottery. Any. hody who publicly or privately keeps any oflice or place wherein a lottery is carried on, or knowingly permits a lottery to be carried on in his house or any room or place occupied by him, is liable to a penalty for each offence to $£ 500$, to be recovered at the suit of the Attorney-General, and he is also liable to be dealt with on summons as a romue and vagabond (penalty $£ 25$ or threc monthas hard labour). It is also an offence to sell any ticket or share in any foreign lottery, or to print or publish any notice relating to it.
The Lottery Act applies just as much to lotteries which are organized for the purpose of charity, or to raffles at bazaars, as it does to any other form of lottery A real skill competition is permitted, but a mere alfair of chance is forbidden. Nor does it make any difference whether or not the prize is to be given out of the money contributed by those who take tickets, or is given by some person who has no interest in the affair.
A Legal Lottery. By the Art Union Act. 1846, a genuine association for the purchase of paintings, drawings, and other works of art, which are to be afterwards allotted and distributed by chancc or otherwise amongat nimbers, subscribers, or contifutors as prizes, is legal although it is a lottery. See fiamhling.

LOTTO. This gaune is played with oblong boards or cards and counters. The cards are divided into $2 \overline{7}$ spaces, ! in a rosv. Four in each row are blank and the other live are marked with numbers, which may be any figure up to 90 . The 90 counters are wooden or ivory pieces, marked from 1 to 90.
The players take one or more cards each, and the banker shalies the counters one by one from a bag. As each falls he calls nut the number, and the players who have that number on their cards mark it, usually by covering it with a counter. This continues until one player has covered all the numbered squarcs in one row on his card.
LOUD SPEAKER. This is an apparatus which converts the electrical energy in the output circuit of a wireless receiver into sound vibrations. It is designed to handle relatively large inputs, so that the volume of sound may be comparable with that of the original. Loud speakers may be divided into two main types, the cone and moving-coil.

Cone Loud Speakers. These are sometimes called the moving-iron type, and comprise armature or reed magnetically balanced between the pole pieces of a permanent mingnet system. The reed is connected to a metal rod, which projects through the apex of a cone of stiff paper, or other material, where
it is held fast by means of a small serew or nut. The cone is mounted at its periphery on a ring (or number of atrips) of some material such as thin rubber, kid glove leather, etc., which is also attached to a supporting framework sometimes forming the baffle. The cone is thus frec to move in a horizontal plane in sympathy with any movements of the arma. ture or reed. The electrical impulses in the out put circuit of the receiver pass through the windings of the "speech" coils and produce varying movements of the armature, which are transmitted by way of the metal rod to the conc.
Cone loud spenkers aresensitive, and givegood results. although careful design is necessary if ohjectionable resonances are to be avoided. The diameter of the cone has a marked effect uloun the reproduction. Too large a diameter may cause bass resonance and hoominess with a poor high note response, while too small a diameter may give a high pitched effect, and lack of bass. A large haffle improves the low notes. It is essential that the metal rod should be sccured tightly to the apex of the cone, ollierwise unpleasant "ditliers" may necur when the loud speaker is in operation. Some cone units have a nieans of adjusting the position of the armature in relation to the niagnet poles, and the adjusting knob or screw should he carefully rotated to give maximum sensitivity
Moving-Coil Loud Speakers. Coil-driven cones are capable of giving reproduction of the highest quality, but are more expensive than the reed types A small circular former, "jon which is wound a number of turns of fine copper wire, is attaclied to the apex of a cone, and is accurately centred between the pole pieces of a powerful electro- or permanentmagnet system. The cone is attacherl to a supporting framework, as in the type described above. The electrical impulses in the output circuit of the receiver pass through the coil winding and produce movements of the coil and attached cone.

Moving-coil loud speakers are obtainable in three types, viz. permanent magnet, battery operated, and mains operated. The permn-nent-magnet models require no external source of supply, whereas the battery- and mainsoperated types derive the energising current for the magnet from a 4- or 6-volt accumulator or from the mains respeotively. Tho moving coil may be wound to have either a low or high resistance, low-resistance coils being employed in conjunction with a step-down transformer. A baffle is cssential for goud low note response. See Filter; Wireless.

LOUIS STYLE: In Furniture. This ceneral term is applied to the four styles of furniture and decoration which were produced in France during the reigns of four of the Ionis, namely-XIII, XIV, XV, and XVI.

Loud Speaker. Fig. 1. Cone type of apparatus, with large conical diaphragm.

Louis XIII. The style Louis XIII, or Louls Treize, was a reaction from that of the previous reign with its superabundance of carving and painting and rich ornament created and revived by the Renaissance. Louis XIII chairs were small and rectan. gular in contour, with slight frames of wonds covered by well-padded velvets, tnpestries and embroideries, fastened by
round-headed brass nails. The arms of the clairs, however, were rarely panded: the legs were joined by stretchers. Large armoires or wardrobes, chests of drawers and knec-hole desks were embellished with inlays of coloured woods, ivory and bone, depicting llowers and birds. The walls were panelled and adorned with ntirrors. This particular style corresponded in period to the early Iacobean in England, hut was far less severe.

Louis XIV. The Louis Quatorze ( Iouis XIV) style is a heavy classical one. The furniture was overlaid with carving, rich inlays and heary carved metal mountings after the designs of Buhl. Some magnificent pieces were made in this style. The chairs had tall backs, square or $V$-shaped; the cabinets were large, glazed and often bowed. The sofas were ample

Louis Style. Fig. 1. Clock of the Louis XIV deriod.in a babl and ormolu case. Fig. 2. Commots
Louis Style. Fig. 1. Clock of the Louis XIV period, in a babland ormolu case. Fig. 2. Commots

ia size, and for them rich brocades and tapes- prototype of many pienes in anites designed for trics of baroque designs were used. Fig. I drawing rooms and labelled Louis Style. shows a clock of this period with its Horid design, classical pilasters, baluster rail and Buhl case with ormolı mounting. Louis XIV wtyle grently influenced English, furnishing and decoration during the reigns of Charles 11 and lames 11. The period concluded approximately with Queen Anne style in England.

Louis XV. Louis Quinze (XV) is the rococo atyle. The wood was heavily carved, or covered with composition moulded into enrichments of rocke, shells, waterfalls and scroll work: among the latter doves, cupids, and lieads and busts of women, terminating in foliage were prominent. Much of the furniture is gilded or painted in delicate tints.
Other pieces were veneered with marquetry and decorated with heavily chased ormolu mountings as seen in the commode in Fig. 2. The chairs and couches have swecping curved bacis upholatered with tapestries, having Howers, figures, or animals worked thereon, or in Howered brocades. The woodwork is gilded. Corner cabinets and little round tables were also produced in this period. These are enriched by inlays of birds, figures and landscapes carried out in tinted and stained ivoods. Louis XV style was often too exaggerated and florid for real beanty. It corresponded in period with the mid-Georgian in Eingland, but lacked the fine designs of the best English furniture and decoration of the time.
Louis XVI. In the style Louis Seize (XVI) a ppear rectangular panela having simple mouldings and fluted columne, with quill and liusk fillings. Dainty ribbons and bows in urmolu and marquetry aurround riohly painted

The marquetry of the period was executed with extrnordinary amoothness and finish, and the mounts of gilded bronze, which were

the leading characteristics of most of the worl: of the 18th century, were finished with a ininute delicacy of touch The famous 18 th century English cabinet makers were not greatly influenced by the Iouis styles, although Chippendale furniture certainly frequently shows Louis XV ornamentations. Sec Buhl Chipliendale: Jacobean; Trpestry.
LOUNGE: How to Furnish. Unleas the term is an affectation, to style a sitting room a lounge means that it is furnished with special regard to comfort and relaxation. It is essential that the colour acheme should be restful withnut being depressing and that the room should have a cosy, homely atmosphero about it, as it often takes the place of a mmok-ing-room and combines a card-room with inl informal sitting room for general family use In country or large detached houses the lounge is usually either an extension of the hall, or a spacious and pleasant room with access to the garden. The former type is discussed in the article on Hall. the litter is well represented in our first illustration

With its southern ontlook over the garden and cheery French windows this lounge is furnished in the most reposeful fashion with a number of large armchairs and a coinfortable settce. The velvet chosen for the upliolstery gives a particularly rich appearance and is an ideal fabric for a lounge. This appearanoe is enhanced by the pile carpet with ite unobtrusive border and all over trellis pattern. There is nothing definitely binding to any particular period, either antique or modern, in the room The wide planning of the brick fireplace is in pericet keeping with the rest of the decoration, and the dark note of the woodwork is repeaterl on the ceiling with excellent effect. On either side of the fireplace is a delightful little swindow with a view on to the tennis lawn. Tho lighting is from wall brackets and table lampa
In suoh a sunny room a restful and beantiful colour scheme would be evolved by chorosing soft mignonette greens for the twotoned carpet, the deeper ahade of green for the velvet upholstery, the lighter whade for the wallpaper. Above the mahogany picture rail the frieze and ceiling would be washed with primrose yellow in a clear pale shade The warmth of the briok and the woodwork of the fireplace contrast happily with theas colours, and the printed linen for the ourtains would repeat the mellow tones of the brick in

Lounge. Fig. 1. Corner of room showing result of harmonious planning. The restifalnesj of the longe is enhanced by the velvet uphointery and the freplace nith its little window on either alde Humphrell \& Vera Joet

Loange. Fig. 2. Modern lounge in which severity of Une is delightfully contrasted with richness of furnishing fabrics and the comfort of the divan and settea Humphreu \& Vera Joel
its conventional Horal pattern with touches ol yellow and brown on a green ground.

In the second illustration a different type of lounge is shown, but here agsin the keynote is one of restful ease. Though the divan and settce are severe of outline, in keeping with the simplicity of the style of the roum, they are luxurinusly comfortable. There are no piotures, no frieze or cornice, and no break in colour or glossy texture of surface between the wall and ceiling. These detaila increas the height end apparent size of the mom and emphasize the uncommon design of the windows whioh add great interest to the scheme.

The upholstery in this case has been carried out in a modern heavily ribbed fabric and the curtains are of dull-surfreed silk. The carpet is a velvet pile in modern design. The built-in bookcase, the table and the two lloor standards are finished with cellulose lacquer. With so much glossy paintwork it is ensential that the furnish ing fabrics and carpet whould be mat and soft of texture. The colour scheme for such a severely simple lounge should he striking, and a beautiful effeot would be gained by using a pale French blue for the walls and ceiling, dark grey for the woodwork of the skirting, a rchitraves of doors and windows, r lighter tone of the same grey for the upholstery fabric and the fireplace surround, and three shades of grey for the carpet. The curtains would blend with the scheme by being of shot blue and silver grey silk, but the whole room would be brightened without any disturbing effect in such a reposeful setting, by choosing lacquer red for the colour of the standard lamps, bookcase. table and leather floor cushion. The pleated Inimpshades would be of parchment colour tied with red and silver cords. See Colour Decoration; Hall; Living.Roum.
Louse. See Lice.
LOUVRE. This is a form of ventilator, which may be made in wood, metal, glass, or other material, and consists of a framework across which a number of parallel slats are fixed, so that they incline downwards, the bottom of one slightly below the top of the next.

Love Bird. Specimena of Australian Budgerigar, Dopularly known as Love Birds

The louvre provides a convenient means of ventilation where it is not desired to leave a simple aperture, or to go to the expense of a sash or casenient window.

Louvres are found as ventilators fixed to the top of a roof, and in other exposed positions, as their structure is of a durable character, and calculated to withstand the attacks of the weather. A small louvre panel fixed in a door is a con. venient method of obtaining ventila. tion while exoluding any possibility of vision. Sometimes the word louvre is applied to a form of lantern, placed on the roofs of outbuildings for ventilation purposes. See House; Shutter.

Love Apple. This is an old name for the tomato (q.v.).
LOVE BIRD. This phrase is used, with. out any very exact meaning, for some of the small parrots. They are usually kopt in pairs, although the idea of mutual affection conveyed by the name is without foundation, the birds perching together merely for the sake of warmth. Solitary love birds do not pine ; if the death of one is followed by that of the other it only indicates 1.hat both were unwell together. The hardiest of the love birds is the rosy faced one. These will often breed in captivity, provided they are placed in a roomy aviary. In general, however, love birds are very delicate. The budgerigar is one of the most propular of the love birds. The breeding season is from April to July. See Budgerigar: Parrot.
LOVE IN A MIST This favourite blueHowered hardy annual ( nigella) flourishes in ordinary soil; the charm of the Howers is enhanced by the finely divided leaves which surround them. The best variety is called Miss Jokyll; it han Howers of deeper blue than the typical kind, Nigella damsacena. Seeds are sown out of doors in April where the plants are to bloom in summer, or in early September for spring flowering.

LOVE LIES BLEEDING. This showv. hardy annual (Amarantus caudatus) hears crimson Howers in long drooping racemes Seedlings, usually raiserl under glass in March, are planted out in .lune, but seeds may be sown out of doory in late April and May.

LOVING CUP. The loving cup is a large drinking vessel, usually made of silver, with two handles and somotimes threc, which is filled with wine and circulated at public banquets, each guest drinking and passing it on to his right-hand neighbour.
Certain formalities in the use of the loving cup were formerly more strictly observed than they are today. Each guest as the cup reaches him rises and bows to his right-hasid
neighbour whose duty it is to remove the cover and hold it while the other drinks. When there is no cover it is customary for both the right and left-hand neighbours to atand up. This is a survival of Tudor times. The cup was formerly filled with wine, ale or mead, with a piece of tonsted bread floating on the top; but it now generally contains spiced wine. This cuatom of (lrinking from onc cup) was obsersed at the Jewish paschal supper

Loving Cup. Example of a two-handled loving cup in silver, dating from 1710-11; helght, 7 inches Victoria A Albert Museum

LOWBERRY. This valuable berried fruit is obtained by cross-breeding between the loganberry and the blackberry; the large fruits have a blackberry-like liavour. Ihe cultivation is similar to that of the loganherry (q.v.).

LOWESTOFT CHINA. The porcelain produced at Lowestoft during the later half of the 18th century was of the same type as Bow and Worcester. As there was no factory mark, specimens of it used to be attributed to these works, especially as the Worcester crescent was sometimes copied at Lowestoft. Because of its rarity there are a number of counterfeits of this warc.

The factory turned out bowls and useful services, with blue and red decorations, sometimes with panelled borders containing local scenes. The ware is inclined to be heavy. opaque and vellowish. with a dull and

Love in a Mist. Blooms of the rich blae variaty named after Miss Jakyll

Lowestoft China. Teanot and cupand saucer of the porcelain formerly produced at Lowestoft. It is decorated with a Chinese design of fowers and birds
speckled glaze. Ribbed and Huted cups, decorated with detached or linked sprigs of llowers, besides embossed tenpots, and picces inscribed "a trille from Lowestolt," may be looked for.

An unsolved mystery is the use of the term Lowestaft china for arınorial ware, made and painted by Chinese nrtiste at Canton during the 18 th century, and never imported into or manipulated at Lowestoft. See China

LOW FREQUENCY. This term is ap plied to alternating currents having frequencies up to about 10,000 cycles per second There is actually no definite dividing line between high and low frequency currents, but in wireless the term low frequency is normally applied to those frequencies within the limits of audibility. See Amplifier: High Frequency
LOW TENSION (L.T.). This name is given to the voltage which is applied to the filament or heater of a wireless receiving valve in contrast to the high tension voltage which is applied to the anode. In a battery operated wireless receiver, the low tension battery may take the form of a 2.4 or $\mathbf{6}$ volt accumulator. according to the type of valves used. In the case of an "all mains" recciver, the heat current is derived from a suitable low-tension winding on the mains transformer. See Accumulator: Eliminator: High Tension.
LUBRICATION : In the Bome. There are many materials that possess properties which render them peculiarly adapted for certain forms of lubrication. Of these, a mineral oil forms the base of nearly all lubricating oils, the practical value of which depends almost entirely upon the proportion of the constituents and the method of manufac1.ure. Broadly speaking, oil suitable for a cypewriter, sewing machine, or clock is thin, alnost as Huid as water, and very pale in colour. Only the very best typewriter oil should be purchased for lubricating the typewriter, and similarly the sewing machine should be oiled with good sewing-machine oil.
For clock work only the very tinest specially prepared oils should te used. In ordinary household use for such purposes as oiling the beriings of a lawn mower, mangle, or other similar appliance, employed for comparatively light work and during short periods, any good quality light machine oil will. give satisfac. tory results.
Lubricants for Bearing Surfaces. Among lubricnnts used for bcaring surfaces are grajhite, sonpstone, and a variety of others which are used dry. Of these, powdered graphite gives excellent results on cast iron surfaces. Solid lubricants, when mixed with animal fats, grense, vascline, or the like, are converted into semi-solid grease, which may be used for bearings and is cxcellent for small carts
and the like. For some purposes vascine is A good lubricant, especially for slow-moving shafts and bearing surfaces lubricants for high speed bearing surfaces, such as those in a small electric motor, require a thin oil generally an animal oil

Objects made of woud and provided with bearing surfaces, such as the slides or bearers supporting a drawer, may need lubricating This is best accomplished by the use of dry graphite, but in practice it can seldlom be used as it tends to soil anything which comes in contact with it. Alternatively, French chalk, fuller's earth. or powdered tale can be employed for the purpose

The lubricating of geir wheels is difficu!t when they are not enclosed in a greaseprouf gear-case. If they do not revolve at a high speed they can be treated either with griphite in the form of a paste or with a heavy gear oil
ahout the thickness of stiff treacle. ()n small geare vascline will often give goud results.

In using lubricants for any machine in the home it is best to wash out the beatring surfaces occasionally with paratlin, wipo the exterior clean. and oil the bearings with Iresh oil. Run the machine for a minute or two to make sure the paraltin is entirely disposed of and that every part is properly oiled Again wipe all the exterior dry and apply a few drops of new oil, which will keep the bearings in good condition and add th the life of the machine. When the bearings are to be ailed the oil holes should be cleaned out before applying the lubricant, otherwise grit and dirt are washed down into the bearing and set up a grinding action which tends to destroy it. Lubricating vils should be kept in closed contuiners and stored in an equable tempera. ture See Bicycle: Oil

## LUBRICATION FOR MOTOR VEHICLES

How to Keep Car and Cycle in Good Running Order
This article deals with a subject of importance to the motorist. who will find other useful informs. tion in the articles Motor Car: Motor Cyele and Motoring. See also Gear: Live Axle, etc.

In all modern motor car engines the lubricating oil is circulated by a pump iutomatically operated by the engine. This pump which is usually little more than two gear wheels enclosed in a case, draws the oil from the crankicase sump, or a tank. and delivers it under pressure to the insin bearings

The methods employed for ensuring adequate lubrication vary in prinoiple and detail, but roughly they may bs divided into three classes as follows
(1) Circulating Splash (sometimes called pump-and-trough). In this system the pump delivers the greater part of the oil through suitable pipes or passages to a series of troughs arranged in the crankicase below the path of the connecting rod big-end bearings. Attached to the lowest pirt of the latter is a small dipper which picks up the oil in the trough and throws it so that, as this is being repented several hundred times a minute, the moving parts of the engine are working in an oil mist. Sume of the oil falls into troughs attached to each main shaft bearing, to the camshaft bearings, and to others feceding the valve tappets. Again, a quantity of the oil falls into holes on the big-end bearings and into troughs at the lower enils of the cylinder bores and pistons, which carry the film of oil up the cylinder walls, while the lubricant which has been splaslice into the pistons serves to lubricate the small-ends of the connecting rods.
(2) Splash and Pressure. This is n system nlso employing troughs under the bigend bearings, but leads from the pump are also taken to the main crankshaft bearings and sometimes to the camshaft bearings as well, thus providing a supply of oil under pressure to these important points. The
eciprocating parts are lubricated in the same manner as described in the circulatingsplash system
(3) Full Pressure Lubrication The pump delivers oil under pressure to the main bearings, nud from the interior of these it pinsses into channels tored in the crankshalt, which communicate with similar channels in the crank pins. Thus the big-ends are lubrieated from within. Similar channels take oil under pressure up ducts in the connecting rols to the sinall-end bearings. Surplus oil from these bearings is thrown off on to the cams, cylinders pistona, etc.
Oil Consumption. The quantity of oil con. sumed in a motor vehicle depends largely upon the size and general efficicncy of the engine, but an average of 1,000 miles to the gallon is regariled as a satisfactory consump. tion in a modern engine. Even if the oil. !evel indicatur in the sump indicates that there is a grod supply after a considerable inileage has been covered, it is desirable to drain the crankease and refill with fresh oil, as oil which has been used over and over again for long perinds loses its viscosity. Moreover, it necones contaminated with particles of carbon nnd with other impurities.

Special oils are now sold which have a high lash point and are known as upper oylinder lubricants. These oils are used alditionally to the main supplies and are usually mixed with the petrol. and so impart to the fuel a lubricating quality which serves to keep the valve stems well lubricated. Scparate containers for this upper cylinder oil are fitted on some cars.

Gear Box and Back Axle. Lubrication of the gear box and back axle (which contains the differential gear) consists mainly of making

Lubrication for motor cars. Fig. 1. Lubrication of the chassis: Tecalemit central asgtem. Arrangement of pumpand
pipes, the latter shown in thick black lines. A, fexible tube from frame to axle. pipes, the latter shown in thick black lines. A, fexible tube from frame to axle. B, connexions to steering wheels
sure that these important parts have an adequate sup. ply of oil. The lubricant ahould never be alluwed to be too much below the level specified by the makers. The level should not fall appreciably in 1,500 miles run ning.

Most cars are equipped with level-plugs (which are removed when filling the gear box or the rear axle to indicate, by overflowing, when the correct level has been reached An excess of oil in a rear axle may cause the surplus to find its way on to the brake drums

also to return the surplus to the outside reservoir.

In two stroke engines it is usually the practice to mix the oil with the petrol, the mixture varying from 30 parts petrol to 1 of oil when the engine is new, to 16 to 1 when the bearings and piaton have been well run in. In this system no other provision is made for lubricating the engine. It is a simple, if crude, method of supplying oil to rapidly moving parta, but is quite satisfactory except that the carburet-
Fig. 8 ter is usually
quantity of luggage carried free of charge, the amount varying with the class of ticket. Anything exceeding this weight is paid for at a fixed rate per lb. Passengers 'are responsible for their own luggage to the extent of seeing that, having been correctly labelled it is put into the right train, but if the company's servants once take charge of a package, the company is liable for its safety.
On most British railways luggage may be sent in advance at a fixed rate per package on production of the passenger's ticket. The charge includea collection and delivery, and notice should be given at least one day before. Travellers by motor coach are allowed a certain amount of luggage, although this is usually confined to suit-cases and bags that can be carried in the hand.
Travelling Abroad. For continental travelling the systems vary. In some countries each passenger is allowed a certain weight of luggage free and pays on the surplus, while in others all luggage except that actually taken in the carriage must be paid for. Luggage can be registered from the station from which the boat-train leaves, and it requires no attention on the passenger's part until he reaches his destination, unless he has to submit to customs and so render the brakes useless. Car ful attention should be paid to woim drive back axles, especially to th se which have the worm on top of the wheel; any shortage of oil here will quickly render the drive inoperative.

Lubrication of the Chassis. Certain bearings on a car chassis require lubricating more frequently than others. The points needing periodical attention are the spring shackles and pins, the joints of the steering rods, the brake operating gear and the front axle steering pins. The modern method of lubricating these parts is through grease-ways supplied with grease by means of a pressure gun. The appropriate grease should be forced into the nipples on the bearings until some of the grease exudes from the end of the bearings.

In some cases there is a sepa. rate nipple which is filled for each bearing, in others several bearings are fed by a group system from single nipples, and in a few from a central point, this feeding all the bearings.

Front wheel hubs require infrequent replenishment, but once every six months they should be given a fresh supply of grease to prevent the balls or rollers on the bearings frum corroding. The steering box, too, should not be neglected, and anould be tith a mixture of oil and grease.
Motor Cycle Engines. Owing to the limited space available in a motor cycle the flywheels of the engine are usually enclosed in the crankcase, and there is seldom ronm for a sump in its base. In most four-stroke motor cycle engines a slow speed oil pump, driven off the timing gear, is used to supply oil in minute quantities frum a reservoir to the crankcase, where it is used on the splash system, or it is carried to the big-end bearing. Hence it is distributed on the cylinder walls, and, through a hole in the partition separating crankcase and valve gear casing, to the valve gearings and tappets.

A few motor cycle engines embody a sump, in line with the practice in car engines, the pump being used to circulate the oil from the sump, through the bearings, and back to the sump. In what is known as the dry-sump system a pump servea to supply oil under pressure to the various parts of the engine and

Lubrication of car engine. Fig. 2. Diagram of fully forced syatem. Crankghaft is sectioned to show oil pasagea Arrowi indicate the path of the oil. Pif. a (above). 8plagh aystem, in which dipper on oonnecting rod cap dips into oil trough. A, oil collector or resarvoir, with feed pipe to bearing. B, oil collector cat in one with bearing
covered with a film of oil. If the engine is examination on crossing the frontier between allowed to stand too long with the supply tap two countries. As a general rule, however, open, there is a possibility of the oil, heavier of course than the petrol, settling in the carburetter and so making starting difficult. Experience has shown that much trouble may be avoided if the supply tap is turned off a little while before the engine is stopped, in order that the float chamber of the carburetter is not left with a supply of the petroil mixture, as it is called.

## L U G G A GE .

 Every passenger by train in Great Britain is entitled to have a certain

Fig. 4. Lubrication of motor cycle ongine. Dry sump asatem as applied to a singlo cylinder j.A.P. ongine Courlesy of the Motor Cycle
topping place.
passenger may take a certain amount of luggage in the cabin, and the reat goes in the hold, the cost of transport being included in the pasarge money The requisite labels are sent by the shipping company. While few people consider it necessary to insure their luggage for an inland journey only, it is, however, a wise precaution to insure it fur foreign travel.

Some Legal Points. The legal duty of the passenger consists solely in delivering his luggage
to a company's servant with directions where he wishes it to go. The company must then label it and send it on and all the passenger has to do is to claim it at its destinstion
The luggage a passenger is entitled to carry free must be peraonal luggage, that is, auch things as are ordinarily taken by a traveller for use as a traveller. If articles of merchandise are delivered to the company as passenger's luggage and are lost, the company is under no liability. They are bound to accept personal luggage up to the proper weight if properly packed, and can refuse to accept a jackage not addressed; but if they accept a package which is not addressed they are responsible for it. It is beat to have luggage put in the guard's van ; for if a passenger takes luggage with him into the carriage, to some extent he relieves the company from responsibility for its safety.

A railway company may make special conditions as to liability for the carriage of luggage by cheap or excursion trains. They are not entitled to make any special conditions exempting themselves from liability when ordinary fares are paid. If a servant carries luggage for his master as his own personal luggage, the master has no claim for its loss ; and the scrvant cannot elaim, because he has suffered no damage

It should be noted that if the passenger has over £10 worth of articles, e.g. jewelry, ctc., in his luggage, and fails to declare them, and they are lost, the railway company is not bround to pay a penny, and the whole loss falls on the owner unless the luggage is insured. See Holidays: Packing: Trunk.
LUMBAGO: How to Treat. Pain in the loins, or lumbago, is commonly due to fibrositis, or inflammation of the sheets of fibrous tissue surrounding and covering the muscles of the back. The fibrous tissue sivells at various points and presses on nerves, giving rise to pain, which may be very sharp.

The exciting causes of an attack are cold. damp, exposure to draughts when perspiring, and muscular strain. Predisposed persons should harden themselves by a daily cold bath or sponging, and by not wearing too warm clothes. But in cold weather the small of the back should be protected.

A Turkish bath will often avert an attack. Rest in bed is advisable. Apply a large, hot linseed poultice, or wring a folded piece of Hannel out of hot water, sprinkle it with turpentine and put it to the back, renewing it as it cools. Dry heat can be applied by half filling a large indiarubber water-bag with hot water and placing it againat the part, or a piece of flannel may be applied and rubbed over with a hot Hat iron.

An attempt should be made to discover the swellings on the inflamed tissue, and these should be kneaded with the thumbs, very gently to begin with, but with inoreasing firmness as the patient is able to bear it.
The bowels must be kept regular by occasional doses of some saline aperient. At the commencement of an attack a powder containing 5 grains each of aspirin and phenacetin may be taken several times at 3 or 4 hour intervals. Friction with stimulating liniments, such as turpentine liniment, or with Chilli paste, is useful as the ncute atage passes.

LUMP. A swelling somewhere about the body is popularly referred to as a lump. In the neck it is usually an enlarged gland, the commonest cause being tuberculosis. A lump in the breasta may be due to inflammation, or to cystic or tumour formation.

Much harm results from voomen delaying too long to get medical advice about such a lump.
In the groin a lump is generally a hernia or rupture, but may be due to enlarged glands or other canses. See Gland.

LUMP SUGAR. Sugar moulded into a loaf or conical shape is broken into cubes and sold as lump sugar. Lump sugar is highly refined and is the purest augar which can be purchased. It is, therefore, most suitable for using either with tea or coffee and also for many delicate sweets, if pounded, sifted, and given the place of castor sugar. See Sugar.
LUNAR CAUSTIC. Nitrate of silver, commonly known as lunar caustic, is used to remove warts and cauterize wounds. In cases of poisoning give a tablespoonful of salt in a pint of water, or the whites of 2 or 3 eggs beaten up in a pint of water See Wart.
LUNATIC: The Legal Position. A lunatio is a person of unsound mind, and under English law such can be put under restraint in an asylum nfter certain formalities have been complied with. There are several forms of procedure in such cases The ordinary method is by n reception order or petition, this being the one usually adopted in the case of private patients where urgent action is not essential.

Four documents are required, these being the petition itsclf, a statement of particulars, and two medical certificates. The petition must be signed, if possible, by the husband, wife, or nearest relntive of the alleged lunatio If this is not done the reason for another person signing it must be given. The signer of the petition must, moreover, have seen the lunatic within 14 days of the rate of the petition. Attached to the petition is a statement of particulars. This inust contain the name, age, sex and occupation of the person with details of his or her present illness and any previous attacks of insanity there nany have been.

Most important are the two medical certificates, one of which should be signed by the usual medical attendant of the alleged lunatic. Each of the medical men must examine the patient, separately from the other, within seven days of the date of the petition.

The Medical Certificate. A medical certificate cannot be given by the petitioner himself, by the superintendent, proprietor or medical attendant of an asylum or home to which the alleged lunatic is to go. It cannot be given by any person interested in the payments on account of the lunatic or by the husband or wife, father or father-in-law, mother or mother-in-law, son or son-in-law, daughter or daughter-in-law, brother or brother-in-law, sister or sister-in-law, or by a partner or assistant of any of the foregoing.
One paragraph of the medical certificate requires two statements: "Facts indicating
insanity observed by mysclf at the time of examination," and "facts communicated to me by others." The statements made under the first heading are the most important part of the certificate, and unless these contain ovidence sufficient to convince an independent reader that the person to whom the certificatc refers is insane the certificate will not he regarded as sufficient. A medical man who signs a certificate of lunacy is not allowed to continue to attend the lunatic. He is not liable to civil or criminal proccedings for any statement made therein, unless it can be proved against him that he has not acted in good faith and with reasonable care.

When they are completed the petition and other documents must be taken hefore a judicial authority, who is either a county court judge, a stipendiary magistrate, or a justice of the peace, specially appointed for the purpose. This authority, if satisfied with the evidence set forth, may sign the reception oriler forthwith, or may appoint a day, not more than seven days after the presentation of the petition, for ita consideration, and may himself visit the lunatic.
Cases of Urgency. When it is urgently necessary, cither for his own safety or for that of others, that a person should be put under restraint at once, the method of procedure is by an urgency order. This may be signed by the hushand, wife, or other near relative of the alleged lunatic. If anyone else signs it the reason for so doing must be given. The person who signs must have seen the lunatic within two days of the date of the order. A person can only lie detained under an urgency order for seven days.
If it is desired to put him under permanent restraint a petition must be presented in the way already deacribed and he can be detained until this is settled. Slightly different forms of procedure are employed in the case of a lunatic who is wandering at large or is a pauper; of one not under proper care or control: or of one who is cruelly treated or neglected by those in charge.

Two commisaioners in lunacy can aign an order for the detention of a lunatic in a recognized mental home even if there is only ollo medical certificate.

When once certified as insane a lunatic must be placed in an asyluin or home that is under the supervision of the lunacy authorities, and if the relatives are dissatisfied with his or her treatment there an appeal can be made to the officials of the Board of Control, whose head quarters aze at (i6, Victoria St., London, S.IV See Insanity.

## LUNCHEON AND LUNCHEON PARTY

## Dainty Catering for Family and Guests

This is a companion article to those in our work on Dinner and Supper. Dining Roon and Table Laying may be further consulted by the housewife. See also the entries on Enbroidery; Glass; Mat; and the articles on Diet ; Food; Pienic: Salad; Sandwich

The family luncheon on Sunday, or everyday where there are children, is a more substantial affair than the light lunch usually served when dinner is the chief meal of the day. The tendency, however, is to simplify midday fare, and, espccially in the sumner, to get away from the heavy joints and puddings associated with the old-fashioned meal. Two or three times a week fish is served instesd of meat for the children, and plenty of stewed fruit or fresh fruit salads and light junkets or custards are aubstituted in hot weather for the suet puddings so valuable as heat producing food in the winter

Variety is essential for healthy enjoyment of meals, and menus can be easily thought out by the housewife before the beginning of each week. The huge Sunday joint which used to supply cold meat on Monday and two or three made up dishes for the next day or two, of little food value in comparison with the
trouble of their preparation, may save a slight effort of imagination, but it is far more profitable and interesting to evolve a series of appetizing and well halanced meals. Such forethought makes all the difference between drudgery and gratifying efficiency.

Children's Midday Meal. Particularly suitable for substantial luncheon dishes in the winter, accompanied by vegetables in season, are beefateak and kidney pudding or pie, Irish stew, casserole stews of oxtail, beef or mutton, freah minced steak, liver and hacon, sausages and mashed potatoes. Boiled cod or hake with egg and parsley sauce, grilled herrings, dried haddock with poached eggs, fish pie and haked whiting fillets, are all excellent sulistitutes for the meat course with or without a nourishing soup, according to the selection of swcet to follow. For instance, if a boiled jam roll or apple pudding is selected, the soup would not be required; but if stewed
fruit or merely an open jam tart is on the luncheon menu, then, on a cold winter's day, Scotch broth or brown vegetable soup will form an admirable prelude to the meal.

In summer egg dishes are light and nourishing for children, particularly in the form of poached eggs on a vegetable such as spinach or runner heans. Nany suggestions for wholesome fish and meat salads will be found in the article on that subject. These are more appetizing on a warm day than hot food. Luncheon in the garden is a pleasant meal to return to from achool, and the service of this is facilitated by a trol. ley wagon laden with one simple hot dish in a casserolc or a substantial cold one, and cold sweets. The inexpensive fruit sets of one big howl with its smaller companions are attractive and useful adjuncts for the summer pudding course out of doors. Iemonade, pineappleade and orangeade are excel lent and popular luncheon heverages.

For children who have to take their hunch to school neat little cases are olstainable either for sand iviches only, or if something more elaborate is required, fitted with cup and saucer in unbreakable ware, a thermos llask and a sandwich tin Some nourishing fillings for sandwiches are described in the article on Sandwich. Oatcake and cream checse, datcs, raisins, celery, tomatoes and apples are all useful varieties of food for the luncheon case. Hot soup in the thermos makes a pleasant change in winter. Cold malted milk or a fruitade, in a wicker-cased bottle, are liked in the summer. A portion of some kind of sandwich calie makes a nice sweet with $\pi$ custarl tart or all iced bun for $n$ change.

The Sunday family luncheon may have to he $n$ more Victorian meal in the larger households. Servants expect it if no one elae does. Even then, cold dishes can be added to the menu in hot weather, joints can he sufficient for the day, the evening supper requiring a certain amount of left-over cold meat. The housewife can also keep her eye open for bargains in poulty and game to substitute for the sirloin of lieef.

Many men if they are at home for lunch on a summer weekilay really prefer a calad, bread and cheese and heer to a made-up, entrée. They will often fancy a dish of hore d'veluvres with a variety of sliced sausnges In winter a good fish or meat curry is an excellent luncheon dish, while many people who prefer a light meal serve a vegetable or macaroni all gratin, or a variety of omelette as the main dish.

Entertaining to Luncheon.
. Many housewivelion friends to meal of dinner than to the more elaborate meal of dinner. Sometimes such a luncheon is given hefore an afternoon's hriilge, or a matinée, at others it is a pleasant way of seeing people who come from a distance. lisitors to luncheon on Nundity entail very
little extra work in the household where a substantial midday meal is usually prepared on that day. It is alnays a mistake to give too formal a character to a luncheon party, and this in itself renders service easy and makes it simple for the hostess to entertain guests in a friendly faahion who are much hetter off than herself. There need be little or no waiting at table.
However simple the fare the first requisite is that it should he good of its kind. the second

Luncbeon. Charming effect on a pulisned table lard with a dainty lace
Courtesy of Welb \& Corbell
that the table service ahould he dainty. Some women prefer the all over damiask cloth, others lace or embroidered mats. As indicated in our illustration, a lace centre and mats show off beautiful glass to perfection, and an antique shade of lace looks particularly well on a dark polished tahle. In this case the table is laid for service from dishes handed round by the maid or from a side table by the hostess. The lace mats are protected by thin cork ones timished in cellulose to match the shade of the table. The effect would he spoilt if another colour intervened.
One solid course is enough as a rule at luncheon, and three or at the most four courses in all. Grape fruit, a fruit cockitail, melon or soup, are $n$ suitalile choice for the first course. Fither of the first two would be served in glasses, the melon on a glass plate, and the soup in cups or small tivo-handled soup howls. Sometimes in hot weather the soup is served iced. One of the small indivilual salads mentioned in the article on Hors d'ocuvres also makes an excellent first course for a luncheon party. Smoked salmon, salmon or prawn mayomaise look appetizing on glass plates.

When fruit is the first course a fish or egg dish niny follow either hot or cold, as taste and season of the year may decide. Veal or lamb cutlets and peas, salmi of game, casserole of chicken, becf tournédos or jugged hare are dishes which obviate the task of carving for the hostess. Vol-au-vent and various patties are often liked. Salads form a most useful series of helpful suggestions for the various courses of this meal. An iced sweet, where this can be made at home, is nearly always apprecinted and petits fours may be served
with it. With regard to beverages, ideas vary. Some people offer red or white wine in the winter, with whisky and beer in reserve for men who prefer them. In summer it is often enough to serve either a cider or a white wine cup, iced lemonade or heer. Many people never take alcoholic drinks at all, others never in the middle of the day. Good coffee should always be provided after lunclieon, and also two or three kinds of cigarettes.

The Luncheon Set. Designs for luncheon sets annsisting of a tahle centre and mats vary greatly in materials, colours and shapes. Sometimes three small mats go to each individual place at the tahle: one for the glasses used, one for the bread plate and one for the plate on which the course is served Sometimes these three are combined in one oblong or oval inat large enough to hold both plates and glass. These larger shapes look particularly well in antique embroidered linen or in coloured linen decorated with applique motifs.

Designs for Irish crochet suitable for luncheon sets are olitainable in various books on crochet and through needlework pattern sarvices. For a cottage set, coloured linen. annvas or raflia cloth mats are charming They may have borders and lloral dosigns embroidered in wool or ratfia. Coloured American cloth hound with bias binding to match and decorated with applique cretome llowers is also a good fabric particularly for an informal luncheon on a garden table or in the loggia.

LUNG. The lungs are two organs conical in shape, and of a spongy and very elastic suhstance. which fill the greater prat of the chest cavity, and which contract or expand as the air is expired or inspired. The air passages in the lungs are termed bronchi. Each lung is surrounded by a double layer of scrous membrane forming the pleural cavity. The right lung is divided into three lobes and the left lung into two It is in the lungs that the blood changes its colour from the dark purpliah red of venous blood to the hright red colour or arterial blood.
Diseases of the Lungs. Acute congestion of the lungs accompanies pneumonia and other inllammatory diseases of the lungs or tubes Passive congestion is common in disease of the heart when the return of the blood from the lungs is obstructed

Bleeding from the lung occurs in pulmonary tuberculosis, pneumonia. infarction and other disorders. An abscess in the lung may occur in pneumonin, in pulmonary tuherculosis, or from einholism.

Bronchitis consists in inllammation of the lining of the bronchi. When one or more of the bronchi hecome enlarged, hronchiectasis is said to be present. Emphysema is the name given to the dilatation of the air cells in the lung. One or hoth lungs may be nfliected.
Collapse of the lung is $n$ condition in which parts of the lung contain no air and are useless for the purpose of respiration. An instance of this frequently occurs in broncho-pneumonin, especially in children, and may be signa!ized hy the child hecoming suddenly very short of breath, while the lips hecome blue. Slonuld this occur, while awaiting the doctor, who should be summoned at once. the child must he placed in a warm bath and quantities of cold water should he thrown on the chest at short intervals, in order to induce deep inspirations See Breathing; Bronchitis : Consumption; Emphysema: Empyema; Inhalation; Pleurisy; Pneumonia; Tuberculosis.

LUNGWORT. This is the common name of a hardy spring-flowering borage-like plant of low growth (pulmonaria), which llourishes in ordinßry soil. The spotted leaves are ornamental. Angustifolia, 12 in., blue;
arvernensis, 9 in., blue; rubra, 12 in., reddish, and saccharata, rose-pink, are some of the chief kinds. They are increased by division in early autumn
LUPIN. The perennial lupin is one of the lovelicst hardy garden flowers of May and June In recent years many new varieties

Lupin. Tall spikes of blossom of the handaome perennial lupin havebeen raised of charming and varied colour ing - yellow, fawn, apricot crimson, rose. pink, eto. Some of them have been given names, but a mixed packet of good seeds will yield varieties of equal value.
The lupin needs deeply dug and man ured soil to be seen at its best; there, in the course of a year or two, it will develop into a large clump and will bear
dozens of flower spikes. It thrives in partial shade or in a sunny place, and is planted in autumn or spring. After a few years the plants are liable to deteriorate, but fresh ones are easily raised by sowing seeds out of doors in May; the seedlings will bloom in the following and succeeding years. Lupins must not be lifted and divided. Two of the best named varieties are Sunshine, yellow, and Downer's Delight, rose and crimson.

The annual lupins are pretty plants, 2 ft . or so high, which bear flowers in blue, rose, and other colours. The showiest is atrococcineus, with red and white blooms. Seeds are sown out of doors in April, where the plants are to bloom in summer
LUPUS. The skin disease known as lupus, which is the Latin word for wolf, received its name from the eating away of the tissues which often occurs in lupus vulgaris, one of the two forms of tho disease. The other form is lupus erythemstosus, which most commonly appears on the bridge of the nose and the cheeks, in what is termed buttertly distribution, covering them with red spots and greyish or yellow shiny scales. Septic conditions of the mouth or poisoning from some other source appears to have much to do with the cause of this form of lupus. The tubercle bacillus is the cause of lupus vulgaris, which is a very chronic form of tuberculosis of the skin.

Treatment consists in destroying the diseased parts by the application of germkilling drugs or chemical caustics, removal by the knifc, light treatment such as lïnsen rays, X-rays, and radium. See Light; X-ray.

LURCHER. Generally a cross between a greyhound and a collie or some other sheepdog, the lurcher scems to unite the virtues of each, with an added spice of mischief. Some are so trained that to all appearances they have nothing to do with their masters if a gamekeeper or policeman happen to be met. A lurcher will hunt for game, catch hare or rabbit. and retrieve it without fuss to the hand of its ouner. See Dog

LUSTRE WARE. Pottery is said to be lustred when a part or the whole of its surface is coated with a metallic film, which imparts to it a refulgent sheen. The earlicst lustre was the
silver. 'The lustre decorntion introduced into Stafordshire in the 18th century is seen st its best in some Wedgwood ware, and was manufactured at Newcastle, Sunderland, Leeds. and Swansea. It was produced by means of solutions of metallic salts, principally platinum, which gives the so-called silver lustre, gold. which is the basis also of metallic pinks and purples, and copper. Sometimes the whole surface was coated in order to impart the appearance of plated ware, a style which went out of use when electro-plating was intro-

Lustre Ware. Two-bandled goblet. dating from abont $1850^{\circ}$ duced and electro-p ated ware became popular. of the same type
churchyards, but in domestic architccture they form an ornamental approach to a house. A lych gate which the home worker can easily construct is shown in Figs. 1 and 2 The necessary dimensions are indicated on the diagrams

The best wond is oak, but well seasoned deal may be used. Such a structure, if roofed with dark red sandfaced tiles and neatly finished, forms an attractive external feature of the home. Fig 3 shows a chequerboard lych gate used in conjunction with fencing (yed and electro-p ated ware became popular. of the same type. See Gate: Roof.
Bismuth was used in Paris for producing an iridescent film resembling mother-of-pearl, and pearly ware of similar appearance is well known to collcctors of Belleek and late Worcester. These modern English wares. as well ns the oheap continental productions of Belgium, Holland, and elsewhere, lack the true refulgence and gleam of the older lustre pottery. But apart from thesc there are available admirable reproductions of much excellence, both from modern Italisn studios, and also among English craftamen, whose work inay be collected
Lustre decoration tends, more or less, to wear off. It should be cleaned with great care, without the use of hot water. The silver lustre made a century ago is sometimes resilvered, when intended for occasional use
LYCASTE. This beautiful and easily managed winter and spring-Howering orchid can be grown in a greenhouse having a minimum winter temperature of 50 degrees. It should be potted in a mixture of loam, neat and sand and is propagated by division as soon as the flowering season is over. The favourite kind is Lycaste skinneri, which has blooms of deep blush or rose-red sliade: the white variety, alba, is beautiful. Nany others are in cultivation

LYCH GATE. A lyoh gate is a covered gateway to the entrance of a building. Ex amples are often found at the entrance to

LYCHNIS. This is the botanical name of a group of hardy sunimer-flowering plants which includes many of considerable garden value. The Jerusalem cross (Lychnis chalce. donica), 3 ft . high. with scarlet llowers, is a favourite border plant. Lychnis (agrostemma) coronaria, 2 ft. , which lias grey leaves and carmine flowers. is a splendid plant for the shady border. Haageana, 12-15 in. high, is very handsome; it needs well drainel, rather light soil; there are soveral varieties of this with tlowers in scarlet, rose and other colours Viscaria (fl. pl.), 12 in ., with rose-red flowers, is very showy. Alpina, $4 \mathrm{in} .$, reddish, and lagsacae, 4-6 in., rose, are suitable for the rock garden. The double white variety of Lychnis vespertina has fragrant Howers. Lychnis flos-cuculi is the wild ragged robin. Although the perennials may be increased by division in early autumn, the best way is t o raise them

Lycb Gate. Fig. 1. Lych gate with a tiled roof which can be easily built by the amateur worker. Fig. 2. Working diagramagiving dimensions. Fig. 3. Cbequerboard lych gate constracted in sections

Fig. 3. courtes, of T. \& C. Associuted Industries, Ltd.
from seeds sown in boxes of soil in a frame in May The annual oampion (ooeli-rosa). 15 in., which bears rose-purple flowers, is sown out of doors in spring for summer bloom.

LYCIUM. The box thorn is a quick. growing hardy shrub with alender branches, especially well suited to seaside gardens. Lycium chinense, the favourite kind, has small purple flowers followed by red fruits. Propas. gation is by outtings in autumn or by seeds sown in a frame in spring.
Lycopersicum. This is the botanical nume of the tomato (q.r.).

LYCOPODIUM. Lycopodium, or club moss, is the name of a group of hardy and greenhouse perennials of somewhat moss-like growth. The hardy kinds, e.g. clavatum and alpinum, need moist peaty soil in the bog garden or rock garden. The greenhouse kinds need peaty compost and moist shady conditions; densum is one of the best.
LYE. The cleansing substance, or bleacher, known as lye, is a solution obtained from ashes or from substances which contain alkali, and is used in the preparation and making of soap, and as a detergent. A useful lye can be made from two parts of salt and one of caustic soda. These are mixed dry, and then diluted with water, the solution being employed for scrubbing or scouring purposes As caustic soda has an injurious effect upon the skin, the hands should be kept free from contact with the solution. See Bleaching.

LYGODIUM. This is a climbing fern suitable for cultivation in a heated groenhouse in a compost of half loam and half peat with annd mixed in. The favourite kind is Lygodium scandens; it miny be trained to cover a pillar or wire trellis.
LYSOL. One of the cresol antiseptios derived from coal tar is lysol, which is used in the home as a disinfectant. A 2 per cent solution in water is commonly made. The strong solution is very poisonous. In cares of poisoning, while awaiting the doctor, white of egg or oil may be given, but wat water. See Antiseptic ; Cresol: Disinfectant.

MACARONI: How to Cook. Macaroni is made from wheat finely ground and made into astiff paste with water, which is squeezed out into long pipes through n hollow, cylindrical vessel During this process the macaroni is partially baked, and is afterwards allowed to dry over artificial heat or in the sun.
Macaroni is cooked by being plunged into boiling water, which must continue to boil quickly, and should be well salted. About half an hour is the time usually required for boiling. The pipes should keep their shape and be quite soft. The macsroni is then draincd and is ready for use.

For thickening soup, use 2 oz cooked macaroni to about a quart of stock. It should be added to the soupalmost at the last, brought to the boil, and boiled for about 5 min

Macaroni with tomatoes makes a nutritious dish. Boil 4 oz. macaroni and make a tomato purée by rubbing a tin of tomatoes through a sieve. Iet it boil up with a tablespoonful of butter melted with the same quantity of flour and seasoning. Add the macaroni and boil it up. The macaroni and tomato can be put in a greased pie-dish with breadcrumbs and lumps of butter on the top, and placed in the oven for about a quarter of an hour

Macaroni also combines well with fish. Have ready any boiled white fish and flake it, removing all bones and skin. Boil the macaroni, using about $\frac{\mathrm{lb}}{\mathrm{lb}}$ macaroni to 1 lb . fish. Grease a pie-dish and place in it first a layer of tish then a layer of macamonif continuing these layers until the diah is full. Seasoning should be sprinkled over each layer. Add a aprinkling of grated oheesc and
breadcrumbs on the top, and a few lumps of butter and bake it for about 20 min

Another appetizing dish consists of boiled macaroni and kidney. Split and skin threc sheep's kidneys, and fry them in 1 oz. smoking hot butter; then lift them out, and in the same fat lightly fry a tablespoonful of chopped

Lggodium. Foliage of a climbing fern which is effective for training up a pillar
onion. Stir in 1 oz. Hour, and when the mixture is deep brown add the water in which the macaroni was cooked. Stir the whole until it boils and forms a smooth sauce; then strain it into a saucepan and add the macaroni and the kidncys cut into quarters. Season and simmer for 10 min , then serve on a hot dish.

Macaroni cooked according to Italian methods may be prepared from $\frac{1}{2} \mathrm{lb}$. macaroni, 4 oz grated cheese, $\frac{1}{d}$ pint tomato pulp, 1 oz. butter, and seasoning to taste. Break the macaroni into 2 in . lengths, put these into a saucepan of rapidly boiling salted water and boil $30-45 \mathrm{~min}$. Strain off the water, and add to the macaroni the sieved fresh or tinned tomato pulp, and a little seasoning.

Cover the pan and atir its contents over a low fire until the macaroni has absorbed suffioient tomato pulp to render the mixture thick and oreamy. Add two-thirds of the cheese and butter and turn the mixture into a greased fireproof dish. Shake the remainder of the cheese over the top, and place here and there amall pieces of butter. Bake the whole until the top is lightly browned, and then serve it with bread and butter.

A good cold sweet in which macaroni is an important ingredient is made by placing in a deep glass bowl alternate layers of stewed fruit and juice and cooked macaroni cut into short lengths. About two breakfastcupfuls fruit and 4 oz . inacaroni will be required Let the last layer be of macaroni, and over this pour $\frac{1}{2}$ pint of custard. sweetened and thavoured to taste. Decorate with glacé cherries.

Macaroni Cheese. A popular way of cooking macaroni for a savoury dish is to make macaroni cheese, or macaroni au gratin. For a dish to serve 4 people, boil 4 oz macaroni till tender, and break it into small pieces after draining well. Melt 2 oz butter and stir in a tablespoonful of flour. Add a pint of milk and bring to the boil, stirring all the time. Add 4 oz. grated cheese and stir until it becomes soft. Season well, and stir in a teaspoonful of made mustard. Grease a pie-dish and place the macaroni in it. Pour the oheese mixture over it and sprinkle the top with breadorumbs, grated cheese, and two or threc lumps of butter Bake in a quick oven until brown, and serve very hot.

Macaroni Pudding. To make a baked macaroni pudding, boil until tender l oz macaroni in a pint of boiling milk. Then draw the saucepan to the side of the fire and add 2 well-beaten eggs, sugar to taste, and any desired flyvouring. Stir over gentle heat for a few minutes, then put the mixture in a greased dish and bake for about $\downarrow$ hour in a slow oven
MACAROON. The almond-flavoured biscuit known as a macaroon is madu by mixing $\frac{1}{2} \mathrm{lb}$. ground almonds with 1 oz rice Hour and 10 oz. castor augar, and adding the whisked whites of 5 egge and a few drops of Havouring Sprend the mixture evenly on wafer papers, using about one dessertapoonful for each macaroon. Blanch $\underset{1}{ } \mathrm{oz}$ of sweet Valencia almonds, split each into four, putting a piece in the centre of each macaroon after brushing the latter over with water. Bake the biscuits in a moderately hot oven for about 20 min .

Macaroon Jelly. A pint packet of red jelly, some macaroon biscuits and fruit are the chief ingredients required for this swect. Arrange 8 medium-sized biscuits in the bottom of a glass or silver dish with a few small pieces of tinned pineapple and a banana split into 6 Dissolve the jelly in a pint of hot water, pour this over and leave the whole to set. Whisk the white of an egg to a stiff froth, and mix it with a gill of whisked cream, adding a dessertapoonful of castor sugar. Shake this on top of the jelly and in the centre place glace cherries and a few pieres of pistachio nut.

Macaroon Tart. Line tartlet tins with short pastry. In the bottom of each tart put a teaspoonful of jam, cover it with the macaroon mixture, as given for making macaroon biscuits, and hrush over the top with cold water. Cut some small thin strips of pastry, place two across each tart, anil bake the latter in a hot oven for 15 or 20 min . See Pastry.

Macaroon Tarts, a popular pastry for Sunday supper
MACARTNEY ROSE. This vigorous, almost evergreen, rose (Rosa bracteata) was introduced from China by Lord Macartney. The Macartney rose bears large single white flowers and is suitable only for planting against a sunny wall.

MACASSAR OIL. A good hair-dressing of this type can be made as follows: Reduce 1 oz. alkanet root to a coarse powder, in an iron mortar, and pour upon it 1 pint pure olive oil. Warm the oil. stir it occasionally, and, after an hour, strain it through fine muslin. When the oil, now coloured red, is cold, add the perfume, which is made in the following way : lemon oil, 15 drops; cinnamon oil, 10 drops; clove oil, 10 drops; and geranium oil, 2 drops.

MACE. Similar in its propertics to nutmeg, mace is a highly aromatic condiment that is procured from the membrane surrounding the shell of the nutmeg. It is prepared by aeparating it from the nutmeg as soon as the latter is ripe, and is dried by the sun and pounded to powder. Mace is chiefly employed in the flavouring of наvouries. Sce Nutmeg.

MACEDOINE. This term denotes a mixture of vegetahles or fruit, usually cut into dice or small pieces. Macedoine of vegetables, which is sometimes used to garnish meat, can be bought or made at home from carrot and turnip cut into dice, fresh or bottled green peas, French beans cut into short lengths. All these must be cooked before being cut up, and then re-heated together in a little butter, and seasoned to taste. If a cold dish is being prepared, they may be mixed with mayonnaise instead of butter.

Macedoine of Iruit consists ol grapes, tinned pears, apricots, pineapple, etc., cut into amall pieces, and set between layers of jelly. See Jelly.

MACKEREL : How to Cook. This fish should never be eaten unless absolutely fresh; it is in scason from June to August. When fresh, the fish is a beautiful bright colour, the flesh is firm, the eyes clear, and the tail stiff and unbending. It can be cooked in a variety of ways, and the roe should be served with the fish or added to the sauce.

Baking is a favourite method of cooking. Use two good-sized mackerel and olean them, removing the heads and roe. Boil the roes in salted water, then chop them, mixing in a tablespoonful of chopped parsley, a sprinkling of thyme, and pepper and salt. Add half teacupful breadcrumbs and bind all together with a beaten egg. Split the mackerel and stuff with the preparation. Brush the fish with olive oil or melted butter, cover it with breadcrumbs and bake it until it is nicely browned. Serve with anchovy sance.

To broil mackerel, clean and wipe the fish and split it down the back Wipe a little olive oil over the fish, and smear the bars of the gridiron with suct. Rub over the back of the mackerel a little chopped parsley mixed with a nut of butter. Broil slowly over gentle heat for about 20 to 30 min Serve with fennel sauce.
To fry mackerel, prepare the fish as for broiling, sprinkle it with Hour and fry it in butter, over gentle hieat, until nicely browned on both sides. Serve with anchovy or bechamel sauce, or with parsley butter. It can be fried in fillets; these should be dipped in egg and hreadcrumbs befure being fried
Soused Mackerel. Prepare four mackerel by cleaning them and splitting them through the midille and removing the backbone. Cut each fillet into three or four pieces. Season with salt and place in a fireproof dish with 12 poppercorns, 2 bry leaves, 1 blade mace, 2 cloves, and 1 teaspoonful salt. Cover with equal quantities of vinegar and water. Cover the dish, bake slowly for $1 \frac{1}{2}$ hours and serve cold in the vinegar.

Preserving Mackerel. Mackerel can be preserved in districts where there is a glut of fresh fish in the following way: Clcan the fish thoroughly and either fry or boil it. Divide the fish, removing the heads, bones, and skin. Rub over the Hesh with the following mixture For each dozen fish use 3 tablespoonfuls salt, $1 \frac{1}{2}$ oz black pepper, 6 or 8 cloves, a sprinkling of mace and of nutmeg. Cover the whole surface of the fish with the seasoning, and pack the fish in layers in a stone jar. Cover all over with good vinegar, and, if it is wished to keep the fish for some time before being used, pour salad oil or melted suet over the top of the jar. Do not use a glazed jar, as vinegar acta on this in an injurious manner See Fish; Sauce.

MACKINTOSH. A mackintosh may be washed by first soaking it in cold water, spreading it on a inble, and then scrubbing it with houschold soap Rinse the mackintosh by dipping it in a tub of cold water, shake, but do not wring it, and let it dry on a coat-hanget either out of doors or near an open window.

Mackintosh aprons, provided with a shiny white rubberized surface, which can be easily kept clean with a damp cloth, are worn by mothers when bathing babies; and it is usual to make up the cot of a small child with a mackintosh sheet immediately under the blanket as a protection to the mattress. See Baby; Rubber.

MACRAME WORK. One of the oldest forms of lace-making is that known as macramé. Macramé twine, a varicty of linen thread, is specially made for this work, which is done on a cushion or board. Some workers use a shallow box, measuring about 20 in . long by 10 in . wide. In this must first be placed heavy leaden weights, then a bag made of unbleached calico, and covered with colnured sateen. The bag is stuffed tightly with bran, and fits firmly and tightly into the box, reaching a little above it. Macramé frames may be purchased, but the box makes a good substitute. It is also possible to use a smooth piece of hoard, about a yard long and $8-10 \mathrm{in}$. wide, and fit it at each end with small, strong screws to hold the thread.

A few glass-headed toilet pins are sometimes used to keep the thread in position, and a large crochet hook to pull the threads under each other. If fine twine is used, all foundation threads should be double. Fasten the first cord lengthways across the board or frame by tying it round the screws or pegs.

To put stitches on, fold together the two ends of a length of twino, pass them up and under the first foundation cord, bring the ends down over it and through the loop thus formed. Draw then down lightly, and fasten as many in this manner as are needed for the length of work: then put another foundation cord just below where the threads are fastened on to the first one. Knot them on to this by taking the first thread in the right hand, passing it over and under the second foundation cord, and through the loop formed. Draw it up tightly, and do this to all before commencing the pattern

The single-knotted bar, one of the simplest patterns, is worked thus. Having got the threads knotted on the foundation cords, hold the first thread in the left hand atraight clown, take the second thread in the right hand, and pass it over the first one, under and up through the loop thus made. Then hold the second thread in the right hand, and work the same stitch with the left hand (first thread). Repent this alternately for the length required, drawing each stitch up tightly as it is made.

Macramé twine in bright colours can also be knitted or crocheted into various articles, such as shopping bags or table mats. See Crochet.

MADAPOLAM. A plain cotton fabric generally sold in the bleached state, madapolam is heavier than cambric and finer than long-cloth, being made from line-spun and good cotton

MADEIRA : The Wine. It is said of madeita that it can never be drunk too old. It is a rich and generouso wine with nutty aromn, owing its excellence to the climate of the island of Madeira, as well as to the black and white grapes from which it is made. It contains from 16 to 20 per cent of alcoliol.

Madeira is served with soup, especially turtle soup, and with fish, and may be drunk instead of port as a dessert or after-dinner wine in hot weather. The hest sweet variety is Malvoisie. White Sercial is dry, and a richer sort is Bual Madeira. See Winc.

MADEIRA CAKE. Madeira cake is made from $\frac{1}{2} \mathrm{lb}$. butter, 10 oz . castor sugar, 1 lb . Hour, (i eggs, a fow drops of lemon essence, a thin slice of citron peel, and a pinch of salt. Cream tho butter and sugar ; then add the Hour and eggs alternately, beating thoroughly after each addition. Mix in the salt and lemon
essence, and beat well for a few minutes, afterwards pouring the mixture into a wellpapered and greased tin. Bake in a moderate oven for $1 \frac{1}{2}$ to 2 hours and, when half-oooked. place the peel on top.

MADEIRA VINE. An attractive half. hardy climbing plant, the Madeira vine beary fragrant llowers during autumn, and reaches a height of about 8 ft . It is most suitable for greenliouse culture, but will grow on a south wall outdoors during a warm summer. The plants are raised from tubers planted in a temperature of $55^{\circ}$ during February.

MADELINE CAKE. Small fancy cakes conted with jam and desiccated coconut are made thus: Sicve together $\& \mathrm{lb}$. Hour and $\frac{1}{2}$ teaspoonful baking powder, and beat $2 \frac{1}{2} \mathrm{Oz}$ margarine or butter to a oream with

Madaline Cakes, coated with jam and coconut, a popular cake with children
the weight of 2 eggs in sugar. To the latter mixture add 2 egga, beating each in separ. ntely for about 10 min . : then fold in the flour and add a little milk. Stir the misture lightly and put it into some greased tin moulds similar in shape to small Hower-pots Bake the cakes in a bot oven for about 12 or 15 min ., until they are lightly browned and spongy to the touch, and leave them to cool un a sieve. Heat about 4 tablespoonfula jam, thinning it down with a little water if necessary, and then rubbing it through a sieve. Brush it over the tops and sides of the cakes, and cont the sides with coconut. The top can be decorated with lialf a glacé cherry.

MADONNA LILY Onc of the uldest and loveliest of lilies (Lilium candidum), this has been cultivated in British gardens for more than 30() years Tho fragrant white llowers on stems 3-4 ft. high open in June. See illus. p. 723.

Madwort. This is another name for the perennial yellow alyssum (q.v.)

Magdyno. See Magneto.
MAGGOT. The larvae or naggots of various Hies do much damage to garden plants and crops, e.g. onion, chirysanthemum, carrot, pea. carnation, marguerite, and cineraria The best preventive treatment is to spray the plants with an evil-smelling insecticide such as paraffin emulaion for the puryose of keeping away the flies.

MAGIC HUNDRED. This puzzle oonsists in arranging the numbers from 1 to 100 in ten rows in such a fashion that the total of the numbers counted in any one of three ways, horizontally, vestically, or dingonally, shall be exactly ro 5 .
The principles upon which the solution is based are fairly easy to remember if the rows are numbered. The horizontal rows sliould he numbered 1 to 5 from both top and bottom. The rows numbered 1 contain the numbers between 1 and 10 and bitween 91 and 100 ; the rows numbered 2 contain the numbers between 11 and 20 and between 81 and 90 ; the rows numbered 3 contain those between 21 and 30 and between 71 and 80 ; the two
rows 4 contain those between 31 and 39 and hetween 60 and 70, except 61 , which is compensated for by the presence of 41 . The rows marked 5 contain the numbers between 42 and 59, and also 40 and 61 .

The vertical rows may he lettered $A, B$, (: D, E from each end. In this case it will lic seen that the unit figures in the $A^{\prime}$ 's are noughts and ones; in the B's they are twos and nines; in the C's they are threes and eights; in the D's they are fours and sevens, and in the F.'s they are lives and sixes. To solve the puzzle the figures should be arranged as shown, and when added up in any direction the result will be 505 .

MAGIC LANTERN. Isntern used tor throwing picture.s on a screen. There are both atandard and toy lanterns, but the principlea are the same in both. They are now better known as optical Innterns. See Iantern Slide; Optical Lantern.

MAGIC MUSIC. In this game one person leaves the room, whide the others hide a thimble or any other amall article. The absent player then returns, and his business is to find the article He is assisted by someone playing the piano. the music being very soft when he is far from the object and becoming louder and louder as he approaches it.

MAGNESIA. The oxide of magnesium, or magnesia, is used in trio forms, the light and the heavy, which are obtained respectively from the light and heavy carbonates of magnesium All these relieve acidity and act as laxatives, and may be administered in doses of 5 to 30 grains for repented administration and of 30 to 60 grains for a single

MAGNESIUM: In Medicine. The salts of magnesium are irequently used in medicine on account of their antacid and purgative qualities. Magnesium sulphate, or Epsom salt, is a reliable saline purgative. White mixture is a useful laxative. It consists of magnesium sulphate, 3 drams; mag. nesium carbonate, $1 \frac{1}{2}$ drams; and peppermint water, 6 oz The dose is $\frac{k}{2}$ to 2 oz .

MAGNESIUM : In Photography. Mag. nesium, in ribbon or powder form, burns with a strong actinic light, and is largely used for indoor and other photographs when daylight is not available. Magnesium powder when mixed with potassium chlorate or perchlorate, or other combustible chemicals, is known as llash powiler. It should not be miade by the anateur, as some formulae give mix tures dangerous to prepare See Flashlight.

## MAGNETOS FOR MOTOR VEHICLES

## Constructional Principles of These Essential Parts of the Car

This article will be found useful by the owner of a motor car or a motor cycle. He should turn to those headings, as well as to Gear; Internal Combustion Engine; Lubrication, etc.

A diagrammatic drawing of a common type large number of turns of thin insulated wire, of magneto is given in Fig. 1, and shows the wound over the primary winding, one end of complete wiring from the armature to the sparking pluge. The return or earth circuit vis the sparking plugs is shown in dotted line. The cycle of opration is as follows: A represents the permanent stationary magnets to which are attached pole pieces, B. that are fitted so as to bring the magnetic field as close as possible to the armature $D$, thus intensifying the field of force. Rotating between these pole pieces is the armature $D$, which is constructed of an iron core, composed of a large number of thin plates tightly compressed. This is done in order to avoid waste current being generated in the core itself. On this core are wound the primary and-secondary coils.

The first, the primary, consists of a few turns of fairly thick insulated wire, one end of which goes to the fixed platinum point of the contact breaker, $E$, and is tappied for the condenser, $F$, and the short circuit or earth switch, G. its other end being earthed. When the earth switch is closed, the current llows through the primary windings across the earth switch back to earth. Therefore, although the contact breaker, F, will still be operating, it will no longer be interrupting, via the platinum points, the llow of the primary circuit. so that no high-tension current will be generated in the secondary winding that goes to the sparking plugs.

The second of these coils, the secondary winding, is composed of a
the armature by means of a long screw The contact breaker carries the fixed platinum point. L, which is in contact with the end of the primary winding, and the movable platinum point, M, through the medium of which the earth or return circuit of the primary winding is closed This movable platinum pnint is operated by a bell-cranli lever, that liceps it in confact with the stationary platinum point. L. by means of a Hat steel spring At the end of the bell crank is inserted a hard fibre block that makes contact with the cums which are on the inside of the cover, $N$, that surmunds the contact braker The action of these cams against the tibe bluck of the bell-crank causes tho platinum points to separate, thereby breaking down the primary circuit and causing the secondary current to be induced Mounted on the back of the contact breaker is a small spring-fed carbon brush that makes contact with the body of the magneto and completes the carth of return circuit of the primary winding via the platinum points. Fig. 2 shows the construction of the contact braker
The armature cuts the field of force twice during one complete revolution. Therefore two high-tension currents will be induced, and for this reason two cams are provided on the contact cover cam ring, and are so arranged that the primary circuit is broken at the monent when the armature is approximately at right angles to the field of force, in which position the maximum intensity of induced current is produced in the secondary winding.

The functioning of the condenser is as fol lows: When the platinum points of the contact breaker separate, the collapse of the primary circuit has the unfortunate effect of inducing a follow on current in the primary winding. but by interposing the condenser in the circuit, as shown in lig 1, this current is arrested Instead of Howing on and leaping the platinum points it takes the easier path into the condenser, and charges up the opposite plates with static electricity, which when fully charged discharge in opposite directions. thereby damping out the follow on current in the primary circuit, and causing the cessential immiediate collapse of the field of force.

Other Systems. Another type of magneto is eniployed, in which the primary and secon dary windings are atationary, the permanent magnet with its pole pieces being the revolving part. A magneto of this kind is shown at Fig. 3.

In the inductor magnoto there arc rotating inductors of aoft imn, and fixed magnets and windings. The magnetic Hux through the core is reversed as the inductors revolve

The Distributor. In the case of magnetos to be employed for engines of 4 or more cylinders it is customary to include a high-tension distributor as part of the unit: this is usualiy mounted at the contact breaker end.

Magneto. Fig. 1. Diggrammatic lay-out of the wiring of the common type high-tension magneto for a

and driven by a gear whee that is a part of the arma ture As the armature gives two high-tension currents per revolution. there will be twice the number of teeth on the distributor gear wheel. For $n 4$-cylinder engine the armature makes two complete revolutions (t) fire the charge in all 4 cylinders, and as the 4 high tension tead go to the one completc revolution during the period. difficulty will be experienced when starting The distributer ueualls congists of a fibro ring into which 4 bronze segments are embedded. Rotating in the centre is the hightension brush driven by engaging a pinion on the gear wheel on the armature. Mounted at the back of the distributor is the spring-fed carbon brush that picks up the high-tension current from the slip-ring and presses it to the segments by way of the rotating carbon brush in the correct order of firing. In place of the brush, on some magnetos a small gap is provided at corresponding points.
With magnetos designed for use on single and twin-cylinder $V$-machines, the high. tension distributor, as described, is dispensed with, and the current taken direct from the slip-ring. The only difference is that for the twin-cylinder engine the slip-ring is formed with two insulated segments, so that the spark shall go to the correct cylinder in order of firing. In the case of the magneto intended for use on twin engines, the cylinders of which are set at an angle of about $50^{\circ}$, it may be noted that it is impossible for the spark to take place at the most efficient position of the
with the slip-ring while the
armature is rotated. If the
end of the carbon brush
is clogged with metal, or
burnt, it should be care-
fully rubbed down with a
piece of fine emery cloth
before being replaced. With
the contact breaker, the
platinum points should be
adjusted to separate by the
correct amount, which is
mm. or ols in ( ${ }^{\text {a }}$ in in.).
wide apart, considcrable
experienced when starting
hand
With a new magneto, the small fibre bushed-bearing, in which the steel pirot of the bellcrank lever works, may be come tight. It is usually only necossary to clean the pin with metal polish, but if that is insufficient finc emery cloth may be used with care. It is inadvisable to enlarge the bush. The pin should be slightly moistened with thin oil before reassembly. At the back of the contact breaker will be found the small carbon brush that carries the earth return of the primary circuit. This should be occasionally treated in the same way as described for the slip-ring carbon brush. All carbon brushes will at intervals require the same treatment.

The magneto is a very powerful electrical machine, its power increasing in proportion to the speed of the armature. Perfect cleanliness of all its parts is absolutely essential if it is to remain in good order for long periods. Care should be taken to see that the wiring is in good order and not slack at the terminals. This applies in particular to the switch terminal on the contact breaker cover. It is not an uncom mon occurrence for one of the fine strands of wire that go to form the complete cable to come adrift and make contact with the metal of the cover, thereby shorting the primary circuit. In all cases of a failure of the high-tension circuit, it is as well to examine very carefully the wiring. as well as the switch itself, before looking to the more com. plicated details of the system.

When replacing the contact breaker, see that the small key that locates this part with the armature is entered into the slot provided to receive it. Also, when oiling at the parts marked be careful not to overdo it, as oil may get on to the armature and damage the insulation.

The Magdyno. On motor cycles a machine is sometimes used which combines in one unit a magneto to energize the sparking plugs and a
dynamo to charge a smali accumulator for lighting. The current output is usually 6 volts, at 5 amps. Since, owing to limitations of space and weight, the accumulator is small in capacity, the dynamo is kept on charge when lights are in use. There is a single drive from the engine, the dynamo being geared up from the magneto spindle Fig. 4. shows a Lucas motor-cycle magdyno.

MAGNOLIA. The magnolia is a group of evergreen and leaf-losing shrubs or amall trees of great beauty. Most of them are suitable for general planting out of doors; others need the shelter of a wall. They thrive best in loamy soil with which peat or leaf-mould has been mixed. Small trees should be planted in carly autumn, as large ones are difficult to transplant successfully. They need no pruning except that which is necessary to keep the trees shapely and well balanced.

Magnolia stellata torms a bush 4 ft . or more high and bears small white flowers in March-April. Other kinds form trees 15 to 30 ft . high and bear large cup-shaped Howers. A few of the best are conspicua (the Yulan), white, April. obovata and soulangeana, reddish, April, and parviflora, white, May. All these lose their leaves in winter. Magnolia grandiflora is a vigorous evergreen with large

armature, l.e. when
it is at right angles to the field of force. The reason for thie is that $50^{\circ}$ cannot be equally divided into $360^{\circ}$.

Care of Parts. Magneto construction of the present day is so extremely specialized that it is seldom that any derangement occurs. There are two parts that should receive periodical atten. tion, namely, the slip-ring and the contact breaker. The slip-ring should be occasionally cleaned with a little petrol and a rag, placed over the end of a piece of wood, and held in contact

Magneto. Fig. 8 (above). M.L. magneto with rotating magnot and frod primary and scoondary rrindings. Fig. \& (below). Luose motor oyde magdyno, wita smal eab anoh functing up from the magneto spindle

Magnolia Large fragrant cream-white towers of maggolia (stollata), Which booms in Maroh-April
handsome leaves and in summer bears immense cream-white fragrant flowers; it must be planted against a sunny wall.

MAGPIE. Magpies are occasionally kept as pets. They need large cages and can be easily taught, so that they will go freely about the house, but they are very prone to theft. They can be fed on scraps from the table, bits of meat, raw or cooked, and ground oats. In the wild state magpies are of some assistance to the gardener, as they feed on worms, insects and snails. See Bird Cage.

MAGPIE MOTR. The caterpillars of this common moth, which is white with black and yellow spots, often do serious damage to gooseberry and currant bushes in carly summer. Many of the caterpillars, which are marked with black and yellow, can be dc. stroyed by shaking the bushes vigorously to cause the pests to fall to the ground and then scattering lime on them. Hand picking is also advised before the caterpillars become numerous.

Poisonous washes, e.g. arsenate of lead. will destroy them, but they must not be used
within 3 or 4 weeks of gathering the fruits, which must be thoroughly washed. Great benefit often follows the use ort caustic sods. 2 oz . per gallon of water, in winter when the bushes are leafless, for the small caterpillars hibernate in crevices on the gooseberry and currant trees.

MAR-JONGG. The Chinese game known as mah-jongg is played with dominoes made of ivory and bamboo. There are usually four players at a table, each one acting for himself, as there are no partners. The dominoes, which number 136, are arranged in 3 suits, and there are 4 sets of each. One consists of 3 honours, red, white, and green ; another represents the four winds, north, south, east, and west. The third is more ela borate. consisting of 3 sets of 9 dominocs each. which are named characters, circles, and bamboos

The object of each player is to obtain the highest scoring hand, which is called mahjongg. Siequences of 3 cards of the same suit, or 3 of a kind and a pair make up a good hand, and extra points are scored for various combinations which may fall to a player's lot, these adding fresh interest to the game.

MAAOGANY. Besides its rich brown red colour, and the figuring of its grain, mahogany has other qualities which make it a good furniture wool. It dees not shrink or warp much, has very few knots, and seldom becomes worm-eaten; its colour darkens and improves with age, and it is obtainable in wide picces. Glue gets a good hold on it, and a high degree of polish is easily produced on its surface.

Two kinds are in common use. The best and most expensive is known as Spanish, which comes from the W. Indies, chiefly Cuba, and has a richer colour and better figure than Honduras mahogany or baywood. The latter is plainer, straighter in grain, and is softer and lighter, but is good material, and in the best work is often used instcad of pine. The best Spanish mahogany is mostly used as veneer.

Mahogany is employed for the interior fittings of houses and public buildings as well as for furniture. Handrails for staircases are often made of it, and so are counter tops and other shop and office fittings ; also the woodwork of cameras and instrument cases, and interior fittings of vehicles.
The colour frequently is darkened by the use of stain. A solution of bichromate of potash and water will darken it, if a little Vandyke brown or liquid ammonia is added. Oil alone may be used, or red oil may bo made by soaking alkanet root in linseed oil. See Furniture; Grain; Wood.

MAIDENEAIR FERN. The common maidenhair fern (Adiantum cuneatum) is a favourite greenhouse plant and may be grown in a room window during the summer months. It needs a minimum winter temperature of 50 degrees. Two of the best varieties of the maidenhair are gracillimum and Pacottii. The finest of all maidenhair ferns is Adiantum farleyense, a vigorous plant with large and beautiful fronds: it must be grown in a hothouse. Two-thirds loam, one-third peat and leaf-mould, with sand added freely, provide a suitable compost. Moist shady conditions are necessary. Adiantum pedatum, 18-24 inches, is hardy, and capillus veneris, 6-8 inches, can be grown out of doors in mild districts; they like shade, and peat and sand should be added to the soil.

MAIDEN PINK. This pretty low-growing pink (Dianthus deltoides) flourishes in sandy soil in s sunny rockery. The flowers are of carmine-rose shade ; those of the variety graniticus are more richly ooloured. This

Magpie Moth. Garden pest which aagpie woth. Gardon pest which mond cherse-cake known as maid of honour is made thus: Curdle $1 \frac{1}{2} \mathrm{pt}$. fresh milk by adding rennet powier as for a junket. A pinch of salt helps to separate curd from whey. Strain the curdled milk through a piece of fine muslin, and drain the curds well before rubbing them, with $\& \mathrm{lb}$. fresh butter, through a sieve. When this is done add the yolks of 2 eggs, heaten lightly to a froth, and also about a desecrtaponnful of brandy.

Blanch and chop finely $\frac{1}{2}$ oz. sweet almonds and 3 or 4 bitter ones, and add them with a little sugar and a sprinkling of powdered cinnamon or nutmeg. Lastly add the juice and grated rind of half a lemon. Line some patty-pans with puff pastry, fill them with the mixture, and, if desired, sprinkle with a few currants before baking them in a good hot oven. See Cheese Cake; Pastry.

MAINSPRING. The driving spring in the mechanism of a timepiece is the mainspring, which performs the same function in any other spring-driven moter, such as that for a gramophone. It is generally in the form of a thin, flat steel grij), hardened and tempered to give it resiliency, and is coiled up by means of the winding arbor into a close, tight spiral. It exerts its power in uncoiling, thus imparting motion to the main wheel. The spring when purehased is coiled up, and is surrounded by a metal band, which prevents it uncoiling until it is removed. This should not be done until the inner end of the spring has been attached to the winding spindle and the outer end to the cage, or part to be driven. Should the retaining ring or pin be removed before the spring is under proper control, it will fly out and probably do damage. The coils of the spring should be thoroughly lubricated. See Clock; Gramophone; Watch.

MAINIENANCE: In Law. When a married woman is obliged to apply, apart from her husband, for parish relief, the authorities may summon the husband before the justices, and the magistrates may make an order upon him to pay such sum weekly or otherwise towards the cost of the relief of his wife as shall be deemed to be proper. They may order that this money be paid to the guardians or to the wife or any other person for the wife's benefit. This should be carcfully dis-

Maidenhair Forn. The delicate fronds of this beantiful fern are much ased for mixing with cut flowess for buttonholes and vases
tinguished from alimony or from the kind of order made under a separation order when the magistrates decide that a husband and wife need not live with each other.

In the divorce court, if a decree has been madc at the instance of the wife for dissolution of the marriage, the court has the power to make an order upon the busband for the permanent maintenance of his wife. This may take the form of an order that he shall hand over some of his property to trustees, who are to apply the income for the wife's maintenance during the remainder of her life, or it pay have the form of an order that he shall pay so much a year to the lady. The court has no power to order the husband to pay a lump sum.
The provision ordered is usually a sufficient maintenance according to the rank and means of the partics. This does not mean a bare maintenance. The rule usually followed is that the husband shall allow such a suin as will make up his wife's income to one-third of the joint incomes of the parties. Thus, if the husband has $£ 1,000$ a year and the wife $£ 200$, the joint income being $£ 1,200$, the wife would be entitled to $£ 400$, i.e. $£ 200$ from the husband in addition to her own $£ 200$.

Although this is the ordinary practice, it is not invariable. Where it is possible the court will order security to be given for the pryment so that the husband cannot subsequently put his money out of her reach and so deprive her of what is her due.
At one time the view was taken that such orders for maintenance should be conditional on the wife remaining single and chaste ; but nowadays the court will not make any such order except in special casce, so that the allowance will be continued although the wife marries again or leads an inmoral life. Somctimes under special circumstances, when the wife is the guilty party and is divorced by the husband, the court will, as a condition of granting the divorce, order the husband to make provision for his wife; and in such cases a clause will generally be ordered to be inserted that the moncy shall only be paid so long as she remains single and chaste. See Divorce; Husband; Separation Urder; Wife.

Maisonette. Literally a small house, this word is often used as a synonym for a flat. See Flat.

MATMRE D'BOTTEL. This name is given to a method of preparing sauces and other dishes by heating them up with parsley and butter flavoured with lemon juice and seasoning. Maitre d'hôtel saucc is a white sauce, made with stock instead of milk, containing chopped puraley and lemon juice. Vegetables re-hcated in butter and (lear soulp) or stock to cover, and then flavoured with chopped parsley and lemon juice, are given the name of maitre d'hôtel. Chives or finely chopped spring onions are often added as a garnish. Haricot or butter beans or a mixture of green peas and carrots cut into smallcubes arc excellent re-heated in this way.
MAIZE. This is un alternative name for the genus of fineleavel grasses known as Indian corn. It is made into meal, which can be cooked in various ways.

Maizo Meal. This meal is made from the ripe grains of maize or Indian corn, finely ground. It is useful for thicisening soups, in
the place of flour, and for making porridge, ceramics, comprises tho output of severia bread, calics, puddinge, etc As it docs not ennous italian fabriqucs, notably in Urum keep very well, it is advisable not to buy more than will be used at once. It will soon go bad if kept in a damp place.

Maize porridge is made by sprinkling the meal into boiling water or milk. flavoured with a little salt, and atirring it for about 10 min., until it thickens Then add a small picce of hutter and serve it hot with milk and sugar. jam or golden syrup.

Maize meal can he used for bread making. using half white llour and half maize meal Caraway seeds are usually adderl.

Buns are made from 4 oz . maize flour, 1 tablespoonful golden syrup, $\frac{1}{2}$ teaspoonful baking-powder, 1 oz dripping or margarine. Mix the dry ingredients and rub in the fat Make a hole in the centre of the flour and add the syrup. Mix it to a stiff paste with a little milk and put it into a greased tin Add a. few raisins or currants, if desired. and bake the buns in a hot oven

The ingredients for $\Omega$ pudding consist of $\ddagger$ oz inaize llour, 2 oz flonr, 2 oz . suct. 1 egg , | oz. sugar, 2 oz dates Mix the flours shred and chop the suet, stone and cut up the dates. Add these to the flours with the sugar and a pinch of salt. Beat the egg and mix this in Use a little mill: in addition, if neccssary, to make the inixture into a soft paste, and put it into a greased basin and steam it for $1 \frac{1}{2}$ hours

Two favourite American dishes made from maize meal are Johnny cake and jolly boys A verv good Johnny cake can be made from the following recipe: Mix together 1 teacupful maize meal and 1 teacupful Hour with 3 oz sugar and a teaspoonful baking powder, also a good pinch of sult. Beat an egg with 1 gill milk, melt 1 oz . butter and stir it to the egg, and milk. Pour the liquid on to the meal and heat as for hatter Turn it into a shallow tin and bake it from 30-40 min

To make jolly boys, first scald $\frac{1}{2}$ pint meal. Cream $\& 1 \mathrm{lb}$. hutter with 6 oz. castor sugar; add 3 well-beaten eggs, then $\frac{1}{2}$ pint milk which has been scalded and cooled. Cream 107. veast; mix the liquirl to it by degrees and then make up into a dough, cover it over, let it rise till light and make it up into balls as for doughnuts, hut rather smaller. Fry these in deep fat and roll thens in sugar while hot. See Bread: Doug'anut; Indian Corn

MAJOLICA: The Ware. Somecxcellent reprorluctions of the majolica faience of medieval Italy, as well as original designs conceived in the sanne spirit, have been made at the Minton works since the middlc of the least century, and similar wares were introduced by W'edgwood. They are produced by different methods, the former being made of dark clays with an opaque enamel, while the latter con-

Majolica Ware. Pharmacy vase with Dortrait Agures. Faenza c. 1540 British Museum
sist of white bodies with transparent colnured glazes.

There is a large output of reproduc. tions of the early ware in Italy, in. cluding round and oval dishes, trenchers and shallow bowls, drug. jarsand ewers.

Genuine oldinajolica, the noblest production of European
lamous Italinn fabriques, notably in Urbinn and its vioinity, which were at their greatest during the 15 th and 16 th centuries. The most characteristio ware was tin-enamelled on dark clays, covered with painted designs, and lustred with metallic shcens. Some of the finest into nccount are the size of the hall or thentre and the brilliance of the stage lighting. If the performance is to be given in a theatre with footlights, lengths, sidelights, battons, toplights, and limelight, all natural shadows are llattened out, and it is essential in order that the oxpression should carry for the features of the players to be emphasized.

For this type of make-up greasc-paints are the best meclium to employ. They can he purchased in numbered sticks, with other requisites for make-up, at any thentrical costumier's and most large chemists' stores. The face should first lie cleansed with cold

tips over the whole face, care heing taken to come below the jawhone on to the neck, or a mask of naint will result. Then the colour is applied for the cheeks and lips, eyelrows, eyc-shading and lines or shadows for older or character make. ups; after that the face is powdered, and lastly the lashes are touched up. The grease-paint should be removed with cold cream or vaseline at the end of the performance, and the fince rubbed clean, after which it may lie lightly powdered.
Methods for Women. A straight make-up for women is obtained by using No $1 \frac{1}{2}$ greasepaint, palest flesh. colour, as a foundation (for a brunette a little No. 5 yellow may be worked in with No. 2), carmine 1 , or decper shade 2, smoothly rubbed into the checks,
oxamples were wrought in the silver-lustre at Deruta and the rubv-lust re at Guhbio. This style of pottery decoration was derived from the lustred faience of Monrish Spain, which in its turn was based upon the great lustre ware of Syria and l'ersia In the Italian ware the designs were usual!y bihlical or historica! scenes.

## MAKE-UP FOR AMATEUR ACTORS

Methods and Procasses Explained and Illustrated
Those readers who are interested in amateur acting should consule also the articles on Stage and Theatricals. See also Fancy Dress and Tablcaux Vivants

Amateur actors, to be successful, require as shown in Fig 1, using only a little colour in knowledge of malie-up. Perhaps the dabs until the desired effect is reached. The most important matters that must he taken sliape of the lips should be improved with the
cream, which is wiped off, and then the founda. tion paint of the desired colour is applied nnd smoothly worked in with the finger- lip-stick, emphasizing the how of the upper lip if necessary, and the evehrows earefully pencilled with a brown or black liner. Shading the eyes effectively requires a litile practice. A dark bluc line may he applied along the Inshes, and this line should be carefully blurred to sharle the lid. With n little more dark blue paint on the tip of the third finger shade under the cychrow to the cyelid, bringing the colour just beyond the outer corner of the cye, and bending it imperceptibly with the founda. tion Care is necessary or a hollow-eyed ap. pearance results. A line drawn for ahout $\frac{1}{2}$ in. with hluc or black liner licyond the outer corner of the cyo gives width. The alge of the lower lid should also he delicately shaded by using the paint on the finger-tip.

A pink powder for fair or yellow powder for dark complexions should be applied thiclily. If the cheeks appear too pale, a touch of dry rouge can lie adiled after powdering. The evebrows should he gently brushed free of powder
 grease-paint. Fig. 2. Melting black grease for lashes. Fig. 3. Applying the eye wig black with a fine camel-hair brush. Fig. 4. When fully made-up make-up for powder period costume with patches
and then the lashes must be treated with carmine 2 for colour and $n$ light shade of black grease cosmetic. A small quantity is powder. The adjustment of a inan's wig melted over a candle in a metal spoon (Fig. 2) and with $n$ fine camel-hair brush the liquid black is applied to the lashes, as shown in Fig. 3. For neck, arms and hands a theatrical wet-white may he applied with a sponge, rubhed in smoothly with the hand and afterwards powdered with white powder.
The effect of fragile age may be got by use of $1 \frac{1}{2}$, with $5 \frac{1}{2}$ predominating for the foundation, a little rose-pink grease paint worked into the cheek-bones, pale colour on the lips, light blue liner blended with a touch of lake liner to obtain a delicate purple for the shadows. Any finint indications of natural lines must be followed, and $n$ high light must be putahoveand below a line with the $1 \frac{1}{2}$, also worked with the finger-tip. The checks should be shadowed with the blue and lake below the cheek-bone and also the hollow emphasized in the inner corner of the cye below the brow and under the eye, very little colour being used to a void a patched appearance. The lashes should not be inade up with grease cosmetic after powdering, but just brushed with water-black.

White or grey wigs for period costumes require a fair maticup such as the first one given, and the same applies to a blonde or red wig. Hair should be tightly smoothed, or plaited round the head if long and the wig drawn on from the back after the makeup is completed (Figs. 4, 5). For gipsy make-up, 5 with $n$ little 9 (red brown) worked into it for foundation and 9 with carmine 3 for the checks should be used. Bule, n red-brown powder, can be applied to neck and arms for darli or sunburnt cffect.
Methods for Men. For a youthful make up for men 5 and 3 (dark flesh pink) should be used for foundation, with a touch of carmine 2 for colour; a rather older elfect is gained by the use of $5 \frac{1}{2}$ and 3 with 9 for colour. The shading round the eyes should be blended with dark blue and lake liners and the eyebrows touched up with brown or black. The lashes should be made up with water-hlack and not grease cosmetic, unless a very romantic costume is to be worn. Lines and shadows should be added for charncter make-ups, Fig. 6. Whiskers, moustache and heards can be bought ready-made at a wig-maker's. They should be adjusted to the face with spirit gum (Figs. 7, 8), and a hard effect of join is removed if crape hair of the same colour be used. A little of this should be pulled out and held near warnith to take out the crimp, and then put on with spirit gum to hide the edges. For a gipay, Mexican, etc., make-up, $5 \frac{1}{2}, 6$ (greyish brown), 8 (brown) should be used, with a touch of 9 for colour, and bole for neek and hands.

Men for make up with period white wigs should use $2 \frac{1}{2}$ with a little 5 for foundation,

Make-up for Men. Fir. 6 Cbaracter make-up; putting in the faisblag touches to the wrinkles before 7owdering. Figs. 7 and 8. Moustache and beard fired to the face with spirit gum. Fig. 9. Wir adjusted
correctiy on forebead and pulled on from sides. Fig. 10 . Join of wig band being hidden bs grease-pant

MALACCA. The malacea cane plant is Calamus, which can be grown in the hothouse in loann and leaf-mould, and attains an average height of from 6 ft to 10 ft . Propagation is by seeds or suckers The stems are split for caning purposes, though in Great Britain they rarely mature sufficiently for the purpose except under special treatment.

Malacca Canes. Although not so popular as formerly. a malncca cane is preferred by many on account of its distinctive appearance, strength. and durability. The cane or rattan from which it is cut is inported in bundles from the E. Indies, only the best canes being selected to be seasoned, cut, and polished. As the stick has no handle, all that is required to finish it is the silver or gold mount, and with ordinary care it will last n lifetime.
When the mahogany colour of $n$ malacea becomes dull after continued use an occasional polish will restore the lustre. For this purpose there is prohably nothing better than pure linseed oil applied with a rag and thoroughly rubbed in. Spirit varnish is nlso used If tlie silver mount works loose or becomes detached. a coment or paste for resetting it can be obtained (rqul most oilshops, or one can be made at hoone by melting and inixing together 6 oz. resin, 4 oz . pitch, and $\frac{1}{2} \mathrm{lb}$. bottle wax Attention should also be paid to the ferrule. See Walking Stick.
MALACHITE. A rich green stone in appearance very like marble, malachite usually has peculiar lines of light and dark shades of green. The stone is found mostly in Siberian and Australian copper mines. In Near Enstern countrics it is frequently used for decorating furniture. It is inlaid into taliles or employed for ornaments.

It is also used for making into cigarette boxes, snuff boxes, etc.. with silver gilt and gold mounts Large blocks of the stone are sometimes found which command high prices when cut into vases or other ornaments Mala. chite green is an oniline dye used for siilk, wool, jute and leather.
MALAGA. Onc of the wines of Spain is malaga. It comes from the province of $\mathbb{F}$ Andalusia, and is shipped from the port of Malaga. It is a hlend of new nnd old liquor and is one of the best swect wines which Spain produces. See Wine

MALAISE. As uscd by doctors, this word refers to the condition of languor and feverishness common in severe colds. influenza. etc. It is one of the premonitory signs of nearly all serious illnesses

MALARIA: Its Treatment. The direct cause of malaria or malarial fever is the bite of the anopheles mosquito, by which minute animal parasites enter the red corpuscles of the blood.

There are three stnges in malarin, known as the cold, the hot and the sweating stage At the early stage diagnosis is often difficult and the condition is lisble to be confused with pyaemia, typhoid, and other diseases. During the cold stage the patient is put to bed and kept thoroughly warm. In the bot stage the body should be sponged with tepid or cold water, an icobag is applied to the head and warm drinks given. In the sweating stage the patient must be guarded against draughts and chills.

Quinine may be giren at any stage. It is best to liegin with a dose of 10 to 15 gr . and follow this with 5 gr thrice daily, but larger
doses ate sometinses required For children cuquinine, which is tasteless. can be given.

Swamps, marshy ground and stagnant pools favour the breeding of mosquitoes, and for the prevention of malaria such spots should be drained. The larvae may be destroyed by pouring paraffin oil on the water, using 1 pint to 200 sq ft . The larvae should be deatroyed in collections of water round a dwelling house and all tubs and water barrels should be emptied every weck. Open windows may be protected with morquito net or fine wire netting, and berls surrounded with mosquito curtnins. Rooms can be cleared of mosquitses by burning pyrethrum powder therein.

Some protection from bites is obtained by mubhing the skin with oil of peppermint, cucalyptus. lavender, rosemary, pennyroyal. or a lution composed of 1 oz . of magnesium sulphate in 10 oz of water. Quinine taken daily may be a powerful prophylaotic, the protective dose, in the case of adults, heing 5 tn 10 gr daily.

MALCOLMIA. This is the botanical name of Virginian stock, a hardy annual which hlooms in about six weeks from sced sowing See Virginian Stock.

Male Fern, effective in a shady border
MALE FERN. This is a vigorous native fern (Nephrodium (Lastrea) filix-mas). Of it many beautiful named varieties have been raised, for instance, cristata, furcans, grandiceps and crispa, all of which have fronds of most graceful appearance. They will grow in any sliady corner if planted in a prepared horder of ordinary soil with which lenf-mould and thoroughly decayed manure have been mixed They should he liept moist in dry wreather. Autumn is the best time in which to plant the fern.

MALINES FOWL. Good alike for table and egg production, the Malines fowl porsesses a long, deep, hrond body and a well-devcloped breast, and when the cockercls are fatted they carry $n$ wealth of white ment of very firic quality.

The Malines is bred in five colours: black, white, blue, cuckoo, and ermine The black is solid and deep in oolour, but does not carro quite so much green sheen as some ather black fowls. The white is pure snowy white. The blue is somewhat like the slaty blue of the Andalusian; it is somewhat rare, and by some is much admired. The cuckoo is the most gencrally bred colour, and looks the most business-like member of the family. Its ground colour is bluc-grey, the feathers being crossed by bars of a inetallic blue-black abade; when exposed to the sun the colour takes on a brown-grey appearance due to sunburn.

The chicks when newly hatched are giey on the top and creamy on the under parts. The most beautiful of all the Malines is the ermine, which is marked like light Sussex fowls, the body colour being a pure snowy white with black in the tnil, wings and
 Chioken Poultry.

Malines Fowl. Prize-winning white pullet of this useful breed
MALINGERING. A hypochondrincal person may helieve with too grent readiness that he is suffering from some serious disease, and a craving for sympathy may be responsible for hysterical manifestations; but these conditions are quite different from malingering, which means feigning disease to secure anne personal adrintage, whether the avoidance of duty, the securing of a holiday, or the receipt of money as compensation for wickness. In most enses the application of appropriate tests provides evidence of malingering whioh is sufficiently convincing, at any rate for a medical man.
MALLET : Some Varieties. A mallet is n small hammer inade of wood. such as is used for driving wooden pegs into the ground and similar purposes. The word is also used for the implement with which players strike the ball in croquet ( $q$ v.)
The carpenter's mallet should he slightly rounded on all facea, and not square or Hat, ns in the case of a joiner's mallet. The handle should be about 13 in . long, and reduced in size at the neck. The handle is generalls. grasped about two-thirds of its length from the head, and, roughly speaking, the angle of the striking faces should be such that if two hattens were placed on the two striking faces of the mallet they would cross at some position near the elbow.
The tinman's mallet has a boxwood head about $2 \frac{1}{2}$ in. in dianmeter and is used for

knocking tin-plate into any required shajec A raw hide mullet has a head made of pieces of hide, coiled round to a diameter of a bout 2 in. and shout 4 in in length Ahole is drilled in the raw hide, and $n$ wooden handle inserted and pegged into place. The ends of the hide may be fastened, and in some onses are strengthened by a pieoe of metal. The mallet is used for sheet inetal work. The carver's mallet is circular in section and some what conical in shape, as in Fig. It is finished in this winy so that the carving tools can readily be strucli a blow in any desired direction, and the striking face of the mallet will be at right angles to the centre line of the Lool. If this were not the case the directional control of the carving tool would be difficult

A metal-bound mallet comprises an iron head, into which two tapered blocks of wood or hide are fitted A bossing inallet has a pear-shaped head and plain handle. The stretching mallet is very similar in general appearance : both are plumber's thols used in the shaping of shect and tube lead. The mason's mallet is very similar to the carver's, but larger and heavier and a little sliorter in the handle. A large circular, cast-iron mullet. known as a stob inallet. is sometimes liandy for rough work.
The method of using a carpenter's mallet is illustrated in Fig. 2, showing how the tonl is held. The worker should strive to strike a fair and square blow. When driving two pieces of work together, givg the whole face of the mallet a share in the work, as if the blow is struck with only one corner of the head this is likely to be split, and the worls is liable. to be very badly hruised. See Amatcur Carpentry: Mortise

MALLOW. The name is applied indisoriminately to many planta and shrubs, for instance, Jew's mallow (kerria), rose mallow (lavatera), and marsh mallow (Malva) See Lavatera; Malope ; Malva; Marah Mallow.

MALMAISON CARNATION. This type of carnation, which bears unusually large and liandsome blooms in early summer is now very little grown. It has been ousted by the perpetual carnation, which has a much longer flower. ing period. Those who wish to grow malmaisuns prefer the new perpetual flowering type, which needs the same treatment as the perpetual carnation (q.v.) Some of the best varieties are Boadicea, deep rose. Hon. Ciarlotte Knollys, red: Jcssie Allwood. yellow ; and Mrs. C H Raphacl, red.

MALMSEY. 'rhis strong, sweet liqueur wine is called by the Italians " manna to the anouth and balsain to the brain," It is made from grapes grown on the islands of the Aegean and the Ievant. See Wine.
MALOPE. Of this flower the only kind grown in gardens is Malope trifida, a showy liandy annual, 2 ft . high, which bears large orimson flowers in summer. Sceds are sown out of donrs in April where the plants are to bloom; the scedlings must be well thinned out to give thein room for development : they ought to be 9 or 10 in . apart.

MALT. By moistening barley and allow. ing it to germinate malt is obtained. In this process a ferment (diastase) in the grain converts some of the starch into malt-sugar and dextrin. The grain is then dried in a kiln and the germinating process stopped.

Malt is used in brewing and distilling, and in medicine. Powdered malt is mixed with
wheaten Hour to form infant fords. On the addition of hot water, or hot milk and water, the diastrase acts on the starch in the flour and converts it into maltose.

In making certain kinds of bread malt is employed, extract of malt being added in the proportion of 1 oz . to $3 \frac{1}{2} \mathrm{lb}$. of wholemeal flour.

Malt Extract. Liquid extracts of malt are prepared by making an infusion of malted barley and evaporating it in a low temperature until a syrupy fluid is obtained. This contains a large amount of sugar, often more than half its own weight, and is a valuable and readily digestible food.

Ground malt or malt extract mixed with wheat flour makes malted bread, the starch of which is partly changed into sugar. Dried as well as liquid malt extracts are obtainable. Mixed with arrowroot, gruel, porridge, and any kind of starchy food, they pre-digest it to some extent. They are therefore valuable in convalescence, dyspepsia, neurasthenia, tuberculosis, and whenever the digestion needs help. It must not be forgotten that their digestive action is destroyed when added to food at a high temperature. Malt extract. either alone or combined with cod-liver oil, often has a valuable tonic effect in wasting discases. The dose of the liquid extract of malt is 1 to 4 drams.

MALTESE DOG. The snowy little Maltese dog is animated, intelligent, very affectionate and good-tempered, cleanly in habit, and an expert in engaging little tricks. Hia

Maltese Dog. A champion of thia pare white, silly. coated breed of pet dog
constitution is delicate, and great care is needed in guarding him from chills. His pure white coat requires constant washing, and the long. silky hairs of which it is composed quickly get matted unless the comb is used frequently Drying after washing must be thoroughly carried out.

Much care is needed in the matter of diet. an excess of animal food producing eruptions, a deficiency causing eczema. His head is much like that of the Skye terrier. The short legs are straight and well feathered, and the feet round with black pads. The longer the coat the better, and the only markings are slight patches of lemon tint. The weight varies from 4 lb . to 10 lb ., but the less it is the more valuable is the dog. See Dog: Skye Terrier.

MALVA. The botanical name of mallow, a hardy flowering plant represented in gardens by the marsh mallow (sylvestris) and the musk mallow (moschata). They will thrive in poor soil and are perhaps better suited to the wild garden than the flower border. The most valuable is the musk mallow, $2 \frac{1}{2} \mathrm{ft}$., which bears rose-coloured flowers in summer: the white variety, alba, is very attractive.

MAMMILLARIA. This is a cactus of quaint, even bizarre, appearance which is easily managed if provided with the conditions suited to the cultivation of these plants -namely a sunny, airy greenhouse and a well.

Mammillaria. 8 mall greenhouse cactas, showing the great namber of apines
drained compost of loam, sand and powdered brick. They need little water and a minimum temperature of about $45^{\circ}$ in winter. Several species are in cultivation; a few of the best are barbata, rose-coloured flowers, biculor, purple, and dasyacantha, red; all are but a few inches high. Missouriensis, yellow, is the hardiest and in mild districts is sometimes grown on a well-drained sunny rockery.
MANCEIESTER TERRIER. Owing to its great popularity in Lancashire, the black and $\tan$ terrier (q.v.) is often referred to as the Manchester terrier. See log.

MANDOLINE : How to Play. There is more than one variety of mandoline, but the Neapolitan is most in favour and is here described. The mandoline consists of three main parts : a deeply convex body, having on the upper side a flat belly or sound-board in which is a round sound-hole, below which is the bridge; the neck. having a flat fingerboard fitted with 17 frets; and the head, which is slightly bent back from the fingerboard and holds the 8 pegs for the strings. These are carried from the pegs across the nut, and over the bridge to the tail-piece at the lower end of the instrument. The strings, 8 in number, are tuned in pairs, thus :

This, it will be seen, is identical with the tuning of the violin. The strings are usually of stoel. the two lowest pairs (D) and G) being wound round with fine wire. The compass is completely chromatic from the low G to the A three octaves and a note higher, though the highest five notes are not very useful. The 17 frets are necessary for the full compass, as
the fretting proccerds by wemitones. The table below will make this clear

As the tuning is like that of the violin, so also is the fingering: that is on the 4th string both A Hat (G sharp) and A natural will be produced by pressing the string behind the respective frets with the first finger, and $B$ Hat (A sharp) and $B$ natural by similarly using the second finger. In order to get higher notes beyond the reach of the little finger, the hand must be shifted down the neck. If on the 4th string the $B$ were played with the first finger. the hand is then said to be in the second position: if it played C, then it is in third position, and so on. The strings are plucked with a plectrum of horn, tortoiseshell, or some other material held in the fingers of the right hand.

Before beginning to play, the strings must be tuned. The standard is the second pair, which must be made to agree either with an $A$ tuning fork or with the $A$ on the pianoforte. The latter course is necessary if the piano and the mandoline are to be played together. Having done this, tune the 1) strings from it. and then the $G$ strings from the D , finally tuning the E strings from the A It is preferable not to tune each string to the piano. as on that instrument fifths are made a shade flat but to tune perfect fifths as violinists do. This needs a keen ear and a knowledge of the desired result, so it is well to listen to a properly tuned violin and try to memorize the sound of the perfect fifth between each adjacent pair of strings. An easy way of testing the correctness is to press the A strings behind the fifth fret, which will give D an octave above the third string. A further test is to use the seventh fret on the 1) strings. If the tuning is right. the result should then be in exact unison with the A strings.

The instrument should be held with the left hand round the neck, the fingers turned over the finger-board. The perfurmer holds it against him, the right forearm keeping it in position, while the right hand, holding the plectrum, plucks the strings just over the plate which is found on the sound-board below the sound-hole. The right wrist must be perfectly free in its action. Both down and up strukes are employed, indicated when necessary by A and V respectively.
Initial practice will be devoted to finding the open strings, using only the down stroke at first, but subsequently alternating up and down. When certainty has been attained in this, proceed to the study of fingering, for which the joints of the fingers must be squared and the tips firmly pressed upon the strings behind the proper fret. Early exercises should involve no shifting of the hand, which should be practised only when easy passages in the first, or normal, position can be played with fair facility.
As with all plucked instruments, the tone of the inandoline is evanescent ; consequently, when the effect of sustained sound is wanted, it has to be suggested, rather than actually produced, by means of the tremolo, which

consists in keeping the strings in cunstant vibration by means of rapid alternate strokes. For this an absolutely lissom wrist is essential. from the frequency of its employment, the tremolo may be regarded as a characteristic of the mandoline, and therefore it must be carefully practised.

'The tuning of the Milanese mandoline, or mandurina, is shown above.

The fingering differs entirely from that of the Noapolitan mandoline, but if the principles underlying the above explanation of the deapolitan mandoline have been clearly comprehended, anyone with aptitude and inclustry will soon be able to play the Milanese variety of the instrument.

MANDRAKE. This is a perennial herb of the genus Mandragora, which Hourishes in shady corners in loamy soil. Thic root is often forked, with a supposed resemblance to human limbs that formerly led to various superstitious beliefs being associated with the mandrake Officinalis bears blue flowers in May ; autumn alis, purple, blooms in September.

The supposed resemblance of mandrake root to the human body has given rise to a perfectly groundless belief in its efficacy in furthering conception. The root has medicinal properties, however, and has been used as a narcotic and hypnotic. It contains an alkaloid mandragorine, which acts similarly to atropine ; and poisoning by the drug is like that due to belladonna, and should receive treat ment on similar lines.

MANDRISL. The steel spindle in the head stock of a lathe is a mandrel, and the name is also given to a bar of steel provided with conical holes at either end. These holes are provided to enable the bar to be mounted upon centres in the lathe or other device, so that when the bar is revolved it will tum perfectly truly about these centres.

The bar is used to support an object to be turned in the lathe, which must have a holc through it of such a size that it will fit tightly on to the mandrel. Work so held can be machined all over, and it can be removed and replaced in the machine many times without fear of its being out of truth.

The Verschoyle patent mandrel is an inexpensive lathe for light wood and meta! turning, spinning, etc. It clamps on to the cdge of a bench or table and is thus very handy. for the home worker who has not a permanent workshop. This particular mandrel is described and illustrated in this work in the article Lathe. See C'andlestick

MANETII. This is the name of a stock, or root plant, upon which roses, chiefly of continental origin, are budded or grafted It is not as successful or popular in Great Britain as is the briar rose, which it resembles. See Grafting; Rose.

MANGE: In Dogs. This dog disease is caused by a parasite so small as to be invisiblc to the naked cye, and is transferable from one animal to another. The mite that produces mange is propagated by eggs, consequently cleanliness is one of the best ways of combating it. Dirt certainly harbours mangc, although it dues not produce it, and if they are undis. turbed the mites hatch and multiply with great rapidity.
Thore are two kinds of mange, follicular and sarcoptio. Follicular mange is almost in curable, the reason being that the parasitc. by burrowing into the hair follicles and sebaceous glands, is almost inaccessible. Thic disease
begins with a small circular pustular eruption, from which the hair falls, and it probably spreads all over the body the skin becoming corrugated and of a bluish colour. Thero is little itching. To treat a dog suffering from this form of inange, bathe with balsam of Peru and alcohol in equal parta, or cecolin and alcohol in equal parts. Some persons employ a 2 p.c. solution of formalin.

Sarcoptic, commonly called red mange, spreads rapidly, the parasites being on the surface, and the irritation is considerable Small red spots are first seen, from which unpleasant matter is exuded. These somn spread into big patohes l'owdered sulphur
with 8 parts of vegetable oil is recommended. applied very liberally for a week or 10 days at intervals of 3 or 4 days. The dog's bedding should immediately be burnt and his slecping box should be disinfected thoroughly brfore it is used again. See Dog.
MANGEL WURETSL. This cont emp is an excellent food for pigs and other animals, one reason being the large amount of sugar it contains. Mangels should not be given to animals until they have been stored for some months This should be done as early in the autumn as possible, and mangcls will usually be found to kcep in good condition, if required until the following midsummer. See Pig.

## Mangles: Their Care \& Repair

## Advice on an Important Feature ot Laundry Work

Other entries dealing with this essential branch of domestic work include lroning: Laundry;
Starch : Soap; Wringer See also Gear
A mangle is a machine for pressing clothes without a tall frame, but instead has clamps and linen. Large articles of a plain or coarse type, such as bed sheets and towels, are generally subjected to this treatment, which is in many cases merely a preliminary to or a substitute for ironing. The art of mangling consists mainly in laying out the clothes smoothly and arranging them so that those of equal substance shall come together. This will ensure an even, regular surface and an equally good pressing for all. Most articles are folded two or three times, and come out better than when arranged in single folds. This is because the thicker the substance the tighter the pressure of the rollers. Care must be taken, however, to see that too thick a substance cloes not result, otherwise the rollers may be badly strained.
The ordinary mangle consists of two heavy rollers, usually of hardwood, and made to rcvolve by means of a cog-wheel attached to one end of the lower roller, which engages a cog attached to the spindle of a whecl turned by hand.

The rollers and cogs are fixed to an upright frame, and pressure is applied to the rollers by a tension screw which levers against the top of the frame.

A table mangle, suitable for use in small familics and where space is limited, is made

Mangle. Electrically driven mangle, the motor ot which will ran for aboat two hours on one anit of electricity
Courtesll of Whittatier Bros (Aeerington). Lid
to fix it to a table or bench. The rollors measure approximately 16 in . by $3 \frac{1}{2} \mathrm{in}$., those of the standard type 21 in by 6 in. to 27 in . by 6 in Another model is fitted with a turn-over table; the back board is made inuch larger and without ledges, so that when the machine is not required for laundrywork the board rests flat on the machine and forms a useful wooden table 31 in. by 20 in . Wherc these table mangles are not in use, and a large mangle is considered unnecessary, wringing machines are often used as substitutes. Thesc. howcrer, do not press the clothes in the same way as a mangle.
Electric Machines. Special electric washing machines with mangle and wringer combined can be obtained. Their initial cost is rather high, but they afford a great economy of space and time. In some of thesc machines a wringer alone is found. In such it is intended to serve the purpose of a mangle, has rollers of the finest rubber, is reversible, and can be swung to any desired position.
The illustration shows an electrically driven mangle of a good type. By pressure on a pedal the driving pulley on the motor shaft is brought into contact with the Hywheel of the mangle, and thus drives the rollers. The motor will run for about two hours on one unit of electricity.
Important Points. When selecting a inangle, the following points should be noted. The cog-wheels or chain should be protected with a metal case, so that children cannot get their fingers caught. At least two whitewood shelves should he provided, the grooves for the lower one being in a sloping position, so that it can act as a drip board. The tension screw ought to produce even pressure along the length of the rollers.

The bottom roller gets greater wear, and for this reason is often made of lignum vitac. On no account must both lower and upper rollers be made of this or any other very hard wood, or the strain on the clothes would be too great, resulting in small holes, and, in extreme cases, when wet clothes have been passed through the machine unevenly, in straight cuts in the fabrics. When renewing rollers carc must be taken that the top roller is made of softer wood than the lower one.

Both rubber and wooden rollers are damaged, but chiefly the former, by wringing very hot clothes, as great heat perishes rubber. To clean rubber, washing is rarely successful: a rag moistened with turpentine is necessary to remove any soap curd and dirt which collect on rubber rollers. When not in use, the tension screw should be loosened so that no strain remains on the rollers.. It is tightened up according to the thickness of the material being passed through the rollers.
The mangle should be oiled regularly with thin machine oil; thick oil collects dust and
clogs the working parts. From time to time the working parts should be freed from all grease and dust: paraffin is a quick. cleanser if applied on a soft cloth. The metal framework ought to be washed from time to time with warm soapy water, then rinsed in clean water When the paint commences to chip or wear, the frame should be well rubbed down with fine glasspaper, and two coats of enamel applied. The exposure of bare ironwork may result in ironmould on the clothes.

When not in use a mangle whould be covered with a dust sheet to protect it from dust and grease. It should not be stored out of doors without some protection, and if $n$ small wonden shed or lean-to is not available, an old tarpaulin will serve.

Repairing a Mangle. After being in use for some years a mangle shows signs of wear principally in the rollers and other wooden parts. Metal parts may be replaced without difficulty if the machine is one of standard make. Of the two rollers, the bottom one wears hollow before the other, and it will pay to have them truad up once or even twice. but there is a limit to the amount a roller can be reduced in diameter without fitting new star wheels to allow for the diflerence

Unless the rollers have a stout cap or ferrule on the ends there is a tendency for the wood to crack and split. Rollers that have been kept in a dry place and not used for some time are very liable to crack: unless such openings are filled up the mangle will not give satisfactory results Small cracks may be made good with a waterproof wood-filler, worked in with a tine blade a nd carefully smoothed on top When set the surface should be smoothed with glasspaper that has been wrapped over a flat piece of wood
Newly turned surfaces should he protected with a varnish made by dissolving 2 oz. of white shellac and $\boldsymbol{2} \boldsymbol{\sigma z}$. of henzoin in suflicient methylated spirit to form a paste, and then adding 1 oz of heeswax which has been dissolved in a small quantity of turpentine. This should he applied with a pad while the roller is revolved

The wheels, heing made of cast iron, do not cost much, and it is not worth while to have new teeth litted. If one of the cogs should get broken off, the wheel must he removel, coated with blacklead on one side so that a rubbing may he made on a piece of paper of the exact shape, including the centre hole. The maker or ironmonger will then be able to supply a new wheel from the shape provided.

In the event of the wooden handle breaking or splitting. it. may be renewed by filing round the end of the iron mod and removing the washer; the new handle should he slipped in place and the end of the iron riveted over with a hammer. The drip board as well as the table is liahle to wear, and if the surface is good, the strengthening liattens on the ends may be replaced with new pieces. In renewing the strips use beech or sycamore.

When renewing the paintwork, the handle, guard and "heels should be taken off and the ironwork scrubhed with soda and hot water to remove grease and dirt. The framework, spring bow, handle of pressure screw. guard, bearing, fly-wheel and collar, with bolt heads. etc., should be painted in colour ; the outside of wheels should he coated with Brunswick black and screws and cog surfaces ccated with blacklead. In re placing the wheels, the keys should he driven in with a hammer and cold chisel.

MANHOLE. In building and other con structive work any aperture of sullicient size to permit of the passage of a man is known as a manhole. The term is also applied to amaller apertures, as, for example, those fitted to a kitchen hoiler. The manholes used to cover the oplenings provided in the sanitary sustem for the cleaning out of the drains usually comprise a framework of rectangular or other shape that is built into the brickwork. The cover or lid is provided with a lip which fits into a slot or groove nound the top edge of the frame. This groove should be filled with cart grease and sand, or some other composition, to render it airtight. In small work the covers are usually kept in place by their own weight and are lifted by means of grips. Sce 1)rains.
MANICURE. This name is given to the trentment of the hands, especially the finger nails. The set of implements and cosmetics used for this purpose can be bought separately from chemists, or completo in cases, differing in price according to size and qualit.v. They include usually-nail polish, a polisher, a small hottle of liquid bleach, cuticle cream, orange sticks, cmory board, some cotton wool, a file, and a pair of manicure acissors which have frequently short curved hlades. See Hand; Nails.
MANNA ASH. The manna or Howering ash is Fraxinus ornus, a handsome small tree, which bears white blooms in early summer. The popular name of manna ash arises from the use of the exuded sap as manna. It is quite hardy and may be grown in London and other gardens.
MANSARD ROOF. This is a style of roof two sections inclined at diflerent angles, or having two separate slopes. It is often undertaken on the scure of economy, as the bulk of the roof sjace may be used for rooms, and what would have heen the outer walls are huilt with roofing material. Another adrantage is that it reduces the height required with the steeply-pitched roof. The proportion between the slope of the lower and upper portions is important; a good outline is generally obtained by making the loirer slope

MANSARD ROOF. This is a style of roof ing mav be utilized. (iN) and the upper one $30^{\circ}$.

The example illustrated comprises a king post, roof truss,
 of hoaril may be edged with fialf-round hall or Jacobean beading, and, instead of the under button or clip, a pair of brass mirros' plates for nailing to the wall may be screwed on as in Fig. 6.

A good decorative effect mav le obtained hy a dentil pattern, as in Fig. $\overline{7}$; the dentils should he square in the front view and a bout half the front dimension in thickness. 'Ihey whould he glued on a strip ahout double the height of the dentils. A further method of securing mantelhoards is shown in Fig. 8. An ordinary wall holdfast, as in l゙ig. 9, should he driven in the wall with the eve uppermost and a screw driven into the board
MANTELPIECE. For almost all practical purposes the mantelpiece and the chimney picce are identical. Strictly speaking, however, the mantelpiece is only a portion of the chimney piece, for the latter enibraces the whole protective structure around the fireplace from fluor to ceiling, while the mantelpiece is only its lower part. Mantelpieces are niade commonly of wood, marble or iron. Iron ones can be standardized and turned out in thousands. The wooden ones are often beautifully carved, and both kinds are sometimes inlaid. Stonc and faience are also used for mantelpieces.

The mantelpiece which is not in itsclf satisfactorilydecorative should be painted or stained with due regard to the general colour scheme of the room. The wooden variety calls for no
special trentment, beyond taking care to olean the work before beginning to paint, and stopping any little holes or cracks that may be visible avith havel stopping.
The marble mantelpiece is very difficult to colour in a setisfactory manner. One method is to roughen the surface with sandpaper and use Hat colours; another is to apply special transparent stains; but these are not very durable. Cast-iron mantel pieces are amenable to treatment if they are well sandpapered hefore applying the first undercoating, after which they may be painted in the same way as woodwork. See Chimney Piece: Fireplace; Gas: Grate.

MANTILLA. Spain's national headdress may be white or bluck. The material is silk blonde lace, and though a great deal of this is machine-made, the best examples of the mantilla are hobbin-made, showing the heary floral lesign with finer filling lace stitches on a delioate net ground.

A mantilla is partly shaped and folded, so that when placed on the shoulders the straight piece may be drawn up and draped
over the high standing comb at the back of the head, and the shaped Hounce forms a graceful cape. Mantillas are sometimes worn as evening wraps See Lace.

MANTLE. In one of its senses a mantle is a form of cloak. In a nother sense a mantle is a piece of network, conical in shape, covered with some highly refractory material, that becomes luminous under a flame and is therefore used to add to the illuminating power of gas See Gas Mantle.

MANTLING. All the cloths used for women's outer coats are inclulled under this description. The variety ranges from soft, smooth woollen velours, blanket cloth, and showy tweeds to moiré silks, matelassés and imitation furs Mantle cloths are wind-proof in very different degrees, and for winter wear it is desirable not to choose too open a texture.

In buying mantling, regard should be paid to thie back as well as the face, hoth an to its appearance and as to its suitability for an unlined garment. Thick, solid oloths are not easy to cut out, and require tailor's skill and heavy ironing to look well.

## Manures for the Garden

## Natural and Artificial Fertilizers and their Uses

Detalled Information on the manuring of various plants will be found under the separate headings, e.g. Asparagus; Celery; Cucumber: Endive; Horseradish, ctc. Sec also Fertilizer:

Fruit: Garden: Hotbed: Kitchen Garden, etc.
Food or stimulant for trees and plants early summer. In the casp of heavy soils, grown in the garden consists either of the ordure of animals, farmyand manure as it is called, or of chemical or artificial fertilizers The three chief plant foods are nitrogen, phosphates and potash. Natural or farm. yard manure contains all three. A fourth substance, lime, is required, not so much, however, as a food for plants as on account of ita chemical astion on the soil.

Natural Manures. Natural manures and road sweepings found in or near towns are of little value, as they are usually impregnated with petrol and oil, and are therefore injurious. Spent hops, leaves and decayed green refuse are valuable manure substitutes. Among the best artificial manures, although it is really a natural prorluct, is guano. Dried blood, bnne manure and bone meal are also useful for various purposes.

A good chemical manure for general application consists of superphosphate of lime, 5 parts, and sulphate of ammonia, 2 parts; the mixture should be applied at 2 oz . per sq. yd. or diluted in water, 1 oz. per gallon.

Sulphate of ammonia and nitrate of sode are the two chief nitrogenous manures : they promote leaf growth and ure used at the rate of $1-2 \mathrm{oz}$. per eq. yd. of ground. Superphosphate of lime, basic slag, and bonemeal are phosphatic manures which help in the building up of stems and the development of flowers and fruits Basic slag should be applied in sutumn, 4-6 oz. per sq. yd. of land, the others in spring at 2 oz. per sq. yd Potash is present naturally in most soils, particularly in clavey ground, but it may lee supplemented by the use of sulphate of potnsh, 1-2 oz. per sq. yard in spring and

Manure 1. Liquid manure: a. solid manure in boz of pan; $b$, wooden rest: $c$ lid; $d$, water. 2. Soot water, bar of soot suspended from stick. 3. Open ground tank ; $a$, sunk tank; $b$, brickbats; $c$, straw; $d$, mannee; from rooi. 5. Manure stack. 6. Same with ank pail to collect draining liquid
on account of the nitrugen it contains, but it also improves the working qualities of the soil. If possible, it should always be stood in a dry shed for some time before use. When used for manure lime and soot should never be mixed, or the lime will drive off the ammonia in the soot. Six civt. of good soot is equivalent to a cwt. of sulphate of ammonia. Poultry manure should be stored in alternate layers with an equal bulk of dry roil in a convenient receptacle, or in a heap in a dry shed until it is nceded. It may be turned twice or three times, and, after such trentment, should be applied to all crops at the rate of from 4 to $\mathbf{6} \mathbf{~ o z}$. per sq. yd
Liquid Manure. Liquid manure can be made in the following ways: Take a peck of poultry manure, or a peck of sheep droppinge, and place this in a 40.gallon cask. Fill this with water, and after atanding 24 hours it should be ready for use. This makes an excellent manure for application to fruit, Hower, and vegetable crops during the growing season, the rate being 2 gallons to the sq. yd.

Lime. Lime is most valuable on heavy clayey soils. It may be applied either in autumn or early spring, ono bushel per three rods of ground, but it should not be put on at the same time as farmyard manure. It is best to do the digging and manuring in the autumn or early winter, and to apply the lime in the dry, slaked form about the beginning of March. Lime should be hoed or raked into the tup 3 in . of soil; not he dug in or buried deeply.
In Leaflet 320, from which much of this information is taken. the Ministry of Agriculture makes the following suggestions about manuring the various individual crops.

Manuring Potatoes and Cabbages. In the case of potatoes where the crop is grown on the flat, sulphate of ammonia should be applied on the surface just before the first
 l lb. per rod. Whare potatoes are planted in drills the sulphate of ammonia may be applied in the drills at the time of planting. Superphosphate of lime should be applied at the rate of It oz. per sc, yd. ( 3 lb . per rod), and may be forked in lightly before planting on the flat, or applied in the drill at time of planting. Superphosphate and steamed bone flour may lie mixed in equal proportions and applied, when planting, at the same rate.

All the members of the cabbage family respond to applications of nitrogenous manures. Sulphate of ammonia should be applied at the rate of $\frac{1}{2}-\frac{3}{3} \mathrm{oz}$. per sq. yd. ( $1-1 \frac{1}{2} \mathrm{lb}$ per rod) before the first earthing up, or as soon as growth starts. Superphosphate, or superphosphate and steamed bone Hour in equal proportions, should be used at the rate of 1 oz per aq. yl ( 2 lb . per mod) at the time of planting, or before the firat earthing up. In inland distriots, where allotment crops on light and medium soils are liablo to suffer from drought, salt is very helpful. It should be applied at the rate of 1 oz . per sq. yd.

Manuring Other Crops. Crops belonging to the pea and bean family can usually provide themselves with sufficient nitrogen. A mixture of superphosphate and steamed bone flour in erpual proportions should he applied to the ground before or after sowing the sced, at the rate of 1 oz . to 4 yd . in length of drill. The manure should never be sown in the hottom of the drill in direct contact with the seed. Basic slag may replace the superphosphate and steamed bone flour, and be sown at the rate of $\frac{\mathrm{l}}{\mathrm{l}} \mathrm{b}$. to 4 yd of drill.

For onions, leeks and celery, sulphate of ammonia should be applied at the rate of 1 oz. per sq. ycl. (l lb. per rod), with superphosphate and steamed bone four, mixed in equal proportions, at the rate of 1 oz . per sq yd. On light soils, liable to dry out, salt may be given with advantage (l oz per sq. yd.).

These crops should all he manured in the early stages of their growth.
For carrots, parsnips and beet, sulphate of ammonia should bo applied at the rate of $\$$ oz. per sq. yd. after singling. Superphosphate and stenmed bone flour, mixed at the rate of 1 oz. per sq. $y d$. , should be applied before sowing the seed. On dry soils, 1 oz. of salt per sq. yd. may be applied before drilling. Lettuce, spinach, and radishes are greatly helper by applications of sulphate of ammonia, which should be applied at the rate of $\frac{1}{2} \mathrm{oz}$. per $\mathrm{ar} . \mathrm{yd}$. in the early stagen of growth. Where radishes do not bulb readily, superphosphate, at the rate of 1 oz . per sq. yd., should be applied to the soil before sowing.
MANZANELLA. Made from n highly prized species of grape, manzanella is a fine sherry with a fragrant floral bouquet and an aromatic flavour. It is said to take its name from its similarity to a wine produced at a place called Manzanella, which is situated some 25 miles from Seville. It is a good beverage wine and goes with most table dishes See Sherry; Wine.

MAPLE. This is the common name of a jarge group of hardy trees and shrubs known botanically as acer: they thrive in ordinary well drained loamy soil. Of the trees the most familiar- are the sycamore (Acer pscudoplatanus), Norway maple (platanoides), the common maple (campestre) and the variegated box eldor (Negundo variegatum): the last named is a most decorative small tree with green and white leaves.
There are many beautiful varieties of the Japanese maple-shrubs which like a somewhat sheltered position: the young leavos are charmingly tinted in spring, and in some the autumn colouring is attractive. A few of the most beautiful of the Japanesc maples are roseo-marginatum, septemlobum elegans, Osakazulii and atropurpureum, which are varietics of Acer palmatuin: aureum and láciniatum are varieties of acer japonicum. These shrubs are slow growing. Maple sugar is mado from the sap of the tree.
Uses of the Wood. The wood of the inaple is light in colour, ranging from white to yellowish brown and grey. It is heavy, hard, tough, and fine-grained, with a lustrous surface, especially when cut radially through the centre of the trunk. This sometimes has a wavy or mottled appearance showing alternate light and shade across the surface. A variety called bird's eye maple has a speckled curly grain, and is used chietly in the form of veneer.
Maple does not easily splinter, and is excellent for floorboards and other interior fittings. It takes stain well and is easily polished. It is used for furniture, plywood, fretwood, turnery, musical instruments, dairy woodwork, wood spoons and platters, and rollers. A bog maple, cut from peat, and pale blue in colour, is sometimes used for vencer and small articles. See Wood.

MARABOUT. The name is that of a bird, and the original marabout was a tuft or plume of soft or grey feathers from beneath the wings and tails of storks, herons, and adjutant birds, and used as a millinery trimming. The term has been extended to cover fluffy feather trimmings, ruffles, stoles, wraps, and valuable coats having no necessary connexion with marabout birds.
Prepared feathers are braided or corded logether with their soft fronds projecting to make exceedingly light trimmings weighing much less than fur and giving similar warmth. They do not wear nearly so well as fur, but often look very becoming for dressing gowns and jackets. Marabout loses substance in wene by detachment of the feathers from the central binding cords, and the articles should be handled lightly and with care. Washing
is often detrimental, but marabout articles may be dipped in a warm soapy lather and dried by being shaken in front of the fire ; they should not be crushed in storage

MARASCRINO. A fine, delicately fla voured varicty of cherry known ns marazques is the suurce from which maraschino is distilled. It is a sweetish liqueur with a subtle taste, and is often used to flavour fruit salads and in some coclitails. A maraschino cherry is often placed in the half of a prepared grape-fruit, and in a cocktail glass containing a sweet liqueur. These cherries are bottled in maraschino.

MARBLE. There are many kinds of marble, some of the best of the English varie ties being found in Dorset. Purbeck is a mottled grey, whioh takes a tino polish and is suitable for decorative work. A fine black marble, known as Mento, comes from Galway. Conhemara, a blue green, and Churchtown, a red marble, are also quarried in Ireland.

Beautiful examples from Derbyshire, Staffordshire, and Devonshire are notable for their delicate colourings, and are employed for carved table ornaments and chimney pieces. Some of the most handsome varieties come from Greece. Pure white, from Carrara, in ltaly, is used for sculpturo and for expensive carving and ornamental work.

Decorative Uses. The purposes for which the various kinds of marble are employed depend largely on their weather-resisting qualities. Red Ogwell, which is a particularly aoft type, will not retain its fine polish out of doors, and is consequently reserved for household use. It is mado into mantelpicces, fenders, and pedestals for marble or bronzo figures. Dove marble, another soft variety, is of a pale grey colour, and, because of its high polish, is specially adaptable for panelling and wainscoting. Like red Ogwell and other coloured marble, it never discolours.

Mottled marble, a variety of white Sicilian, is also used for janelling, because of its fine markings, the slabs being arranged so as to form diamonds and other patterns. Unlike the coloured marbles, this is a hard type, and can be used equally well out of doors in the form of flower vases for the garden or terrace steps. Veined white Sicilian marble varics from the mottled only in the markings, and is employed for very much the same purposes.
Among the choicest and rarest of the many articles executed in marble are pictures wrought by Italian oraftsmen, in almost every variety and colour of marble, including bright einerald green, the supply of which is extremely limited, and crimson, which is equally rare. As a rule, these pictures are portraits rather than landscapes or seasca pes and usually fetch high prices. They are generally framed in mahogany or oak.

Domestic Uses. As used in the home, marble takes the form of wash-basins, table tops, pantry shelves, mantelpieces, curbs, etc., its chicf advantages being that it is sanitary, cool to the touch, and easily kept clean. Due, moreover, to its natural composition. which contains lime, it has the further property of heing germ-destroying, and so is ospecially suitable for lavatories.

Its cooling properties are best revealed in the pantry, where, in the form of shelves and receptacles for butter, milk, etc., it is the most practical material In the hottest weather it remains at a comparatively low temperature, and diffuses its coolness to such foods as would otherwise ensily melt. For the same reason it is of essential value for storing meat. Slabs for the purpose are eold cheaply at most monumental works.

Plain marblc curbs may be put together at home, parts for which may be cheaply obtained. Three blocks of the required measurements should be bought, two being
of short lengths for the side3, and the other as long as the hearth itself. These blocks may be polished or unpo!ished. Outside the bousc marble is used for doorsteps and terrace ornaments.

Cleaning Marble. When discoloration occur a little crystallized oxalic acid should be dissolved in water, and the mixture app!ied. Meat or vegetable stains require other treatment; $\frac{1}{2} \mathrm{lb}$. each of stone potash and pipeclay should be mixed in water with a little oxalic acid added to form a paste. Cover the stain with this preparation, and let it remain on overnight. The application should be repeated until the stain vanishes. Mineral stains, caused by rusty nails, etc., rarely yield to treatment, but may be subjected to the above application. Unpolished surfaces should be rubbed vigorously with pumicestone and water. A polished or glossy surface can be produced by a mixture consisting of four parts of oxalic acid to one part of sulphate of learl. This should be applied with it wet flannel cloth, and a brilliancy that will last for years will then be obtained
When marhle has beel exposed to the air for any length of time without attention the stains formed may be removed by first applying potash water and rubbing it down thoroughly, afterwards washing clean with lirst clean water and then water with a few drops of hydrochloric acid in it, although care should be taken not to add too much hydrochloric acid.
Another method that is sometimes used is to apply cqual quantitics of soft soap and реarl ash with a soft rag washing it off after a few minutes with warm water, and finishing with a soft dry flannel. If there are no stains a good plan is first to rub olive oil on to the marble and then rub down thoroughly with a sof trag, or a solution of 2 oz . soda carbonate in a quart of water should be well scrubbed down the marble, finishing with a soft rag.

Marble table tops, the tops of washstands and other articlea when cracked or broken may be riveted as is described in the article on the repair of crockery. The rivet holes need only be drilled half way through from the back of the material. The rivets are fixed in the holes by filling them $w$ ith plaster of Paris mixed with water. The joint should not be coated with the plaster, but if desired. when the top is finished, and the marble top replaced, the crack, if at all visible, may be filled with plaster by working it in through the top and colouring with suitable pigments to match the existing work.
MARBLE CAKE. To make a marble cakc, prepare and bake a cake according to directions given for Russien e:ake; cut this up into pieces of all shapes and sizes, and atir them

Marble Cake, a fancy cake with iced top
into a little sieved apricot jam melted in a pan over the fire. Line a tin with greascproof paper, and pack in the cake mixture, hlending the colours prettily. Put a lid with weights on it over the cake and leave it for an bour or two. Then turn it out catefully, putting the most level side uppermost. Pour over it some white glacé icing and decurate the top with wavy lines of chocolate glace icing applied with a forcing bng und plain pipe. See Russian Cake.

Marbling. See Graining; Iacquer Work.

## Notes for the Month

## Marcu 1-S. Dnvld's Day <br> Marck 26 . Lidy Day Quarter Day

are empluyed in the manufacture. After being relined they are churned with milk; colouring mintter and salt are added, tho latter acting as a preser. vative

Anrgarine is a wholesoneand chenp article of foorl. should not be bought in large quantities. On nccount of the milk which it conlains it does not remain in good conlition indefinitely. and should be used as fresh as possible.

Although it is very suitable for some purjoses, such as for making cakes and sauces, mirga. rine is not so suitable as lard or dripping for frying, owing to the milli and salt which it contains. If occasion arises when margarinc only is available for frying, the difficulty may be overcoine to aoncextent by placing the fat in a sauccpan on top of the stove or in a hasin in the oven, and allowing it to remain for some time, stirring occasionally. The heat eraporates

MARCOBRUNNER. 'I'his famous brand of Germian hock of fragrant aroma and brilliant colour is the product of the vinepard of Marcubrumn, which stands amons the lijls some little distance from the Rhine. The output is amall, and a great deal of wine which is not grown there is sold under the name of Marcobrunner. See Hock.

Mare's Tail. Hardy rush-like waterside plant
MARE'S TAIL. This is the common name of a hardy perennial with rush-like stems A few linds are suitable for waterside planting, but others are weeds which thrive chiclly in boggy ground

## MARGARINE. The term margarine is

 applied to any substance that has the same appearance as butter and that is used as a substitutc for butter. Beef and mutton fat,lard, coconut, cotton seed, and pea nut oil
the water, and dry
sediment resulting from the inilli can be emnved by straining
Margarine can be used for making pastry in conjunction with lard, in the proprtion of half land and half margarine; but, it should be noted, it is not advisable to use margarine lone for making pastry.
The Law About Margarine. Any margar inc or any margarine cheese that is imported into Great lbritain inust bear conspicuuusly on the ticliet the words margarine, or margarine cheesc, as the casc may require. Margarine must not contain more than 16 per cent of water or more than 10 per cent of butter fats, nor must it containany preservative prohibited by the regulations.

Any breach of the above protisions renclers the aifender, whether he be manufacturer, im. porter, consignor, consignec, commission agent or otherwise, linble to a penalty of $£ \geq 0$ for the first offence, $£ 50$ for the second and $£ 100$ for any subsequent offence. Thie prackage, whether open or closed, must be printed, or durably marked, with the words margarine or margarine cheses on the tol, bottom and sides in printed capital letters not less than 3 in. square, and this brand or mark must be on the package itself nnd not simply on a label.
Fuither, when these rticlea arc expored for sale by retail, a label must be on every parce so exposed in such manner as to he clearly

Marguerite. Flowers of the single variety grown as a pot plant. Above, fine large bloom of the double white variety Mrs, Sarde

MARIGOLD. The common marigold is clavatus, yellow; lilacinus, lilac; anıenus, a showy dwarf plant with orangecoloured rosy purple, and venustus, of which there are flowers. New brilliantly colonmed varieties have heen raised; they should he grown in prefcrence to the old-fashioned kind Orange King and Radio are especially finc. Once

MARJORAM. The hardy aromatic herb eplants should he prit in rich soil in spring

Marigold. Left, large, lemon-coloured, globular flowers of the African marigold.
Right, orange blooms of the common marigold
introduced into the garden, it will sow itself. and come up the next year in profusion. It is a Calendula, while African and French marigolds belong to the genus Tagetes, producing brilliant Howers in great abundance.

African marigolds, with their large globular dunble llowers, are of leminn and orange they thrive in almost any fertile, friable soil, heing raised froin seed under glass in February Thev grow 2 to 3 ft . hish.

Both single and double coloured and striped sorts of French marigolds are availahle, I to 2 ft . high, alen miniature single kinds about 9 in. high Etoile d'Or, lagion of Honour. Meteor, Diadem, Silver King, and Star of Indin make gold edgings. See Fig Marigold; French Marigold; Marsh Marigold
MARINADE. This is the name given to a brine uszd for sousing or jlickling fish and micat. A game or meat marinade is made as follows In a large earthenware vessel put 2 onions and 2 carrots cut into thin slices, a small handful of salt. a bunch of herbs, including sprigs of thyme, basil and sage, a few hay leaves, jeppercorns, macs and cloves. Pour over thesc 1 pint vinegar and 2 pints cold water cover the vessel and keep) it in a conl place. The meat or game is soused in this marinale hefore it is cooked.

A marinade for lish can be made thus: A gill of salad or olive oil is mixed with the same quantity of white vinegar, a finely chopped onion, a bunch of herbs, and a little salt and cayenne. The fish is put in this mixture to souse, and is then broiled, or it can hic haked in the marinade in the oven. See Mackerel ; Pickle, etc

MARINE GLUE. A special typic of glue. used in ship and boat building for making watertight joints, is known as marine glue. It is gencrally composed of shellac, or caoutchouc mixed with turpentine or naphtha. It can be used under any circumstances where a sound waterproof glue is required. See Glue

MARIPOSA LILY. This is the common name of Calochortus, a group of rather tender flowering bulbs. They should be ginwn in a bod of well-drained sandy soil in a sumny, sheltered position, as at the foot of a wail. In winter it is wise to protert the bed with a frame "light" to keep, off excessive rains. The bulus should be planted 3 in . deep, in carly autumn. The flowers are of many charming colours. A few of the best are
majority of the smaller towns they are still important. See Early Closing.
MARKING. Marking personal and house. hold possessions with the name or initials of their owner is usually done by means of marking ink and a pell sold for the purpose. Some people use a stencil specially made to use with marking ink. When marked each article must be left until it is dry. Tablecloths, shects, and other items of house linen are often marked in this way with the names of their owner, and many persons so mark their pocket handkerchiefs and other possessions. Another method of marking articles of clothing is to write or print the name on a strip of cotton, or other anitable material, and then to sew this on to the garment.

Clothing and house linen can be marked in another way. This is by means of initials, which are worked on to the garment in silk or cotton thread, either in white or colour.
To mark suitcases and nther luggage the initials should first be outlined in a suitable size, and then the paint. white or black oil colour, as desired, can be laid between the lines with a bush Careful measurements are necessary in order to make the letters

uniform insize and similar also in style. See Initial

Marking Ink. For marking the name of the owner on clothing. a marking ink ought to be permanent in its elfect, and not liable to hecome faint and illegible after repeated washing of the linen. The hest ink for the purpose is onc having nitrate of silver for a basis : but if blcaching powder is used in washing fahrics inarked with this ink there is a tendency for the linen to rot into holes at the places where the marking was donc. Other bases used are coal tar and aniline

The manufacture of marking inks is somewhat complicated, but a simple form can he made by grinding Chinese ink with a little water to a thick, smonth liquid: this is dried by placing it in a warm place, and is then reduced to ponder. To the powder is added a mixture of coal tar 1 part, mineral naphtha 2 parts, until a thin crean is formed. The resulting ink marks are quite permanent.

MARKING GAUGE. Onc of the indispensa ble tuols of the woodworker, the niarking gauge is used for marking incised lines in the clirection of the grain parallel to the edge. lt is illustrated and described in the article Gauge (q.v)

MARL. Largely consisting of decomposed limestone with a amall percentage of clay, marl is nutural soil which pussesaes the property of hardening very rapidly. Ordinary niarl contains fom 15 to 2() per cent of carbonate of lime. Being comparatively immune from the attacks of insect jests, it is much in request for grass courts, and it is sometimes applied to the surfaces of other garden suils as a top-dressing. Mas is used with other ingredients in the preparation of cement, concrete, and other building materials. Marl giays is a pasture grass which is sometimes used in garilen mixtures to match existing turf. It belongs to the elover family. See Soil.

# Marmalade: Orange and Other Makes 

## Directions for Using the Ingredients to the Best Advantage

This article contains adviec on the hest fruit to c.aoose, as uell as simple and excellent recipes. Sce also Jam ; Jelly

Although marmalade is the name originally given to a preserve of Seville oranges, other fruit preserves are now included as mama. lades. Sweet oranges and lemons arc used in conjunction with Seville oranges: lemons and tangerines noke delicious preserves, and grape fruit, melons, pineapples, and quinces are also malc into marmalades

The making of marmalade is rather a tedious process, as much depends on the preparation of the fruit, and this must not be done carelessly if a good preserve is to lie made. All the rinds must be shredded finely, and all pips and pith removed. The cutting can be facilitated if a marmalade machinc is a vailable: these can be hought quite reasonably, or sometimes a machine can be hired for a shilling or tiln Some people prefer the jeel sliced coarsely, in short sections, after the manner of Oxford inarmalade, in which case it is necessary to cut it with a knife by hand.

Success in marmalade making depends on sound fruit, good sugar, and careful preparation and boiling. Experts say that the earliest shipments of Seville oranges make the tinest marmalade, Fehruary and March heing the best monthis Certainly they are most plentiful and at their cheapest then. A good quality of fruit should always be used, and it should not be under-ripe or over-ripe. Overripe fruit is not worth preserving, as it will not keep, and the marmalade is sure to ferment and turn mouldy in a very short time. Under-ripe fruit is lacking in juice, and contains a large proportion of hard pith and skin, which has to be discarded. Also the under-ripe oranges do not contain enough pectin, the jellifying quality in the fruit which is essential. No amount of boiling will make the preserve jelly if this quality is lacking.

The best preserving sugar is necessary for a good, well-flavoured marmalade, and in the
long run is most economical, as it reduces skimming to a minimum Sugar should not be added to the marmalade until the neel and pulpare tender: it is not the sugar that needs conking, or that causes the marmalade to jelly Its purpose is to sweeten only.
There are numernus recipes for orange marmalade all varying a little in accordance with the experience and tastes of the makers. The proportion of water varies in each recipe, but for general guidance it is safe to sny that weight for weight of fruit and water will make a solid marmalade, and for a thinner one the water may be increased to a pint and a half for every pound of fruit.

The propurtion of sugar varies greatly, though pound for pound is usually advised for all Seville oranges; the length of time for boiling varics according to the quality of the fruit.

Orange Marmalade. A good general recipe for orange marmalade is to allow a pound of sugar to each orange, a pint of water to each orange, and one lenion to every four oranges Thus, to 12 Seville oranges allow 12 lb . sugar. 12 pints water, and 3 lemons. Wipe the oranges and lemons well, quarter them and remove peel from each quarter, and take as much pith as possible frmm fruit and peel: Cut up the pulp roughly with a knife or put through the marmalade machinc Remove all the pips into a separate basin. Shred the skins finely. Put fruit and peel into an earthenware pan, cover with 11 pints water, and leave to soak for 24 hours or longer. Then put the pips with the remaining pint of water in a saucepan and simmer for an hour Strain the liquid into the prepared fruit

Put the soaked fruit and liquor into a prescrving pan, bring to the boil and simmer for an hour. The marmalade must never hoil rapidly, as this toughens the skins. Then add the sugar, stir well and simmer gently for another half hour, removing scum as it rises. Use a wooden spoon, as a metal one will taint the preserve.

Test the marmalale on a plate; if it jellies when cold it is finished, but longer boiling may be necessary. Too long boiling makes the marmalade dark and gummy, so do not leave it too long without testing.

When finished pour off into warmed, dry jars, leave until cold and cover securely, first with a piece of waxed paper on top of the preserve, and then with a thick gummed circle that comes well down the side of the jar to keep it airtight. Store in a cool, wellventilated place
Jelly Marmalade. To 12 Sevillc oranges allow 3 sweet oranges and 2 lemons. Peel the fruit very thinly. cutting none of the white

Marmalade Machine. Type requiring the fruit to be inserted from the Top. There is also an attachment at the side for cutting French or
part with it. Cut the peel into the thinnest possible strips and tie them in a muslin bag big enough to allow them to swell Remove all the white inner rind from the fruit. and cut up the fruit conrsely. making about three pieces out of each. Lenve the pips in Put the bag of orange peel strips and thic fruit into an earthenware pan, cover with 12 pinta of cold water, and let it stand overnight.

Next day boil all together rather quickly for three hours, then remove the muslin bag and empty the strips into a hasin. Strain the pulp twice, and add the strips to the strained liquor Weigh it, nnd add an equal weight of sugar. Clean out the preserving pan, and put in the syrup and boil until it sets-about 25 or 30 minutes Let it stand half an hour before pouring off into jars.

Lemon Marmalade. To every pound of fruit allow 3 pints of water. Slice the lemons very thinly, removing the pips. Let the fruit stand in the water for 24 hours, and let the pips soak in water to cover them. Then atrain off the water from the pips and add to the rest, and hoil the whole until the lemons are tender. Leave to get cool, or pour off into an earthen vessel and leave until next day. Then weigh the pulp again, and to every pound allow $1 \frac{1}{2} \mathrm{lb}$. preserving sugar. Boil again until the strips of lemon become trans parent and the pulp jellies.

Tangerine Marmalade. Tangerine marma lade is made by using 6 Seville oranges. 2 sweet, 6 tangerines, and 1 lemon. P'are the fruit finely, and divide it Put the pips to soak overnight in $\frac{1}{2}$ pint water. Shred the rinds finely and weigh them, allowing 2 pints water to each $\mid$ b. fruit Let the rinds soak in this water overnight. Boil up next day arlding the water in which the pips were soa ked, and continue boiling until the rinds are tender Iet the preparation stand for another day, then weigh the rinds and allow 1 lb preserv ing sugar to each lb . fruit. Boil up until it reaches the jelly stage. This should take about $\$$ hour.

Grape Fruit Marmalade. Wipe the fruit, remove rinds and alice thinly. Remove the white inner tissue, pith and sceds Cut the fruit in slices. Weigh the pulp, and allow pound for pound of sugar. Put pulp and rind in a preserving pan, juat cover with $w a t e r$ and boil till rinds are tender. If the marmalade seems too bitter, the water should be changed once When rind is soft, add the sugar, and simmer until the marmalade scts when tested on a plate
